Starting in ***EOS Release 4.23.1F***, there is an additional config command to configure SRLG mode.

`srlg` [strict]

`no srlg` [strict]

`default srlg` [strict]

This command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When **`srlg`** is specified with the **strict** keyword, then if a path for a bypass tunnel excluding SRLGs of the next-hop interface of primary LSP can not be found, RSVP does not setup the bypass tunnel. When **`srlg`** is specified without a **strict** keyword, then a bypass tunnel is setup with as many links as possible that exclude the SRLGs of the next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.

When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the **no** and **default** versions of the command take you back to the default of SRLG processing being turned off.

The SRLGs of an interface can be configured using the following traffic-engineering CLI as below:

```
(config)#interface Et1
(config-if-Et1)#traffic-engineering srlg 100

(config)#interface Et2
(config-if-Et2)#traffic-engineering srlg 200
```

Note: Although a large number of SRLGs can be configured on an interface (ranging from 0 to 2^32 -1), CSPF only takes into account a maximum of 16 SRLGs for finding a path with SRLG constraints.

19.4.1.8 CSPF configuration command

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. The following CLI command is used under the **router traffic-engineering** mode to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF.

cspf delay [initial *n* back-off *n*] max *n*

All three values are in milliseconds and default to ***100***, ***200***, and ***1000*** milliseconds, respectively.

19.4.1.9 Traffic-engineering Configuration Commands

For CSPF to compute the FRR backup path to a particular destination, enable traffic-engineering on all the IGP enabled interfaces, and enable globally the traffic engineering extensions. For IS-IS, enable under ***router isis*** mode, and for OSPFv2, enable under ***router ospf***. This is required for the IGP to start exchanging TE-related attributes with peers and build its topology database.

Also, CSPF needs some notion of router ID to uniquely identify a router, so that it can find a path to it. CSPF also uses self router-id as a source for running SPF. So a router-id is required to be configured under ***router traffic-engineering*** mode for CSPF to function properly.

19.4.1.10 MTU Signaling

Starting in ***EOS Release 4.23.1F***, MTU along a path can be signaled using RSVP.

Example

mtu signaling

no mtu signaling

default mtu signaling

RSVP can discover the lowest MTU used along an LSP by evaluating and updating, at each hop, the composed MTU, stored in the General Parameters fragment of an AdSpec object in RSVP Path messages.

At each RSVP hop, when MTU signaling is enabled, the value is updated by taking the minimum between the downstream interface for an LSP and the composed MTU value from the incoming Path message.

When the feature is disabled, the composed MTU is not updated.

19.4.1.11 Soft Preemption

Starting in ***EOS Release 4.23.1F***, soft preemption is supported, which enables deferred failure of RSVP-TE LSPs on link oversubscription. A preemption timer value can be used to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (***RFC 5712***).

`preemption method` [hard | soft] timer *t*

`no preemption method` [hard | soft] timer *t*

`default preemption method` [hard | soft] timer *t*

The default preemption method is soft preemption with a timer value of ***30*** seconds.

In this example, the preemption method is soft preemption with a timer value of ***10*** seconds.

```
(config-mpls-rsvp)#preemption method soft timer 10
```

Setting the preemption method to hard preemption results in a timer value of ***0*** seconds and disables the feature.

```
(config-mpls-rsvp)#preemption method hard
```

Sample Configuration

```
switch(config)#ip routing
!
switch(config)#mpls ip
!
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ip address 10.0.0.1/24
switch(config-if-Et1)#isis enable isis
switch(config-if-Et1)#traffic-engineering
switch(config-if-Et1)#traffic-engineering bandwidth 100 percent
switch(config-if-Et1)#traffic-engineering metric 5
!
switch(config)#router traffic-engineering
switch(config-te)#router-id ipv4 0.1.1.1
!
switch(config)#router isis isis
switch(config-router-isis)#net 49.0000.0000.0000.1111.00
switch(config-router-isis)#is-type level-2
   !
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#maximum-paths 32
   !
switch(config-router-isis-af-te)#traffic-engineering
switch(config-router-isis-af-te)#no shutdown
switch(config-router-isis-af-te)#is-type level-2
!
switch(config)#mpls rsvp
switch(config-mpls-rsvp)#no shutdown
!
```

The following displays the overall state of RSVP.

```
switch>show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
```

```
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none

```

19.4.1.12 Path Specifications

Path specifications can be **explicit** and **dynamic** depending on Constrained Shortest Path First (CSPF) search procedure to find a path in the network topology.

Explicit Path Specifications

The operator provides all hops in the path explicitly. The given path is used directly as the Explicit Route Object (ERO) in RSVP Path messages. All hops are implicitly **strict** hops. Explicit loose hops are not supported. The submode to configure explicit paths is entered by specifying the name.

```
switch(config-te-rsvp)# path MyPath explicit
switch(config-te-rsvp-path-expl-MyPath)#
```

Each hop is specified explicitly in order.

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.12.2
(config-te-rsvp-path-expl-MyPath)# hop 10.0.34.4
```

Adding hops with **before** and **after** create a unique internal ordering in **show running-config**.

```
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.23.3 before 10.0.34.4
switch(config-te-rsvp-path-expl-MyPath)# hop 10.0.45.5 after 10.0.34.4
```

no hop command removes the hop.

```
switch(config-te-rsvp-path-expl-MyPath)# no hop 10.0.12.2
```

show active command retrieves the currently active configuration. The pending configuration that becomes active upon exiting the submode is retrieved with **show pending** command; the difference between these two can be retrieved with **show diff** command.

```
switch(config-te-rsvp-path-expl-MyPath)# show active
router traffic-engineering
   rsvp
      path MyPath explicit
         hop 10.0.23.3
         hop 10.0.34.4
         hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)# show pending
   hop 10.0.23.3
   hop 10.0.44.4
   hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)# show diff
 hop 10.0.23.3
-hop 10.0.34.4
+hop 10.0.44.4
 hop 10.0.45.5
(config-te-rsvp-path-expl-MyPath)#
```

exit command keeps the changes in the submode.

```
switch(config-te-rsvp-path-expl-MyPath)# exit
switch(config-te-rsvp)#
```

abort command discards the changes in the submode.

```
switch(config-te-rsvp-path-expl-MyPath)# abort
switch(config-te-rsvp)#
```

Dynamic Path Specifications

In a dynamic path specification, the operator provides constraints with which a CSPF procedure finds a path in the network topology. The CSPF result is a list of strict hops which forms the ERO.

The submode to configure dynamic paths is entered by specifying the name with **dynamic**.

```
switch(config-te-rsvp)# path MyPath dynamic
switch(config-te-rsvp-path-dyn-MyPath)#
```

Exclude hop constraints specify that CSPF must not choose the specified address on the path. Note that other interfaces on the same node may be used.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.56.6 exclude
```

Include hop constraints specify these hops included in the computed path in a certain order. A hop can be loose which allows other hops to be filled by the CSPF procedure. The keywords **before** and **after** work in the submode for explicit paths.

```
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.23.3
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.45.5 loose
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.12.2 before 10.0.23.3
switch(config-te-rsvp-path-dyn-MyPath)# hop 10.0.67.7 loose after
 10.0.45.5
```

19.4.1.13 Tunnel Specifications

Tunnel specification has its own sub-mode.

```
switch(config-te-rsvp)#tunnel MyTunnel
switch(config-te-rsvp-tunnel-MyTunnel)#
```

Each tunnel has a tunnel destination IP.

```
switch(config-te-rsvp-tunnel-MyTunnel)#destination ip 10.2.2.2
```

A tunnel specifies for path for its LSP(s). It configures the **primary** LSP.

```
switch(config-te-rsvp-tunnel-MyTunnel)#path MyPath
```

A **secondary** LSP is configured, when the **primary** LSP is not available. Only one secondary path can be configured per tunnel.

```
switch(config-te-rsvp-tunnel-MyTunnel)#path MyOtherPath secondary pre-
signaled
```

A tunnel reserves bandwidth along the path. The bandwidth can be configured explicitly.

```
switch(config-te-rsvp-tunnel-myTunnel)#bandwidth 10 mbps
```

Auto bandwidth specifies the minimum and maximum bandwidth used for the tunnel and adjusts bandwidth with an **adjustment period** based on the observed traffic going over the tunnel. The adjustment period is specified in seconds.

```
switch(config-te-rsvp-tunnel-myTunnel)#bandwidth auto min 1 mbps max 5
 mbps adjustment-period 60
```

Setup and hold priorities from ***0*** to ***7*** can be configured for the tunnel, where ***0*** is ***most preferred*** and ***7*** the ***least preferred***.

```
switch(config-te-rsvp-tunnel-myTunnel)#priority setup 5 hold 3
```

By default, a tunnel is not enabled.

```
switch(config-te-rsvp-tunnel-myTunnel)#no shutdown
```

Changes in the sub-mode only take effect when the sub-mode is exited normally for **show active**, **show pending** and **show diff** commands.

```
switch(config-te-rsvp-tunnel-myTunnel)#exit
switch(config-te-rsvp)#
```

Changes are discarded when sub-mode is aborted.

```
switch(config-te-rsvp-tunnel-myTunnel)#abort
switch(config-te-rsvp)#
```

Periodic tunnel optimization is configured globally as well as individually for a specific tunnel. For global periodic tunnel optimization, the optimization interval is configured in ***config-te-rsvp*** mode, and this configuration automatically gets applied to all the RSVP tunnels.

```
switch(config-te-rsvp)#optimization interval 3600 seconds
switch(config-te-rsvp)#
```

The optimization interval can also be individually configured on a tunnel by entering the command in ***tunnel*** sub-mode. The optimization interval configured in the ***tunnel*** sub-mode overrides the optimization interval configured globally.

```
switch(config-te-rsvp)#tunnel myTunnel
switch(config-te-rsvp-tunnel-myTunnel)#optimization interval 3600 seconds
```

Optimization can also be disabled on a specific tunnel. Optimization is enabled for all the tunnels with a common interval but a specific tunnel has optimization disabled.

```
switch(config-te-rsvp)#optimization interval 3600 seconds
switch(config-te-rsvp)#tunnel myTunnel
switch(config-te-rsvp-tunnel-myTunnel)#optimization disabled
```

alias IPv4 and IPv6 endpoints per tunnel allow these additional next hops to resolve using the existing tunnel. The command allows a maximum of ***15*** alias endpoints to be configured per tunnel.

```
switch(config-te-rsvp-tunnel-myTunnel)#alias endpoint 5.5.5.5
switch(config-te-rsvp-tunnel-myTunnel)#alias endpoint 2001::10
```

The **split-tunnel** command allows splitting the bandwidth for a tunnel between multiple sessions. With this enabled, RSVP automatically creates multiple LSPs with smaller bandwidth reservations for a single tunnel.

```
switch(config-te-rsvp-tunnel-myTunnel)#split-tunnel quantum 10 kbps
switch(config-te-rsvp-tunnel-myTunnel)#split-tunnel quantum 10 kbps sub-
tunnels limit 20
```

IGP shortcut in IS-IS

IGP shortcuts enable traffic to get forwarded along paths computed to take advantage of traffic-engineered paths setup using RSVP using a modified SPF algorithm. This enables operators to take advantage of TE capabilities of RSVP tunnels which traverse over links satisfying bandwidth, latency or fast reroute considerations.

IGP shortcuts are enabled on a RSVP Label Edge Router (LER) selectively on specific RSVP tunnels. When IGP shortcut is enabled, IP routes resolving over RSVP tunnels are installed in FIB. As a result all IP traffic including control plane traffic is forwarded through IGP shortcut tunnels. All protocols relying on FIB for nexthop resolution such as Static routes or BGP is also resolved over IGP shortcuts.

Configuring IGP shortcut on RSVP Tunnel

On a RSVP LER, IGP shortcut is enabled individually on each RSVP tunnel that is intended for them. No configuration changes are needed on any of the RSVP Label Switch Routers.

```
switch(config)# router traffic-engineering
switch(config-te)# rsvp
switch(config-te-rsvp)# tunnel R3b
switch(config-te-rsvp-tunnel-T1)# igp shortcut
switch(config-te-rsvp-tunnel-T1)# exit
```

IGP shortcuts is enabled by default in IS-IS, following command disables this under the IS-IS ***address-family ipv4*** mode.

```
switch#conf terminal
switch(config)#router isis inst1
switch(config-router-isis)#address-family ipv4
switch(config-router-isis-af)#igp shortcut disabled
```

Limitations

- IGP shortcut is only supported for IPv4.
- IGP shortcuts can only be computed over RSVP tunnels'
- IS-IS must be enabled on the loopback interface whose primary IP address is used as the RSVP tunnel end point.
- This is only available in the multi-agent routing protocol model.
- TI-LFA protection is not enabled for Segment Routing destinations reachable via IGP shortcuts.

Show Commands

The **`show traffic-engineering rsvp tunnel`** command gives the information about the paths for its LSP(s).

```
switch#show traffic-engineering rsvp tunnel
Tunnel TestTunnel
   Source: 10.1.1.1
   Destination: 10.4.4.4
   State: up
   Bandwidth: 0.0 bps, mode explicit
   LSPs: 2
   Active path: primary
   Primary path: Path1to4
      State: up, in use
      Path (dynamic):
         10.0.12.2
         10.0.23.3
         10.0.34.4
   Secondary path: Path1to4detour
      State: up
      Path (explicit):
         10.0.16.6
         10.0.67.7
         10.0.37.3
         10.0.34.4
```

The **`show traffic-engineering rsvp tunnel lsp`** command gives the details of the paths for its LSP(s).

```
switch(config)#show traffic-engineering rsvp tunnel lsp
```

```
Tunnel TestTunnel
   Source: 10.1.1.1
   Destination: 10.4.4.4
   State: up
   Bandwidth: 0.0 bps, mode explicit
   LSPs: 2
   Active path: primary
   LSP 1:
      Path specification: Path1to4, primary
      CSPF Path ID: 10001
      Bandwidth: 0.0 bps
      State: up, in use
      Path (dynamic):
         10.0.12.2

         10.0.16.6
         10.0.67.7
         10.0.37.3
         10.0.34.4
```

The **show traffic-engineering rsvp tunnel history** command gives the history for the paths.

```
switch#show traffic-engineering rsvp tunnel history
Tunnel TestTunnel
Mon 2020-07-13 07:04:44 CSPF query on primary path
Mon 2020-07-13 07:04:44 State change: down
Mon 2020-07-13 07:04:44 LSP #1 added
Mon 2020-07-13 07:04:44 CSPF reply for primary path, path found
Mon 2020-07-13 07:04:44 LSP #2 added
Mon 2020-07-13 07:04:46 State change: up using primary path
LSP #1
Mon 2020-07-13 07:04:44 LSP created
Mon 2020-07-13 07:04:44 State change: establishing
Mon 2020-07-13 07:04:46 State change: up
LSP #2
Mon 2020-07-13 07:04:44 LSP created
Mon 2020-07-13 07:04:44 State change: establishing
Mon 2020-07-13 07:04:47 State change: up
```

The **show isis summary** command shows the status of IGP shortcut configuration if IGP shortcut is enabled for IS-IS.

```
switch#show isis summary
IS-IS Instance: inst1 VRF: default
  Instance ID: 0
  System ID: 1111.1111.1001, administratively enabled
  Router ID: IPv4: 1.0.5.1
  Multi Topology disabled, not attached
  IPv4 Preference: Level 1: 115, Level 2: 115
  IPv6 Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 2, Number active interfaces: 3
  Routes IPv4 only
  LSP size maximum: Level 1: 1492, Level 2: 1492
  …
  Shortcut SPF for IGP: Enabled
  …
```

The **show isis network topology** command verifies the best path details computed after IS-IS SPF. RSVP tunnel details are shown if the destination is reachable through a IGP shortcut.

```
switch#show isis network topology
IS-IS Instance: inst1 VRF: default
 IS-IS paths to level-2 routers
  System Id        Metric   IA Metric Next-Hop         Interface
       SNPA
  1111.1111.1003   10    0         1111.1111.1003   RSVP LER tunnel index
 5  IGP Shortcut
```

19.4.1.14 Show Commands

19.4.1.14.1 RSVP Show Commands

Use the **show mpls rsvp** command to display the overall state of the RSVP.

```
switch>show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
```

```
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none
   Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
   Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

Use the **show mpls rsvp neighbor** command to display RSVP neighbors.

```
switch>show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
   Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

Use the **show mpls rsvp neighbor summary** command to display neighbors filtered by IP address.

```
switch>show mpls rsvp neighbor summary
Neighbor             Role       Sessions LSPs
==================== ========== ======== ========
10.0.1.1             Upstream   1     1
10.0.2.2             Downstream 1     1
```

or use the **show mpls rsvp session** command.

```
switch>show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        Type: primary
        Source address: 0.1.1.1
        LSP ID: 1
```

```
         LSP uptime: 00:02:38
         Session name: Session1
         Local label: 100000
         Downstream label: 100000
         Upstream neighbor: 10.0.1.1
            Last refresh received: 17 seconds ago
            Last refresh sent: 10 seconds ago
         Downstream neighbor: 10.0.2.2
            Last refresh received: 7 seconds ago
            Last refresh sent: 9 seconds ago
         Bypass tunnel: not requested
```

Session #ID and LSP #ID are internal values that are locally significant. Use these to filter sessions in the **show mpls rsvp session summary** command and in LSP ping and traceroute commands (see below). Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

```
switch>show mpls rsvp session summary
Session  Destination        LSP      Name         Role    Bypass State
======== ================== ======== ============ ======= ======
 =========
1        0.4.4.4             1        Session1    transit n/req  up
```

Beginning with ***EOS Release 4.23.1F***, use the **show mpls rsvp session detail** command to display detailed information of RSVP sessions.

```
switch>show mpls rsvp session detail
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        [...]
        MTU Signaling: enabled
           Received Path MTU: 1800 bytes
           Sent Path MTU: 1500 bytes
  [...]
```

Use the **show mpls rsvp counters** command to display RSVP message counters by interface.

```
switch>show mpls rsvp counters
Received Messages:

19.4.1.14.2 CSPF Show Commands

RSVP-TE uses CSPF to compute the FRR backup path. Starting from ***EOS Release 4.23.1F***, if **srlg** is configured in RSVPconfig to exclude SRLG, then details about the SRLG related constraint attributes are also shown as in the following show commands.

Use the **`show traffic-engineering cspf path`** command to display all the paths computed by CSPF. In the following example, path ***20.0.0.1*** is selected for display.

```
switch>show traffic-engineering cspf path 20.0.0.1 20.0.0.1

Destination     Constraint                          Path
20.0.0.1        exclude Ethernet1                   0.1.1.1
                exclude SRLG of Ethernet1           0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
                exclude Ethernet2                   0.1.1.1
                                                    0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
```

Using the **`show traffic-engineering cspf path detail`** command, path ***20.0.0.1*** is displayed in detail.

```
switch>show traffic-engineering cspf path 20.0.0.1 detail

Destination: 20.0.0.1
   Path Constraint: exclude Ethernet1
                    exclude SRLG of Ethernet1: orange-link (500),
                       green-link (400), 100, red-link (200), 600

   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2
```

19.4.1.14.2.1 Displaying the Traffic-engineering Database

You can display the topology used for CSPF computations by using the **show traffic-engineering database** command. Starting from ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.

Beginning with ***EOS Release 4.24.2F***, information for the OSPFv2 topology, if configured, displays.

```
switch#show traffic-engineering database

19.4.1.15 Limitations

RSVP-TE LSR contains the following limitations:

- Supports only IPv4.
- Supports only the default VRF.
- Supports only strict EROs with host hops (***/32***).
- Supports only transit role functionality.
- Traffic Engineering links with secondary IP addresses are not supported.
- The maximum number of supported RSVP sessions and LSPs is ***5000***.
- For FRR, the maximum number of supported LSPs per interface is ***2000***.
- Changing the RSVP FRR mode while a bypass tunnel is already in use can bring down both primary and bypass tunnels which cause traffic loss.
- Changing the RSVP SRLG mode while a bypass tunnel is already in use could bring down both primary and bypass tunnels which cause traffic loss.
- The maximum number of IS-IS/OSPFv2 routers supported by CSPF on a single broadcast network is ***30***.
- The maximum number of IS-IS/OSPFv2 adjacencies supported by CSPF for a single router is ***500***.
- CSPF only takes into account a maximum of ***16*** SRLGs per TE link, when excluding SRLGs while computing a path.

19.5 RSVP-TE LER

RSVP-TE, the Resource Reservation Protocol (RSVP) for Traffic Engineering (TE), is used to distribute MPLS labels for steering traffic and reserving bandwidth. The Label Edge Router (LER) feature implements the headend functionality, such as, RSVP-TE tunnels can originate at an LER which is used to steer traffic into the tunnel.

To Configure RSVP-TE LER

To configure RSVP-TE LER, use the traffic-engineering mode to configure the **`rsvp`** command.

Example

```
switch(config)#router traffic-engineering
switch(config-te)# rsvp
switch(config-te-rsvp)
```

In the RSVP-TE submode, the configuration has three components.

- Global configuration
- Path specifications
- Tunnel specifications

Global Configuration

In global configuration, all settings apply to all configured tunnels. Path specifications describe a set of constraints for paths. These are referenced from tunnel specifications to describe which path each tunnel can take.

Path Specifications

Path specifications are **explicit** and **dynamic** which differ in whether they involve a Constrained Shortest Path First (CSPF) search procedure to find a path in the network topology known to the headend. A path specification of a certain name is only either **explicit** or **dynamic**, such as, they share a namespace.

Explicit Path Specifications

In an explicit path specification, the operator provides all hops in the path explicitly. The given path is used directly as the Explicit Route Object (ERO) in RSVP Path messages. All hops are implicitly strict hops. Explicit loose hops are not supported.

Example

The submode to configure explicit paths is entered by specifying the name and the **explicit** keyword.

```
switch(config-te-rsvp)#path MyPath explicit
switch(config-te-rsvp-path-expl-MyPath)#
```

To explicitly specify the order of each hop, use the RSVP-TE explicit path configuration mode. In this example, hop 10.0.12.2. then hop 10.0.34.4 is specied.

Example

```
switch(config-te-rsvp-path-expl-MyPath)#hop 10.0.12.2
switch(config-te-rsvp-path-expl-MyPath)#hop 10.0.34.4
```

Adding hops with **before** and **after** keywords creates a unique internal ordering which will be represented in a canonical form using neither before nor after in the **`show running-config`**.

Example

Using the keyword **before**, the configuration places hop ***10.0.23.3*** before ***10.0.34.4***. Then, using the keyword **after** the configuration places hop ***10.0.45.5*** after ***10.0.34.4***.

```
switch(config-te-rsvp-path-expl-MyPath)#hop 10.0.23.3 before 10.0.34.4
switch(config-te-rsvp-path-expl-MyPath)#hop 10.0.45.5 after 10.0.34.4
```

When it is no longer necessary to have a hop order use the **`no hop`** command.

Example

Use the **`no hop 10.0.12.2`** command when removing hops.

```
switch(config-te-rsvp-path-expl-MyPath)#no hop 10.0.12.2
```

The **`show active`** command explains what is currently happening with the configuration

Example

The currently active configuration is retrieved with the **`show active`** command.

```
switch(config-te-rsvp-path-expl-MyPath)#show active
router traffic-engineering
   rsvp
      path MyPath explicit
         hop 10.0.23.3
         hop 10.0.34.4
         hop 10.0.45.5
```

The **`show pending`** command explains what happens when exiting the submode.

Example

The pending configuration that becomes active upon exiting the submode is retrieved with the **`show pending`** command.

```
switch(config-te-rsvp-path-expl-MyPath)#show pending
   hop 10.0.23.3
   hop 10.0.44.4
```

```
    hop 10.0.45.5
```

The **show diff** command displays the differences between the **show active** and **show pending** commands.

Example

The difference between these two commands is that they are retrieved with the **show diff** command.

```
switch(config-te-rsvp-path-expl-MyPath)#show diff
 hop 10.0.23.3
-hop 10.0.34.4
+hop 10.0.44.4
 hop 10.0.45.5
switch(config-te-rsvp-path-expl-MyPath)#
```

When you want to keep all your saved changes, use the **exit** command.

Example

The change in the submode only takes effect when the submode is exited normally.

```
switch(config-te-rsvp-path-expl-MyPath)#exit
switch(config-te-rsvp)#
```

when you do not want to save any changes, use the **abort** command.

Example

Changes are discarded when the submode is aborted.

```
switch(config-te-rsvp-path-expl-MyPath)#abort
switch(config-te-rsvp)#
```

Dynamic Path Specifications

In a dynamic path specification, the operator provides constraints with which a Constained Shortest Path First (CSPF) procedure finds a path in the network topology. Effectively, the path specification serves as a template to get instantiated together with other tunnel constraints (like bandwidth requirements). The CSPF result is a list of strict hops which form the ERO.

Example

The submode to configure dynamic paths is entered by specifying the name of the path, in this example MyPath, and use the **dynamic** keyword.

```
switch(config-te-rsvp)#path MyPath dynamic
switch(config-te-rsvp-path-dyn-MyPath)#
```

Exclude hop constraints specifies that CSPF must not choose the selected address on the path. Each excluding hops expresses that neither end of a link in the path may have the specified address. Note that other interfaces on the same node may be used.

Example

This example excludes hop 10.0.56.6.

```
switch(config-te-rsvp-path-dyn-MyPath)#hop 10.0.56.6 exclude
```

Include hop constraints are supported and specify that these hops have to be included in the computed path in a certain order. By default, a hop is strict, meaning that in the computed path it has to appear

directly after the previously specified hop. when a hop is loose it allows other hops to be filled by the CSPF procedure. The keywords before and after work as in the submode for explicit paths.

Example

In the following example hop 10.0.23.3 must be included in the path.

```
switch(config-te-rsvp-path-dyn-MyPath)#hop 10.0.23.3
```

In the following example hop 10.0.45.5 loose shows the hop does not have to be in any paticular order.

```
switch(config-te-rsvp-path-dyn-MyPath)#hop 10.0.45.5 loose
```

The following example shows hop 10.0.12.2 comes before 10.0.23.3.

```
switch(config-te-rsvp-path-dyn-MyPath)#hop 10.0.12.2 before 10.0.23.3
```

The following example shows hop 10.0.67.7 comes loose after 10.0.45.5.

```
switch(config-te-rsvp-path-dyn-MyPath)#hop 10.0.67.7 loose after
 10.0.45.5
```

Administrative group constraints are specified to restrict CSPF path computation to links that match a set of admin groups. Their IDs are globally significant and the specification contains lists and ranges of admin groups to include or exclude. In particular, every chosen link for a dynamic path must be in all of the admin groups specified in the ***include all*** range, must be in one of the admin groups specified in the ***include any*** range, and must not be in any of those in the ***exclude*** range. The admin group range starts at ***0*** and ends at ***31***. On the wire, the admin-group of ***0*** is translated to ***0x1***, ***1*** is translated to ***0x2***.

Example

In this example include 1 and anything inbetween 2-4, and exclude 7 and 9.

```
switch(config-te-rsvp-path-dyn-MyPath)#administrative-group include all 1
 include any 2-4 exclude 7,9
```

Administrative group constraints are specified using a name as an alias mapped to a numerical value. The mapping is configured under the global TE mode.

These names are directly used to configure administrative group constraints in addition to the existing numerical format. The admin group constraints for the dynamic path are configured using the following RSVP LER CLI.

Example

In this example the administartive-group includes all blue and anything between 2-4 red, and excludes 7 green.

```
switch(config-te-rsvp-path-dyn-MyPath)#administrative-group include all
 blue include any 2-4,red exclude green,7
```

The list of administrative groups is provided as a comma-separated input without spaces.

The submode for dynamic paths has the same commit/abort semantics and show commands as the submode for explicit paths.

Local Interface

Use the **`local-interface Loopback`** command to derive the source IP address for RSVP-TE tunnels. This is a mandatory setting.

Example

```
switch(config-te-rsvp)#local-interface Loopback 0
```

A few settings are taken from the global ***mpls rsvp*** configuration like Fast-Reroute (FRR) mode and soft preemption. The SRLG setting from the global ***mpls rsvp*** configuration is also used to specify if the secondary path of a tunnel is set up by excluding SRLGs of all the links in the primary path as additional constraints, therefore allowing the secondary path to be disjoint from the primary path.

Tunnel Specifications

A tunnel needs a specification of which tunnel to go to.

Example

In this example, MyTunnel is the name of the submode tunnel to use.

```
switch(config-te-rsvp)#tunnel MyTunnel
switch(config-te-rsvp-tunnel-MyTunnel)#
```

Basic Tunnel Configuration

Each tunnel must have a tunnel destination IP.

Example

The this example the selected destination IP is 10.2.2.2.

```
switch(config-te-rsvp-tunnel-MyTunnel)#destination ip 10.2.2.2
```

Adding Path Specifications

A tunnel needs to specify along the path in which its LSPs are established. Therefore, a path specification is referenced by its name and configures the **primary** LSP.

Example

The specified name for the path is ***MyPath***.

```
switch(config-te-rsvp-tunnel-MyTunnel)#path MyPath
```

A secondary LSP is specified which provides a fallback in case the primary LSP is not available. The secondary LSP is either established on-demand cold standby once the primary is not available or pre-signaled hot standby regardless. Configuring a secondary path is optional.

Example

To configure the secondary path, in this example, the name ***MyOtherPath*** is selected as a seconday path and is configured to be pre-signaled.

```
switch(config-te-rsvp-tunnel-MyTunnel)#path MyOtherPath secondary pre-
signaled
```

Only one secondary path can be configured, per tunnel.

Bandwidth Specification

Use the **bandwidth** command to reserve bandwidth along the path. The bandwidth is explicitly configured.

Example

In this example, a bandwidth of ***10*** mbps is selected as the reserve bandwidth for the ***myTunnel*** tunnel path.

```
switch(config-te-rsvp-tunnel-myTunnel)#bandwidth 10 mbps
```

Available units are bps, kbps, mbps, and gbps. By default, no bandwidth reservation is signaled, such as a bandwidth of***0*** bps.

An alternative to **explicit** bandwidth configuration is to use the **autobandwidth** feature which specifies the minimum and maximum bandwidth to be used for the tunnel and otherwise adjusts bandwidth with an **adjustment period** based on the observed traffic going over the tunnel. The adjustment period is an optional parameter measured in seconds. The default adjustment period is ***0*** . A special value meaning that the algorithm decides when to adjust bandwidth based on statistical measurements (the actual adjustment cannot happen more frequently than the sampling, which occurs every ***30*** seconds).

Example

In this example the bandwidth is set to auto with a minimum of 1 mbps and a maximum of 5 mbps, and has an adjustment-period of 60 seconds.

```
switch(config-te-rsvp-tunnel-myTunnel)#bandwidth auto min 1 mbps max 5
 mbps adjustment-period 60
```

The adjustment period is specified in seconds.

Tunnel Priorities

Setup and hold priorities from ***0*** to ***7*** are configured for the tunnel, where ***0*** means most preferred, and ***7*** means least preferred.

Example

In this example, the setup priority is configured of 5 and the hold priority is configured of 3.

```
switch(config-te-rsvp-tunnel-myTunnel)#priority setup 5 hold 3
```

The CLI does not impose restrictions on the priority values. Therefore, hold priority should be more preferred than setup priority to avoid cycles where an LSP is continuously established and immediately preempted.

Enabling The Tunnel

By default, a tunnel is not enabled, so it needs to be explicitly enabled.

Example

Use the **no shutdown** command to explicitly enable the tunnel.

```
switch(config-te-rsvp-tunnel-MyTunnel)#no shutdown
```

As for path specifications, the submode provides **show active**, **show pending** and **show diff** commands. It has abort/commit semantics.

When you want to keep all your saved changes, use the **exit** command.

Example

The change in the submode only takes effect when the submode is exited normally.

```
switch(config-te-rsvp-tunnel-MyTunnel)#exit
switch(config-te-rsvp)#
```

when you do not want to save any changes, use the **abort** command.

Example

Changes are discarded if the submode is aborted.

```
switch(config-te-rsvp-tunnel-MyTunnel)#abort
switch(config-te-rsvp)#
```

19.6 LDP Pseudowire

LDP pseudowire provides support for emulating Ethernet connections over a Multiprotocol Label Switching (MPLS) network, and controlled using the extension of the MPLS Label Distribution Protocol (LDP) specified in RFC4447.

The **patch panel** command allows "patching" a local interface "connector" to an LDP pseudowire "connector", terminating on the local switch. The LDP pseudowire itself is defined under the **pseudowires** configuration mode, under the ***mpls ldp*** configuration mode.

LDP pseudowire also supports locally patching traffic between two interfaces and is configured under the **patch panel** command.

19.6.1 Configuring LDP Pseudowire

19.6.1.1 Local-Remote Patch Configuration

To configure an LDP pseudowire, complete the following task.

1. Enter the pseudowire configuration section under the ***mpls ldp*** configuration section, and specify an LDP pseudowire name using the **pseudowire** command. In this example, the selected LDP pseudowire name is ***ldppw***.

   ```
   switch(config)#mpls ldp
   switch(config-mpls-ldp)#pseudowire
   switch(config-mpls-ldp-pw)#pseudowire ldppw
   ```

2. Once an LDP pseudowire has been configured, configure the neighbor IP address, pseudowire ID, and pseudowire MTU using the **neighbor**, **pseudowire-id**, and **mtu** configuration commands.

   ```
   switch(config-mpls-ldp-pw-ldppw)#neighbor 1.2.3.4
   switch(config-mpls-ldp-pw-ldppw)#pseudowire-id 1
   switch(config-mpls-ldp-pw-ldppw)#mtu 9000
   ```

3. To configure a cross-connection between two connectors, configure a pseudowire patch by specifying a patch name in the **patch panel** configuration section.

   ```
   switch(config)#patch panel
   switch(config-patch)#patch example
   ```

4. After entering a ***patch*** configuration mode, configure a type 4 LDP pseudowire by specifying a VLAN tagged interface connector and an LDP pseudowire connector using the **connector** command.

   ```
   switch(config-patch-example)#connector interface ethernet1 dot1q vlan
    100
   switch(config-patch-example)#connector pseudowire ldp ldppw
   ```

5. After entering a ***patch*** configuration mode, configure a type 5 LDP pseudowire by specifying an interface connector and an LDP pseudowire connector using the **`connector`** command.

```
switch(config-patch-example)#connector interface ethernet1
switch(config-patch-example)#connector pseudowire ldp ldppw
```

Note: IP routing must be enabled and the interface used for the local connector must be routed.

```
switch(config)#ip routing
switch(config)#interface ethernet1
switch(config-if-Et1)#no switchport
```

19.6.1.2 Local-Local Patch Configuration

The patch can also consist of two interface connectors or two VLAN tagged interface connectors to configure local stitching.

```
switch(config-patch)#patch example
switch(config-patch-example)#connector conn1 ethernet1
switch(config-patch-example)#connector conn2 ethernet2
switch(config-patch)#patch example2
switch(config-patch-example2)#connector conn1 ethernet1 dot1q vlan 100
switch(config-patch-example2)#connector conn2 ethernet2 dot1q vlan 200
```

Note: IP routing must be enabled and both interfaces used for the local connectors must be routed.

```
switch(config)#ip routing
switch(config)#interface ethernet1
switch(config-if-Et1)#no switchport
switch(config)#interface ethernet2
switch(config-if-Et2)#no switchport
```

19.6.1.3 Additional Patch Configuration Commands

The **`shutdown`** configuration command can be used to disable a pseudowire patch.

Example

```
switch(config-patch-example)#shutdown
```

19.6.1.4 Forwarding Behavior For Layer 2 Control Packets

There are differences in forwarding behavior for reserved MACs between the Ethernet Tagged Mode and the Ethernet Raw Mode. Some Layer 2 control packets are terminated and consumed at the Provider Edge, while others are encapsulated and forwarded on the pseudowire. Below is a list of the common Layer 2 control packets, and a summary of their forwarding behavior.

	Ethernet Tagged Mode (type 4)	Ethernet Raw Mode (type 5)
STP	When STP is enabled, STP packets are terminated. Otherwise, they are forwarded.	Forwarded
LLDP	Terminated	Forwarded
LACP	Terminated	Terminated
MACsec	Not supported	Forwarded

In addition, custom Layer 2 Control Packet forwarding behavior for type 5 pseudowire can be configured using the Layer 2 Protocol Forwarding functionality.

19.6.2 LDP Pseudowire Limitations

When a subinterface has been configured with the same VLAN tag as a pseudowire connector on the same parent interface, or vice versa, only the first configured feature will be active.

When a port-based connector is used for a pseudowire or local cross-connect patch, dot1q-tagged packets will have the outer tag incorrectly removed on ingress/encap if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.

When a VLAN-based connector (or subinterface with dot1q encapsulation) is used for a pseudowire or local cross-connect patch, tagged packets will have incorrect tags after forwarding if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.

19.6.3 LDP Pseudowire Show Commands

Use the **`show patch panel`** command to display the overall status of the configured pseudowire patches.

Example

```
switch#show patch panel
Patch     Connector                              Status
--------- -------------------------------------- ----------
example   1: Ethernet3                           Up
          2: Port-Channel2
example2  1: Ethernet1 802.1Q VLAN 100           Up
          2: LDP neighbor 1.1.1.1 PW ID 1111
example3  1: LDP neighbor 4.4.4.4 PW ID 1040     Up
          2: Ethernet2
```

Use the **`show patch panel detail`** command to display the detailed status of the configured pseudowire patches.

Example

```
switch#show patch panel detail
PW Fault Legend:
   ET-IN - Ethernet receive fault
   ET-OUT - Ethernet transmit fault
```

```
   TUN-IN - Tunnel receive fault
   TUN-OUT - Tunnel transmit fault
   NF - Pseudowire not forwarding (other reason)
Patch: example, Status: Up
   Connector 1: Ethernet3
      Status: Up
   Connector 2: Port-Channel2
      Status: Up
Patch: example2, Status: Up
   Connector 1: Ethernet1 802.1Q VLAN 100
      Status: Up
   Connector 2: LDP neighbor 1.1.1.1 PW ID 1111
      Status: Up
      Local MPLS label: 100032, Group ID: 0
         MTU: 9000, 802.1Q VLAN request sent: -
      Neighbor MPLS label: 900000, Group ID: 0x0
         MTU: 9000, 802.1Q VLAN request received: -
      PW type: 4 (tagged), Control word: N
      Tunnel type: LDP, Tunnel index: 198
Patch: example3, Status: Up
   Connector 1: LDP neighbor 4.4.4.4 PW ID 1040
      Status: Up
      Local MPLS label: 100002, Group ID: 0x0
         MTU: 1500, 802.1Q VLAN request sent: -
      Neighbor MPLS label: 400000, Group ID: 0x0
         MTU: 9213, 802.1Q VLAN request received: -
      PW type: 5 (raw), Control word: N
      Tunnel type: LDP, Tunnel index: 2
   Connector 2: Ethernet2
      Status: Up
```

Use the **`show patch panel forwarding`** command to display the forwarding information for configured pseudowire connectors.

Example

```
switch#show patch panel forwarding
Legend:
   Type - Pseudowire type: 4 (tagged)
                           5 (raw)
   CW - Control word used

In/Out                          Type CW VLAN Status Patch
------------------------------ ---- -- ---- ------ ------------
Et1 802.1Q VLAN 100               4         Up     example2
   Label 900000, LDP Tun 198
Et2                               5         Up     example3
   Label 400000, LDP Tun 2
Et3                                         Up     example
   Po2
Po2                                         Up     example
   Et3

PW Label Out                    Source Type CW Status Patch
-------- ---------------------- ------ ---- -- ------ ----------
100002   Et2                    LDP       5    Up     example3
100032   Et1 802.1Q VLAN 100    LDP       4    Up     example2
```

19.7 LDP Entropy Label

If a network device uses deep packet inspection for load balancing, it is recommended to use entropy label in LDP to improve load balancing in MPLS networks by providing sufficient entropy in the label stack itself.

19.7.1 Configuring LDP Entropy Label

Use the **`entropy-label`** command to enable the MPLS LDP entropy labelling on the switch. Use the **no** form of the command to disable the MPLS LDP entropy labelling. By default, the entropy label knob is disabled.

```
switch(config)#mpls ldp
switch(config-mpls-ldp)#entropy-label
switch(config-mpls-ldp)#exit
```

19.7.2 Show Commands

The **`show running-config all`** command displays the Entropy Label Signaling status.

```
switch#show running-config all
!
mpls ldp
   ...
   no entropy-label
   ...
!
```

The **`show mpls ldp bindings detail`** command displays whether the ELC is advertised or not for a given FEC for both local/remote bindings.

```
switch#show mpls ldp bindings 1.1.1.1/32 detail
1.1.1.1/32
     Local binding:    Label: imp-null, ELC: False
          Uptime:   1:51:14
          Advertised to: 2.2.2.2:0, 3.3.3.3:0
     Remote binding: Peer ID: 2.2.2.2:0, Label: 100001, ELC: True
          Uptime:   1:51:57
     Remote binding: Peer ID: 3.3.3.3:0, Label: 100002, ELC: True
          Uptime:   1:52:05
```

Following debug commands are modified to incorporate Entropy label and Entropy label indicator information in label stack for debugging on ingress router.

```
switch>show platform fap fec <idx>
Tunnel Type: Mpop(mpls pop), Mpush(mpls push), Mswap(mpls swap),

  ',
```

19.7.3 Limitations

- When the Transit LSR is acting as a PHP hop for a given LDP tunnel with entropy label pushed onto it by an Ingress LSR, only the LDP tunnel label will be popped at PHP whenever the Egress LSR has signaled implicit-null in LDP.
- Egress LSR should be capable of handling ELI as top label in the label stack like [ELI, EL, VPN, Payload].

19.8 MPLS Commands

MPLS Commands

- **MPLS Commands**
  - entropy-label
  - mpls ip
  - mpls shared index
  - mpls static
  - mpls static vrf-label
  - mpls tunnel termination
  - show mpls route
  - show mpls route summary
- **RSVP-TE LSR**
  - authentication
  - cspf delay
  - fast-reroute
  - fast-reroute reversion
  - hello interval
  - ping mpls rsvp session
  - preemption method
  - refresh method
  - shutdown
  - srlg
- **RSVP-TE LSR Show Commands**
  - show mpls rsvp counters
  - show mpls rsvp neighbor
  - show mpls rsvp session detail
  - show mpls rsvp session summary
  - show mpls rsvp session
  - show mpls rsvp
  - show traffic-engineering cspf path
  - show traffic-engineering database

19.8.1 authentication

Use the **authentication** command to enable cryptographic authentication. The **no** form and the **default** form of the command removes crytographic authentication.

Command Mode

MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax

authentication [index *1-4294967295* [active | password]|[sequence-number window *1-255*]|[type [md5 | none]]]

no authentication [index *1-4294967295* [active | password]|[sequence-number window *1-255*]|[type [md5 | none]]]

default authentication [index *1-4294967295* [active | password]|[sequence-number window *1-255*]|[type [md5 | none]]]

Parameters

- **index *1-4294967295*** Password index.
  - **active** Use index as the active password.
  - **password** password.
- **sequence-number** Index in the sequesnce.
  - **window *1-255*** Reorder window size. The default value is ***5***. A value of ***1*** turns off support for packet reordering.
- **type** Authentication mechanism.
  - **md5** MD5 hash.
  - **none** No authentication mechanism. Disables cryptographic authentication.

Examples

- Cryptographic Authentication (***RFC 2747***) is enabled by setting the **authentication type** to **md5** and configuring an active password.

```
(config-mpls-rsvp)#authentication type md5
```

- Authentication secrets are configured with an index. One of the indices should be chosen as the actively used password:

```
(config-mpls-rsvp)#authentication index 1 password s3cr3t
(config-mpls-rsvp)#authentication index 1 active
```

  The **active** password is used to authenticate outgoing messages. All configured passwords are accepted for authentication of incoming packets, which allows smooth key rollover.
- Password obfuscation is available:

```
(config-mpls-rsvp)#authentication index 1 password 7 07092E43
```

- The size of the sequence number reorder window can be changed to accommodate a larger number of out-of-order packets. A value of *N* means that a packet is accepted if all earlier received packets with a higher sequence number are within the preceding *N-1* packets.

```
(config-mpls-rsvp)#authentication sequence-number window 5
```

  The default value is ***5***. A value of ***1*** effectively turns off support for packet reordering.

19.8.2 cspf delay

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. Use the **`cspf delay`** command to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF. The **`no`** form and the **`default`** form of the command removes the CSPF delay.

Command Mode

Router traffic engineering mode

Command Syntax

`cspf delay` [initial *n* back-off *n*] max *n*

`no cspf delay` [initial *n* back-off *n*] max *n*

`default cspf delay` [initial *n* back-off *n*] max *n*

Parameters

- **initial** Specify initial wait interval for CSPF.
  - ***n*** Time in milliseconds. ***1-300000***.
    - **back-off** specify back-off interval for CSPF.
      - ***n*** Time in milliseconds. ***1-300000***.
- **max** Specify maximum wait interval for CSPF.
  - ***n*** Time in milliseconds. ***1-300000***.

19.8.3 entropy-label

The **`entropy-label`** command enables the MPLS LDP Entropy Label.

The **`no entropy-label`** command removes the MPLS LDP Entropy Label configurations from the ***running-config***.

Command Mode

MPLS LDP Configuration Mode

Command Syntax

`entropy-label`

`no entropy-label`

Example

This command enables the MPLS LDP Entropy Label.

```
switch(config)#mpls ldp
switch(config-mpls-ldp)#entropy-label
switch(config-mpls-ldp)#exit
```

19.8.4 fast-reroute

Use the **fast-reroute** command to support Fast Reroute (FRR) link protection/NHOP (***RFC 4090***). You can enable FRR protection by setting the Fast Reroute mode to **link-protection**.

Command Mode

MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax

fast-reroute [mode [link-protection | node-protection | none]|[reversion [global | local]]

Parameters

- **mode** Fast reroute mode.
  - **link-protection** Protects against failure of the next link.
  - **node-protection** protects against failure of the next node.
  - **none** Disables fast reroute.
- **reversion** Select reversion behavior.
  - **global** Global revertive repair (default).
  - **local** Local revertive repair.

Examples

- Support for Fast Reroute (FRR) link protection/NHOP (***RFC 4090***) is enabled by setting the Fast Reroute mode to **link-protection**.

```
(config-mpls-rsvp)#fast-reroute mode link-protection
```

- To turn off FRR, change the mode to the default setting **none**.

```
(config-mpls-rsvp)#fast-reroute mode none
```

- You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the **global** revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is d keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery

```
(config-mpls-rsvp)#fast-reroute reversion local
```

- The default for reversion is **global**.

```
(config-mpls-rsvp)#fast-reroute reversion global
```

19.8.5 fast-reroute reversion

You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the **global** revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is dead keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery.

The default for reversion is **global**.

Command Mode

Configuration sub-mode for RSVP

Command syntax

`fast-reroute reversion` [global | local]

Parameters

- **global** Global revertive repair.
- **local** Local revertive repair.

Examples

- Setting the fast-reroute reversion to local:

```
(config-mpls-rsvp)#fast-reroute reversion local
```

- The default for reversion is **global**.

```
(config-mpls-rsvp)#fast-reroute reversion global
```

19.8.6 hello interval

The **hello interval** command sets the time between the hello packets. The **no** form of the command explicitly disables the Hello messages, while the **default** form of the command resets to the default setting of 10 seconds with a multiplier of 4.

Command Mode

Configuration sub-mode for RSVP.

Command Syntax

hello interval [interval [*sec*]] [multiplier [*num*]]

no hello interval [interval [*sec*]][multiplier [*num*]]

default hello interval [interval [*sec*]][multiplier [*num*]]

Parameters

- **interval *sec*** The interval in units of seconds.
  - **multiplier *num*** The number of missed hellos after which the neighbor is expired.

Examples

- In this example, hello messages are sent to all known neighbors every ***10*** seconds. If no hello responses are received from a neighbor for 4*10=40 seconds, communication is considered to be lost and the neighbor is reset.

```
(config-mpls-rsvp)#hello interval 10 multiplier 4
```

- In this example, the default of ***10*** seconds with multiplier ***4*** is reset.

```
(config-mpls-rsvp)#default hello interval
```

- in this example, the command to explicitly disables the Hello messages.

```
(config-mpls-rsvp)#no hello interval
```

19.8.7 mpls ip

The **mpls ip** command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The **no mpls ip** and **default mpls ip** commands disable MPLS routing by removing the **mpls ip** command from ***running-config***. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

mpls ip

no mpls ip

default mpls ip

Examples

- This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

```
switch(config)#mpls ip
switch(config)#show running-config

! Command: show running-config

!
ip routing
!
mpls ip
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

- This command disables MPLS routing.

```
switch(config)#no mpls ip
switch(config)#show running-config

! Command: show running-config
                 <-------OUTPUT OMITTED FROM EXAMPLE-------->
!
ip routing
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

19.8.8 mpls shared index

The **mpls shared index** command configures an Ethernet-Segment (ES) shared-index to allocate an ESI label value based on the shared-index configuration.

The **no mpls shared index** command removes mpls shared index configuration from the ***running-config***.

Command Mode

EVPN Ethernet-Segment Mode

Command Syntax

mpls shared index *index-value*

no mpls shared index *index-value*

Parameter

- ***index-value*** Label index value. Value ranges from ***1*** to ***1024***.

Example

- These commands place the switch on Ethernet-Segment (ES) configuration mode and configure an MPLS shared index value of ***100***.

```
switch(config)#interface Ethernet4
switch(config-if-Et1)#switchport access vlan 1000
switch(config-if-Et1)#evpn ethernet-segment
switch(config-evpn-es)#identifier 0022:2222:2222:2222:2222
switch(config-evpn-es)#mpls shared index 100
switch(config-evpn-es)#route-target import 00:02:00:02:00:02
```

19.8.9 mpls static

The **mpls static** command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter:** The top-label parameter specifies the 20-bit value that the MPLS packet's top header label must match to be handled by the rule.
- **Nexthop location:** Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action:** Specifies the MPLS label stack management action performed on the packet:
  - **pop-payload:** removes the top label from stack; this terminates an LSP (label-switched path).
  - **swap-label:** replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority:** Specifies the rule to be used when an MPLS packet matches multiple rules.

The **no mpls static** and **default mpls static** commands delete the specified MPLS rule from ***running-config***.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no **PRIORITY** parameter remove all matching routes of every metric value.

Command Mode

Global Configuration

Command Syntax

mpls static top-label *top_tag* [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

no mpls static top-label *top_tag*

no mpls static top-label *top_tag* [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

default mpls static top-label *top_tag*

default mpls static top-label *top_tag* [**DEST_INTF**] **NEXTHOP_ADDR ACTION** [**PRIORITY**]

Parameters

- ***top_tag*** Top header's label field contents. Value ranges from ***0*** to ***1048575*** (20 bits).
- **DEST_INTF** Specifies interface through which ***NEXTHOP_ADDR*** is accessed. Options include:
  - ***no parameter*** Any interface.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- ***NEXTHOP_ADDR*** Nexthop address for MPLS for filtered MPLS packets. Options include:
  - ***ipv4_addr*** IPv4 address.
  - ***ipv6_addr*** IPv6 address.
- **ACTION** MPLS header stack management action performed on packet. Options include:
  - **pop payload-type ipv4** Removes top layer from stack. Payload is handled as IPv4 packet.
  - **pop payload-type ipv6** Removes top layer from stack. Payload is handled as IPv6 packet.
  - **swap-label *0*** to ***1048575*** Replaces header label with specified label value (20 bits).
- **PRIORITY** Specifies rule priority when multiple rules match a packet. Options include:

- ***no parameter*** Assigns a metric value of 100 to the rule.
- **metric *1*** to ***255*** Lower values denote higher priority. Value ranges from ***1*** to ***255***.

The **mpls static** command does not support push label actions.

Examples

- These commands create an MPLS rule that matches packets with a top label value of ***3400*** and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address ***10.14.4.4*** through Ethernet interface ***3/3/3***. This rule has a metric value of ***100***.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
payload-type ipv4
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
!

end
switch(config)#
```

- These commands create a backup rule that forwards the packet through Ethernet interface ***4/3***. This rule's metric value of ***150*** assigns it backup status prior to the first rule.

```
switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop
 payload-type
ipv4 metric 150
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
!

                     <-------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch(config)#
```

- These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type
 ipv4
switch(config)#show running-config

                      <-------OUTPUT OMITTED FROM EXAMPLE-------->

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
 ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
switch(config)#
```

19.8.10 mpls static vrf-label

Use the **mpls static vrf-label** command to configure a static VRF label route. The **no** and **default** versions of the command removes the configuration.

Command Mode

Global configuration mode

Command Syntax

mpls static vrf-label *mpls-label* [vrf *vrf-name*]

no mpls static vrf-label *mpls-label* [vrf *vrf-name*]

default mpls static vrf-label *mpls-label* [vrf *vrf-name*]

Parameters

- ***mpls-label*** Value of the MPLS label.
- **vrf *vrf-name*** VRF instance name.

Example

```
switch(config)#mpls static vrf-label 100 vrf default
switch(config)#mpls static vrf-label 200 vrf v1
```

19.8.11 mpls tunnel termination

Command Mode

Global configuration mode

Command Syntax

mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

no mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

default mpls tunnel termination [model [php model][ttl [[pipe | uniform] dscp]| pipe | uniform]

Parameters

- **model** Tunnel termination TTL and DSCP model.
- **php** Penultimate hop popping configuration.
- **ttl** Model for TTL.
- **pipe** Preserve the inner value.
- **uniform** Propagate value from outer header.
- **dscp** mode for DSCP.

Example

```
switch(config)#mpls tunnel termination model ttl uniform dscp pipe
```

19.8.12 ping mpls rsvp session

LSP Ping allows the user to check if the remote endpoint of an RSVP session is reachable through the LSP. Running ping on an RSVP LSP creates an LSP Ping Request packet with the label programmed by RSVP and that packet will follow the MPLS path until it reaches the end of the tunnel. If the node that receives this Request is the intended destination, it replies with an RSVP Ping Reply through normal IP routing. When the source receives the Reply it indicates that there are no apparent data plane failures and that the endpoint of that LSP is reachable.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

`ping mpls rsvp session` [id *num* | name *word*] [lsp | pad-reply | repeat | source | standard | tos | tos]

Parameters

- **id** Specifies the session by ID
  - ***num*** RSVP session ID.
    - **lsp** Specifies LSP
    - **pad-reply** Indicates that the reply should copy the pad TLV.
    - **repeat** Specifies repeat count.
    - **source** Specifies source address.
    - **standard** Sets the standard to comply with.
    - **tos** Specifies ToS value.
    - **tos** Specifies MPLS traffic class field.
- **name** Specifies session by name.
  - ***word*** RSVP session name.
    - **lsp** Specifies LSP
    - **pad-reply** Indicates that the reply should copy the pad TLV.
    - **repeat** Specifies repeat count.
    - **source** Specifies source address.
    - **standard** Sets the standard to comply with.
    - **tos** Specifies ToS value.
    - **traffic-class** Specifies MPLS traffic class field.

Examples

- A user can invoke the ping utility for a specific LSP by using the session and LSP IDs displayed in the CLI show commands.

```
switch#ping mpls rsvp session id 1 lsp 1 repeat 3
LSP ping to RSVP session #1 LSP #1
   timeout is 5000ms, interval is 1000ms
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=53.294ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=75.329ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=3, time=85.574ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
Via 10.0.12.2, Ethernet1, label 100000
   3 packets transmitted, 3 received, 0% packet loss, time 2272ms
   3 received from 10.0.34.4, rtt min/max/avg 53.294/85.574/71.399 ms
```

- For the **`ping mpls rsvp session`** command, the argument **lsp** is optional. If unspecified, the utility pings all LSPs within that session.

```
switch#ping mpls rsvp session id 1 repeat 2
LSP ping to RSVP session #1
   timeout is 5000ms, interval is 1000ms
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=60.28ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=1, time=81.701ms, success: egress ok
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=52.807ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=2, time=62.814ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 52.807/60.280/56.544 ms

LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 62.814/81.701/72.257 ms
```

- Similarly, the session can be specified by name and the utility pings all the LSPs within that session.

```
switch#ping mpls rsvp session name Session1to4 repeat 2
LSP ping to session Session1to4
   timeout is 5000ms, interval is 1000ms
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=1, time=63.314ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=1, time=75.639ms, success: egress ok
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   Reply from 10.0.34.4: seq=2, time=60.875ms, success: egress ok
LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   Reply from 10.0.34.4: seq=2, time=77.135ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lspping statistics ---
LSP 1
Via 10.0.12.2, Ethernet1, label 100000
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 60.875/63.314/62.094 ms

LSP 2
Via 10.0.12.2, Ethernet1, label 100002
   2 packets transmitted, 2 received, 0% packet loss, time 1262ms
   2 received from 10.0.34.4, rtt min/max/avg 75.639/77.135/76.387 ms
```

19.8.13 preemption method

The **preemption method** command enables deferred failure of RSVP-TE LSPs on link oversubscription. Use a preemption timer value to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (***RFC 5712***).

The default preemption method is soft preemption with a timer value of 30 seconds.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

preemption method [hard | soft] timer *t*

no preemption method [hard | soft] timer *t*

default preemption method [hard | soft] timer *t*

Parameters

- **hard** Hard preemption.
- **soft** Soft preemption.
  - **timer** Time limit for LSP teardown.
    - ***t 1-65535*** Timer value in units of seconds.

Examples

- In this example, the preemption method is soft preemption with a timer value of ***10*** seconds.

```
(config-mpls-rsvp)#preemption method soft timer 10
```

- Setting the preemption method to hard preemption results in a timer value of ***0*** seconds and disables the feature.

```
(config-mpls-rsvp)#preemption method hard
```

19.8.14 refresh method

Using the **refresh method** command with the **bundled** keyword enables the Refresh Overhead Reduction that supports the sending of message IDs and refreshing state with refresh messages.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

refresh method [bundled | explicit]

Parameters

- **bundled** Refresh states using message identifiers lists. This is the default setting.
- **explicit** Send each message individually.

Examples

- Use the **bundled** keyword to enable the Refresh Overhead Reduction.

```
(config-mpls-rsvp)#refresh method bundled
```

- To turn off refresh overhead reduction, use the **explicit** keyword.

```
(config-mpls-rsvp)#refresh method explicit
```

19.8.15 show mpls route summary

The **show mpls route summary** command displays statistics about the configuration and implementation of MPLS rules.

Command Mode

EXEC

Command Syntax

show mpls route summary

Example

This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

19.8.16 show mpls route

The **show mpls config route** command displays the switch's MPLS static rule configuration for the specified routes and rules.

Command Mode

EXEC

Command Syntax

show mpls [**INFO_LEVEL**] **route** [*header_label*]

Parameters

- **INFO_LEVEL** Specifies the filters that are used to select the routes to display. Options include:
  - ***no parameter*** Displays routes published by the forwarding agent.
  - **config** Displays all configured routes.
  - **lfib** Displays routes stored to the Label Forwarding Information Base (LFIB).
- ***header_label*** Filters routes by MPLS top header label. Options include:
  - ***no parameter*** Displays routes for all header values.
- ***0*** to ***1048575*** Specifies header for which command displays information.

Example

This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

19.8.17 show mpls rsvp

Use the **show mpls rsvp** to display the overall state of the RSVP.

Command Mode

EXEC

Command Syntax

show mpls rsvp [bandwidth | counters | ip | ipv6 | neighbor | session]

Parameters

- **bandwidth** Displays RSVP bandwidth information.
- **counters** Displays RSVP message counters.
- **ip** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **neighbor** Displays RSVP neighbors.
- **session** Displays RSVP session information.

Example

```
switch>show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
   Mode: none
   Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
   Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

19.8.18 show mpls rsvp counters

Use the **show mpls rsvp counters** command to display RSVP message counters, per interface.

Command Mode

EXEC

Command Syntax

show mpls rsvp counters [[interface [Ethernet |Fabric | Loopback | Management | Port-Channel | Switch | Tunnel | Vlan | Vxlan]]| ipv4 *interface* | ipv6 *interface*

Parameters

- **interface** Filter by interface.
  - **Ethernet** Hardware Ethernet interface.
  - **Fabric** Fabric interfaces.
  - **Loopback** Hardware interface used for looping packets.
  - **Management** Management interface.
  - **Port-Channel** Lag interface.
  - **Switch** Switch interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** Logical interface into a VLAN.
  - **Vxlan** VXLAN tunnel interface.
- **ipv4** Filter by IPv4.
  - ***interface*** Filter by interface.
- **ipv6** Filter by IPv6.
  - ***interface*** Filter by interface.

Example

```
switch>show mpls rsvp counters
Received Messages:

Interface  Path  PathTear  PathErr  Resv  ResvTear  ResvErr  Srefresh  Other  Errors
---------  ----  --------  -------  ----  --------  -------  --------  -----  ------
Ethernet1  5     0         0        0     0         0        8         51     1
Ethernet2  0     0         0        14    0         0        0         0      0

Sent Messages:

Interface  Path  PathTear  PathErr  Resv  ResvTear  ResvErr  Srefresh  Other  Errors
---------  ----  --------  -------  ----  --------  -------  --------  -----  ------
Ethernet1  0     0         0        4     0         0        9         49     0
Ethernet2  13    0         0        0     0         0        0         4      0
```

19.8.19 show mpls rsvp neighbor

Use the **show mpls rsvp neighbor** command to display a summary of all RSVP neighbors, or the list of active LSPs for a specific neighbor.

Command Mode

EXEC

Command Syntax

show mpls rsvp neighbor [*A.B.C.D* | *A:B:C:D:E:F:G:H* | summary]

Parameters

- ***A.B.C.D*** IP (v4 or v6) address of neighbor.
- ***A:B:C:D:E:F:G:H*** IP (v4 or v6) address of neighbor.
- **summary** Displays summarized information.

Examples

- Use the **show mpls rsvp neighbor** command to display a summary of all RSVP neighbors.

```
switch>show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
   Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

- Use the **show mpls rsvp neighbor summary** command to display summarized information.

```
switch>show mpls rsvp neighbor summary
Neighbor             Role       Sessions LSPs
==================== ========== ======== ========
10.0.1.1             Upstream   1     1
10.0.2.2             Downstream 1     1
```

19.8.20 show mpls rsvp session detail

Use the **show mpls rsvp session detail** to display the detailed information of RSVP sessions.

Command Mode

EXEC

Command Syntax

show mpls rsvp session detail

Example

```
switch>show mpls rsvp session detail
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        [...]
        MTU Signaling: enabled
           Received Path MTU: 1800 bytes
           Sent Path MTU: 1500 bytes
  [...]
```

19.8.21 show mpls rsvp session summary

Use the **show mpls rsvp session summary** command to filter sessions in the show command and in LSP ping and traceroute commands. Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

Command Mode

EXEC

Command Syntax

show mpls rsvp session summary

Example

```
switch>show mpls rsvp session summary
Session  Destination         LSP      Name          Role    Bypass State
======== ================== ======== ============ ======= ======
 =========
1        0.4.4.4             1        Session1    transit n/req  up
```

19.8.22 show mpls rsvp session

Use the **show mpls rsvp session** command to list the current RSVP sessions filtered by IP address.

Command Mode

EXEC

Command Syntax

show mpls rsvp session

Example

```
switch>show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
        State: up
        Type: primary
        Source address: 0.1.1.1
        LSP ID: 1
        LSP uptime: 00:02:38
        Session name: Session1
        Local label: 100000
        Downstream label: 100000
        Upstream neighbor: 10.0.1.1
           Last refresh received: 17 seconds ago
           Last refresh sent: 10 seconds ago
        Downstream neighbor: 10.0.2.2
           Last refresh received: 7 seconds ago
           Last refresh sent: 9 seconds ago
        Bypass tunnel: not requested
```

19.8.23 show traffic-engineering cspf path

Use the **show traffic-engineering cspf path** command to display all the paths conuted by CSPF.

Command Mode

EXEC

Command Syntax

show traffic-engineering cspf path [*destination-IP*]detail]

Parameters

- ***A.B.C.D*** CSPF path to this destination IP address.
- **detail** Show detailed path information.

Examples

In this example, the CSPF destination path ***20.0.0.1*** is selected to display.

```
switch>show traffic-engineering cspf path 20.0.0.1

Destination     Constraint                          Path
20.0.0.1        exclude Ethernet1                   0.1.1.1
                exclude SRLG of Ethernet1           0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
                exclude Ethernet2                   0.1.1.1
                                                    0.1.1.2
                                                    0.2.2.2
                                                    3.3.3.2
```

In this example, the CSPF destination path ***20.0.0.1*** is selected to display detailed information.

```
switch>show traffic-engineering cspf path 20.0.0.1 detail

Destination: 20.0.0.1
   Path Constraint: exclude Ethernet1
                    exclude SRLG of Ethernet1: orange-link (500),
                       green-link (400), 100, red-link (200), 600
   Request Sequence number: 1
   Response Sequence number: 1
   Number of times path updated: 2
   Last updated: 00:01:58
   Reoptimize: Always
   Path:
   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2

   Path Constraint: exclude Ethernet2
   Request Sequence number: 2
   Response Sequence number: 2
   Number of times path updated: 3
   Last updated: 00:00:38
   Reoptimize: Always
   Path:
   0.1.1.1
   0.1.1.2
   0.2.2.2
   3.3.3.2
```

19.8.24 show traffic-engineering database

Use the **show traffic-engineering database** to display the topology used for CSPF computations. Starting from ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.

Command Mode

EXEC

Command Syntax

show traffic-engineering database

Special Considerations

- Beginning with ***EOS Release 4.23.1F***, the SRLG group details of a neighbor are shown if it is advertised.
- Beginning with ***EOS Release 4.24.2F***, information for the OSPFv2 topology is displayed if configured.

Example

```
switch#show traffic-engineering database

TE Router-ID: 1.0.0.2

```

19.8.25 shutdown

The **shutdown** command disables the RSVP-TE protocol instance or the RSVP-related functions for the interface. The RSVP-TE configuration information associated with the interface is retained.

RSVP-TE is enabled globally by issuing **no shutdown** in the configuration sub-mode. This is the only mandatory setting for RSVP-TE to work. There is no per-interface knob to enable or disable RSVP. However, RSVP is only enabled on interfaces on which MPLS is enabled.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

`shutdown`

`no shutdown`

Examples

- You can enable RSVP-TE globally by issuing the **no shutdown** command.

```
(config-mpls-rsvp)#no shutdown
```

- Similarly, it is disabled with the **shutdown** command, which is the default.

```
(config-mpls-rsvp)#shutdown
```

19.8.26 srlg

The **srlg** command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When the **srlg** command is specified with **strict** keyword, then when a path for a bypass tunnel excluding SRLGs of next-hop interface of primary LSP can not be found, RSVP does not setup the bypass tunnel. When the **srlg** command is specified without the **strict** keyword, then a bypass tunnel is setup with as many links as possible that exclude the SRLGs of next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.

When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the **no** and **default** versions of the command takes you back to the default of SRLG processing being turned off.

Command Mode

Configuration sub-mode for RSVP

Command Syntax

srlg strict

no srlg strict

default srlg strict

Parameters

strict Applies strict SRLG constraints.

Example

The SRLGs of an interface can be configured using the following traffic-engineering CLIs.

```
(config)#interface Et1
(config-if-Et1)#traffic-engineering srlg 100

(config)#interface Et2
(config-if-Et2)#traffic-engineering srlg 200
```

Chapter 20

Visibility and Monitoring Services

The Visability and Monitors Services chapter contains the following sections:

- Test Access Point (TAP) Aggregation
- Latency Analyzer (LANZ)
- Sampled Flow Tracking
- sFlow
- SNMP
- VM Tracer
- MapReduce Tracer
- Transceiver Performance Monitoring

20.1 Test Access Point (TAP) Aggregation

This section describes Test Access Point (TAP) aggregation and the data structures that it requires. Topics in this section include:

- TAP Aggregation Introduction
- TAP Aggregation Description
- TAP Aggregation Extra MPLS Pop (4 to 6 Labels)
- TAP Aggregation Configuration
- TAP Aggregation Traffic Steering
- TAP Aggregation GUI
- TAP Aggregation Keyframe and Timestamp Configuration
- TapAgg GRE Tunnel Termination
- Tap Aggregation Hardware Forwarding Profile
- TAP Aggregation MPLS Pop
- TAP Aggregation 802.1br EVN Tag Stripping
- TAP Aggregation Commands

Port mirroring is described in Test Access Point (TAP) Aggregation.

20.1.1 TAP Aggregation Introduction

Ethernet-based switches are commonly deployed in dedicated networks to support Test Access Point (TAP) and mirror port traffic toward one or more analysis applications. Ports configured to mirror data can simultaneously switch traffic to its primary destination while directing a copy of that traffic to analysis or test devices. TAP ports are typically part of a dedicated environment that allows for the aggregation of data streams from multiple sources that can be directed to multiple destinations.

Arista switches support port mirroring and TAP aggregation and the data structures required by these functions.

20.1.2 TAP Aggregation Description

These sections describe TAP aggregation, timestamps, and keyframes:

- TAP Aggregation
- Timestamps and Keyframes

20.1.2.1 TAP Aggregation

Tool Access Point (TAP) aggregation is the accumulation of data streams and the subsequent dispersal of these streams to devices and applications that analyze, test, verify, parse, detect, or store data. TAP aggregation requires an environment free from switching operations. Arista switches operate in one of two device modes:

- **Switching mode**: the switch performs normal switching and routing operations. Data mirroring is supported in switching mode. Tap aggregation is not available in switching mode.
- **TAP aggregation mode**: The switch is a data-monitoring device and does not provide normal switching and routing services. Data mirroring is not available in tap aggregation mode.

  Access control lists, port channels, LAGs, QoS, and VLANs function normally in both modes.

Ethernet and port channel interfaces are configured as **TAP** and **tool** ports to support tap aggregation.

- **TAP ports**: a tap port is an interface that receives a data stream that two network ports exchange.

TAP ports prohibit egress traffic. MAC learning is disabled. All control plane interaction is prevented. Traps for inbound traffic are disabled. Tap ports are in STP forwarding mode.

- **Tool ports**: A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to devices that process the monitored data streams.

  Tool ports prohibit ingress traffic. MAC learning is disabled. All control plane interaction is prevented. Tool ports are in STP forwarding mode.

TAP and tool ports are configured with the **`switchport mode`** command. These ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

TAP and tool ports are designated through switchport mode commands and act similar to trunk ports, in that they can allow access to VLANs specified through allowed-VLAN lists. Tap ports also specify a native VLAN for handling untagged frames.

Access, trunk, and dot1q-tunnel mode ports are active when the switch is in switching mode and error-disabled when the switch is in tap aggregation mode.

TAP and tool mode ports are active when the switch is in TAP aggregation mode and error-disabled when the switch is in switching mode.

TAP aggregation groups are data structures that map a set of TAP ports to a set of tool ports. Both TAP and tool ports may belong to multiple TAP aggregation groups, and a TAP aggregation group may contain multiple TAP and tool ports.

20.1.2.2 Timestamps and Keyframes

FM6000 platform switches support packet timestamping of packets sent from any port at line rate. Timestamps are used to correlate network events and in performance analysis. Keyframes provide information to assist in the interpretation of timestamps.

The switch contains two 64-bit counters to maintain ASIC time and UTC time. ASIC time is based on an internal 350 MHz counter. UTC is absolute time that is maintained by a precision oscillator and synchronized through PTP.

Timestamps are derived from the least significant 31 bits of ASIC time. Based on the 350 MHz counter period and 31-bit resolution, timestamp values repeat every 6.135 seconds.

Keyframes are periodically inserted into the data stream to provide context for interpreting timestamps. Keyframes contain the 64-bit value of the ASIC time counter, the corresponding 64-bit value of the UTC time counter, and the elapsed time since the last PTP synchronization of the UTC counter. Inserting one keyframe every second into the data stream assures that the timestamp value in each egress packet can be associated with values of the complete 64-bit ASIC time counter and the corresponding UTC counter.

20.1.2.2.1 Timestamps

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Timestamping is configured on the egress port where the timestamp is applied to the frame.

A timestamp consists of the least significant 31 bits of the ASIC time counter. The most significant bit of the least significant byte is a 0 pad, resulting in a 32-bit timestamp with 31 bits of data. The keyframe mechanism provides recovery of the most significant 33 bits of the ASIC counters and a map to UTC time. Applications use this mechanism to determine the absolute time of the frame timestamp.

The switch supports three timestamp modes, which are configurable on individual Ethernet ports. The modes differ in the management of the egress frame's 32-bit frame check sequence (FCS):

- **Disabled**: timestamping is disabled.

- **FCS Replacement Mode**: the original FCS is discarded, and the ingress timestamp is appended to frame data, followed by a new FCS that is based on the appended timestamp. The result is a valid Ethernet frame, but the headers of all nested protocols are not updated to reflect the timestamp.
- **FCS Appending Mode**: the original FCS is discarded and replaced by the ingress timestamp. The size of the original frame is maintained without any latency impact, but the FCS is not valid.

20.1.2.2.2 Keyframes

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. Keyframes have valid L2 and L3 headers. Keyframes contain these header fields:

- MAC fields (12 bytes):
  - Source MAC address is the address of the egress interface transmitting the keyframe.
  - Destination MAC address is configured through a CLI command.
- IP Header (20 bytes):
  - Source IP address is configured through CLI; default is management interface IP address.
  - Destination IP address is configured through a CLI command.
  - TTL is set to ***64***.
  - TOS is set to ***0***.
  - Protocol field is set to ***253***.
  - IP header's ID field is set to ***0***.

Keyframes contain these payload fields:

- **ASIC time**: (64 bits) ASIC time counter. (***2.857*** ns resolution).
- **UTC time**:(64 bits) Unix time that corresponds to ASIC time (ns).
- **Last sync time**: (64 bits) ASIC time of most recent PTP synchronization.
- **Keyframe time**: (64 bits) ASIC time of the keyframe's egress (ns).
- **Egress interface drops**: (64 bits) Number of dropped frames on keyframe's egress interface.
- **Device ID**: (16 bits) device ID (user defined).
- **Egress interface**: (16 bits) Keyframe's egress switchport.
- **FCS type (8 bits)**: Timestamping mode configured on keyframe's egress port.
  - ***0***: timestamping disabled.
  - ***1***: timestamp is appended to payload; new FCS is added to the frame.
  - ***2***: timestamp overwrites the existing FCS.
- **Reserved (8 bits)**: reserved for future use.
- **Skew numerator/skew denominator**: form a ratio indicating the ASIC clock skew. If the ratio is greater than ***1***, the clock is skewed fast; if the ratio is less than ***1***, the clock is skewed slow.

Last sync time equals ***0*** when there was no previous synchronization or the time since the last synchronization is greater than ***8*** hours.

The 31-bit frame timestamp provides high-resolution timing, rolling over about every ***6.135*** seconds (31 bits at 2.857ns per tick). To obtain the full ASIC time and to correlate the timestamp to an absolute UTC time, the switch sends keyframes. Each keyframe contains the current ASIC time and UTC time; hence an application can compute the high order bits of the ASIC time (for precise, relative timing) from the ASIC to UTC time mapping, and then determine absolute time.

ASIC to UTC time conversion is not quite immediate, so the UTC time in the frame will not be the current time. A keyframe timestamp is provided for this purpose. The frame also includes the timestamping mode (FCS type) so applications can dynamically determine the timestamp's byte offset. Each field is shown in the following table.

Table 74: Keyframe Payload

0 7	8 15	16 31
ASIC time		
UTC time		
Last sync time		
Skew numerator		
Skew denominator		
Keyframe timestamp		
Drop count		
Device ID		Egress interface
FCS type	Reserved	

20.1.3 TAP Aggregation Extra MPLS Pop (4 to 6 Labels)

Available starting with ***EOS Release 4.23.1F*** extra MPLS pop for TAP Aggregation allows you to remove four to six MPLS labels from a packet. Previously, only one to three labels were able to be popped.

When configured, popping four to six MPLS labels will work in all the cases where popping one to three MPLS labels works. MPLS pop for ***1*** to ***3*** labels can be found here: https://eos.arista.com/eos-4-15-0f/tap-aggregation-mpls-pop/.

20.1.3.1 TAP Aggregation Extra MPLS Pop Configuration

MPLS pop is configurable per tap port as follows to pop one to three labels:

```
(config-if-Et1/1)#switchport tap mpls pop all
```

However, MPLS pop for four to six labels requires a user defined TAP Aggregation profile based on off of tap-aggregation-extended. This profile must have one action and three fields configured under the tapagg port feature, such as the following:

```
(config)#hardware tcam
(config-hw-tcam)#profile foo copy tap-aggregation-extended
(config-profile-foo)#feature tapagg port
(config-profile-foo-feature-tapagg-port)#action set-fwd-header
(config-profile-foo-feature-tapagg-port)#key field mpls-label1-l
ower-24b mpls-label2-lower-24b mpls-label3-lower-24b
(config-profile-foo-feature-tapagg-port)#tap aggregation
Saving new profile 'foo'
(config-tap-agg)#mode exclusive profile foo
```

With the above profile changes, four to six MLPS label pop is additionally supported when the MPLS pop feature is configured on a tap port.

To check if a profile is installed correctly, use the **show hardware tcam profile** command.

```
(config-tap-agg)#show hardware tcam profile
```

Upon successful installation of a TAP Aggregation profile, you should see a display similar to the following:

```
Configuration            Status
FixedSystem          foo*                    foo
* configuration overridden by TapAgg
```

20.1.3.1.1 Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments

The Point of Local Repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

To configure a convergence delay only to LFIB routes that are being protected, the following command is used either in the router IS-IS mode or the router IS-IS address-family sub-mode. A default of 10 seconds is used when using the command without an explicitly specified delay.

```
switch(config-router-isis-af)#timers local-convergence-delay
 [<delay_in_milliseconds>] protected-prefixes
```

20.1.3.2 Limitations

20.1.3.2.1 IP Steering

IP steering does not work for MPLS packets with four or more labels. Currently, you must work around this limitation with a configuration similar to the **Configuration for IP Steering**. This workaround does not work when MPLS pop is not enabled.

20.1.3.2.2 Configuration for IP Steering

When MPLS pop is enabled, you can enable IP steering for for to six MPLS labels by adding an extra port into the configuration as a tap-tool port.

For example, you want to perform IP steering from interface ***Ethernet1*** to a set of interfaces and also want MPLS labels to be popped. Add a new interface ***Ethernet2***, which will not receive any external traffic, as a tap-tool port with traffic loopback. Then configure ***Ethernet1*** to forward to ***Ethernet2*** as its default interface. The commands would look similar to the following:

```
(config-if-Et2)#swi mode tap-tool
(config-if-Et2)#traffic-loopback source system device phy
(config-if-Et2)#int et1
```

```
(config-if-Et1)#swi tap default interface et2
```

All of ***Ethernet1***'s old tool ports should be disabled and become ***Ethernet2***'s tool ports. Then, all IP steering configuration that was originally meant to be between ***ET1*** and its old tool ports should be configured with ***Ethernet2*** in place of ***Ethernet1***. Finally, configure MPLS pop on ***Ethernet1***.

20.1.3.3 TAP Aggregation Extra MPLS POP (4 to 6 Labels) Commands

show hardware tcam profile

20.1.4 TAP Aggregation Configuration

These sections describe TAP aggregation configuration tasks:

- Enabling Tap Aggregation Mode
- Tap Aggregation Mixed Mode
- Tap Port Configuration
- Tool Port Configuration
- Per-linecard TCAM Profile Configuration
- Two-Way Ports for Tap Aggregation
- Tap Aggregation QoS Handling on Tap Ports
- Identity VLAN Tagging
- Tap Aggregation Group Configuration

20.1.4.1 Enabling Tap Aggregation Mode

The switch supports switching mode and TAP aggregation mode. In switching mode, normal switching and routing functions are supported while TAP aggregation functions are disabled. In TAP aggregation mode, TAP aggregation functions are enabled while normal switching and routing functions are disabled. By default, the switch is in switching mode.

A ports switchport status depends on its switchport mode and the switch's TAP aggregation mode.

- **Tap aggregation mode enabled**: TAP and tool ports are enabled. Switching ports are errdisabled.
- **Tap aggregation mode disabled**: TAP and tool ports are errdisabled. Switching ports are enabled.

To enable the switch to carry out TAP aggregation, first enter TAP aggregation configuration mode using the **`tap aggregation`** command, then set the mode to **exclusive**.

Note: The switch can also perform TAP aggregation in **mixed** mode. See Mixed Mode Configuration.

Example

These commands enter TAP aggregation configuration mode, then place the switch in TAP aggregation **exclusive** mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
   mode exclusive
switch(config-tap-agg)#
```

To return the switch to switching mode, remove the **mode** command from ***running-config***.

Examples

- These commands enter TAP aggregation configuration mode, then place the switch in switching mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```

- These commands enter switching mode and remove all TAP aggregation configuration mode statements.

```
switch(config)#no tap aggregation
switch(config)#
```

20.1.4.2 TAP Aggregation Mixed Mode

On a modular switch, the user can configure TAP Aggregation on some linecards and leave other linecards to operate normally. This is referred to as TAP aggregation mixed mode.

- Mixed Mode Platform Compatibility
- Mixed Mode Configuration

20.1.4.2.1 Mixed Mode Platform Compatibility

The following platforms support TAP Aggregation Mixed Mode.

- DCS-7500R
- DCS-7500R2

20.1.4.2.2 Mixed Mode Configuration

Complete the following steps to configure Linecard 3 as a TAP aggregation linecard in mixed mode.

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation.

```
switch(config)#tap aggregation
```

3. Enable TAP aggregation mixed mode, selecting the targeted linecard module using the TAP aggregation default.

```
switch(config-tap-agg)#mode mixed module linecard 3 tap-aggregation-
default
```

Note: Changing modes may affect available functionality. Unsupported configuration elements will be ignored.

The profile selection in mixed mode is the same as in exclusive mode. The user can configure multiple linecards for TAP aggregation in mixed mode.

The user can check TAP Aggregation Mixed Mode status by executing the following show commands:

```
switch(config)#show running-config section tap
tap aggregation
   mode mixed module linecard 3 profile tap-aggregation-default
switch(config)#show hardware tcam profile
                     Configuration        Status
Linecard4            default              default
Linecard3            default              tap-aggregation-default
Linecard6            default              default
switch(config)#
```

20.1.4.3 TAP Port Configuration

TAP ports function when the switch is in TAP aggregation mode. TAP ports receive traffic for replication to one or more tool ports. In TAP aggregation mode, TAP ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

TAP mode ports are configured through switchport mode commands. TAP mode command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tap port configuration steps.

- Configuring an Interface as a TAP Mode Port
- TAP Port Allowed VLAN List Configuration
- TAP Port Native VLAN
- TAP Port Packet Truncation

Configuring an Interface as a Tap Mode Port

Ethernet and port-channel interfaces are configured as TAP ports with the **`switchport mode`** command.

Example

These commands configure interface ethernet ***41*** through ***43*** as TAP mode ports.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#switchport mode tap
switch(config-if-Et41-43)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            1        1    0
 ---
Et42      tap            tap            1        1    0
 ---
Et43      tap            tap            1        1    0
 ---
switch(config-if-Et41-43)#
```

TAP Port Allowed VLAN List Configuration

By default, TAP mode interfaces handle tagged traffic for all VLANs. The **switchport tap allowed vlan** command creates or modifies the set of VLANs for which a TAP port handles tagged traffic.

Example

These commands create TAP-mode allowed VLAN lists for interface ethernet ***41*** through ***43***.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap allowed vlan 401-410
switch(config-if-Et41)#interface ethernet 42
switch(config-if-Et42)#switchport tap allowed vlan 411-420
switch(config-if-Et41)#interface ethernet 41-42
switch(config-if-Et41-42)#show active
interface Ethernet41
   switchport mode tap
   switchport tap allowed vlan 401-410
interface Ethernet42
   switchport mode tap
   switchport tap allowed vlan 411-420
switch(config-if-Et41-42)#
```

TAP Port Native VLAN

Tap mode Interfaces associate untagged frames with the tap mode native VLAN. The **switchport tap native vlan** command specifies the TAP-mode native VLAN for the configuration-mode interface. The default TAP-mode native VLAN for all interfaces is ***vlan 41***.

Example

These commands assign ***vlan 400*** as the TAP-mode native VLAN for ***interface ethernet 41***.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap native vlan 400
switch(config-if-Et41)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 ---
Et42      tap            tap            1        1    0
 ---
Et43      tap            tap            1        1    0
 ---
switch(config-if-Et41)#
```

TAP Port Packet Truncation

TAP ports can be configured to truncate inbound packets. The **switchport tap truncation** command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. By default, TAP ports do not truncate packets.

Examples

- These commands configure ***interface ethernet 41*** to truncate packets to ***150*** bytes.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap truncation 150
switch(config-if-Et41)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id
 Truncation Default
          Mode                          Vlan     Vlan
   Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    150
   ---
Et42      tap            tap            1        1    0
   ---
Et43      tap            tap            1        1    0
   ---
switch(config-if-Et41)#
```

- These commands configure ***interface ethernet 41*** to send complete packets for replication.

```
switch(config-if-Et41)#no switchport tap truncation
switch(config-if-Et41)#show interface ethernet 41 tap
Port      Configured     Status         Native   Id
 Truncation Default
          Mode                          Vlan     Vlan
   Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
   ---
switch(config-if-Et41)#
```

20.1.4.4 Tool Port Configuration

Tool ports replicate traffic received by TAP ports. Tool ports are mapped to the TAP ports through TAP aggregation groups. A tool port may belong to multiple aggregation groups and an aggregation group may contain multiple tool ports.

Tool ports function when the switch is in TAP aggregation mode. In this switch mode, tool ports are in STP forwarding state and ingress traffic is prohibited. MAC learning, control plane interaction, and traps for inbound traffic are disabled. All control plane interaction is prevented and L2 agents do not send PDUs to tool-mode interfaces. When the switch is in switching mode, tool ports are error-disabled.

Tool-mode ports are configured through switchport commands. Tool-mode command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tool port configuration steps.

- Configuring an Interface as a Tool-mode Port
- Tool Port Allowed VLAN List Configuration
- Tool Port Packet Truncation

Configuring an Interface as a Tool-mode Port

Ethernet and port channel interfaces are configured as tool ports with the **switchport mode** command.

Example

These commands configure port-channel interfaces ***101*** through ***103*** as tool-mode ports and display the result.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport mode tool
switch(config-if-Po101-103)#show interface port-channel 101-103
 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag
 Mode
-------------------------------------------------------------
-----------
Po101     tool           tool           All                 Off
 ---
Po102     tool           tool           All                 Off
 ---
Po103     tool           tool           All                 Off
 ---
switch(config-if-Po101-103)#
```

Tool Port Allowed VLAN List Configuration

By default, tool mode interfaces handle tagged traffic for all VLANs. The **switchport tool allowed vlan** command creates or modifies the set of VLANs for which a tool port handles tagged traffic.

Example

These commands create tool mode allowed VLAN lists for port-channel interfaces 101 through 103.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport tool allowed vlan
 1010-1020
switch(config-if-Po101-103)#interface port-channel 101
switch(config-if-Po101)#switchport tool allowed vlan add
 1001-1009
switch(config-if-Po103)#interface port-channel 102
switch(config-if-Po102)#switchport tool allowed vlan remove
 1016-1020
switch(config-if-Po102)#interface port-channel 103
switch(config-if-Po103)#switchport tool allowed vlan add
 1021-1030
switch(config-if-Po103)#show interface port-channel 101-103 tool
```

```
Port      Configured     Status         Allowed              Id
 Timestamp
          Mode                          Vlans                Tag
 Mode
-------------------------------------------------------------
-----------
Po101     tool           tool           1001-1020            Off
 ---
Po102     tool           tool           1010-1015            Off
 ---
Po103     tool           tool           1010-1030            Off
 ---
switch(config-if-Po103)#
```

Tool Port Packet Truncation

Tool ports can be configured to truncate outbound packets. The **switchport tool truncation** command configures the configuration-mode interface, as a tool port, to truncate outbound packets to ***160*** bytes. By default, tool ports do not truncate packets.

Tool port packet truncation is supported only on the 7150 series platform.

Examples

- These commands configure ***interface ethernet 41***, as a tool port, to truncate packets on egress to ***160*** bytes.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport mode tool
switch(config-if-Et41)#switchport tool truncation 160
switch(config-if-Et41)#
```

- These commands configure ***interface ethernet 41*** to send complete packets.

```
switch(config-if-Et41)#no switchport tool truncation
switch(config-if-Et41)#
```

20.1.4.5 Per-linecard TCAM Profile Configuration

This feature gives the ability to specify different profiles for different linecards in mixed mode.

To enable the TAP aggregation mode and configure a TCAM profile for a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)#tap aggregation
```

3. Configure the TCAM profile for a linecard set.

```
switch(config-tap-agg)#mode mixed module linecard 3,4 profile tap-
aggregation-default
```

```
switch(config-tap-agg)#mode mixed module linecard 5,6 profile tap-
aggregation-extended
switch(config-tap-agg)#
```

To disable TAP aggregation on a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)#tap aggregation
```

3. Disable TAP aggregation for a linecard set.

```
switch(config-tap-agg)#no mode mixed module linecard 3,4
switch(config-tap-agg)#
```

Note: If a TAP is a port-channel, its members must all come from linecards using the same profile.

20.1.4.6 Two-Way Ports for TAP Aggregation

While in TAP aggregation mode, there is support for traffic only in one direction through either TAP ports that receive packets from mirroring, or through optical TAP or tool ports that send out packets to customer devices. Two-way ports for TAP aggregation allow bidirectional transmit and receive capability on a single port in TAP aggregation mode. Using the TAP-tool switchport mode enables both TAP and tool configurations simultaneously on an interface.

- Two-Way Ports Platform Compatibility
- Two-Way Ports Configuration

20.1.4.6.1 Two-Way Ports Platform Compatibility

The following platforms support two-way ports for TAP aggregation.

- DCS-7280R
- DCS-7280R2
- DCS-7500R
- DCS-7500R2

20.1.4.6.2 Two-Way Ports Configuration

To enable a two-way port, use the **tap-tool** option of the **`switchport mode`** command.

Example

The following commands configure ***interface ethernet 4/1*** as a two-way port, allowing it to function as both a TAP and a tool port.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#switchport mode tap-tool
switch(config-if-Et4/1)#
```

Additional configurations for TAP and tool functionality on the interface remain the same. Once the user enables the TAP-tool switchport mode on the interface, they can use the existing TAP and tool mode commands to enable their respective configurations.

Arista recommends using this feature with unidirectional send-receive enabled on the interface, which allows the receiver and transmitter for the interface to operate independently. If one goes down, the other remains active. To enable unidirectional send-receive on an interface, use the **`unidirectional send-receive`** command.

Example

These commands enable unidirectional send-receive on ***interface ethernet 4/1***.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#unidirectional send-receive
switch(config-if-Et4/1)#
```

20.1.4.7 TAP Aggregation QoS Handling on TAP Ports

Before EOS 4.20.5F, QoS behavior was not enforced for TAP aggregation ports, meaning that QoS behavior for packets passing through the device was not changed.

- QoS Handling Platform Compatibility
- QoS Handling Configuration
- Displaying QoS Handling Status

20.1.4.7.1 QoS Handling Platform Compatibility

The following platforms support QoS handling on TAP ports.

- DCS-7280E
- DCS-7280R
- DCS-7500E
- DCS-7500R
- DCS-7280R2

Note: QoS is not available on TAP aggregation ports on the DCS-7150.

20.1.4.7.2 QoS Handling Configuration

Trust Mode of TAP Ports

TAP ports are in QoS **untrusted** mode by default. This means that the QoS marking of an incoming packet is not trusted when determining the QoS attributes of the packet. Therefore, the default QoS handling takes place. Consider the default CoS to traffic class mapping in the following example.

```
switch(config)#show qos maps
[...]
 Cos-tc map:
   cos:  0  1  2  3  4  5  6  7
   ---------------------------
   tc:   1  0  2  3  4  5  6  7
[...]
```

The Class of Service (CoS) field of incoming packets is ignored and is assumed to be zero. In this example, all packets are assigned to traffic class 1 when using the above mapping.

To override the default trust mode behavior on a TAP port, use the **qos trust** command.

Example

The following commands override the default trust mode behavior on ***Ethernet port 1***, configuring it to use Class of Service (CoS) trust mode instead so that incoming packets will be placed in their CoS-marked classes.

```
switch(config-if-Et1)#qos trust cos
switch(config-if-Et1)#
```

Class of Service Rewrite of TAP Ports

By default, TAP ports do not override the existing Class of Service (CoS) field of incoming packets. In other words, the CoS marking of steered packets is not changed in any way.

However, the CoS field of added tags may change according to the traffic class to CoS mapping. For example, the identity tag added by TAP ports may have the CoS value from the global traffic class to CoS mapping. Consider the following mapping:

```
switch(config)#show qos maps
[...]
   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  7  2  3  4  5  6  0
[...]
```

Using this mapping, the added tag CoS field of packets assigned to ***traffic class 1*** may be set to ***7***.

20.1.4.7.3 Displaying QoS Handling Status

Use the Displaying QoS Handling Status to see the active QoS mappings.

Example

This command displays the QoS maps that are configured on the switch.

```
switch#show qos maps
Number of Traffic Classes supported: 8
   Number of Transmit Queues supported: 8
   Cos Rewrite:  Disabled
   Dscp Rewrite:  Disabled

   Cos-tc map:
     cos:  0  1  2  3  4  5  6  7
     ---------------------------
     tc:   1  0  2  3  4  5  6  7

   Dscp-tc map:
     d1 :  d2 0  1  2  3  4  5  6  7  8  9
     ---------------------------------------
      0 :     1  1  1  1  1  1  1  0  0
      1 :     0  0  0  0  0  0  2  2  2  2
```

```
      2 :     2  2  2  2  3  3  3  3  3  3
      3 :     3  3  4  4  4  4  4  4  4  4
      4 :     5  5  5  5  5  5  5  5  6  6
      5 :     6  6  6  6  6  6  7  7  7  7
      6 :     7  7  7  7

   Tc-cos map:
     tc:   0  1  2  3  4  5  6  7
     ---------------------------
     cos:  1  0  2  3  4  5  6  7

   Tc-dscp map:
     tc:    0  1  2  3  4  5  6  7
     ------------------------------
     dscp:  8  0 16 24 32 40 48 56

   Tc - tx-queue map:
     tc:         0  1  2  3  4  5  6  7
     ---------------------------------
     tx-queue:   0  1  2  3  4  5  6  7

switch#
```

20.1.4.8 Identity VLAN Tagging

By default, tool port output packets are identical to the replicated packets they receive from the tap ports to which they are associated. Identity tagging modifies packets sent by tool ports by adding a dot1q VLAN tag that identifies the originating TAP port. Each TAP port is associated with an identity number. Tool ports that are configured to add an identity tag append the originating TAP port's identity number in the outer layer (or s-VLAN) tag.

The following sections describe identity VLAN tagging on TAP and tool ports.

- Tap Port Identity Value Configuration
- Tool Port Identity Tag Configuration

Tap Port Identity Value Configuration

The **`switchport tap identity`** command configures the TAP port identity value for the configuration-mode interface. The default identity value for all TAP ports is ***1***.

Example

These commands configure ***1042*** as the identity value for ***interface ethernet 42*** and display the result.

```
switch(config)#interface ethernet 42
switch(config-if-Et42)#switchport tap identity 1042
switch(config-if-Et42)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 ---
Et42      tap            tap            1        1042 0
 ---
```

```
Et43      tap             tap             1        1    0
 ---
switch(config-if-Et42)#
```

Tool Port Identity Tag Configuration

The **`switchport tool identity`** command configures the configuration-mode interface to include a tier-1 VLAN tag (dot1q) in packets it transmits. The VLAN number on the dot1q tag is the identity value configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

Example

These commands configure ***port channel 102*** to include the identity tag in packets it transmits.

```
switch(config)#interface port-channel 102
switch(config-if-Po102)#switchport tool identity dot1q
switch(config-if-Po102)#show interface port-channel 101-103 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag
 Mode
-------------------------------------------------------------
-----------
Po101     tool           tool           1001-1020           Off
 ---
Po102     tool           tool           1010-1015           On
 ---
Po103     tool           tool           1010-1030           Off
 ---
switch(config-if-Po102)#
```

20.1.4.9 TAP Aggregation Group Configuration

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A tool port replicates packets it receives from TAP ports that are in the aggregation groups to which it belongs. A TAP port can be configured to send data to multiple TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. TAP aggregation groups may contain multiple TAP ports and multiple tool ports.

The following sections describe the configuration of TAP aggregation groups:

- Assigning a Tool Port to a TAP Aggregation Group
- Assigning TAP Ports to a TAP Aggregation Group
- Viewing TAP Aggregation Group Assignments
- LAGs in Tool Groups

Assigning a Tool Port to a TAP Aggregation Group

Tool ports are assigned to a TAP aggregation group through the **`switchport tool group`** command. Each command either creates a list or alters the existing list of groups to which a tool port belongs.

Examples

- These commands assign ***port-channel interface 101*** to TAP aggregation groups **analyze1**, ***analyze2***, and ***analyze3***.

```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tool group set analyze1
 analyze2 analyze3
switch(config-if-Po101)#show active
interface Port-Channel101
   switchport mode tool
   switchport tap identity 2101
   switchport tool allowed vlan 1001-1020
   switchport tap default group tag-9
   switchport tool group set analyze3 analyze1 analyze2
switch(config-if-Po101)#
```

- These commands remove **analyze-1** from ***port channel 101***'s TAP aggregation group list.

```
switch(config-if-Po101)#switchport tool group remove analyze1
switch(config-if-Po101)#show active
interface Port-Channel101
   switchport mode tool
   switchport tap identity 2101
   switchport tool allowed vlan 1001-1020
   switchport tap default group tag-9
   switchport tool group set analyze3 analyze2
switch(config-if-Po101)#
```

Assigning TAP Ports to a TAP Aggregation Group

TAP ports are assigned to a TAP aggregation group using the **`switchport tap default group`** command. Multiple ports can be added to a group simultaneously by entering the command in group interface configuration mode for all of the ports to be included.

Example

These commands assign ***interface ethernet 41-42*** to TAP aggregation group ***analyze2*** and assign ***interface ethernet 43*** to TAP aggregation group ***analyze3***.

```
switch(config)#interface ethernet 41-42
switch(config-if-Et41-42)#switchport tap default group analyze2
switch(config-if-Et41-42)#interface ethernet 43
switch(config-if-Et43)#switchport tap default group analyze2
switch(config-if-Et43)#show interface ethernet 41-43 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan
 Group
-------------------------------------------------------------
------------
Et41      tap            tap            400      1    0
 analyze2
Et42      tap            tap            1        1042 0
 analyze2
Et43      tap            tap            1        1    0
 analyze3
```

```
switch(config-if-Et43)#
```

Default TAP Aggregation Groups

When a TAP port belongs to multiple aggregation groups, one of those groups is its default group. When traffic entering a TAP port does not match any filtering or traffic-steering rules for TAP aggregation groups configured on that port, it is sent to the default group. The first group listed in the switchport tap default group statement is configured as the default group for the interfacse.

Example

These commands assign ***interface ethernet 43*** to TAP aggregation groups **analyze2** and **analyze3**. Because it is listed first, **analyze2** is configured as the default group for the interface.

```
switch(config)#interface ethernet 43
switch(config-if-Et43)#switchport tap default group analyze2
 group analyze3
switch(config-if-Et43)#
```

Viewing TAP Aggregation Group Assignments

TAP aggregation group membership is displayed by **`show tap aggregation groups`**. Options allow the display of individual groups or of all configured groups. The command displays active tool and TAP ports by default, and provides an option to display configured ports that are not active.

Example

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
Group Name                          Tool Members
------------------------------------------------------------
analyze2                            Po101, Po102
analyze3                            Po101, Po103

Group Name                          Tap Members
------------------------------------------------------------
analyze2                            Et41, Et42
analyze3                            Et43
switch#
```

LAGs in Tool Groups

Link Aggregation Groups (LAGs) can be included in tool groups for load balancing. A tool group can contain both LAGs and regular ports. Each member of a tool group receives one copy of the traffic destined to the group. Traffic is replicated to tool group members using multicast replication. The traffic replicated to LAGs is then load balanced to their members as per load-balance policies configured on the system.

If a tool group has no more than ***60*** members with at least one hardware LAG, then the replication mode of the tool group is set to **ingress-only**. Otherwise, the replication mode of the tool group is

set to the configured system default multicast replication mode. See **platform sand multicast replication default** for more information on configuration of the system default replication mode.

Example

The following command changes the system-wide default multicast replication mode to **ingress**.

```
switch(config)#platform sand multicast replication default
 ingress
switch(config)#
```

20.1.5 TAP Aggregation Traffic Steering

Traffic steering is a TAP aggregation process that uses class maps and policy maps to direct data streams at tool ports that are not otherwise associated to the ingress TAP port. A policy map is a data structure that filters data streams upon which identity VLAN tagging or TAP aggregation group assignment is implemented.

TAP-aggregation class maps and policy maps are similar to QoS and control-plane maps. However, policy maps and their components are not interchangeable among function types.

20.1.5.1 TAP Aggregation Policies

A policy map filters data packets by using classes and match rules. Each class contains an eponymous class map and a traffic resolution command. Each match rule contains packet content descriptors and a traffic resolution parameter.

- A class map uses ACLs that identify packets that comprise a specified data stream.
- Packet content descriptors specify packet field values that are compared to inbound packets.
- A traffic resolution command or parameter specifies data handling methods for filtered traffic.

Each data packet entering an entity to which a policy map is assigned is managed as defined by the traffic resolution command of the highest priority class or rule that matches the packet.

Class maps are user-created and can be edited or deleted. They filter traffic with IPv4 ACLs and are listed in ***running-config***. TAP aggregation traffic resolution commands do one the following:

- specify a TAP aggregation group to direct the packet.
- specify a VLAN number for identity tagging the packet.

TAP aggregation policy maps do not define an implicit **deny** statement. Packets that do not match a policy map class or rule are replicated and sent out tool ports specified by the default aggregation group assigned to the ingress TAP port. If no default group is selected, these packets are dropped.

20.1.5.2 Configuring TAP Aggregation Traffic Policies

TAP aggregation traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port-channel interfaces.

Creating Class Maps

A class map is an ordered list of IPv4 Access Control Lists (ACLs). Each ACL is assigned a sequence number that specifies its priority in the class map. TAP aggregation class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class maps are created and modified in class-map configuration mode, which is entered using the **`class-map type tapagg`**. The **match (class-map (tapagg))** command inserts a specified ACL into the class map, assigning it a sequence number that denotes its placement.

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **`show active`** command displays the saved version of class map. The **`exit`** command returns the switch to ***global*** configuration mode and saves pending class-map changes. The **`abort`** command returns the switch to global configuration mode and discards pending changes.

Examples

- This command creates a TAP aggregation class map named ***t-class_1*** and places the switch in the ***class-map*** configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

- These commands add two IPv4 ACLs (***tacl-1*** and ***tacl-2***) to the ***t-class_1*** class map. The commands use the default method of assigning sequence numbers to the ACLs.

```
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

- These commands exit class-map configuration mode, store pending changes to ***running-config***, then display the class map.

```
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
class-map type tapagg match-any t-class_1
10 match ip access-group tacl-1
20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

Creating Policy Maps

Policy maps are created and modified in ***policy-map*** configuration mode. A policy map is an ordered list of classes and match rules. Policy maps are edited by adding or removing map elements. Data packets are managed by commands of the highest priority class or rule that matches the packet.

Classes

Each class contains a class map, a set command, and a sequence number:

- The **class map** identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode.
- The **`set`** command specifies the replication method for filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The **sequence number** specifies the class's priority within the policy map. Lower sequence numbers denote higher priority.

Matching Rules

Each rule contains a filter list, an action, and a sequence number:

- The **filter list** identifies a data stream by using a set of packet field values.
- The action, (**SET_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.

- The **sequence number** specifies the rule's priority within the policy map. Lower sequence numbers denote higher priority.

Policy-map and ***policy-map-class*** configuration modes are group-change modes. Changes are saved with the **`exit`** command or discarded with the **`abort`** command. The **`show active`** and **`show pending`** commands display the saved and modified policy map versions respectively.

The **`class (policy-map (tapagg))`** command enters policy-map configuration mode.

Example

This command creates the TAP aggregation policy map named ***t-policy_1*** and places the switch in ***policy-map*** configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

The **`class (policy-map (tapagg))`** command adds a class to the configuration mode policy map and places the switch in ***policy-map-class*** configuration mode for adding a traffic resolution command to the class. The **`set (policy-map-class (tapagg))`** command specifies the data replication method for traffic filtered by the associated class map in the *configuration-mode* policy map. The **`set`** command performs one of the following replication actions for filtered data packets.

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

Examples

- These commands add the ***t-class_1*** class map to the ***t-policy_1*** policy map, associate a set statement with the class, then save the policy map by exiting the modes. Packets filtered by the class map are identity tagged with ***VLAN 444*** and replicated as specified by the ***t-grp*** aggregation group.

  ```
  switch(config-pmap-t-policy_1)#class t-class_1
  switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group
  t-grp id-tag 444
  switch(config-pmap-c-t-policy_1-t-class_1)#exit
  switch(config-pmap-t-policy_1)#exit
  switch(config)#policy-map type tapagg t-policy_1
  switch(config-pmap-t-policy_1)#show active
  policy-map type tapagg t-policy_1
  10 class t-class_1
  set aggregation-group t-group id-tag 444
  switch(config-pmap-t-policy_1)#
  ```

  The **match (policy-map (tapagg))** command adds a match rule to the configuration-mode TAP aggregation policy map.
- This command enters policy-map configuration mode for ***t-policy_1***, then creates a match rule for the policy map that filters OSPF packets and replicates them as specified by ***t-grp*** TAP aggregation group.

  ```
  switch(config-pmap-t-policy_1)#match ip ospf any any set
  aggregation-group t-grp
  switch(config-pmap-t-policy_1)#
  ```

Applying Policy Maps to an Interface

The **service-policy type tapagg (Interface mode)** command applies a specified policy map to the configuration-mode interface.

Example

These commands apply the ***t-policy_1*** policy map to ***interface ethernet 17***.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#service-policy type tapagg input tpolicy_1
switch(config-if-Et17)#
```

Stripping VLAN Tags

The traffic-steering policies in tap aggregation mode allows steering traffic from tap ports to tool ports using **set (policy-map-class (tapagg))** command, while the 'set id-tag' tags the traffic with the specified VLAN ID in the dot1q format. The **class (policy-map (tapagg))** command allows removing VLAN tags from the steered traffic. It supports all traffic types that the traffic steering policies support such as IPv4, IPv6, and MAC.

A tap port is an interface that receives a data stream where two network ports exchange.

A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to the devices that process monitored data streams.

Example

These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1t-class_1)#set aggregation-group t-group
 remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
 id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q
 outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
 id-tag 10 remove dot1q outer 1-2
```

20.1.5.3 Traffic Steering to Match Inner Header Fields

This feature allows matching the inner header fields (either IPv4 or IPv6 inner fields) of encapsulated traffic.

The following convention is adopted when describing an encapsulated traffic: ***<inner-protocol>-over-<outer-protocol>***. For example, the IPv4-over-IPv6 packet indicates that the inner fields belong to IPv4 protocol and the outer fields belong to IPv6 protocol.

Supported Packet Types and Inner Header Fields

The types of traffic for which inner header field matching is supported are:

1. IP-over-IP traffic
2. IP-over-GRE traffic, with the following packet format supported:
   - [Eth | IPv4 or IPv6 | GRE | Inner IPv4 or IPv6]
   - [Eth | IPv4 | GRE | Inner Eth | Inner IPv4], which will be referred to as L2-GRE packet
3. IP-over-GTP traffic (only in DCS-7280R3 and DCS-7500R3 series), with the following packet format supported
   - [Eth | IPv4 | GTP | Inner IPv4 or IPv6]
   - [Eth | IPv6 | GTP | Inner IPv4 or IPv6]

The following inner header fields are supported:

- inner source IP address
- inner destination IP address
- inner TCP/UDP protocol
- inner source port number
- inner destination port number.

20.1.5.3.1 Configuring Traffic Steering to Match Inner Header Fields

To enable traffic steering with an ACL rule that matches the inner IP addresses, a user-defined TCAM profile must be configured for each type of IP protocol to which the inner IP addresses belong. For example, to match the inner IPv4 addresses of an IPv4 packet (i.e. IPv4-over-IPv4 traffic) or the inner IPv4 addresses of an IPv6 packet (i.e. IPv4-over-IPv6 traffic), one user-defined TCAM profile must be configured. A different user-defined TCAM profile is needed if matching the inner IPv6 addresses of an IPv4 packet or the inner IPv6 addresses of an IPv6 packet is desired.

The following commands show how to configure different TCAM profiles needed to enable support for matching inner IP headers, depending on the desired inner IP version, and inner IP header fields to be matched. These TCAM profiles are referred to as user-defined TCAM profiles and created based on the existing TCAM profile tap-aggregation-extended.

TCAM Profile to Match Inner IPv4 Header Fields

Match inner IPv4 addresses only.

The following commands configure the TCAM profile for matching only the inner source and destination IP addresses of IPv4 traffic based on the existing TCAM profile **tap-aggregation-extended**.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip4 copy tap-
aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#no key field src-ip dst-ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-ta
pagg-ip)#key field inner-src-ip-high inner-src-ip-low inner-dst-ip-high
 inner-dst-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-ipv6)#no key field src-ipv6 src-ipv6-high dst-ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)#key field inner-src-ip-high inner-src-ip-low inner-dst-ip-
high inner-dst-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#exit
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-IP and IP-over-GRE traffic.

In addition to matching inner IPv4 addresses, the previous user-defined TCAM profile can also be configured to match the inner TCP/UDP protocol and their corresponding port numbers. The commands to configure these inner fields are shown below.

Note that, due to hardware limitation, the feature “tapagg mac” is disabled in this TCAM profile to make room for matching additional inner header fields.

Example

```
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip4
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#no feature
 tapagg mac
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#no key field outer-vlan-id inner-vlan-id l4-src-port l4-dst-
port udf-16b-1 udf-16b-2 udf-16b-3 udf-16b-4 udf-32b-1 udf-32b-2
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#key field inner-ip-protocol inner-l4-src-port inner-l4-dst-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-ip)#feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-ipv6)#no key field l4-src-port l4-dst-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ipv6)#key field inner-ip-protocol inner-l4-src-port inner-l4-dst-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-ipv6)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#exit
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for L2-GRE packets.

The same user-defined TCAM profile can be updated to support traffic steering that matches on inner header fields for L2-GRE packets, simply by adding a new packet type.

Example

```
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip4
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-port)#packet ipv4 eth ipv4 forwarding bridged
```

Match inner IPv4 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-GTP packets.

We can re-use the same user-defined TCAM profile and update it to support traffic steering that matches on inner header fields for IP-over-GTP packets, simply by adding a new packet type.

Example

```
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip4
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-
tapagg-ip)#no packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-t
apagg-ip)#packet ipv4 gtpv1 ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg port
```

```
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-port)#no packet ipv4 eth ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-t
apagg-port)#packet ipv4 gtpv1 ipv4 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4)#feature
 tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip4-feature-tapa
gg-port)#packet ipv6 gtpv1 ipv4 forwarding bridged
```

Match inner and outer IPv4 addresses.

If matching a combination of inner and outer IP header fields is desired, the user-defined TCAM profile must be updated to include the desired fields. For example, instead of matching both inner source and inner destination IPv4 addresses as illustrated by this TCAM profile, if users would like to match outer source IPv4 address and inner destination IPv4 address only (and ignoring outer destination and inner source IPv4 addresses). The following commands show how to configure a TCAM profile for such filtering.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tap-aggregation-user-outer-inner-ip4 copy
 tap-aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4
)#feature tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-
feature-tapagg-ip)#no key field dst-ip
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-feat
ure-tapagg-ip)#key field inner-src-ip-high inner-src-ip-low
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4-
feature-tapagg-ip)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-outer-inner-ip4)#exit
```

TCAM Profile to Match Inner IPv6 Header Fields

Match inner IPv6 addresses only.

These commands are to configure a TCAM profile that can match inner IP addresses of IPv6 traffic are as follows:

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip6 copy tap-
aggregation-extended
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#no key field dst-ip src-ip udf-16b-1  udf-16b-2 udf-16b-3
 udf-16b-4 udf-32b-1 udf-32b-2 outer-vlan-id inner-vlan-id l4-src-port
 l4-dst-port l4-ops
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#key field inner-src-ipv6-high-high-32b inner-src-ipv6-high-
low-32b inner-src-ipv6-low-high-32b inner-src-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#key field inner-dst-ipv6-high-high-32b inner-dst-ipv6-high-
low-32b inner-dst-ipv6-low-high-32b inner-dst-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg ipv6
```

```
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-ipv6)#no key field src-ipv6 src-ipv6-high dst-ipv6 l4-dst-port l4-src-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)#key field inner-src-ipv6-high-high-32b inner-src-ipv6-high-
low-32b inner-src-ipv6-low-high-32b inner-src-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)#key field inner-dst-ipv6-high-high-32b inner-dst-ipv6-high-
low-32b inner-dst-ipv6-low-high-32b inner-dst-ipv6-low-low-32b
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ipv6)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#exit
```

Match inner IPv6 addresses, inner TCP/UDP protocol and inner port numbers.

In addition to matching inner IPv6 addresses, the previous user-defined TCAM profile can also be configured to match the inner TCP/UDP protocol and their corresponding port numbers. The commands to configure these inner fields are shown below.

Note that, due to hardware limitation, the feature **tapagg mac** is disabled in this TCAM profile to make room for matching additional inner header fields.

Example

```
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#no feature
 tapagg mac
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#key field inner-ipv6-next-header inner-l4-src-port inner-l4-
dst-port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-ip)#feature tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-ipv6)#key field inner-ipv6-next-header inner-l4-src-port inner-l4-dst-
port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-ipv6)#exit
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#exit
```

Match inner IPv6 addresses, inner TCP/UDP protocol and inner port numbers for IP-over-GTP packets.

We can re-use the same user-defined TCAM profile and update it to support traffic steering that matches on inner header fields for IP-over-GTP packets, simply by adding a new packet type.

```
switch(config-hw-tcam)#profile tap-aggregation-user-inner-ip6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg ip
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-
tapagg-ip)#packet ipv4 gtpv1 ipv6 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg port
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-port)#packet ipv4 gtpv1 ipv6 forwarding bridged
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6)#feature
 tapagg ipv6
switch(config-hw-tcam-profile-tap-aggregation-user-inner-ip6-feature-tapa
gg-port)#packet ipv6 gtpv1 ipv6 forwarding bridged
```

Apply TCAM Profile

To apply the newly-defined TCAM profile use **tap-aggregation-user-inner-ip4** or **tap-aggregation-user-inner-ip6** command.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive profile tap-aggregation-user-inner-
ip4
```

For modular systems

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode mixed module Linecard <linecard number>
 profile tap-aggregation-user-inner-ip4
```

Set-Up ACL Rules for Matching Inner Header Fields

In order to apply traffic steering for particular packets based on their inner header fields, ACL rules that can filter such traffic must be created, as shown in the example.

1. ACL rule for filtering an IPv4-over-IPv4 traffic based on the inner addresses.

   ```
   switch(config)#ip access-list acl1
   switch(config-acl-acl1)#permit ip any any inner ip host 1.2.3.4 host
    5.6.7.8
   ```

2. ACL rule for filtering an IPv4-over-IPv4 traffic based on the outer source and inner destination addresses.

   ```
   switch(config)#ip access-list acl1
   switch(config-acl-acl1)#permit ip host 1.2.3.4 any inner ip host any
    host 5.6.7.8
   ```

3. ACL rule for filtering an IPv6-over-IPv4 traffic based on the inner addresses.

   ```
   switch(config)#ip access-list acl2
   switch(config-acl-acl2)#permit ip any any inner ipv6 host 1001::abcd
    host 2002::cafe
   ```

4. ACL rule for filtering an IPv4-over-IPv6 traffic based on the inner addresses, inner TCP/UDP protocol, and inner TCP/UDP ports.

   ```
   switch(config)#ipv6 access-list acl3
   switch(config-ipv6-acl-acl3)#permit ipv6 any any inner ip tcp host
    10.11.12.13 eq 9999 host 20.22.24.26 eq 8888
   ```

5. ACL rule for filtering an IPv6-over-GRE(IPv4) traffic based on the inner addresses, inner TCP/UDP protocol, and inner TCP/UDP ports.

   ```
   switch(config)#ip access-list acl4
   switch(config-acl-acl4)#permit gre any any inner ipv6 udp host
    2019::baba eq 9999 host 1986::deca eq 8888
   ```

6. ACL rule for filtering an IPv4-over-GTP traffic based on the inner addresses.

   ```
   switch(config)#ip access-list acl5
   switch(config-acl-acl5)#permit gtp any any version 1 protocol gtp-u
    inner ip host 1.2.3.4 host 5.6.7.8
   ```

20.1.5.3.2 Limitations

- Only IP (IPv4 and IPv6), GRE and GTP outer protocols are supported.
  - Other outer protocols are not supported.
- Only IP (IPv4 and IPv6), TCP and UDP inner protocols are supported.
  - Other inner protocols are not supported.
- To configure support for matching inner IPv4 addresses (for either IPv4 or IPv6 outer packets), a custom user-defined TCAM profile is required. A different user-defined TCAM profile is needed if matching inner IPv6 addresses is desired.
- The total size of fields to match must not exceed the TCAM key size limitation (which is ***320*** bit if tap-aggregation-extended system profile is used as the base profile, or ***160*** bit for tap-aggregation-default system profile). For example, it is not possible to create a user-defined TCAM profile that matches both outer and inner source/destination address pairs for an IPv6-over-IPv6 packet. This is because each IPv6 address is ***128*** bit, requiring at least ***512*** bit to match all ***4*** addresses, and the TCAM key size is limited to ***320*** bit.

20.1.6 TAP Aggregation GUI

The switch provides a Graphical User Interface (GUI) for creating and viewing a TAP aggregation configuration and displaying LANZ traffic statistics.

All commands available on the GUI are accessible through the CLI. The TAP aggregation configuration created through either the CLI or the GUI can be viewed and modified through either medium.

This section provides a brief description of the TAP aggregation GUI.

20.1.6.1 Accessing the TAP Aggregation GUI

The URL for the TAP aggregation GUI is: **`//hostname/apps/TapAgg/index.html`** where the hostname is the switch's configured hostname. The **`TAP Aggregation GUI Initial Panel`** displays the initial TAP aggregation GUI panel for the switch with the hostname ***ro402***.

The TAP aggregation panel contains two sections:

- The **configuration section** displays the TAP aggregation configuration, including the TAP interfaces, tool interfaces, and aggregation groups. Links are displayed to indicate interface group membership.
- The **component section** displays information and control buttons for the active configuration entity. When an entity is not selected, the section displays information for the switch (device).

The configuration section displays TAP aggregation components only when the switch is in TAP aggregation mode. To enter TAP aggregation mode, click the TAP Aggregation icon in the component section for the device. The icon is a toggle mechanism; clicking it again disables TAP aggregation mode.

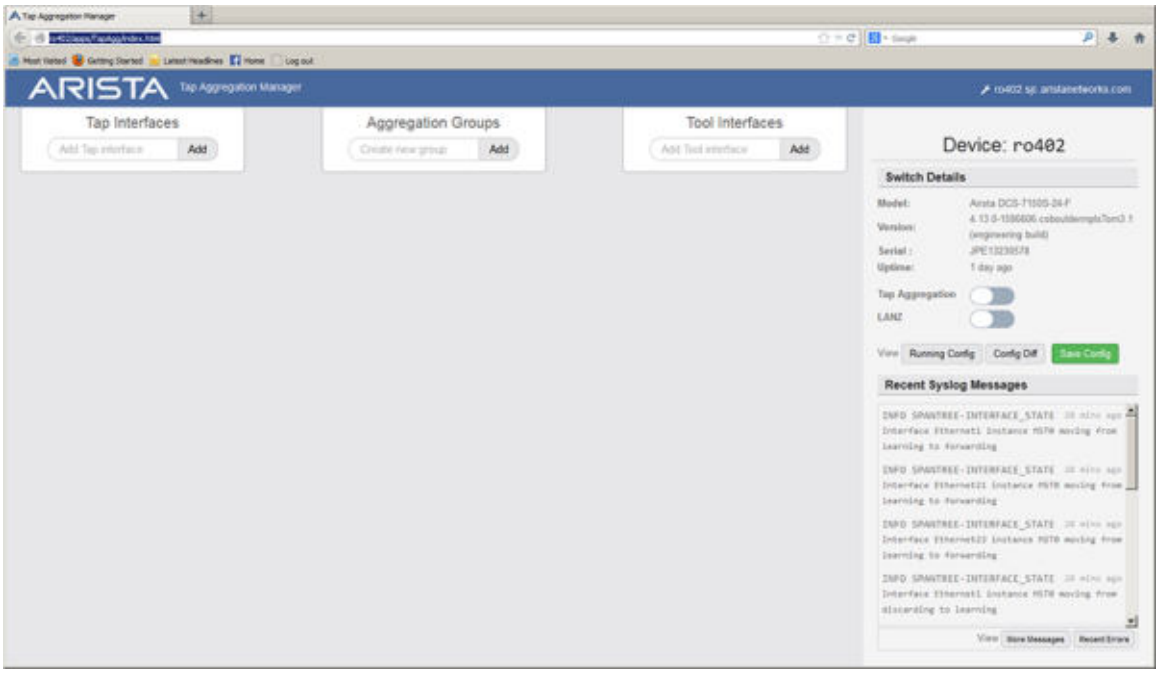

Figure 141: TAP Aggregation GUI Initial Panel

20.1.6.2 Viewing TAP Aggregation Component Details

TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled displays the TAP aggregation panel when the switch is in TAP aggregation mode. The configuration section indicates that the TAP aggregation configuration consists of three tool interfaces, one TAP interface, and four aggregation groups. ***Ethernet port 10*** is the active component; configuration control and traffic information for this interface is available in the component section.

The active component is changed by clicking on the desired component in the configuration section. To display device (switch) information, click on any configuration section outside of any component.

20.1.6.3 Modifying a TAP Aggregation Configuration

The TAP aggregation configuration can be modified only when the switch is in TAP aggregation mode, (see Accessing the TAP Aggregation GUI). The following is a partial list of configuration tasks that are available from the GUI:

- **adding a TAP or tool interface**: begin typing the interface name in the desired add-interface data entry area to access a drop-down list of available interfaces. Select the desired interface and press the **Add** button.
- **removing an interface from the configuration**: select the desired interface in the configuration section and click the deconfigure button in that interface's component section.
- **adding an aggregation group**: type the desired name of the new group in the data entry area and press the **Add** button. The TAP aggregation group name can consist of alphanumeric characters and specific special characters (**- _ [ ] { } :**) only.
- **adding an interface to an aggregation group**: select the desired interface in the configuration section, then press the icon of the group in the group membership area of the interface's component section.

Group icons are toggle buttons; clicking the icon of a group to which the interface belongs removes that interface from the group.

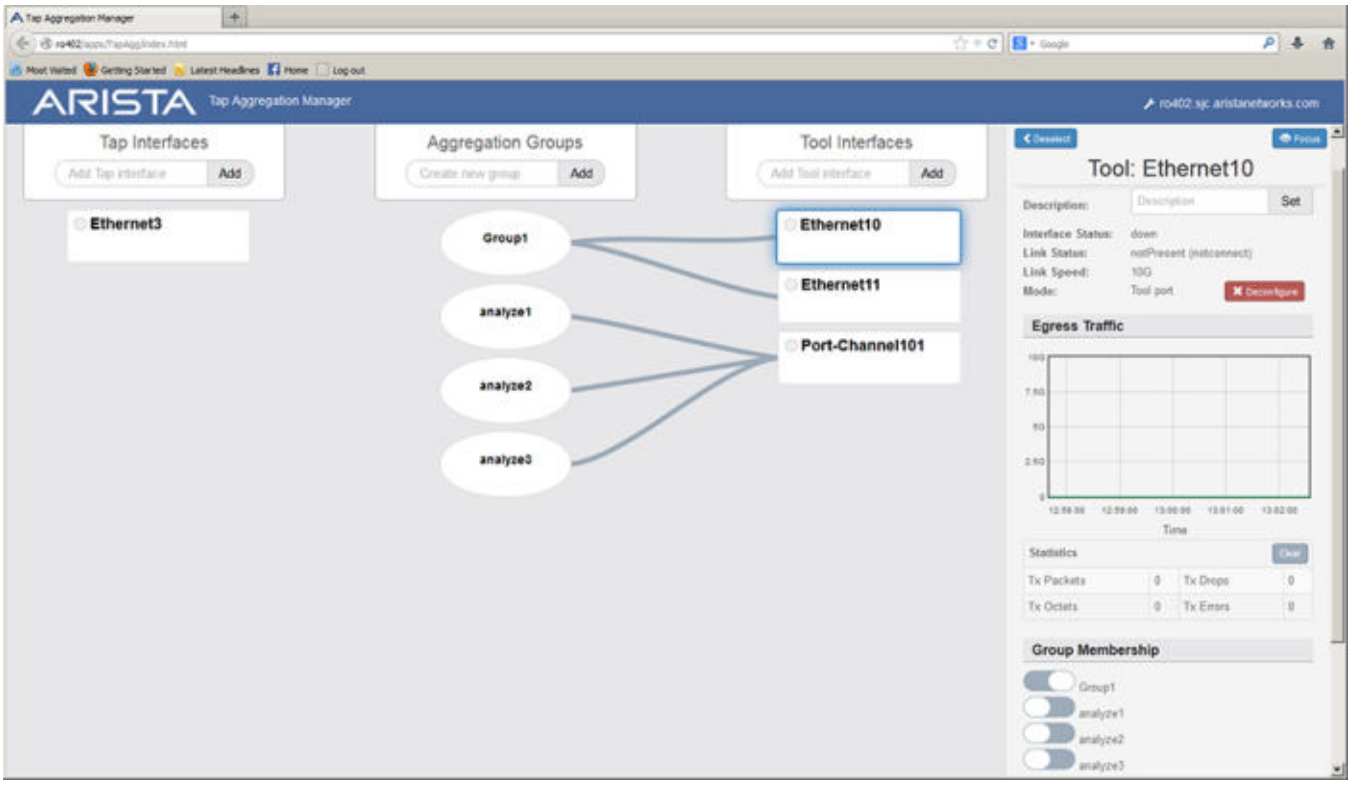

Figure 142: TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled

20.1.7 TAP Aggregation Keyframe and Timestamp Configuration

This section contains the following topics:

- TAP Aggregation Keyframe and Timestamp Configuration
- Enabling Timestamp Insertion on an Interface

20.1.7.1 TAP Aggregation Keyframe Generation

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. The switch supports a maximum of ten keyframes, which are distinguished by their name label. Each keyframe can egress from every Ethernet port.

Keyframe generation is enabled by the `platform fm6000 keyframe` command. Command options specify ports that transmit keyframes along with the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source:

- the `platform fm6000 keyframe rate` command configures the keyframe's transmission rate.
- the `platform fm6000 keyframe source` command configures the source IP address that is placed in each keyframe's header. The management interface IP address is the default source address.

  The source MAC address is the MAC address of the egress interface transmitting the keyframe
- the `platform fm6000 keyframe device` command configures the 16-bit number that keyframes list as the device ID in their payload.
- the `platform fm6000 keyframe fields skew` command enables the inclusion of clock skew fields in the keyframe.
- the `show platform fm6000 keyframe` command displays keyframe configuration information.

Examples

- This command enables the generation of a keyframe named ***key-1*** and configures it to egress from interfaces ethernet ***11*** through ***15*** with a source IP address of ***10.21.1.4*** and a MAC address of ***10.4E21.9F11***.

```
switch(config)#platform fm6000 keyframe key-1 interface
 ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#
```

- This command configures the generation rate for the keyframe of ***10*** frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)#platform fm6000 keyframe key-1 rate 10
switch(config)#
```

- This command enables the generation of a keyframe named ***key-1*** and configures ***100*** as the value that is placed in the keyframe's device ID field.

```
switch(config)#platform fm6000 keyframe key-1 device 100
switch(config)#
```

- This command enables the inclusion of clock skew fields in the keyframe named ***key-1***.

```
switch(config)#platform fm6000 keyframe key-1 fields skew
switch(config)#
```

- This command displays configuration information for keyframe ***key-1***.

```
switch(config)#show platform fm6000 keyframe

Keyframe key-1
----------------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13,
 Ethernet14, Ethernet15
Source IP: 172.22.30.142
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 100
Rate: 10 packet(s) per second

switch(config)#
```

20.1.7.2 Enabling Timestamp Insertion on an Interface

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Time-stamping is configured on the egress port where the timestamp is applied to the frame.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware when the packet arrived at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The **`mac timestamp`** command enables time-stamping on the configuration-mode interface. The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit Frame Check Sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

Examples

- These commands enable timestamping in **before-fcs** mode on ***interface ethernet 44***.

```
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
   mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on ***interface ethernet 44***.

```
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```

20.1.8 TapAgg GRE Tunnel Termination

The TapAgg GRE Tunnel Termination feature terminates the GRE packets on a TapAgg switch by stripping the GRE header and then letting the decapped packets go through the normal TapAgg path. With this feature, we can use an L3 GRE tunnel to transit tapped traffic to the TapAgg switch over an L3 network. That would widely extend the available use cases for TapAgg.

- Support IPv4 GRE tunnel interfaces only.
- Support the following GRE types: IPoGRE, L2GRE, GREenSPAN, ERSPAN Type I, ERSPAN Type II, and GREenTAP.
- Do packet forwarding/steering on the decapped packets. Not routing.
- Packets can be forwarded to a set of tool ports.
- Have a command to configure for not stripping the GRE header, so that the TapAgg side may use the information present in the GRE metadata.

20.1.8.1 Configuring TapAgg GRE Tunnel Termination

The TapAgg GRE Tunnel Termination is allowed to be configured in the following two modes:

- TapAgg Exclusive Mode
- TapAgg Mixed Mode

20.1.8.1.1 TapAgg Exclusive Mode

In Tapagg Exclusive mode, GRE tunnel termination is enabled on a selected tap ports through CLI. When traffic comes into those tap ports, the matched GRE packets is decapped and forwarded to the tap port's default forwarding destinations or the steering destinations if it matches the policy ACLs applied.

Adding the TCAM Feature

Tap tunnel termination on tapAgg exclusive mode is supported by built-in profiles **tap-aggregation-default** and **tap-aggregation-extended**. Custom profiles can support tap tunnel termination with the configuration of the tapagg tunnel termination feature through the following steps:

```
switch#conf
switch(config)#hardware tcam
switch(config-tcam)#profile tap-aggregation-gre copy tap-aggregation-
profile
switch(config-tcam-profile-tap-aggregation-gre)#feature tapagg tunnel
 termination copy system-feature-source-profile
switch(config-tcam-feature-tapagg-tunnel-termination)#exit
switch(config-tcam-profile-tap-aggregation-gre)#exit
Saving new profile 'tap-aggregation-gre'
switch(config-tcam)#exit
switch(config)#
```

To check if a TCAM profile has the feature, use the following command:

```
switch(config)#show hardware tcam profile tap-aggregation-gre
Features enabled in TCAM profile tap-aggregation-gre:
 mpls
 acl port ipv6
 tapagg port
 tapagg mac
 tapagg ip
 tapagg ipv6
 tapagg tunnel termination
 acl port ip
 tunnel vxlan
 acl port mac
 forwarding-destination mpls
```

Change Hardware Forwarding Profile

On DCS-7280R3, DCS-7500R3 and DCS-7800R3 systems, the hardware forwarding profile needs to be set to **system-profile-tap-aggregation** on all linecards.

Enable GRE Termination on a Tap Port

Use **`switchport tap encapsulation gre [tunnel destination <dst IP address> [source <src IP address> ]] strip`** to enable GRE termination on a tap port. The command allows specification of tunnel endpoints, to support termination on a specific tunnel.

```
switch(config-if-Et7/1)#switchport tap encapsulation gre destination
 <dst-ip> source <src-ip> strip
```

Without the specification of tunnel endpoints, it will terminate GRE packets for all tunnels. If only the destination endpoint is specified, then any GRE packet that matches this destination is terminated.

Example

In this example the following configuration tap port ***et7/1*** will strip GRE packets for all GRE tunnels and forward the decapped packets to tool group ***tool1***.

```
switch(config-if-Et7/1)#switchport mode tap
switch(config-if-Et7/1)#switchport tap default group tool1
switch(config-if-Et7/1)#switchport tap encapsulation gre strip
```

GRE Termination into Traffic Steering

If the matched GRE packet also hits the policy map that is applied on the tap port, after stripping the GRE header, the packets are forwarded to the steering destination configured for the policy map. In the example below, a policy map named 'pm' is applied on the tap port which has gre strip enabled on it. Then the GRE packets with an outer destination IP ***dst-ip*** and source IP ***src-ip***, matching the permit rule in the policy map, is forwarded to the tool group ***tool2*** aftering stripping the GRE header.

Note: The ACLs are applied on the original GRE packet, and not the one after the GRE header is stripped.

```
switch(config)#show policy-map type tapagg
Service policy pm
  Configured on:
  Applied on:
  10: Class-map: cm (match-any)
    Match: 10 IP Access List testAcl
        10 permit ip host 1.1.1.1 host 2.2.2.2

    Configured actions: set group tool2

switch(config-if-Et7/1)#show active
interface Ethernet7/1
   service-policy type tapagg input pm
   switchport mode tap
   switchport tap encapsulation gre strip
   switchport tap default group tool1
```

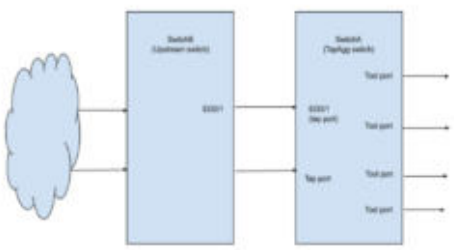
GRE Termination with Ingress/Egress Truncation

When there is truncation enabled, either on the tap port that has GRE termination configured or on the tool port that is configured to egress out the decapped packets, the GRE header is stripped from the truncated packets. In other words, the GRE header stripping occurs after truncation. That means the size of the egress packet will be less than the original expectation. For example, if we have configured to truncate packets to a size of ***178*** bytes, after enabling GRE termination, the egress out packet for a GREenSpan will have a size of ***136***. It is ***178*** minus ***42*** (the total bytes stripped for GREenSpan).

Configuring the Upstream Switch

In TapAgg exclusive mode, the routing protocols are not running so TapAgg Switch will rely on its upstream switch which has routing protocol enabled to forward the GRE packets to it. Tap ports which are selected to receive the GRE packets should be connected to the upstream switch. The upstream switch needs to configure a static route to forward the GRE packets to the link.

Example



If TapAgg switch A is connected to the upstream ***Switch B*** through the link between ***A-et30/1*** and ***B-et30/1*** then the static route for forwarding GRE packets with Destination IP address ***40.1.1.2*** terminated on TapAgg ***Switch A*** can be configured with the following commands:

```
switchB(config-if-Et30/1)#show active
interface Ethernet30/1
   speed forced 100gfull
   no switchport
   ip address 10.10.10.1/24
SwitchB(config-if-Et30/1)#ip route 40.1.1.2/32 ethernet 30/1
```

The static route should be present in the output of the **`show ip route`** command.

```
SwitchB#show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,
       RC - Route Cache Route

Gateway of last resort is not set

 C        10.10.10.0/24 is directly connected, Ethernet30/1
 S        10.80.0.0/13 [1/0] via 10.240.25.1, Management1
 S        10.95.0.0/16 [1/0] via 10.240.25.1, Management1
 C        10.240.25.0/25 is directly connected, Management1
 S        10.240.0.0/15 [1/0] via 10.240.25.1, Management1
 S        10.242.0.0/15 [1/0] via 10.240.25.1, Management1
 S        40.1.1.2/32 is directly connected, Ethernet30/1
 S        172.16.0.0/12 [1/0] via 10.240.25.1, Management1
```

Setup static ARP entry for the route. ***44:4c:a8:be:35:e9*** is the MAC address of ***A-et30/1***. Note that any unicast MAC address can be used for static ARP entry.

```
switchB(config)#arp 40.1.1.2 44:4c:a8:be:35:e9 arpa
```

Use the following command to check ARP entries.

```
switchB# show arp
Address                  HWtype  HWaddress           Flags Mask
  Iface
10.240.25.1              ether   28:99:3a:67:7f:93   C
  ma1
40.1.1.2                 ether   44:4c:a8:be:35:e9   CM
  et30_1
```

With the above configurations, the upstream ***Switch B*** can forward the GRE packets to TapAgg ***Switch A***.

20.1.8.1.2 TapAgg Mixed Mode

For a modular system, such as the DCS-7500R or DCS-7500R2, routed ports on a non-TapAgg linecard is used to receive GRE packets. In order to use the tap tunnel termination feature, **dbTapTunnelTermination** must be added to the TCAM profile for the non-TapAgg linecards.

Adding the TCAM Feature

For example, if the current system profile is profile **default**, we can use the following commands to create a new profile **`default-with-tap-gre`**, which is copied from the current system profile, and add the new feature that we need.

```
switch(config)#hardware tcam
switch(config-tcam)#profile default-with-tap-gre copy default
switch(config-tcam-profile-default-with-tap-gre)#feature tapagg tunnel
 termination copy system-feature-source-profile
switch(config-tcam-feature-tapagg-tunnel-termination)#exit
switch(config-tcam-profile-default-with-tap-gre)#exit
Saving new profile 'default-with-tap-gre'
switch(config-tcam)#exit
```

Use the following command to apply the new TCAM profile.

```
switch(config)#hardware tcam
switch(config-tcam)#system profile default-with-tap-gre
```

Configure TapAgg mixed mode. In the below example, we configure TapAgg mixed mode and leave the linecard ***6*** in normal mode.

```
switch(config)#tap agg
switch(config-tap-agg)#mode mixed module linecard 3,4,5
! Changing modes may affect available functionality. Unsupported
 configuration elements will be ignored.
switch(config)#show hardware tcam profile
                  Configuration            Status
Linecard3         tap-aggregation-default* tap-aggregation-default
Linecard4         tap-aggregation-default* tap-aggregation-default
Linecard5         tap-aggregation-default* tap-aggregation-default
Linecard6         default-with-tap-gre     default-with-tap-gre
* configuration overridden by TapAgg
```

There could be some cases where we need to remove some features from the TCAM profile in order to have room to fit the feature **tapagg tunnel termination** in. This kind of 'tradeoff' is needed when we want this feature to be with a specific user-defined tcam profile.

Below is an example of solving that problem.

```
switch(config)#tap agg
switch(config-tap-agg)#mode mixed module linecard 3,4,5
! Changing modes may affect available functionality. Unsupported
 configuration elements will be ignored.
switch(config)#show hardware tcam profile
                  Configuration            Status
Linecard3         tap-aggregation-default* tap-aggregation-default
Linecard4         tap-aggregation-default* tap-aggregation-default
Linecard5         tap-aggregation-default* tap-aggregation-default
Linecard6         default-with-tap-gre     ERROR
* configuration overridden by TapAgg

switch(config)#hardware tcamswitch(config-tcam)#profile default-with-tap-
gre
```

```
switch(config-tcam-profile-default-with-tap-gre)#no feature mirror ip
switch(config-tcam-profile-default-with-tap-gre)#no feature pbr ip
switch(config-tcam-profile-default-with-tap-gre)#exitswitch(config-
tcam)#show hardware tcam profile
                    Configuration            Status
Linecard3           tap-aggregation-default* tap-aggregation-default
Linecard4           tap-aggregation-default* tap-aggregation-default
Linecard5           tap-aggregation-default* tap-aggregation-default
Linecard6           default-with-tap-gre     default-with-tap-gre
* configuration overridden by TapAgg
```

Change Hardware Forwarding Profile

On DCS-7280R3, DCS-7500R3 and DCS-7800R3 systems, the hardware forwarding profile needs to be set to system-profile-tap-aggregation on all tap agg linecards. Detailed instructions on how to set it can be found in the Resources section.

Configure GRE Tunnel Interface

Configure the GRE tunnel interface that we want the packets it received to be terminated and redirected.

In the below example, the GRE packets for this tunnel interface should have destination IP address ***40.1.1.1*** and source IP address ***40.1.1.2***.

```
switch(config)#interface tunnel 1
switch(config-if-Tu1)#tunnel mode gre
switch(config-if-Tu1)#tunnel source 40.1.1.1
switch(config-if-Tu1)#tunnel destination 40.1.1.2
```

For a tunnel interface, if **tunnel source** is configured but **tunnel destination** is not, then any GRE packet with destination IP address matching the tunnel source will be stripped and redirected. In the example below, the GRE packet with destination IP *40.1.1.1* is what we are interested in.

```
switch(config-if-Tu1)#show active
   tunnel mode gre
   tunnel source 40.1.1.1
   tap default group gr1
   tap default interface Ethernet3/1
```

If neither **tunnel source** nor **tunnel destination** is configured, then the GRE packets for any endpoints will be stripped and redirected.

```
switch(config-if-Tu1)#show active
   tunnel mode gre
   tap default group gr1
   tap default interface Ethernet3/1
```

Use the **`tap default group`** and **`tap default interface`** commands to configure the redirecting destination. In the example below, the GRE packets sent to interface tunnel 1 will be redirected to tool group gr1 and tool interface et3/1 after stripping the GRE header. (In current version, the target interfaces must be tool ports on TapAgg linecards. A non tool port putting in this command will not take effect.)

```
switch(config)#interface tunnel 1
switch(config-if-Tu1)#tap default group gr1
switch(config-if-Tu1)#tap default interface ethernet 3/1
switch(config-if-Tu1)#
```

If we want to redirect the packets but do not want to strip the GRE header, command **tap encapsulation gre preserve** can be configured for that purpose, not stripping the GRE header.

```
switch(config)#interface tunnel 1
switch(config-if-Tu1)#tap encapsulation gre preserve
switch(config-if-Tu1)#
```

The show command below is used to check the tunnel interface status. In TapAgg mixed mode, routing protocols can run on non-TapAgg linecards, and any routed port in non-TapAgg linecards can be used to receive the GRE packets. For Tap tunnel termination feature, the status of the tunnel interface doesn't have to be **connected**, but there must be some routes to help the GRE packets find the way to the routed ports on this switch.

```
switch(config)#show interfaces tunnel 1
Tunnel1 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 2801.0102.0800
  Tunnel source 40.1.1.2, destination 40.1.1.1
  Tunnel protocol/transport GRE/IP
  Hardware forwarding enabled
  Tunnel transport MTU 1476 bytes (default)
  Up 35 minutes, 57 seconds
```

Enable Tap Tunnel Termination on TapAgg Linecards in Mixed Mode

If you do want to enable GRE Termination on a specific tap port in TapAgg mixed mode, follow the **TapAgg exclusive mode** section and refer to configuring TCAM profile and GRE termination for the TapAgg linecard.

20.1.9 Tap Aggregation Hardware Forwarding Profile

In order to enable the MPLS Pop and 802.1br-E/VN Tag Stripping features, the hardware forwarding profile needs to be set. Setting the hardware forwarding profile will not affect the functionality of any other features that are supported while in Tap Aggregation mode. However, changing the forwarding profile does interrupt forwarding for a short period of time while the new configuration is applied.

20.1.9.1 Configuring Tap Aggregation Hardware Forwarding Profile

- The default hardware forwarding profile can be set globally with the **hardware forwarding system profile** command:

  ```
  switch(config)#hardware forwarding system profile system-profile-tap-
  aggregation
  ```

- When not in Tap Aggregation mode the default hardware forwarding profile should be returned to the default system profile with the same command:

  ```
  switch(config)#hardware forwarding system profile system-profile-
  default
  ```

- For a modular system the system default profile can also be overridden on a per line card basis with the command:

  ```
  switch(config)#hardware forwarding module Linecard3 profile system-
  profile-tap-aggregation
  ```

  Note: If this command is used to set the hardware forwarding profile of a specific line card then changing the system default profile with the **hardware forwarding system profile** command will not affect that line card until the line card specific configuration is removed.

20.1.9.2 Show Commands

The following show command is available to see the hardware forwarding profile configuration:

```
(config)#show hardware forwarding profile
Linecard          Configured Profile
----------------- ------------------------------
FixedSystem       system-profile-tap-aggregation

System default profile: system-profile-tap-aggregation
```

For a modular system, this example shows the system default profile, configured by `hardware forwarding system profile`, is set to **`system-profile-default`**. While the configuration for line cards *4* and *5* has been overridden and is set to **`system-profile-tap-aggregation`**.

```
(config)#show hardware forwarding profile
Linecard        Configured Profile
--------------- ------------------------------
Linecard3       system-profile-default
Linecard4       system-profile-tap-aggregation
Linecard5       system-profile-tap-aggregation

System default profile: system-profile-default
```

20.1.9.3 Limitations

Changing the hardware forwarding profile on the system or on a specific line card will interrupt forwarding on that system or line card for a short period of time.

20.1.10 TAP Aggregation MPLS Pop

The MPLS pop supports tools that do not parse MPLS labels and therefore need the switch to remove (pop) the MPLS header. The MPLS pop supports both IPv4 and IPv6 over MPLS.

20.1.10.1 Configuring MPLS Pop

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R MPLS pop is configurable at the tap port using the switchport command:

  ```
  (config-if-Et1)#[no] switchport tap mpls pop all
  ```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3 MPLS pop is configurable at the tool port using the switchport command. As the commands suggest, all MPLS labels will be popped.

  ```
  (config-if-Et1)#[no] switchport tool mpls pop all
  ```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before MPLS pop can be used. This is done globally by the command:

  ```
  (config)#hardware forwarding system profile system-profile-tap-aggrega
  tion
  ```

- The system profile can also be overridden on a per line card basis with the command:

  ```
  (config)#hardware forwarding module Linecard3 profile system-profile-
  tap-aggregation
  ```

20.1.10.2 Limitations

R/R2 series MPLS pop has the following limitations:

- New L2 Header on Egress
  - Always inserts a tap port Identity VLAN ID, even if not configured. Default Identity VID is *1*.
  - Destination / source MAC addresses are not configurable.
- Tool Port / Egress VLAN Filtering
  - Because the incoming L2 header is discarded, the tool port does not have access to the original VLAN ID.
  - Tap ports can still filter on VLAN ID.
- ACL-Based Tap Aggregation
  - Matching IP headers contained inside an MPLS header is only supported since ***EOS-4.20.5F***.

On both R/R2 series and R3 series some Tap Aggregation features do not work when forwarding MPLS-encapsulated traffic:

- Non-IP over MPLS
  - If the incoming L3 header is not recognized as IPv4 or IPv6 the MPLS pop feature is bypassed and the packet is not stripped.

20.1.11 TAP Aggregation 802.1br EVN Tag Stripping

802.1br-E/VN Tag Stripping feature for Tap Aggregation mode strips IEEE 802.1BR E-Tag and Cisco VN-Tag headers from all tagged packets received on tap interface before delivering them out of tool interfaces. Untagged packets are unaffected. The 802.1br EVN Tag Stripping may be useful for third-party tools and/or packet analyzers which cannot parse these headers.

20.1.11.1 Configuring 802.1br-E/VN Tag Stripping

By default, Arista switches do not strip BR-E/VN tags from ingress packets.

On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R the BR-E/VN tag stripping is globally configured for Tap Aggregation. This means that packet ingressing any tap port will have their BR-E/VN tags stripped if the BR-E/VN tag stripping is enabled. The BR-E/VN tag stripping allows a choice of stripping both or either of the tags.

- To enable BR E-Tag stripping add the following configuration:

```
switch(config)#tap aggregation
switch(config-tap-agg)#[no] encapsulation dot1br strip
```

- To enable VN-TAG stripping add the following configuration:

```
switch(config)#tap aggregation
switch(config-tap-agg)#[no] encapsulation vn-tag strip
```

On DCS-7280R3, DCS-7500R3and DCS7800R3, BR-E/VN tag stripping is configured at the tool port level. When enabled on a tool port, only packets egressing this tool port will have their BR-E/VN tags stripped. The BR-E/VN tag stripping allows a choice of stripping both or either of the tags.

- To activate BR E-Tag stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)#[no] switchport tool encapsulation dot1br strip
```

- To activate VN-TAG stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)#[no] switchport tool encapsulation vn-tag strip
```

On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before BR-E/VN tag stripping is used. This is done globally by the command:

```
switch(config)#hardware forwarding system profile system-profile-tap-
aggregation
```

The system profile can also be overridden on a per line card basis with the command:

```
switch(config)#hardware forwarding module Linecard3 profile system-profil
e-tap-aggregation
```

20.1.11.2 Show Commands

The tap or tool ports with BR-E/VN tag stripping configured is verified with the following show commands.

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R:

```
switch(config)#show interfaces tap tunnel
  Port        Configured         Status       Port            Allowed Vlans       Native
 Truncation
              Mode                            Identity                            Vlan       Size
---------- ------------------ ------------ --------------- ------------------- -------------
 -----------
  Et1/1       tap                tap          0               All                 1          0

   Port        VN Tag Action       BR Tag Action       VxLAN Action    MPLS Action
----------- ------------------- ------------------- ------------------ -----------
   Et1/1       strip               none                none            none
```

- On DCS-7280R3, DCS-7500R3, and DCS7800R3:

```
switch(config)#show interface tool tunnel
   Port         Configured         Status       Id Tag       Allowed Vlans    Timestamp
                Mode                                                         Mode
----------- ------------------ ------------ ------------ ------------------- -----------
   Et1/1        tool               tool         Off          100              None

   Port         VN Tag Action       BR Tag Action    MPLS Action
----------- ------------------- ------------------- -----------
   Et1/1        strip               none             none
```

20.1.11.3 Feature Interactions

On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R the following Tap aggregation features are supported with BR-E/VN tagged packets when tag stripping is enabled. Some or all of these features may not work for BR-E/VN tagged packets when tag stripping is not configured.

- MAC, IPv4, IPv6 Traffic Steering
- Tap identity tagging
- MPLS Termination
- Ingress VLAN Membership Filtering
- Egress VLAN Membership Filtering

On DCS-7280R3, DCS-7500R3, and DCS7800R3 the following Tap aggregation features are supported with BR-E/VN tagged packets when tag stripping is enabled.

- MAC, IPv4, IPv6 Traffic Steering
- Tap identity tagging

20.1.11.4 Limitations

The following lists feature limitations on DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R when BR-E/VN tag stripping is enabled with tagged packets:

- IPv4/IPv6 traffic steering on VLAN IDs is not supported.
- IPv6 traffic steering is not supported on packets with two or more accompanying 802.1Q tags
- Ingress VLAN membership filtering is scale limited. Only ***4096*** entries, used for whitelisting or allowing specific port-VLAN pairs, are supported. The default case of allowing all VLANs does not consume any of these entries. For example, a tap interface configured to allow ***4093*** VLANs will consume all but three entries.
- Ingress VLAN membership filtering on Tap interface LAGs for BR-E/VN tagged packets is not supported. To use Ingress VLAN membership for BR-E/VN tagged packets on a LAG Tap interface the Ingress VLAN membership configuration must be configured on each physical interface of the LAG.
- Time stamping and BR-E/VN tag stripping cannot be configured on the same tool interfaces. Time stamping, if configured, will take precedence over BR-E/VN tag stripping.
- 802.1Q Tag Stripping does not support BR-E/VN tagged packets.

The following lists feature limitations on DCS-7280R3, DCS-7500R3, and DCS7800R3 when BR-E/VN tag stripping is enabled with tagged packets:

- IPv4/IPv6/MAC traffic steering on VLAN IDs is not supported.
- MPLS pop and BR-E/VN tag stripping can not be used simultaneously on a tool port. If MPLS pop and BR-E/VN tag stripping are both configured on the same tool port, MPLS pop will take precedence and BR-E/VN tags will not be stripped.
- Ingress and Egress VLAN Membership filtering of BR-E/VN tagged packets is not supported in ***EOS-4.25.2F***.
- 802.1Q Tag Stripping does not support BR-E/VN tagged packets.

20.1.12 TAP Aggregation Commands

Global Configuration Commands

- hardware forwarding system-profile-tap-aggregation
- platform fm6000 keyframe
- platform fm6000 keyframe device
- platform fm6000 keyframe fields skew
- platform fm6000 keyframe rate
- platform fm6000 keyframe source
- platform sand multicast replication default
- platform sand multicast replication ingress maximum
- tap aggregation

Interface Configuration Commands

- mac timestamp
- switchport mpls pop all
- switchport tap allowed vlan
- switchport tap default group
- switchport tap identity
- switchport tap native vlan
- switchport tap truncation
- switchport tool allowed vlan
- switchport tool encapsulation
- switchport tool group
- switchport tool identity
- switchport tool truncation

Tap Aggregation Configuration Mode

- encapsulation
- mode (tap-agg configuration mode)
- mode exclusive no-errdisable (tap-agg configuration mode)

Tap Aggregation Traffic Steering

- class (policy-map (tapagg))
- class-map type tapagg
- match (class-map (tapagg))
- match (policy-map (tapagg))
- policy-map type tapagg
- resequence (class-map (tapagg))
- resequence (policy-map (tapagg))
- service-policy type tapagg (Interface mode)
- set (policy-map-class (tapagg))

Display Commands EXEC Mode

- show hardware tcam profile
- show interfaces tap
- show interfaces tool
- show platform fm6000 keyframe

- show platform sand mcast capacity
- show tap aggregation groups

20.1.12.1 class (policy-map (tapagg))

The **`class (policy-map (tapagg))`** command places the switch in the ***policy-map-class*** (TAPagg) configuration mode, which is a group-change mode that defines a TAP aggregation class by associating the class's eponymous class-map to a **`set`** statement. Upon exiting the policy-map-class mode, the class is placed in the policy-map as specified by an assigned sequence number.

A policy map is an ordered list of classes and match rules. Each class contains a class map, a **`set`** command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode. Data packets are managed by commands of the highest priority class or rule that matches the packet.
- **`set`** commands specify the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence numbers specify the class's priority within the policy map. Lower sequence numbers denote higher priority.

The **`exit`** command returns the switch to policy-map configuration mode. However, saving policymap-class changes also requires an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to ***running-config*** and returns the switch to global configuration mode. The **`abort`** command discards pending changes and returns the switch to global configuration mode.

The **`no class`** and **`default class`** commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from ***running-config***.

Command Mode

Policy-Map (tapagg) Configuration accessed through **`class (policy-map (tapagg))`**

Command Syntax

[**SEQ_NUM**] **`class`** *class_name*

`default` [**SEQ_NUM**] **`class`** *class_name*

`no` [**SEQ_NUM**] **`class`** *class_name*

Parameters

- **SEQ_NUM** priority of the class within the policy map. Lower numbers denote higher priority.
  - ***no parameter*** number is derived by adding 10 to number of the map's last class or rule.
  - ***1 to 4294967295*** number assigned to class.
- ***class_name*** name of the class.

Guidelines

When a class is not associated with a **set (policy-map-class (tapagg))** command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

Commands Available in Policy-map-class (tapagg) Configuration Mode

- **set (policy-map-class (tapagg))** assigns VLAN identity tag or tap aggregation group to class.
- **`exit`** returns the switch to parent policy map configuration mode.
- **`abort`** discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

- **class (policy-map (tapagg))** places the switch in the ***policy-map*** (tapagg) configuration mode.
- **match (policy-map (tapagg))** assigns a match rule to a TAP aggregation policy map.

Examples

- These commands place the switch in ***policy-map-class*** and add the ***t-class_1*** class map to the ***tpolicy_1*** policy map. Packets filtered by the class map are identity tagged with ***VLAN 444***.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
10 class t-class_1
set id-tag 444
switch(config-pmap-t-policy_1)#
```

- These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1t-class_1)#set aggregation-group t-group
 remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-
group id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q
 outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-
group
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-
group id-tag 10 remove dot1q outer 1-2
```

20.1.12.2 class-map type tapagg

The **class-map type tapagg** command places the switch in class-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg class map. A tapagg class map is a data structure that uses Access Control Lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise the stream. Tapagg policy maps use class maps to specify traffic that is managed by policy map criteria.

The **exit** command saves pending class map changes to ***running-config***, then returns the switch to the ***global*** configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type tapagg** and **default class-map type tapagg** commands delete the specified class map by removing the corresponding class-map type qos command and its associated configuration.

Command Mode

Global Configuration

Command Syntax

class-map type tapagg match-any *class_name*

no class-map type tapagg match-any *class_name*

default class-map type tapagg match-any *class_name*

Parameters

class_name name of class map.

Commands Available in Class-Map (tapagg) Configuration Mode

- **match (class-map (tapagg))**
- **resequence (class-map (tapagg))**

Related Commands

class (policy-map (tapagg))

Example

This command creates a TAP aggregation class map named ***t-class_1*** and places the switch in the ***class-map*** configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

20.1.12.3 encapsulation

The **encapsulation** command is configured under Tap Aggregation mode to enable the 802.1br-E/VN Tag Stripping the packets ingressing any tap port on DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R.

The **no encapsulation** or **default encapsulation** commands disable the 802.1br-E/VN Tag Stripping configuration from the **running-config**.

Command Mode

Tap Aggregation Configuration Mode

Command Syntax

encapsulation {dot1br | vn-tag} strip

no encapsulation {dot1br | vn-tag} strip

default encapsulation {dot1br | vn-tag} strip

Parameters

- **dot1br** strips the 802.1br-E headers.
- **vn-tag** strips the VN Tag headers.

Examples

- To enable BR E-Tag stripping add the following configuration:

```
switch(config)#tap aggregation
switch(config-tap-agg)#[no] encapsulation dot1br strip
```

- To enable VN-TAG stripping add the following configuration:

```
switch(config)#tap aggregation
switch(config-tap-agg)#[no] encapsulation vn-tag strip
```

20.1.12.4 hardware forwarding system-profile-tap-aggregation

The **hardware forwarding system-profile-tap-aggregation** command sets the global hardware forwarding system profile on a switch.

The **hardware forwarding system-profile-default** command returns the switch to the default system profile configurations when not in Tap Aggregation mode.

Command Mode

Global Configuration Mode

Command Syntax

hardware forwarding system profile [system-profile-default | system-profile-tap-aggregation | module]

default hardware forwarding system profile [system-profile-default | system-profile-tap-aggregation | module]

Parameters

- **system-profile-default** normal forwarding profile.
- **system-profile-tap-aggregation** tap aggregation features profile.
- **module** used to set the tap aggregation features profile on a modular system.

Examples

- This command configures the tap aggregation features profile.

```
switch(config)#hardware forwarding system profile system-profile-tap-
aggregation
```

- This command returns the to the default system profile configurations when not in Tap Aggregation mode.

```
switch(config)#hardware forwarding system profile system-profile-
default
```

- This command overrides the system default profile on a per line card basis for a modular system.

```
switch(config)#hardware forwarding module Linecard3 profile system-
profile-tap-aggregation
```

20.1.12.5 mac timestamp

The **mac timestamp** command enables timestamping on the configuration mode interface.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit Frame Check Sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

The **no mac timestamp** and **default mac timestamp** commands restore the default behavior of disabling timestamping on the configuration mode interface by removing the corresponding **mac timestamp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mac timestamp TS_PROPERTY

Parameters

- **TS_PROPERTY** specifies the timestamp insertion mode. Options include:
  - **before-fcs** the ingress timestamp is appended to the frame and the FCS is recalculated.
  - **replace-fcs** the ingress timestamp replaces the original FCS.

Examples

- These commands enable timestamping in **before-fcs** mode on ***interface ethernet 44***.

```
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
   mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on ***interface ethernet 44***.

```
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```

20.1.12.6 match (class-map (tapagg))

The **match** command adds an ACL to the configuration-mode class map and associates a sequence number to the ACL. A class map is an ordered list of ACLs that define a data stream; the sequence number specifies an ACL's priority within the list. A class map is used by policy maps to filter data packets. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class map (tapagg) configuration mode is a group change mode. **Match** statements are not saved to ***running-config*** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the specified **match** statement from the configuration-mode class map by deleting the corresponding **match** command from ***running-config***.

Command Mode

Class-map (tagagg) Configuration accessed through **class-map type tapagg** command.

Command Syntax

[**SEQ_NUM**] **match ip access-group** *list_name*

no SEQ_NUM] **match ip access-group** *list_name*

default SEQ_NUM] **match ip access-group** *list_name*

Parameters

- **SEQ_NUM** sequence number assigned to the ACL. Options include:
  - ***no parameter*** number is derived by adding 10 to the number of the map's last ACL.
  - **1 to *4294967295*** number assigned to ACL.
- ***list_name*** name of ACL assigned to class map.

Guidelines

match statements accept IPv4 ACLs.

Related Commands

- **class-map type tapagg** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (tapagg))** assigns a class map to a policy map.

Example

These commands add two IPv4 ACLs (***tacl-1*** and ***tacl-2***) to the ***t-class_1*** class map, save the command by exiting class-map mode, and re-enter the mode to display the added ACLs.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
 class-map type tapagg match-any t-class_1
      10 match ip access-group tacl-1
      20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

20.1.12.7 match (policy-map (tapagg))

The **match** command adds a rule to the configuration-mode TAP aggregation policy map. A policy map is an ordered list of classes and rules. Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream through a set of packet field values.
- The action, (**SET_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The sequence number specifies the rule's priority within the policy map.

The **no match** and **default match** commands remove the **match** rule from the configuration-mode policy by deleting the corresponding statement from ***running-config***.

Command Mode

Policy-Map (tapagg) Configuration accessed through **class (policy-map (tapagg))**.

Command Syntax

[**SEQ_NUM**] **match** [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**] [**FLAGS**] [**MESSAGE**] [**fragments**] [**tracked**] [**DSCP_FILTER**] [**TTL_FILTER**] [**log**] **SET_VALUE**

no match [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**][**FLAGS**][**MESSAGE**] [fragments][tracked] [**DSCP_FILTER**][**TTL_FILTER**] [log] **SET_VALUE**

default match [**VLAN_TAG**] **SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**PROTOCOL**][**FLAGS**] [**MESSAGE**][fragments] [tracked][**DSCP_FILTER**] [**TTL_FILTER**][log] **SET_VALUE**

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** priority of the rule within the policy map. Lower numbers denote higher priority.
  - ***no parameter*** number derived by adding 10 to number of the map's last class or rule.
  - ***1*** to ***4294967295*** number assigned to class.
- **VLAN_TAG** VLAN field filter. Options include:
  - ***no parameter*** packets are not filtered by VLAN field.
  - **vlan *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
  - **vlan inner *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
  - **vlan *1*** to ***4094 0*** to ***4095*** **inner *1*** to ***4094 0*** to ***4095*** VLAN ID and mask.
- **PROTOCOL** protocol field filter. Values include:
  - ***no parameter*** packets are not filtered by host name.
  - **ahp** authentication header protocol (51).
  - **icmp** internet control message protocol (1).
  - **igmp** internet group management protocol (2).
  - **ip** internet protocol IPv4 (4).
  - **ospf** open shortest path first (89).
  - **pim** protocol independent multicast (103).
  - **tcp** transmission control protocol (6).
  - **udp** user datagram protocol (17).
  - **vrrp** virtual router redundancy protocol (112).
  - ***protocol_num*** integer corresponding to an IP protocol. Values range from ***0*** to ***255***.

- **SOURCE_ADDR** and **DEST_ADDR** source and destination address filters. Options include:
  - ***network_addr*** subnet address (CIDR or address-mask).
  - **any** packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** source and destination port filters. Options include:
  - **any** all ports.
  - **eq *port-1 port-2*** ... ***port-n*** a list of ports. Maximum list size is ***10*** ports.
  - **neq *port-1 port-2*** ... ***port-n*** the set of all ports not listed. Maximum list size is ***10*** ports.
  - **gt *port*** the set of ports with larger numbers than the listed port.
  - **lt *port*** the set of ports with smaller numbers than the listed port.
  - **range *port_1 port_2*** the set of ports whose numbers are between the range.
- **fragments** filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** rule filters packet by its DSCP value. Values include:
  - ***no parameter*** rule does not use DSCP to filter packets.
  - **dscp *dscp_value*** packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** rule filters packet by its TTL (time-to-live) value. Values include:
  - ***no parameter*** rule does not use TTL field to filter packets.
  - **ttl eq *ttl_value*** packets match if ttle in packet is equal to ***ttl_value***.
  - **ttl gt *ttl_value*** packets match if ttl in packet is greater than ***ttl_value***.
  - **ttl lt *ttl_value*** packets match if ttl in packet is less than ***ttl_value***.
  - **ttl neq *ttl_value*** packets match if ttl in packet is not equal to ***ttl_value***.
- **log** triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **SET_VALUE** specifies the replication method for filtered packets.
  - **set aggregation group *agg_group*** peplication specified by aggregation group.
  - **set id-tag *1*** to ***4094*** packet is identity tagged with specified VLAN number.
  - **set aggregation group *agg_group*** id-tag ***1*** to ***4094*** assigns agg group and identity tag.

Related Commands

- policy-map type tapagg places the switch in the ***policy-map*** (tapagg) configuration mode.
- class (policy-map (tapagg)) assigns a class to the configuration-mode policy map.

Example

This command creates a match rule for the ***t-policy_1*** policy map that filters OSPF packets and replicates them as specified by the ***t-group*** tap aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-g
roup t-group
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
```

```
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#
```

20.1.12.8 mode (tap-agg configuration mode)

The **mode** command configures the switch's TAP aggregation mode. The **mode exclusive** command enables TAP aggregation. When TAP aggregation is enabled, TAP and tool ports are enabled, switching mode is disabled, and switching ports are errdisabled. TAP aggregation is disabled by default.

The **no mode** and **default mode** commands disable TAP aggregation mode and enable switching mode by removing the **mode** command from ***running-config***.

Command Mode

TAP Aggregation Configuration

Command Syntax

mode exclusive

no mode exclusive

default mode exclusive

Parameters

exclusive TAP aggregation is enabled.

Related Command

tap aggregation places the switch in the ***TAP-aggregation*** configuration mode.

Examples

- These commands place the switch in ***TAP-aggregation*** configuration mode, enable TAP aggregation mode, and display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
   mode exclusive
switch(config-tap-agg)#
```

- These commands disable ***TAP-aggregation*** mode by removing the **mode** command from ***running-config***, then display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```

20.1.12.9 mode exclusive no-errdisable (tap-agg configuration mode)

The **mode exclusive no-errdisable** command configures the specified interface to remain enabled, regardless of its switchport mode, when TAP aggregation is enabled. This command is used primarily to configure a port to support PTP functions while the switch operates as a TAP aggregator.

Each command configures one Ethernet or port-channel interface. Subsequent **mode exclusive no-errdisable** commands add to the list of ports that remain enabled when TAP aggregation is enabled.

The **no mode exclusive no-errdisable** and **default mode exclusive no-errdisable** commands configure the specified interface to be error-disabled when programmed in access, trunk, or dot1q-tunnel switching mode (when TAP aggregation is enabled) by removing the corresponding **mode exclusive no-errdisable** command from ***running-config***.

Command Mode

TAP Aggregation Configuration

Command Syntax

mode exclusive no-errdisable **INT_NAME**

Parameters

INT_NAME interface type and number. Options include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **port-channel *p_num*** port-channel interface specified by ***p_num***.

Related Commands

- **tap aggregation** places the switch in ***TAP-aggregation*** configuration mode.
- **mode (tap-agg configuration mode)** configures the switch's TAP-aggregation mode.

Guidelines

In order for a TAP-aggregation switch to receive PTP traffic, the upstream device to which it is connected should be set to statically send PTP multicast traffic to the connected port on the switch.

Since IGMP snooping is disabled on TAP-aggregation switches and with no configuration to support sending upstream join messages in such a state, the messages are transmitted statically from the upstream device. Once the upstream messages are received, the port will move to the slave state and follow the standard PTP mechanism.

Example

These commands place the switch in TAP-aggregation configuration mode and place ***interface ethernet 21/3*** in no-errdisable mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#mode exclusive no-errdisable ethernet 21/4
switch(config-tap-agg)#
```

20.1.12.10 platform fm6000 keyframe device

The **platform fm6000 keyframe device** command configures the 16-bit number that the specified keyframe lists as the device ID in its payload. By default, the device value placed in the specified keyframes is ***0***.

The **no platform fm6000 keyframe device** and **default platform fm6000 keyframe device** commands restore the default device ID insertion value of ***0*** for the specified keyframe by removing the corresponding **platform fm6000 keyframe device** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe device** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe *kf_name* **device** *device_id*

no platform fm6000 keyframe *kf_name* **device**

default platform fm6000 keyframe *kf_name* **device**

Parameters

- ***kf_name*** keyframe name.
- ***device_id*** value inserted in keyframe's device ID field. Values range from ***0*** to ***65535***. Default is ***0***.

Example

These commands enable the generation of a keyframe named ***key-1***, then configure ***100*** as the value that is placed in the keyframe's device ID field.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 device 100
switch(config)#
```

20.1.12.11 platform fm6000 keyframe fields skew

Keyframes may optionally include skew numerator and skew denominator fields. These skew fields form a ratio indicating the ASIC clock skew. If the ratio is greater than ***1***, the clock is skewed fast; if the ratio is less than ***1***, the clock is skewed slow. Clock skew fields are omitted by default.

The **`platform fm6000 keyframe fields skew`** command enables the inclusion of clock skew fields in the keyframe.

The **`no platform fm6000 keyframe fields skew`** and **`default platform fm6000 keyframe fields skew`** commands remove the clock skew fields from the keyframe.

Command Mode

Global Configuration

Command Syntax

`platform fm6000 keyframe` *kf_name* **`fields skew`**

Parameters

kf_name keyframe name.

Example

This command enables the inclusion of clock skew fields in the keyframe named ***key-1***.

```
switch(config)#platform fm6000 keyframe key-1 fields skew
switch(config)#
```

20.1.12.12 platform fm6000 keyframe rate

The **platform fm6000 keyframe rate** command specifies the transmission rate for the specified keyframe from each interface from which it is configured to egress. By default, one keyframe is sent per second.

The **no platform fm6000 keyframe rate** and **default platform fm6000 keyframe rate** commands restore the default transmission rate for the specified keyframe of one per second by removing the corresponding **platform fm6000 keyframe rate** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe rate** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe *kf_name* **rate** *tx_rate*

Parameters

- ***kf_name*** the keyframe's name.
- ***tx_rate*** keyframe transmission rate (frames per second). Values range from ***1*** to ***100***. Default value is ***1***.

Example

These commands enable the generation of a keyframe named *key-1*, then configure the generation rate for the keyframe of *10* frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4
10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 rate 10
switch(config)#
```

20.1.12.13 platform fm6000 keyframe source

The **platform fm6000 keyframe source** command configures the source IP address that the specified keyframe lists in its IP header. By default, keyframes use the IP address of the management interface as their source address.

The **no platform fm6000 keyframe source** and **default platform fm6000 keyframe source** commands restore the management interface IP address as the specified keyframe's source IP address by removing the corresponding **platform fm6000 keyframe source** command from ***running-config***. The **no platform fm6000 keyframe and default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe source** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform fm6000 keyframe` *kf_name* `source ip` *ipv4_addr*

`no platform fm6000 keyframe`

kf_name `source ip`

`default platform fm6000 keyframe` *kf_name* `source ip`

Parameters

- ***kf_name*** keyframe's name.
- ***ipv4_addr*** keyframe's source IPv4 address (dotted decimal notation).

Example

These commands enable the generation of a keyframe named ***key-1***, then sets the keyframe source IP address to ***10.1.1.101***.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 source 10.1.1.101
switch(config)#
```

20.1.12.14 platform fm6000 keyframe

The **platform fm6000 keyframe** command enables keyframe generation for data streams transmitted from specified ethernet interfaces. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with absolute UTC time and the switch's complete ASIC time counter.

The switch supports a maximum of ten keyframes. The keyframe name is the label that distinguishes different keyframes. Each keyframe can egress from every ethernet port. Command options specify the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source.

The **no platform fm6000 keyframe and default platform fm6000 keyframe** commands disable generation of the specified keyframe by deleting the corresponding platform fm6000 keyframe command from ***running-config***. These command also remove all supporting **platform fm6000 keyframe** commands for the specified keyframe.

Command Mode

Global Configuration

Command Syntax

platform fm6000 keyframe *kf_name* interface ethernet *e_range ipv4_addr mac_addr*

no platform fm6000 keyframe *kf_name*

default platform fm6000 keyframe *kf_name*

Parameters

- ***kf_name*** the keyframe's name.
- ***e_range*** Ethernet interface range over which the keyframe egresses. Valid formats include number, range, or comma-delimited list of numbers and ranges.
- ***ipv4_addr*** destination IPv4 address inserted into keyframes (dotted decimal notation).
- ***mac_addr*** destination MAC address inserted into keyframes (48-bit dotted hex notation).

Guidelines

Subsequent issuance of this command for a specified keyframe replaces the existing command in ***running-config***. Ethernet interfaces are inserted into an existing keyframe only by issuing the complete command that identifies all interfaces through which the keyframe is transmitted.

Example

This command enables the generation of a keyframe named ***key-1***. This keyframe egresses from Ethernet interfaces ***11*** through ***15*** and specifies a source IP address of ***10.21.1.4*** and a MAC address of ***10.4E21.9F11***.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
 10.21.1.4 10.4E21.9F11
switch(config)#
```

20.1.12.15 platform sand multicast replication default

The **platform sand multicast replication default** command configures the default replication mode on Sand platform switches. The factory default replication mode differs in various scenarios as follows:

- The default replication mode on switches with fabric is **fabric-egress** mode.
- The default replication mode on switches with single Fabric Access Processor (FAP) systems is **ingress** mode.
- The default replication mode on switches without fabric barring single FAP systems is **ingress-egress** mode.
- If a tool group with less than ***60*** LAGs has at least one hardware LAG, then the default replication mode of the tool group is **ingress-only** mode. Else the default replication mode of the tool group is the one configured across all LAGs in the tool group.

The **default platform sand multicast replication default** and **no platform sand multicast replication default** commands revert the current state to the factory default behavior.

Command Mode

Global Configuration

Command Syntax

platform sand multicast replication default {fabric-egress | ingress}

no platform sand multicast replication default

default platform sand multicast replication default

Parameters

- **fabric-egress** configures the replication mode to use fabric-egress VoQ buffers.
- **ingress** configures the replication mode to use ingress VoQ buffers.

Guidelines

This command is supported on Sand platforms only.

Related Commands

- `platform sand multicast replication ingress maximum`
- `show platform sand mcast capacity`

Example

This command configures the default replication mode to ingress.

```
switch(config)#platform sand multicast replication default ingress
switch(config)#
```

20.1.12.16 platform sand multicast replication ingress maximum

The **platform sand multicast replication ingress maximum** command configures maximum members for ingress-only replication.

The **default platform sand multicast replication ingress maximum** command reverts the maximum members for ingress-only replication to the default value.

The **no platform sand multicast replication ingress maximum** command deletes the maximum member value for ingress-only replication.

Command Mode

Global Configuration

Command Syntax

platform sand multicast replication ingress maximum *max_value*

no platform sand multicast replication ingress maximum

default platform sand multicast replication ingress maximum

Parameters

max_value specifies the maximum number of members for ingress-only replication. Values range from ***1*** to ***64***. The default value is ***64***.

Note: ***max_value*** for a single FAP Jericho system ranges from ***1*** to ***4096***.

Guidelines

This command is supported on Sand platforms only.

Related Commands

- platform sand multicast replication default
- show platform sand mcast capacity

Example

This command specifies a maximum of ***63*** members for ingress-only replication.

```
switch(config)#platform sand multicast replication ingress maximum 63
switch(config)#
```

20.1.12.17 policy-map type tapagg

The **policy-map type tapagg** command places the switch in policy-map (tapagg) configuration mode, which is a group-change mode that modifies a TAP-aggregation policy map. A TAP-aggregation policy map is a data structure that consists of class maps and match statements that filter a specific data stream. Packets in that data stream are either managed as specified by a TAP aggregation group or modified to add a VLAN identity tag. Policy maps manage traffic when applied to an Ethernet or port-channel interface.

The **exit** command saves pending policy map changes to ***running-config*** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type tapagg** and **default policy-map type tapagg** commands delete the specified policy map by removing the corresponding **policy-map type tapagg** command and the associated policy map statements from ***running-config***.

Command Mode

Global Configuration

Command Syntax

policy-map type tapagg *map_name*

no policy-map type tapagg *map_name*

default policy-map type tapagg *map_name*

Parameters

map_name name of policy map.

Commands Available in Policy-Map Configuration Mode

- **class (policy-map (tapagg))**
- **match (policy-map (tapagg))**

Related Commands

- **class-map type tapagg**
- **service-policy type tapagg (Interface mode)**

Example

This command creates the TAP-aggregation policy map named *t-policy_1* and places the switch in the ***policy-map*** configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

20.1.12.18 resequence (class-map (tapagg))

The **resequence** command assigns sequence numbers to access control lists (ACLs) in the configuration mode TAP-aggregation class map. Sequence numbers denote an ACL's priority within the class map. Command parameters specify the number of the first ACL and the numeric interval between consecutive ACLs.

Maximum rule sequence number is ***4294967295***.

Command Mode

Class-map (tagagg) Configuration

accessed with the **class-map type tapagg** command

Command Syntax

resequence [*start_num* [*inc_num*]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***1***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***1***.

Example

These commands display a policy map whose entities were entered with default sequence numbers, then renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
   20 class fred
      set aggregation-group t-group id-tag 444
   30 class t-class_2
      set id-tag 500
   40 class t-class_3
      set id-tag 600
   50 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
 policy-map type tapagg t-policy_1
   100 match ip ospf any any set aggregation-group t-group
   120 class fred
      set aggregation-group t-group id-tag 444
   140 class t-class_2
      set id-tag 500
   160 class t-class_3
      set id-tag 600
   180 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#
```

20.1.12.19 resequence (policy-map (tapagg))

The **resequence** command assigns sequence numbers to classes and rules in the configuration mode TAP-aggregation policy map. Sequence numbers denote the priority of a class or rule within the policy map. Command parameters specify the number of the first policy map entity and the numeric interval between consecutive entities.

Maximum rule sequence number is ***4294967295***.

Command Mode

Policy-Map (tapagg) Configuration

accessed with the **class (policy-map (tapagg))** command

Command Syntax

resequence [*start_num* [*inc_num*]]

Parameters

- ***start_num*** sequence number assigned to the first rule. Default is ***1***.
- ***inc_num*** numeric interval between consecutive rules. Default is ***1***.

Example

These commands display a policy map whose entities were entered with default sequence numbers, then use the **resequence** command to renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
 policy-map type tapagg t-policy_1
   10 match ip ospf any any set aggregation-group t-group
   20 class fred
      set aggregation-group t-group id-tag 444
   30 class t-class_2
      set id-tag 500
   40 class t-class_3
      set id-tag 600
   50 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
 policy-map type tapagg t-policy_1
   100 match ip ospf any any set aggregation-group t-group
   120 class fred
      set aggregation-group t-group id-tag 444
   140 class t-class_2
      set id-tag 500
   160 class t-class_3
      set id-tag 600
   180 class t-class_4
      set id-tag 700
switch(config-pmap-t-policy_1)#
```

20.1.12.20 service-policy type tapagg (Interface mode)

The **service-policy type tapagg** command applies a specified TAP-aggregation policy map to the configuration-mode interface. A policy map is a data structure that identifies data traffic through class maps and match rules, then specifies the method of replicating the traffic. This command is active only when TAP aggregation mode is enabled on the switch.

The **no service-policy type tapagg** and **default service-policy type tapagg** commands remove the policy map assignment from the configuration mode interface by deleting the corresponding **service-policy tapagg** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

service-policy type tapagg input *policymap_name*

Parameters

- **input** policy map applies to inbound packet streams. This is the only option.
- ***map_name*** name of policy map.

Guidelines

A policy map that is attached to a port-channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy-map implementation specified by its Ethernet interface configuration.

Related Commands

class (policy-map (tapagg)) places the switch into the ***policy-map*** configuration mode to create a policy map.

Example

These commands apply the ***t-policy_1*** policy map to ***interface ethernet 17***.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#service-policy type tapagg input t-policy_1
switch(config-if-Et17)#
```

20.1.12.21 set (policy-map-class (tapagg))

The **set** command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The **set** command specifies one of these replication actions for filtered data packets:

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

The **no set** and **default set** commands remove the specified set command data action from the configuration-mode class by deleting the associated **set** command from ***running-config***.

Command Mode

Policy-map-class (tapagg) Configuration

accessed using the **class (policy-map (tapagg))** command

Command Syntax

set SET_VALUE

no set SET_VALUE

default set SET_VALUE

Parameters

SET_VALUE specifies the replication method for filtered packets. Options include:

- **aggregation group *agg_group*** replication specified by aggregation group.
- **id-tag *VLAN_number*** packet is identity tagged with specified VLAN number. VLAN numbers range from ***1*** to ***4094***.
- **aggregation group *agg_group* id-tag *VLAN_number*** assigns aggregation group and identity tag (VLAN number). VLAN numbers range from ***1*** to ***4094***.

Related Commands

- **policy-map type tapagg** places the switch in the ***policy-map*** (tapagg) configuration mode.
- **class (policy-map (tapagg))** assigns a class to the ***policy-map*** configuration mode.
- **match (policy-map (tapagg))** assigns a rule to the ***policy-map*** configuration mode.

Guidelines

When a class is not associated with a **set** command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

Example

These commands place the switch in policy-map-class to add the ***t-class_1*** class map to the ***t-policy_1*** policy map. Packets filtered by the class map are identity tagged with ***vlan 444*** and replicated as specified through the ***t-group*** aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
 id-tag
444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
 policy-map type tapagg t-policy_1
   10 class t-class_1
      set aggregation-group t-group id-tag 444
```

```
switch(config-pmap-t-policy_1)#
```

20.1.12.22 show hardware tcam profile

Use the **show hardware tcam profile** command to display The TCAM prifile by configuration and status.

Command Mode

EXEC

Command Syntax

show hardware tcam profile detail

Parameters

detail Displays TCAM profile details.

Example

```
(config-tap-agg)#show hardware tcam profile
                    Configuration            Status
FixedSystem         foo*                     foo
* configuration overridden by TapAgg
```

20.1.12.23 show interfaces tap

The **show interfaces tap** command displays TAP-port configuration information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **tap** [**INFO_LEVEL**]

Parameters

- **INTERFACE** interface type and numbers. Options include:
  - ***no parameter*** all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** management interface range specified by ***m_range***.
  - **port-channel *p_range*** port-channel interface range specified by ***p_range***.
  - Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays table that summarizes TAP data.
  - **detail** command displays TAP data summary table and a list of ACLS applied to TAP ports.

Examples

- This command displays TAP-port configuration information for interface ethernet *36* through *40*.

```
switch#show interface ethernet 31-35 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1
Et32      tap            tap            1        132  0          tag_1
Et33      tap            tap            303      233  0          tag_1
Et34      tap            tap            1        334  0          tag_3
Et35      tap            tap            1        345  0          tag_3
switch#
```

- This command displays detailed TAP-port configuration information for ***interface ethernet 17***.

```
switch#show interface ethernet 17 tap detail
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1

Port      ACLs Applied
-------------------------------------------------------------------
switch#
```

20.1.12.24 show interfaces tool

The **show interfaces tool** command displays tool port configuration information for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **tool**

Parameters

INTERFACE interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** management interface range specified by ***m_range***.
- **port-channel *p_range*** port-channel interface range specified by ***p_range***.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays tool port configuration information for interface ethernet ***36*** through ***40***.

```
switch#show interface ethernet 36-40 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag  Mode
-------------------------------------------------------------------------
Et36      tool           tool           201-205             Off  None
Et37      tool           tool           201-205             Off  None
Et38      tool           tool           201-205             Off  None
Et39      access         errdisabled    All                 Off  None
Et40      tool           tool           All                 On   None

switch#
```

20.1.12.25 show platform fm6000 keyframe

The **show platform fm6000 keyframe** command displays configured information for the specified keyframes. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with the absolute UTC time and the switch's complete ASIC time counter.

Command Mode

Privileged EXEC

Command Syntax

show platform fm6000 keyframe [**KEYFRAME_ID**]

Parameters

KEYFRAME_ID specifies keyframes that the command displays. Options include:

- ***no parameter*** command displays all configured keyframes.
- ***kf_name*** specifies a single keyframe to display information for.

Example

This command displays information concerning the three keyframes that the switch sends.

```
switch#show platform fm6000 keyframe
Keyframe key-2
------------------------
Egress Interface(s): Ethernet17, Ethernet18, Ethernet19, Ethernet20,
 Ethernet21
Source IP: 10.22.30.144
Destination IP: 10.21.1.14
Destination MAC: 00:09:00:09:00:09
Device ID: 0
Rate: 5 packet(s) per second

Keyframe key-1
------------------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14,
 Ethernet15
Source IP: 10.22.30.146
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 0
Rate: 2 packet(s) per second

switch#
```

20.1.12.26 show platform sand mcast capacity

The **show platform sand mcast capacity** command displays the usage details of hardware resources on Sand platform switches.

Command Mode

EXEC

Command Syntax

show platform sand mcast capacity [threshold *threshold_value*]

Parameters

threshold *threshold_value* displays the list of resources whose usage percentage is greater than or equal to the specified threshold value. Values range from ***0*** to ***100***. The default value is ***100***.

Guidelines

This command is supported on Sand platforms only.

Examples

This command displays the usage details of hardware resources on a Sand platform switch.

```
switch#show platform sand mcast capacity

Multicast Resources
-------------------
'*' - Applies to all Modules
'-' - Not applicable
                          TCAM Resources
------------------------------------------------------------------------
------
Resource                            Module        Total     Used     Used%

   v4 MC TCAM       Linecard3-Jericho3/0         4096        2       0.0
   v4 MC TCAM       Linecard5-Jericho5/0         4096      506      12.4

                          Replication Table Resources
------------------------------------------------------------------------
------
Resource                            Module        Total     Used     Used%

Multicast Table Row
                  Linecard3-Jericho3/0.0        262143    10586       4.0
                  Linecard3-Jericho3/1.0        262143    10576       4.0
                  Linecard3-Jericho3/0.1        262143    10586       4.0
                  Linecard3-Jericho3/1.1        262143    10576       4.0
                  Linecard6-Jericho6/2.0        262143    10576       4.0

switch#
```

20.1.12.27 show tap aggregation groups

The **show tap aggregation groups** command displays the TAP and tool port members of the specified TAP aggregation groups.

Command Mode

EXEC

Command Syntax

show tap aggregation groups [**INFO_LEVEL**] [**GROUP_NAMES**]

Parameters

- **INFO_LEVEL** port information to display. Options include:
  - ***no parameter*** displays active TAP and tool ports.
  - **detail** displays all configured TAP and tool ports, including inactive ports.
- **GROUP_NAMES** TAP aggregation groups. Options include:
  - ***no parameter*** displays information for all TAP aggregation groups.
  - ***group_list*** displays information for the specified TAP aggregation group list.

    Valid ***group_list*** format is a space-delimited list of one or more TAP aggregation group names.

Example

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
Group Name                          Tool Members
------------------------------------------------------
analyze2                            Po101, Po102
analyze3                            Po101, Po103

Group Name                          Tap Members
------------------------------------------------------
analyze2                            Et41, Et42
analyze3                            Et43
switch#
```

20.1.12.28 switchport mpls pop all

The **switchport mpls pop all** command configures the MPLS Pop on the switch.

- On DCS-7280R/R2, DCS-7500R/R2, and DCS-7020R MPLS pop is configurable at the tap port using the switchport command.
- On DCS-7280R3, DCS-7500R3, and DCS7800R3 MPLS pop is configurable at the tool port using the switchport command.
- On DCS-7280R3, DCS-7500R3, and DCS7800R3 the hardware forwarding profile must also be set before MPLS pop can be used.

The **no switchport mpls pop all** command removes the switchport configuration by modifying the corresponding statements in ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

switchport [tool | tap] **mpls pop all**

no switchport [tool | tap] **mpls pop all**

Parameters

- **tool** Tool port configuration.
- **tap** Tap port configuration.

Examples

- This command configures the MPLS Pop at the Tap port on the switch.

```
switch(config-if-Et1)#[no] switchport tap mpls pop all
```

- This command configures the MPLS Pop at the Tool port on the switch.

```
switch(config-if-Et1)#[no] switchport tool mpls pop all
```

20.1.12.29 switchport tap allowed vlan

The **switchport tap allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in TAP mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The **no switchport tap allowed vlan** and **default switchport tap allowed vlan** commands restore the TAP mode default allowed VLAN setting of **all** by removing the corresponding **switchport tap allowed vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap allowed vlan EDIT_ACTION

Parameters

EDIT_ACTION modifications to the VLAN list. Options include:

- *v_range* creates VLAN list from range of VLANs specified by *v_range*.
- **add** *v_range* adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except** *v_range* VLAN list contains all VLANs except those specified by *v_range*.
- **none** VLAN list is empty (no VLANs).
- **remove** *v_range* removes VLANs specified by *v_range* from current list.

Example

These commands create the TAP mode allowed VLAN list of ***26-30*** for ***interface ethernet 20***.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#switchport tap allowed vlan 26-30
eswitch(config-if-Et20)#show active
interface Ethernet20
   switchport mode tap
   switchport tap allowed vlan 26-30
switch(config-if-Et20)#
```

20.1.12.30 switchport tool encapsulation

The **switchport tool encapsulation** command is configured under Ethernet Interface configuration mode. When enabled on a tool port, only packets egressing this tool port will have their BR-E/VN tags stripped on DCS-7280R3, DCS-7500R3and DCS7800R3.

The **no switchport tool encapsulation** or **default switchport tool encapsulation** commands disables the 802.1br-E/VN Tag Stripping from the **running-config**.

Command Mode

Interface-Ethernet Configuration Mode

Command Syntax

switchport tool encapsulation {dot1br | vn-tag} **strip**

no switchport tool encapsulation dot1br | vn-tag} **strip**

defualt switchport tool encapsulation dot1br | vn-tag} **strip**

Parameters

- **dot1br** strips the 802.1br-E headers.
- **vn-tag** strips the VN Tag headers.

Examples

- To activate BR E-Tag stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)#[no] switchport tool encapsulation dot1br strip
```

- To activate VN-TAG stripping on a tool port, add the following configuration:

```
switch(config-if-Et1)#[no] switchport tool encapsulation vn-tag strip
```

20.1.12.31 switchport tap default group

The **switchport tap default group** command assigns the configuration-mode interface to the specified tool group as a TAP port member. TAP aggregation groups associate a set of TAP ports with a set of tool ports. Both TAP ports and tool ports may belong to multiple TAP aggregation groups.

The **no switchport tap default group** and **default switchport tap default group** commands remove the configuration-mode interface from the TAP aggregation group to which it is assigned by deleting the corresponding **switchport tap default group** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-port Channel Configuration

Command Syntax

switchport tap default group *group_name*

no switchport tap default group

default switchport tap default group

Parameters

group_name tool group name.

Restriction

This command is only available on FM6000 platform switches.

Example

These commands assign ***port channel 101*** to TAPs aggregation group ***tag-1***.

```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tap default group tag-1
switch(config-if-Po101)#show interfaces port-channel 101 tap
Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Po101     access         notconnect     1        1    0          tag-1
switch(config)#
```

20.1.12.32 switchport tap identity

The **switchport tap identity** command associates a VLAN number to the configuration mode TAP interface. Tool ports that are configured to encapsulate packets with an dot1q-style tag enter the number specified by this command as the s-VLAN (tier 1) for packets received from this TAPs port. The default identity value is 1.

The **no switchport tap identity** and **default switchport tap identity** commands restore ***vlan 1*** as the configuration-mode ports's identity VLAN by removing the corresponding **switchport tap identity** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap identity *port_id*

no switchport tap identity

default switchport tap identity

Parameters

port_id port's identity VLAN. Values range from ***1*** to ***4094***. Default is ***1***.

Related Commands

switchport tool identity configures a tool port to encapsulate packets received from TAP ports.

Restriction

This command is available only on FM6000 platform switches.

Example

These commands ***171*** as the identity value for ***interface ethernet 17***.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#switchport tap identity 171
switch(config-if-Et17)#show active
interface Ethernet17
   switchport tap identity 171
switch(config-if-Et17)#show interfaces ethernet 17 tap

Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et17      access         connected      1        171   0
switch(config-if-Et17)#
```

20.1.12.33 switchport tap native vlan

The **switchport tap native vlan** command specifies the TAP-mode native VLAN for the configuration-mode interface. Interfaces in TAP mode associate untagged frames with the native VLAN. The default native VLAN for all interfaces is ***vlan 1***. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode.

The **no switchport tap native vlan** and **default switchport tap native vlan** commands restore ***vlan 1*** as the TAP-mode native VLAN to the configuration-mode interface by removing the corresponding **switchport tap native vlan** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap native vlan *v_num*

no switchport tap native vlan

default switchport tap native vlan

Parameters

v_num TAP-mode native VLAN ID. Values range from 1 to 4094. Default is 1.

Restriction

This command is available only on FM6000 platform switches.

Example

These commands assign ***vlan 25*** as the TAP-mode native VLAN for ***interface ethernet 7***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport tap native vlan 25
switch(config-if-Et7)#show interface ethernet 7 tap
Port      Configured     Status         Native   Id   Truncation Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et7       tool           connected      25       1     0          ---
switch(config-if-Et7)#
```

20.1.12.34 switchport tap truncation

The **switchport tap truncation** command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. This command is in effect when the port is in TAP mode and the switch is in TAP aggregation mode. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode. By default, TAP ports do not truncate inbound packets.

The **no switchport tap truncation** and **default switchport tap truncation** commands restore the default behavior of not truncating packets received by the configuration-mode interface by removing the corresponding **switchport tap truncation** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tap truncation *packet_size*

no switchport tap truncation

default switchport tap truncation

Parameters

packet_size size of truncated packets (bytes). Values range from ***100*** to ***9236***. Default value of ***0*** corresponds to not truncating packets.

Restriction

This command is available only on FM6000 platform switches.

Examples

- These commands configure ***interface ethernet 38*** to truncate packets to ***150*** bytes.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport tap truncation 150
switch(config-if-Et38)#show interface ethernet 38 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et38      access         notconnect     1        1     150        ---
switch(config-if-Et38)#
```

- These commands configure ***interface ethernet 38*** to send complete packets to tool ports in its TAP aggregation group.

```
switch(config-if-Et38)#no switchport tap truncation
switch(config-if-Et38)#show interface ethernet 38 tap
Port      Configured     Status         Native   Id   Truncation
 Default
          Mode                          Vlan     Vlan            Group
-------------------------------------------------------------------------
Et38      access         notconnect     1        1     0          ---
switch(config-if-Et38)#
```

20.1.12.35 switchport tool allowed vlan

The **switchport tool allowed vlan** command creates or modifies the list of VLANs for which the configuration-mode interface, in tool mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The **no switchport tool allowed vlan** and **default switchport tool allowed vlan** commands restore the tool mode default allowed VLAN setting of **all** by removing the corresponding **switchport tool allowed vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool allowed vlan EDIT_ACTION

Parameters

EDIT_ACTION modifications to the VLAN list. Options include:

- ***v_range*** creates VLAN list from ***v_range***.
- **add *v_range*** adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except *v_range*** VLAN list contains all VLANs except those specified.
- **none** VLAN list is empty (no VLANs).
- **remove *v_range*** removes specified VLANs from current list.

  Valid ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

These commands create the tool mode allowed VLAN list of ***16-20*** for ***interface ethernet 38***.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport tool allowed vlan 16-20
switch(config-if-Et38)#show interfaces ethernet 38 tool
Port      Configured     Status         Allowed             Id
 Timestamp
          Mode                          Vlans               Tag  Mode
-------------------------------------------------------------------------
Et38      access         notconnect     16-20               Off  None
switch(config-if-Et38)#
```

20.1.12.36 switchport tool group

The **switchport tool group** command modifies the configuration-mode interface's tool port membership in the specified TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. Command options for configuring a port's TAP aggregation group membership include:

- specifying the groups to which the port belongs (supersedes the port's previous group memberships).
- adding to the list of groups to which the port belongs.
- deleting from the list of groups to which the port belongs.

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A TAP port can belong to a maximum of one default TAP aggregation group.

The **no switchport tool default group** and **default switchport tool default group** commands remove the configuration-mode interface from all TAP aggregation groups to which it is assigned as a tool port by modifying the corresponding statements in ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool group **EDIT_ACTION**

Parameters

EDIT_ACTION specifies changes to the list of groups to which the port belongs.

- **add *group_list*** specifies additional groups to which the port belongs.
- **remove *group_list*** removes interface as a tool port member from specified groups.
- **set *group_list*** specifies groups to which interface belongs as a tool port.

  Valid ***group_list*** format is a space-delimited list of one or more TAP aggregation group names.

Restriction

This command is available only on FM6000 platform switches.

Examples

- These commands associate ***interface ethernet 40*** with three TAP aggregation groups.

```
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool group set tag-1 tag-2 tag-3
switch(config-if-Et40)#show active
interface Ethernet40
   switchport tool group set tag-3 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands add ***tag-7*** to the tap aggregation groups to which ***interface ethernet 40*** belongs.

```
switch(config-if-Et40)#switchport tool group add tag-7
switch(config-if-Et40)#show active
interface Ethernet40
   switchport tool group set tag-3 tag-7 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands specify ***tag-9*** as the only group to which ***interface ethernet 40***belongs.

```
switch(config-if-Et40)#switchport tool group set tag-9
switch(config-if-Et40)#show active
```

```
interface Ethernet40
   switchport tool group set tag-9
switch(config-if-Et40)#
```

20.1.12.37 switchport tool identity

The **switchport tool identity** command configures the configuration-mode interface to add a tier-1 VLAN tag (dot1q) to packets it receives from TAP ports. The VLAN number on the dot1q tag is specified by the **switchport tap identity** command configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

The **no switchport tool identity** and **default switchport tool identity** commands restore the default VLAN handling method for the configuration-mode interface by removing the corresponding **switchport tool identity** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport tool identity dot1q

no switchport tool identity dot1q

default switchport tool identity dot1q

Restriction

This command is available only on FM6000 platform switches.

Example

These commands configure ***interface ethernet 40*** to include a dot1q tag on egress packets.

```
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool identity dot1q
switch(config-if-Et40)#show active
interface Ethernet40
   switchport mode tool
   switchport tool identity dot1q
   switchport tool group set tag-9
switch(config-if-Et40)#
```

20.1.12.38 switchport tool truncation

The **`switchport tool truncation`** command configures the configuration-mode interface, as a tool port, to truncate outbound packets to ***160*** bytes. This command is in effect when the port is in tool mode and the switch is in TAP aggregation mode. Command settings persist in ***running-config*** without taking effect when the switch is not in TAP aggregation mode or the interface is not in tool mode. By default, tool ports do not truncate outbound packets.

The **`no switchport tool truncation`** and **`default switchport tool truncation`** commands restore the default behavior (not truncating packets that exit the configuration mode interface) by removing the corresponding **`switchport tool truncation`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

`switchport tool truncation` *packet_size*

`no switchport tool truncation`

`default switchport tool truncation`

Parameters

packet_size size of truncated packets in bytes. The only permitted value is *160*.

Examples

- These commands configure ***interface ethernet 38***, as a tool port, to truncate packets on egress to ***160*** bytes.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport mode tool
switch(config-if-Et38)#switchport tool truncation 160
switch(config-if-Et38)#
```

- These commands configure ***interface ethernet 38*** to send complete packets.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#no switchport tool truncation
switch(config-if-Et38)#
```

20.1.12.39 tap aggregation

The **tap aggregation** command places the switch in TAP-aggregation configuration mode. The switch's TAP aggregation mode is enabled or disabled by the **mode** command in TAP-aggregation configuration mode.

When TAP aggregation mode is enabled, normal switching and routing operations are disabled. A port's switchport status depends on the switch's TAP aggregation mode and the port's switchport mode:

- **TAP aggregation mode enabled**: TAP and tool ports are enabled. Switching ports are errdisabled.
- **TAP aggregation mode disabled**: TAP and tool ports are errdisabled. Switching ports are enabled.

The **no tap aggregation** and **default tap aggregation** commands disable tap aggregation mode on the switch by removing all TAP-aggregation configuration mode commands from ***running-config***.

TAP-aggregation configuration mode is not a group-change mode; ***running-config*** is changed immediately upon entering commands. Exiting TAP-aggregation configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

tap aggregation

no tap aggregation

default tap aggregation

Commands Available in TAP-aggregation Configuration Mode

mode (tap-agg configuration mode)

Related Commands

switchport mode

Examples

- These commands place the switch in TAP-aggregation configuration mode and enable TAP aggregation.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
 mode exclusive
switch(config-tap-agg)#
```

- This command disables TAP aggregation and removes all TAP-aggregation configuration mode commands from ***running-config***.

```
switch(config)#no tap aggregation
switch(config)#
```

20.2 Latency Analyzer (LANZ)

Arista Networks' Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the network. The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho, Tomahawk and XP80 switch platforms.

This section describes the purpose, behavior, and configuration of LANZ features. Topics covered by this section include:

- Introduction to LANZ
- LANZ Overview
- Configuring LANZ
- LANZ Commands

20.2.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

20.2.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

20.2.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port's output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.

20.2.2.1.1 Notifying and Polling Modes

Notifying Mode

In Notifying Mode (available on all platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the queue-monitor length update-interval command.
- **End** event is generated when the congested queue drops below the lower threshold.

Polling Mode

Polling Mode is available only on Arad and Jericho switches. On these switches, LANZ can be configured to use Notifying Mode, but it operates in Polling Mode by default. In Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every ***800*** microseconds until all queue lengths for the port pass below the lower threshold.

20.2.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port's queue.

20.2.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of ***500*** entries.

20.2.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to ***100*** clients via TCP through port ***50001***.

Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

20.2.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Enabling and Disabling LANZ
- Specifying the LANZ Mode on Jericho and Arad Switches
- Configuring LANZ Congestion Thresholds
- Setting LANZ Traffic Sampling
- Logging LANZ Congestion Events
- Viewing LANZ Data
- Streaming LANZ Data

20.2.3.1 Enabling and Disabling LANZ

LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), allowing the switch to collect and display latency information. LANZ is disabled by default on all other switches. If LANZ is disabled, the **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if none have been configured.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see **queue-monitor length log**)
- CLI display or CSV-format output (see **show queue-monitor length**)
- data stream (see **queue-monitor streaming**)

To disable LANZ globally, enter the **no queue-monitor length** command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the **no queue-monitor length** command in interface Ethernet configuration mode.

Examples

- This command enables LANZ on the switch.

```
switch(config)#queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch.

```
switch(config)#no queue-monitor length
switch(config)#
```

- These commands disable LANZ on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#no queue-monitor length
switch(config-if-Et7)#
```

20.2.3.2 Specifying the LANZ Mode on Jericho and Arad Switches

On Jericho and Arad switches, LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. They also support Notifying Mode (the LANZ mode used on all other switches), which generates Start, Update, and End events for all queues.

Notifying Mode is enabled using the **queue-monitor length notifying** command.

Examples

- This command enables Notifying Mode on a Jericho or Arad switch.

```
switch(config)#queue-monitor length notifying
```

- This command disables Notifying Mode on a Jericho or Arad switch, returning LANZ to the default Polling Mode.

```
switch(config)#no queue-monitor length notifying
```

20.2.3.3 Configuring LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

20.2.3.3.1 Setting the Congestion Update Interval

The **queue-monitor length update-interval** command specifies the frequency with which congestion information is updated in microseconds.

- This command sets the time between congestion updates to ***10*** seconds.

```
switch(config)# queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of ***5*** seconds.

```
switch(config)# default queue-monitor length update-interval
switch(config)#
```

20.2.3.3.2 Congestion Thresholds on FM6000, Trident II, Trident 3, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, and in 256-byte segments on Trident 3 switches. The default threshold values are ***512*** segments and ***256*** segments. To change the threshold values for a specific interface, use the **queue-monitor length thresholds** command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are ***10940*** segments and ***4376*** segments. To enable global buffer monitoring, use the **queue-monitor length global-buffer** command. To change the threshold values for global buffer usage monitoring on the switch, use the **queue-monitor length global-buffer thresholds** command.

Examples

- These commands set the upper and lower queue-length thresholds on ***interface ethernet 5*** to ***300*** segments and ***200*** segments.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to ***9000*** segments and ***4000*** segments.

```
switch(config)# queue-monitor length global-buffer
switch(config)#queue-monitor length global-buffer thresholds 9000 4000
switch(config)#
```

20.2.3.3.3 Congestion Thresholds on Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between ***2*** and ***52428800*** bytes (the default value is ***52428800*** bytes). To change the upper threshold value for a specific interface, use the **queue-monitor length threshold (Arad/Jericho)** command.

Example

These commands set the upper queue-length threshold on ***interface ethernet 5*** to ***2614400*** bytes.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#queue-monitor length thresholds 2614400
switch(config-if-Et5)#
```

20.2.3.3.4 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the **queue-monitor length cpu thresholds** command. Individual CPU port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length cpu thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length cpu thresholds
switch(config)#
```

20.2.3.3.5 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the **queue-monitor length fabric thresholds** command. Individual fabric port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)# queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of ***512*** and ***256***.

```
switch(config)# default queue-monitor length fabric thresholds
switch(config)#
```

20.2.3.4 Setting LANZ Traffic Sampling

The switch can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination when a queue threshold is crossed by enabling LANZ mirroring through the command **queue-monitor length mirror**. The CPU or an egress interface mirror destination is then configured through the command **queue-monitor length mirror destination**. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command **tcpdump queue-monitor**.

Examples

- This command enables LANZ traffic sampling.

```
switch(config)#queue-monitor length mirror
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)#no queue-monitor length mirror
switch(config)#
```

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)#queue-monitor length mirror destination cpu
```

```
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***1*** through ***5***.

```
switch(config)#queue-monitor length mirror destination Ethernet 1-5
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***6***, ***10***, and ***12*** through ***14***.

```
switch(config)#queue-monitor length mirror destination Ethernet
 6,10,12-14
switch(config)#
```

- This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535
 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

20.2.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the **queue-monitor length log** command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see **queue-monitor length threshold (Arad/Jericho)** or **queue-monitor length thresholds**). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see **queue-monitor length global-buffer thresholds**). To enable global buffer monitoring, use the **queue-monitor length global-buffer** command. To log over-threshold events for the global buffer, use the **queue-monitor length global-buffer log** command.

Examples

- This command enables queue-length over-threshold logging with a minimum interval of ***10*** seconds between messages for a given interface.

```
switch(config)#queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)#queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD:
 Interface
Ethernet6 queue length is over threshold of 512, current
 length is 1024.
```

- This command enables global buffer over-threshold logging on the switch with a minimum interval of ***60*** seconds between messages.

```
witch(config)#queue-monitor length global-buffer log 60
```

20.2.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

20.2.3.6.1 Viewing LANZ Data on Arad Platform Switches

When LANZ is enabled on an Arad platform switch, the **show queue-monitor length** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the **show queue-monitor length limit** command.

Example

This command displays the last ***100*** records for Ethernet interfaces ***6*** through ***8***.

```
switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                         Interface   Queue length (segments, 1 to 512 bytes)
---------------------------------------------------------------------------------
0:00:07.43393 ago            Et6         1049
0:00:39.22856 ago            Et7         2039
1 day, 4:33:23.12345 ago     Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the **show queue-monitor length status** command.

Example

This command displays LANZ configuration and status information.

```
switch(config)#show queue-monitor length status
Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Maximum queue length in bytes : 52428800
Port threshold in bytes:
Port     High threshold
Et3/1           5242880
Et3/2           5242880
Et3/3           5242880
Et3/4           5242880
Et3/5           5242880
```

20.2.3.6.2 Viewing LANZ Data on FM6000, Trident II, Trident 3, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, Trident 3, or Tomahawk platform switch, the **show queue-monitor length** command displays a report of recent over-threshold events for a range of

interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last ***1000*** records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the **show queue-monitor length limit** command.

Example

This command displays the last ***100*** records for Ethernet interfaces ***6*** through ***8***.

```
switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                         Interface   Queue length (segments, 1 to 512 bytes)
---------------------------------------------------------------------------
0:00:07.43393 ago            Et6         1049
0:00:39.22856 ago            Et7         2039
1 day, 4:33:23.12345 ago     Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the **show queue-monitor length status** command.

Example

This command displays LANZ configuration and status information.

```
switch(config)# show queue-monitor length status
queue-monitor length enabled
Global Buffer Monitoring
------------------------
Global buffer monitoring is enabled
Segment size in bytes :   160
Total buffers in segments : 36864
High threshold : 10940
Low threshold :  4376

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes :   480
Maximum queue length in segments :  3647
Port thresholds in segments:
Port     High threshold  Low threshold
Et1                 512            256
Et2                 512            256
Et3                 512            256
Et4                 512            256
Et5                 512            256
```

To view all available LANZ records, use the **show queue-monitor length all** command.

Example

This command displays all available LANZ records.

```
switch> show queue-monitor length all

Report generated at 2013-04-01 13:23:13

switch>
```

On the FM6000, Trident II, Trident 3, and Tomahawk platforms, information is also available for the number of dropped packets (see **show queue-monitor length drops**) and transmission latency (see **show queue-monitor length tx-latency**); global buffer usage can also be viewed on FM6000 platforms (see **show queue-monitor length global-buffer**).

20.2.3.7 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port ***50001*** and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to ***10*** client connections for streaming LANZ data. This limit can be configured up to a maximum of ***100***. Maximum connections can be configured when LANZ is disabled.

20.2.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the **`no show queue-monitor streaming clients`** command in queue-monitor streaming configuration mode. To disable streaming, use the **show queue-monitor streaming clients** command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.

To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (***50001***) before initiating a client connection for streaming from a remote host. A static rule (sequence number ***130***) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

Examples

- These commands enable the streaming of LANZ data from the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```

- These commands disable LANZ data streaming.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#shutdown
switch(config-qm-streaming)#
```

20.2.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of ***10*** client connections for LANZ data streaming. This maximum can be configured using the **max-connections** command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

Example

This command sets the maximum number of client connections for LANZ data streaming to ***50***.

```
switch(config-qm-streaming)#max-connections 50
```

20.2.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

Configuration Messages

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- **`timestamp`** time of change in configuration in tens of microseconds (UTC).
- **`lanzVersion`** LANZ feature version.
- **`numOfPorts`** number of ports in the switch.
- **`segmentSize`** segment size.
- **`maxQueueSize`** maximum queue size in segments.
- **`qLenInterval`** frequency of updates.
- **`intfName`** name of the port.
- **`switchId`** ID of the chip on a multi-chip system.
- **`portId`** ID of the port.
- **`internalPort`** “true” if it is an internal port.
- **`highThreshold`** higher threshold value.
- **`lowThreshold`** lower threshold value.

Congestion Messages

A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- **`timestamp`** time of congestion in micro-seconds (UTC).
- **`intfName`** name of the port.
- **`switchId`** ID of the chip on a multi-chip system.
- **`portId`** ID of the port.
- **`queueSize`** queue size in segments at time of congestion.

20.2.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

Google Protocol Buffers

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: **http://code.google.com/p/protobuf/downloads/list**

LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available in the Extensions/LANZ directory on this page: **https://www.arista.com/en/support/software-download**

```
package LanzProtobuf;

message ConfigRecord {
required uint64 timestamp = 1; // Time of change in configuration in
micro-seconds (UTC)
required uint32 lanzVersion = 2; // LANZ feature version
required uint32 numOfPorts = 3; // Num of ports in the switch
required uint32 segmentSize = 4; // Segement size
required uint32 maxQueueSize = 5; // Maximum queue size in segments
optional uint32 qLenInterval = 10; // Frequency of update
message PortConfigRecord {
required string intfName = 1; // Name of the port
required uint32 switchId = 2; // Id of the chip on a multi-chip system
required uint32 portId = 3; // Id of the port
required bool internalPort = 4; // 'True' if it's an internal port
required uint32 highThreshold = 5; // Higher threshold
required uint32 lowThreshold = 6; // Lower threshold
}

repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of
 each
port
}

message CongestionRecord {
required uint64 timestamp = 1; // Time of congestion in micro-seconds
(UTC)
required string intfName = 2; // Name of the port
required uint32 switchId = 3; // Id of the chip on a multi-chip system
required uint32 portId = 4; // Id of the port
required uint32 queueSize = 5; // Queue size in segments at time of
congestion
}

message ErrorRecord {
required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
required string errorMessage = 2; // Text message
}

message LanzRecord {
optional ConfigRecord configRecord = 1;
optional CongestionRecord congestionRecord = 2;
optional ErrorRecord errorRecord = 3;
}
```

Implementation Procedure

The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

1. Download the example client (lanz_client.py) from the Arista website. It is available in the Extensions/LANZ directory on this page: https://www.arista.com/en/support/software-download
2. Decompress the GPB archive to a directory.
3. Run the GPB C++ compilation and install. With default flags using GCC on *nix platforms, this will produce a binary called “protoc” in your /usr/local/bin directory.
4. From the archive root, **cd** to python, and run the following commands:

- **python setup.py build**
- **python setup.py test**

5. Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:
   - **protoc --python_out=. Lanz.proto**
   - The **--python_out=.** flag drops the compiled Python program in the directory where you ran the command.
6. Run **lanz_client.py -h** to activate the LANZ client.

20.2.4 LANZ Commands

LANZ Commands: Global Configuration

- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length cpu thresholds
- queue-monitor length fabric thresholds
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor length notifying
- queue-monitor length update-interval
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode

- queue-monitor length threshold (Arad/Jericho)
- queue-monitor length thresholds

LANZ Commands: Queue-Monitor Streaming Configuration Mode

- max-connections

LANZ Display Commands

- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length drops
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
- show queue-monitor streaming clients

20.2.4.1 clear queue-monitor length statistics

The **clear queue-monitor length statistics** command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

Command Mode

Privileged EXEC

Command Syntax

clear queue-monitor length statistics

Example

This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch#clear queue-monitor length statistics
switch#
```

20.2.4.2 max-connections

The max-connections command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the **queue-monitor streaming** command to enable LANZ data streaming.

Command Mode

Queue-Monitor-Streaming Configuration

Command Syntax

`max-connections` *connections*

queue-monitor streaming

Parameters

connections maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from ***1*** through ***100***.

Example

This command sets the maximum number of client connections the switch accepts for LANZ data streaming to ***50***.

```
switch(config-qm-streaming)#max-connections 50
switch(config-qm-streaming)#
```

20.2.4.3 queue-monitor length (global configuration mode)

The **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), and disabled by default on all other switches.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see **queue-monitor length log**).
- CLI display or CSV-format output (see **show queue-monitor length**).
- data stream (see **queue-monitor streaming**).

The **no queue-monitor length** command entered in global configuration mode disables LANZ and discards LANZ log data, but retains settings. LANZ settings include:

- logging settings (see **queue-monitor length log**).
- queue length thresholds (see **queue-monitor length threshold (Arad/Jericho/Qumran)** or **queue-monitor length thresholds**).
- data streaming settings (see **queue-monitor streaming**).

To disable LANZ on an interface, use the **no queue-monitor length** command in interface configuration mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor length

no queue-monitor length

default queue-monitor length

Examples

- This command enables LANZ on the switch.

```
switch(config)#queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch and discards LANZ data but maintains configurations.

```
switch(config)#no queue-monitor length
switch(config)#
```

- This command disables LANZ on Ethernet interface 3/30.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#no queue-monitor length
switch(config-if-Et3/30)#
```

20.2.4.4 queue-monitor length cpu thresholds

The **queue-monitor length cpu thresholds** command sets the queue length threshold to define "congested" on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see **queue-monitor length (global configuration mode)**), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the **queue-monitor length log** command.) Different monitoring thresholds cannot be set for individual CPU ports.

The **no queue-monitor length cpu thresholds** and **default queue-monitor length cpu thresholds** commands reset thresholds to the default values (high: ***512*** segments; low: ***256*** segments).

Command Mode

Global Configuration

Command Syntax

queue-monitor length cpu thresholds [*upper_limit* | *lower_limit*]

no queue-monitor length cpu thresholds

default queue-monitor length cpu thresholds

Parameters

- ***upper_limit*** is the queue length in segments that triggers an over-threshold event. Values range from ***8*** to ***16382***. Default setting is ***512***. Segment size varies by platform.
- ***lower_limit*** When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***16382***. Default setting is ***256***.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)#queue-monitor length cpu thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of ***512*** and ***256***.

```
switch(config)#default queue-monitor length cpu thresholds
switch(config)#
```

20.2.4.5 queue-monitor length fabric thresholds

The **queue-monitor length fabric thresholds** command sets the **queue length threshold** to define "congested" on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see queue-monitor length (global configuration mode)), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the **queue-monitor length log** command.) Different monitoring thresholds cannot be set for individual fabric ports.

The **no queue-monitor length fabric thresholds** and **default queue-monitor length fabric thresholds** commands reset thresholds to the default values (high: *512* segments; low: *256* segments).

Command Mode

Global Configuration

Command Syntax

queue-monitor length fabric thresholds [*upper_limit* | *lower_limit*

no queue-monitor length fabric thresholds

default queue-monitor length fabric thresholds

Parameters

- ***upper_limit*** is the queue length in segments that triggers an over-threshold event. Values range from ***8*** to ***16382***. Default setting is ***512***. Segment size varies by platform.
- ***lower_limit*** When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***16382***. Default setting is ***256***.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to ***1000*** segments and the lower limit to ***300*** segments.

```
switch(config)#queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of ***512*** and ***256***.

```
switch(config)#default queue-monitor length fabric thresholds
switch(config)#
```

20.2.4.6 queue-monitor length global-buffer log

The **queue-monitor length global-buffer log** command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see **queue-monitor length global-buffer thresholds**). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per interval as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the **show queue-monitor length global-buffer** command.

The **no queue-monitor length global-buffer log** and **default queue-monitor length global-buffer log** commands disable global buffer logging by removing the corresponding **queue-monitor length global-buffer log** command from ***running-config***. The **queue-monitor length global-buffer log** command with an interval value of ***0*** also disables global buffer logging.

Command Mode

Global Configuration

Command Syntax

queue-monitor length global-buffer log interval

no queue-monitor length global-buffer log

default queue-monitor length global-buffer log

Parameters

interval minimum interval in seconds between logged messages.

- ***0*** global buffer logging is disabled on the switch (the default setting).
- ***1*** to ***65535*** minimum logging interval (in seconds).

Guidelines

This command is available on FM6000 platform switches.

Examples

- This command enables global buffer logging with a minimum interval of ***10*** seconds between messages.

```
switch(config)#queue-monitor length global-buffer log 10
```

- This command disables global buffer logging on the switch.

```
switch(config)#no queue-monitor length global-buffer log
```

20.2.4.7 queue-monitor length global-buffer thresholds

The queue-monitor length global-buffer thresholds command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the **queue-monitor length global-buffer log** command.)

The no queue-monitor length global-buffer and default queue-monitor length global-buffer commands disable global buffer reporting.

The **no queue-monitor length global-buffer thresholds** and **default queue-monitor length global-buffer thresholds** commands erase custom global buffer threshold settings.

Command Mode

Global Configuration

Command Syntax

`queue-monitor length global-buffer thresholds` *max_segments min_segments*

`no queue-monitor length global-buffer` log

`default queue-monitor length global-buffer` log

Parameters

- ***max_segments*** upper threshold in 160-byte segments. Value ranges from ***2*** to ***36864***. Default is ***10940***.
- ***min_segments*** lower threshold in 160-byte segments. Value ranges from ***1*** to ***36864***. Default is ***4376***.

Examples

- This command sets the upper and lower global buffer thresholds to ***9000*** segments and ***3000*** segments.

```
switch(config)#queue-monitor length global-buffer thresholds 9000 3000
switch(config)#
```

- This command resets the upper and lower global buffer thresholds to their default values.

```
switch(config)#no queue-monitor length global-buffer thresholds 9000
 3000
switch(config)#
```

20.2.4.8 queue-monitor length global-buffer

The **queue-monitor length global-buffer** command includes global buffer usage in LANZ reporting.

When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the **queue-monitor length global-buffer thresholds** command. Usage data may be viewed using the **show queue-monitor length global-buffer** command. To view status and threshold information, use the **show queue-monitor length status** command.

Global buffer usage is measured in segments of ***160*** bytes.

The **no queue-monitor length global-buffer** and **default queue-monitor length global-buffer** commands disable global buffer usage reporting by removing the corresponding **queue-monitor length global-buffer** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

queue-monitor length global-buffer

no queue-monitor length global-buffer

default queue-monitor length global-buffer

Guidelines

This command is available on FM6000 platform switches.

Examples

- This command enables global buffer monitoring on the switch.

```
switch(config)#queue-monitor length global-buffer
switch(config)#
```

- This command disables global buffer monitoring on the switch.

```
switch(config)#no queue-monitor length global-buffer
switch(config)#
```

20.2.4.9 queue-monitor length log

The **queue-monitor length log** command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see **queue-monitor length (global configuration mode)**). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see **queue-monitor length threshold (Arad/ Jericho)**). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the **show queue-monitor length** command.

The queue-monitor length log command with an interval value of 0 disables event logging.

Command Mode

Global Configuration

Command Syntax

queue-monitor length log interval

Parameters

interval minimum interval in seconds between logged messages from a single interface.

- ***0*** queue-length logging is disabled on the switch (the default setting).
- ***1*** to ***65535*** minimum logging interval (in seconds).

Examples

- This command enables over-threshold logging with a minimum interval of ***10*** seconds between messages for a given interface.

```
switch(config)#queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)#queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface
Ethernet6 queue length is over threshold of 512, current length is
 1024.
```

20.2.4.10 queue-monitor length mirror destination

The **queue-monitor length mirror destination** command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command **queue-monitor length mirror**.

Command Mode

Global Configuration

Command Syntax

queue-monitor length mirror destination cpu | *ports*

Parameters

ports any combination of Ethernet ports ***1*** through ***24***.

Examples

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)#queue-monitor length mirror destination cpu
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports ***3***, ***11***, and ***15*** through ***20***.

```
switch(config)#queue-monitor length mirror destination Ethernet
 3,11,15-20
switch(config)#
```

20.2.4.11 queue-monitor length mirror

The **queue-monitor length mirror** command enables LANZ mirroring. As a result, the switch is configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. To set the destination for the mirrored traffic, use the **queue-monitor length mirror destination** command.

Command Mode

Global Configuration

Command Syntax

queue-monitor length mirror

Examples

- This command enables LANZ traffic sampling.

```
switch(config)#queue-monitor length mirror
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)#no queue-monitor length mirror
switch(config)#
```

20.2.4.12 queue-monitor length notifying

The **queue-monitor length notifying** command enables Notifying Mode on Arad and Jericho switches. By default, LANZ operates in Polling Mode on Arad and Jericho switches. On all other switches, LANZ operates only in Notifying Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and End events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the **queue-monitor length thresholds** command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the **queue-monitor length update-interval** command.

The **no queue-monitor length notifying** and **default queue-monitor length notifying** commands reset LANZ to the default Polling Mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor length notifying

no queue-monitor length notifying

default queue-monitor length notifying

Guidelines

- Polling mode is available only on Arad and Jericho platform switches.
- On Jericho platforms, LANZ will revert to Polling Mode if there are not enough counter resources to operate in Notifying Mode.
- On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
- On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
- If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

Examples

- This command enables Notifying Mode on an Arad or Jericho switch.

```
switch(config)#queue-monitor length notifying
switch(config)#
```

- This command disables Notifying Mode on an Arad or Jericho switch, returning LANZ to the default Polling Mode.

```
switch(config)#no queue-monitor length notifying
switch(config)#
```

20.2.4.13 queue-monitor length threshold (Arad/Jericho/Qumran)

The **queue-monitor length threshold** command sets the upper queue-length threshold on Arad, Jericho, and Qumran platforms to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see **queue-monitor length (global configuration mode)**), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the **queue-monitor length log** command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length threshold** command or the **default queue-monitor length threshold** command enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length threshold** and **default queue-monitor length threshold** commands erase custom queue length threshold settings for the interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

queue-monitor length threshold *upper_limit*

no queue-monitor length

default queue-monitor length

Parameters

upper_limit is the queue length in bytes that triggers an over-threshold event. Values range from ***40962*** to ***52428800*** bytes. Default setting is ***52428800***.

Guidelines

On Arad, Jericho, and Qumran platforms, the queue length is measured in bytes. Only the upper threshold is configurable using this command, and it is set at a default value of ***52428800*** bytes. Both upper and lower thresholds can be set using the **queue-monitor length thresholds** command.

Examples

- These commands set the upper queue-length threshold on ***Ethernet interface 3/30*** to ***40000000*** bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#queue-monitor length threshold 40000000
switch(config-if-Et3/30)#
```

- These commands reset the upper queue-length threshold on ***Ethernet interface 3/30*** to its default value of ***52428800*** bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#default queue-monitor length threshold
switch(config-if-Et3/30)#
```

20.2.4.14 queue-monitor length thresholds

The **queue-monitor length thresholds** command sets both upper and lower queue length thresholds to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see **queue-monitor length (global configuration mode)**), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the **queue-monitor length log** command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length** command or the **default queue-monitor length** command in interface configuration mode enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length thresholds** and **default queue-monitor length thresholds** commands in interface configuration mode both erase custom queue length threshold settings for the interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

queue-monitor length thresholds *upper_limit lower_limit*

no queue-monitor length

default queue-monitor length

Parameters

- ***upper_limit*** queue length in segments that triggers an over-threshold event. Must be higher than ***lower_limit***. The minimum value is *2*. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is ***512***.
- ***lower_limit*** lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than ***upper_limit***. Values range from ***1*** to ***4806***. Default setting is ***256***.

Guidelines

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, in 256-byte segments on Trident 3 switches, and in bytes on Arad and Jericho switches. Default thresholds vary by platform. Both upper and lower thresholds are configurable.

Examples

- These commands set the upper and lower queue-length thresholds on ***interface ethernet 5*** to ***300*** segments and ***200*** segments.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands reset the upper and lower queue-length thresholds on ***interface ethernet 5*** to their default values.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#default queue-monitor length thresholds
switch(config-if-Et5)#
```

20.2.4.15 queue-monitor length update-interval

The **queue-monitor length update-interval** command sets the interval between congestion updates when LANZ is in Notifying Mode.

The **no queue-monitor length update-interval** and **default queue-monitor length update-interval** commands reset the update interval to its default value of ***5000000*** (***5*** seconds).

Command Mode

Global Configuration

Command Syntax

queue-monitor length update-interval *interval*

no queue-monitor length

default queue-monitor length

Parameters

interval is the time in microseconds between congestion updates. Values range from ***80***-***10000000***; default setting is ***5000000*** (***5*** seconds).

Examples

- This command sets the time between congestion updates to ***10*** seconds.

```
switch(config)#queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of ***5*** seconds.

```
switch(config)#default queue-monitor length update-interval
switch(config)#
```

20.2.4.16 queue-monitor streaming

The **queue-monitor streaming** command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; ***running-config*** is changed immediately upon command entry. The exit command does not affect ***running-config***.

To enable LANZ data streaming on the switch, use the **no show queue-monitor streaming clients** command.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

queue-monitor streaming

Commands Available in queue-monitor streaming Configuration Mode

- **max-connections**
- **show queue-monitor streaming clients**

Example

This command places the switch in the ***queue-monitor streaming*** configuration mode.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#
```

20.2.4.17 show queue-monitor length all

The **show queue-monitor length all** command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length all

Guidelines

This command is available on FM6000 platform switches.

Example

This command displays all available LANZ records from the switch.

```
switch>show queue-monitor length all

20.2.4.18 show queue-monitor length cpu

The **show queue-monitor length cpu** command displays LANZ data for CPU ports on the switch. On Trident II and Tomahawk platforms, the “Interface” column identifies the CPU port by its card slot and chip index.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length cpu

- This command displays LANZ data for CPU ports on a Trident II or Tomahawk switch.

```
switch>show queue-monitor length cpu

20.2.4.19 show queue-monitor length csv

The **show queue-monitor length csv** command displays LANZ records in Comma-Separated Value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

Command Mode

EXEC

Command Syntax

show queue-monitor length csv

Example

This command displays LANZ records in CSV format.

```
switch>show queue-monitor length csv

20.2.4.20 show queue-monitor length drops

The **`show queue-monitor length drops`** command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

Command Mode

EXEC

Command Syntax

`show queue-monitor length` [**INTERFACES**][**FACTOR**] **`drops`**

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - ***ethernet e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - ***no parameter*** displays the last ***1000*** records.
  - **limit number samples** displays the last ***number*** records.
  - **limit number seconds** displays all records generated during the last ***number*** seconds. Value of number ranges from ***1*** to ***1000000***.

Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

Examples

- This command displays the last 10 records of transmission drop data on an FM6000 switch.

```
switch>show queue-monitor length limit 10 samples drops

20.2.4.21 show queue-monitor length ethernet

The **show queue-monitor length ethernet** command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

Command Mode

EXEC

Command Syntax

show queue-monitor length ethernet *e-range*

Parameters

e-range the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

Examples

- This command displays the last ***1000*** records for ***interface ethernet 9*** on an FM6000 platform switch.

```
switch>show queue-monitor length ethernet 9

Note: The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.

20.2.4.22 show queue-monitor length global-buffer

The **show queue-monitor length global-buffer** command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length global-buffer

Guidelines

This command is available on FM6000 platform switches.

Example

This command displays the global buffer event records for the switch.

```
switch>show queue-monitor length global buffer

switch>
```

20.2.4.23 show queue-monitor length limit

The **show queue-monitor length limit** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see queue-monitor length (**global configuration mode**)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode

EXEC

Command Syntax

show queue-monitor length limit [**INTERFACES**] *number*

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- ***number*** number of records to display. Values range from ***1*** to ***1000000***.

Example

This command displays the last ***100*** records for interface ethernet ***6*** through ***8***.

```
switch>#show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13
Time                         Interface   Queue length (segments, 1 to 512 bytes)
-------------------------------------------------------------------------------
0:00:07.43393 ago            Et6         1049

1 day, 4:33:23.12345 ago     Et6         1077
switch>
```

20.2.4.24 show queue-monitor length statistics

The **show queue-monitor length statistics** command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

Command Mode

EXEC

Command Syntax

show queue-monitor length statistics

Example

This command displays LANZ statistics for all interfaces on the switch.

```
switch>show queue-monitor length statistics

Report generated at 2016-02-09 22:59:56
Interface      Traffic Class  Count
-------------------------------------------------------------
Et29            11             1
```

20.2.4.25 show queue-monitor length status

The **show queue-monitor length status** command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

Command Mode

EXEC Global Configuration

Command Syntax

show queue-monitor length status

Guidelines

On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the **queue-monitor length** command), the command displays the monitoring mode per-linecard.

On Arad and Jericho switches, even when all linecards are configured in Notifying Mode (using the **queue-monitor length notifying** command), some linecards may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to Polling Mode when SSO redundancy mode is configured on the card (here, the mode is shown as “polling due to SSO configured”).
  - On Jericho-based linecards, LANZ may run in Polling Mode when many features that use the switch’s statistic capabilities have been configured (here, the mode is shown as “polling due to counters exhausted”).

Examples

- This command displays the current LANZ configuration on an FM6000 device.

```
switch#show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds:  5000000

```

20.2.4.26 show queue-monitor length tx-latency

The **show queue-monitor length tx-latency** command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

Command Mode

EXEC

Command Syntax

show queue-monitor length [**INTERFACES**][**FACTOR**] tx-latency

Parameters

- **INTERFACES** interface type and number for report. Values include:
  - ***no parameter*** displays information for all interfaces.
  - ***ethernet e-range*** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - ***no parameter*** displays the last ***1000*** records.
  - **limit number samples** displays the last ***number*** records.
  - **limit number seconds** displays all records generated during the last ***number*** seconds. Value of number ranges from ***1*** to ***1000000***.

Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

Example

This command displays transmission latency data for the last ***1000*** LANZ events on the switch.

```
switch>show queue-monitor length tx-latency

20.2.4.27 show queue-monitor length

The **show queue-monitor length** command displays a report of recent over-threshold events for all interfaces, limited to the last ***1000*** records, with the newest events listed first.

LANZ must be enabled to use this command (see **queue-monitor length (global configuration mode)**). If LANZ is disabled, the command displays "queue-monitor is disabled."

To limit the output to a specified number of seconds and/or records, use the **show queue-monitor length limit** command.

Command Mode

EXEC

Command Syntax

show queue-monitor length

Examples

- This command displays the last ***1000*** LANZ records on an Arad or Jericho platform switch in Polling Mode.

```
switch>show queue-monitor length

20.2.4.28 show queue-monitor streaming clients

The **show queue-monitor streaming clients** command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

Command Mode

EXEC

Command Syntax

show queue-monitor streaming clients

Example

This command displays the number of clients connected to LANZ streaming.

```
switch#show queue-monitor streaming clients
Number of clients connected: 3
--------------------------------
172.20.63.161:6565
172.24.17.58:42
172.38.54.142:333
```

20.2.4.29 shutdown (queue-monitor-streaming configuration)

The **shutdown** command disables the streaming of LANZ data to external clients. The **no shutdown** command enables LANZ data streaming. Streaming is disabled by default.

Command Mode

Queue-Monitor-Streaming Configuration

Command Syntax

shutdown

no shutdown

Example

These commands enable the streaming of LANZ data on the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```

20.2.4.30 tcpdump queue-monitor

The **tcpdump queue-monitor** command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

Command Mode

Global Configuration

Command Syntax

tcpdump queue-monitor [file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose]

Parameters

- ***file*** output file.
  - **certificate:** certificate file.
    - **file:** standard file.
    - **flash:** flash file.
    - **sslkey:** sslkey file.
    - **usb1:** usb1 file.
- **filecount** specify the number of output files: ***1*** to ***100***.
- **filter** set the filtering expression to select which packets will be dumped.
- **lookup-names** enable reverse DNS lookups.
- **max-file-size** specify the maximum file size by entering *1* to ***100*** million bytes.
- **packet-count** specify ***1*** to ***10000*** packets to capture.
- **size** specify the maximum number of bytes to dump per packet with a size of ***1*** to ***65536*** bytes.
- **verbose** enable verbose mode.

Example

This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

20.3 Sampled Flow Tracking

This chapter describes Arista's implementation of sampled flow tracking, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Sampled Flow Tracking Overview
- Configuring Sampled Flow Tracking
- Hardware Flow Tracking with IPFIX Export
- Postcard Telemetry
- Inband Network Telemetry (INT) Support
- Sampled Flow Tracking Configuration Examples
- Sampled Flow Tracking Commands

20.3.1 Sampled Flow Tracking Overview

Network administrators require access to flow information that passes through various network elements to analyze and monitor networks. Sampled flow tracking provides access to IP flow information by sampling traffic flows in ingress direction on the interfaces on which it is configured. The samples are then used to create flow records that are exported to the configured collectors in the Internet Protocol Flow Information Export (IPFIX) format.

Sampled flow tracking terminology:

- **Flow tracker**: It is a collection of interfaces that collect samples and create flow records. The flow tracker has one or more exporters.
- **Exporter**: It sends flow records to one or more collectors.
- **Collector**: It receives flow records from one or more exporters.
- **Data record**: It contains values of the parameters corresponding to a template record.
- **Template record**: It defines the structure and interpretation of fields in a data record. It is an ordered sequence of type and length pairs.
- **Options template record**: It is a type of template record that defines the structure and interpretation of fields in a data record, including how to scope the applicability of the data record.

Data records are created based on the following flow key fields: source IP address, destination IP address, IP protocol, source port, destination port, VRF, and VLAN. These records support IPv4 flow data record and IPv6 flow data record.

Sampled flow tracking supports the following options data records:

- **VRF record**: mapping of VRF ID to VRF name.
- **Interface record**: mapping of interface ID to interface name.
- **Flow key indicator record**: mapping of template ID to flow key indicator.
- **Flow tracker record**: contains information about configured flow tracker.

20.3.1.1 Sampled Flow Tracking Limitations

The limitations of Sampled flow tracking are:

- Sampled flow tracking is active only when sFlow is disabled on the device.
- Sampled flow tracking does not support export of IPFIX messages over ECMP paths.
- Sampled flow tracking route simulation is not supported for ECMP paths.

20.3.2 Configuring Sampled Flow Tracking

These sections describe sampled flow tracking configurations.

Configuring Sampled Flow Tracking

Use the **flow tracker sampled** command to enable sampled flow tracking on a tracker. Each tracker should have a minimum of one exporter configured.

Example

This command enables sampled flow tracking on an interface ***Eth1*** and the flow tracker ***ftr1***.

```
switch(config)# interface Eth1
switch(config-if-Et1)# flow tracker sampled ftr1
```

Use the **sample** command to enable the sample rate for a specific sampled flow tracker. The default sample rate is ***1048576***.

Example

These commands configure a sample rate of ***1024*** for the sampled flow tracker.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#sample 1024
```

20.3.2.1 Configuring the Sampled Flow Tracker

Use the **tracker** command to configure a sampled flow tracker for a device.

Example

This command configures a sampled flow tracker named ***ftr1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

Use the **record export on interval** command to configure the interval at which active flow records are exported. The default interval is *300000* milliseconds.

Example

These commands configure an active record interval of ***7000*** for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on interval
 7000
```

Use the **record export on inactive timeout** command to configure the interval at which timed-out inactive flow records are exported. The default interval is ***15000*** milliseconds.

These commands configure an inactive record interval of ***4000*** for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on inactive
 timeout
4000
```

20.3.2.2 Configuring Exporter for Sampled Flow Tracker

Use the **exporter** command to configure or unconfigure an exporter for a specific tracker.

Example

This command configures exporter ***exp1*** for the specific tracker ***ftr1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

Use the **`collector`** command to configure the collector for the specific exporter.

Example

These commands configure a collector for the IPv4 address ***192.0.2.0*** and collector port number ***10***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 192.0.2.0 port 10
```

Use the **`local interface`** command to configure the local source interface for the specific exporter.

Example

These commands configure the local source ***interface Ethernet1*** for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
```

Use the **`dscp`** command to configure the DSCP value for the specific exporter. The default DSCP value is ***0***.

Example

These commands configure a DSCP value of ***10*** for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10
```

Use the **`format ipfix version`** command to configure the IPFIX version and maximum packet size for the specific exporter. The default IPFIX version is ***10*** and the default maximum packet size is ***9152***.

Example

These commands configure an IPFIX version of ***10*** and a maximum packet size of ***854*** for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#format ipfix version 10
max-packet-size 854
```

Use the **`template interval`** command to configure the interval at which templates are exported for the specific exporter. The default template interval is ***3600000*** milliseconds.

Example

This command configures the interval of ***3400000*** milliseconds for the exporter ***exp1***.

```
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```

20.3.3 Hardware Flow Tracking with IPFIX Export

Hardware flow tracking uses match criteria to collect data from packets based on defined flow profiles. The data collected is sent to an external node called Collector using IPFIX flow export protocol. The flow tracking engine tracks up to 32K flows going through a given set of ports in a switch with IPFIX-capability. Flow tracking is configured on physical interfaces or LAG interfaces. The matching fields in the packet header are:

- IP source
- IP destination
- IP protocol
- IP protocol's source port
- IP protocol's destination port

The information collected is:

- Byte count (4 bytes)
- Packet count (4 bytes)
- New-learn timestamp
- Flow start timestamp
- Flow end timestamp

Configuring Hardware Flow-tracking

This file extract show a hardware flow-tracking configuration.

```
! Define a loopback interface to act as the local source interface for
! IPFIX export
int Loopback0
 ip address 1.2.3.4/32

@ Enable IP routing for IPFIX packet to be routed to the collector
ip routing

! The flow tracker definition
flow tracking hardware
   tracker myFtr
      record export on inactive timeout 60000
      record export on interval 30000
      !
      exporter myExporter
         local interface Loopback0
         template interval 5000
         collector 172.28.130.153
   no shutdown

! Flow tracked interface/port
int Ethernet48
 flow tracker hardware myFtr
 no shutdown
```

This command shows general information about hardware flow tracking.

```
switch#show flow tracking hardware
Flow Tracking Status
  Type: Hardware
  Running: yes
  Tracker: myFtr
    Active interval: 30000ms
```

```
    Inactive timeout: 60000ms
    Groups: IPv4, IPv6, VxlanIPv4, VxlanIPv6
    Exporter: myExpoter
      VRF: default
      Local interface: Loopback0 (1.2.3.4)
      Export format: IPFIX version 10, MTU 1500
      DSCP: 0
      Template interval: 5000ms
      Collectors:
        172.28.130.153 port 4739
    Active interfaces:
      Et48
```

This command shows hardware flow tracking **IPFIX** template.

```

20.3.4 Postcard Telemetry

The postcard telemetry gathers per flow telemetry information like path and per hop latency. The path, latency and congestion information for flows at different times help in troubleshooting and monitoring flows. Postcard telemetry samples flows at every switch, aggregates them and sends the samples to a collector with path and latency information using GRE encapsulation. For calculating latency information, switches in the network need to be in PTP sync.

The information collected is:

- Length of the truncated samples in bytes.
- 48-bit timestamp.
- SNMP OID values of Ingress and Egress ports.
- 16 bit IP payload checksum, uniquely identify the sample of the same packet from different switches at the collector.
- Sample Rate (Multiplier is 1K).
- Sample data, packet inclusive of L2 header, truncated to 256 bytes.

Configuring Postcard Telemetry for Collector

All switches have same configuration for postcard telemetry to give correct information to collector and it should enabled with PTP.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# no disabled
switch(config-tele-postcard-policy)# ingress collection gre source
 10.10.10.10 destination 172.16.1.1
```

```
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# telemetry postcard policy profile default
```

The sample rates can be selected:

- 16384 Set sample rate to 1 in 16k packets
- 32768 Set sample rate to 1 in 32k packets
- 65536 Set sample rate to 1 in 64k packets

This example configures sample policy for matching two different flow sets.

Match Rule 1:

- Destination IP prefix ***10.1.1.0/24*** and Source IP prefix ***10.2.2.0/24***
- TCP source port number ***100*** and destination source port number ***200***

Match Rule 2:

- Destination IP prefix ***172.16.2.0/24***
- Source IP prefix ***172.16.3.0/24***

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# sample policy mypolicy
switch(config-postcard-sample-policy-mypolicy)# match myrule1
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# destination prefix 10.1.1.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# source prefix 10.2.2.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# protocol tcp source port 100 destination port 200

switch(config-postcard-sample-policy-mypolicy)# match myrule2
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# destination prefix 172.16.2.0/24
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# source prefix 172.16.3.0/24

switch(config-postcard-sample-policy-mypolicy)# profile myprofile
switch(config-postcard-profile-myprofile)# ingress sample policy
 mypolicy

switch(config)# interface Ethernet2/1
switch(config-if-Et1/1)# telemetry postcard policy profile
 myprofile
```

These actions can be configured for any match rule, sample at specified rate, sampling all packets, or no sampling for the flow. The last option is the default.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)# sample policy mypolicy
switch(config-postcard-sample-policy-mypolicy)# match myrule1
 ipv4
switch(config-postcard-sample-policy-match-mypolicy-myrule1-ipv4
)# actions
```

```
switch(config-postcard-sample-policy-actions-mypolicy-
myrule1)# sample
```

Sampling can also be done based on user specified checksum value and mask in TCP/UDP header.

```
switch(config)# monitor telemetry postcard policy
switch(config-tele-postcard-policy)#ingress sample tcp-udp-check
sum value <val> mask <mask>
```

Show Commands

This shows sample rate and collector IP configuration.

```
switch#show monitor telemetry postcard policy
Enabled: true
Ingress collection sample rate: 16384
Ingress collection type: GRE
Ingress collection source: 10.10.10.10
Ingress collection destination: 172.16.1.1
```

This shows information about postcard telemetry sample policies.

```
switch#show monitor telemetry postcard sample policy
Sample policy default
Total number of rules configured: 1
match ipv4 ipv4-all-default:
        Actions: sample

Sample policy mypolicy
Total number of rules configured: 3
match ipv4 myrule1:
        Source: 10.2.2.0/24
        Destination: 10.1.1.0/24
        Protocol: tcp
                Source port: 100
                Destination port: 200
match ipv4 myrule2:
        Source: 172.16.2.0/24
        Destination: 172.16.2.0/24
match ipv4 ipv4-all-default:
```

This shows different profiles configured and interfaces on which profiles are configured and active.

```
switch#show monitor telemetry postcard policy profiles
Profiles
Name: default
Sample policy: default
Configured on: Et1/1
Active on: Et1/1

Name: myprofile
Sample policy: mypolicy
Configured on: Et2/1
Active on: Et2/1
```

```
switch#show monitor telemetry postcard policy profile myprofile
Profiles
Name: myprofile
Sample policy: mypolicy
Configured on: Et2/1
Active on: Et2/1
```

20.3.4.1 Configuring TCAM Profile for Postcard Telemetry

The postcard telemetry requires the system TCAM profile to have postcard telemetry enabled. This can be achieved by creating a user defined TCAM profile.

The system TCAM profile must have the **`telemetry postcard policy ipv4`** to support postcard telemetry for IPv4 packets. This is applicable for both copied or newly created TCAM profiles.

Creating the User Defined TCAM profile

This adds the postcard telemetry to the default profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile <profile name> copy default
switch(config-hw-tcam-profile-<profile>)# feature telemetry postcard
 policy ipv4 copy
switch(system-feature-source-profile) #
```

Postcard telemetry is supported for ipv4 bridged and routed packets.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# packet ipv4
 forwarding bridged
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# packet ipv4
 forwarding routed
```

Key size is limited to 160. This is optional for feature copied from the ***system-feature-source-profile***.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# key size
 limit 160
```

This removes the unused features to ensure that the TCAM DB for postcard telemetry gets allocated.

```
switch(config-hw-tcam-profile-<profile>-feature-<feature>)# exit
switch(config-hw-tcam-profile-<profile>)# no feature mirror ip
switch(config-hw-tcam-profile-<profile>)#
```

Applying the User Defined TCAM Profile

This sets the profile as the system profile under the ***hardware tcam*** mode.

```
switch(config-hw-tcam)# system profile <profilename>
```

When the system TCAM profile is changed, it is expected for some of the agents to restart. This removes the unused features to ensure that the TCAM DB for postcard telemetry gets allocated.

Limitations

- Only IPv4 collector in default VRF is supported.
- Only IPv4 match rules are supported in sample policy.
- Postcard telemetry for VxLAN encapsulated packets is not supported.
- Postcard telemetry for PBR forwarded packets is not supported.

- Postcard telemetry for packets with IP options are not supported.
- Postcard telemetry for multi destination packets is not supported.
- Postcard telemetry for packets dropped or consumed by switch is not supported.
- DCS-7280 and DCS-7500 platforms can support at most 3 postcard policies.
- For INT to be enabled, all the other telemetry features must be in disabled state (e.g.: Sflow, Sampled flow tracking).

20.3.5 Inband Network Telemetry (INT) Support

The Inband Network Telemetry, eXport Data (INT-XD) gathers flow, queue, drop telemetry information like network path, hop latency, queue congestion, drop reasons and more which are used for network monitoring and troubleshooting.

The INT-XD supports:

- Flow telemetry report generates from flow events. Flow events include new flows, change in the attributes of flow like ingress/egress port or latency. Flow reports include information about the path that packets traverse as well as other telemetry metadata such as hop latency and queue occupancy.
- Drop reports provide visibility into the impact of packet drops on user traffic. Drop reports include information about the path that packets traversed as well as other telemetry metadata such as drop reason code and queue id.
- Queue congestion reports are generated from queue-related events, like packets exceeding the queue depth or latency. This provides visibility into the traffic causing and prolonging queue congestion.

Platform Compatibility

The following platforms support the INT-XD feature.

- DCS-7170-64C-F
- DCS-7170-64C-R
- DCS-7170-64C#
- DCS-7170-64C-M#
- DCS-7170-32C-F
- DCS-7170-32C-R
- DCS-7170-32C#
- DCS-7170-32C-M-F
- DCS-7170-32C-M-R
- DCS-7170-32C-M#
- DCS-7170-32CD-F
- DCS-7170-32CD-R
- DCS-7170-32CD#

Configuration

All switches have same configuration for INT-XD and postcard telemetry to give correct information to collector and they are supported only in default profile.

```
switch(config)# platform barefoot profile default
```

This command enters the postcard telemetry context to enable the feature.

```
switch(config)# monitor telemetry postcard int-xd
```

This command enables the postcard telemerty.

```
switch(config-tele-postcard-int-xd)# no disabled
```

This command enables flow report.

```
switch(config-tele-postcard-int-xd)# report flow
```

This command configures flow report refresh interval. By default it is set to 5 seconds.

```
switch(config-tele-postcard-int-xd)# report flow refresh-interval <value>
 seconds
```

This command enables drop report.

```
switch(config-tele-postcard-int-xd)# report drop
```

This command enables queue report.

```
switch(config-tele-postcard-int-xd)# report queue
```

This command configures queue depth threshold. By default it is set to 2 percent.

```
switch(config-tele-postcard-int-xd)# report queue depth 10 percent
```

This command configures switch hop latency threshold. By default it is set to 2048 ns.

```
switch(config-tele-postcard-int-xd)# report queue latency 1024
 nanoseconds
```

This command configures queue report suppression limits. Default value is 1000 reports/sec per queue.

```
switch(config-tele-postcard-int-xd)# report queue rate-limit 1000
 reports-per-second
```

This command configures unique id of a switch.

```
switch(config-tele-postcard-int-xd)# device id 25
```

This command exits the mode to commit the changes.

```
switch(config-tele-postcard-int-xd)# exit
```

Show Commands

This example shows the mapping between drop reason text and drop reason code.

```
switch(config)# show platform barefoot int drop codes
Code                      Reason
------  ---------------------------------------------------
---------
     1    Ingress STP blocked
```

```
      2    Ingress invalid VLAN
```

This command shows the current sequence number of the INT-XD reports. Sequence number is incremented every time an INT-XD report is sent. It shows the sequence number in HEX format.

```
switch(config)# show platform barefoot registers seqNumber
```

Limitations

- Specific flow watchlist to filter flows is not supported in this release.
- A 5-tuple of outer header is used for tracking the flows.
- Collector reachability through overlay networks is not supported.
- Packets punted to the CPU are not exported to the collector.
- Collector reachability over non default vrf is not supported.
- Collector reachability via out of band management port is not supported.
- Only unicast packet tail drops are exported to collectors.
- INT reports are sent to a single collector reachable via IPv4.

20.3.6 Sampled Flow Tracking Configuration Examples

This section describes the command configurations required to configure sampled flow tracking.

20.3.6.1 Sampled Flow Tracking Basic Configuration

The following commands enable a basic configuration.

1. Enable configuration mode for the sampled flow tracking on a device.

```
switch(config)#flow tracking sampled
```

2. Configure a sampled flow tracker for a device.

```
switch(config-flow-tracking-sampled)#tracker ftr1
```

3. Configure an exporter for the specific tracker.

```
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
```

4. Configure the collector for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 172.31.22.131
```

5. Configure the local source interface Ethernet1 for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
```

6. Enable sampled flow tracking.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#no shutdown
```

7. Configure the interface Ethernet2 for the specific exporter.

```
switch(config)#interface Ethernet2
```

8. Configure the sampled flow tracker on ***interface Ethernet2***.

```
switch(config)#interface Ethernet2
switch(config-if-Et2)#flow tracker sampled ftr1
```

20.3.7 Sampled Flow Tracking Commands

This section contains descriptions of Sampled flow tracking commands.

Configuration Commands

- collector
- dscp
- exporter
- flow tracking sampled
- format ipfix version
- local interface
- record export on inactive timeout
- record export on interval
- sample
- shutdown (sampled flow tracking)
- template interval
- tracker

Interface Configuration Command

- flow tracker sampled

Privileged EXEC Command

- clear flow tracking sampled counters

Sampled Flow Tracking Display Commands

- show flow tracking sampled
- show flow tracking sampled counters
- show flow tracking sampled flow-table
- show flow tracking sampled ipfix options-table
- show flow tracking sampled ipfix template

20.3.7.1 clear flow tracking sampled counters

The **clear flow tracking sampled counters** command clears the flow tracking counters for all trackers, a specified tracker, or a specified tracker and exporter.

Command Mode

Privileged EXEC

Command Syntax

clear flow tracking sampled counters [tracker *tracker_name* [exporter *exporter_name*]]

Parameters

- **tracker *tracker_name*** Specifies the flow tracker.
- **exporter *exporter_name*** Specifies the exporter.

Example

This command clears the flow counters for the tracker ***ftr1*** and exporter ***exp1***.

```
switch#clear flow tracking sampled counters tracker ftr1 exporter exp1
switch#
```

20.3.7.2 collector

The **collector** command configures a collector to receive flow records from a specified exporter.

The **no collector** and **default collector** commands remove the configured collector from ***running-config***.

Command Mode

Sampled Flow Tracking Exporter Configuration

Command Syntax

collector {*ipv4_address* | *ipv6_address*} [port *port_number*]

no collector {*ipv4_address* | *ipv6_address*} [port *port_number*]

default collector {*ipv4_address* | *ipv6_address*} [port *port_number*]

Parameters

- ***ipv4_address*** Specifies the IPv4 address of the collector.
- ***ipv6_address*** Specifies the IPv6 address of the collector.
- **port *port_number*** Specifies the port number for the collector. Values range from ***1*** to ***65535***. The default value is ***4739***.

Example

These commands configure a collector for the IPv4 address ***192.0.2.0*** and collector port number ***10***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 192.0.2.0 port 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```

20.3.7.3 dscp

The **dscp** command configures the Differentiated Services Code Point (DSCP) value for a specific exporter.

The **no dscp** and **default dscp** commands reset the DSCP value to the default of 0.

Command Mode

Sampled Flow Tracking Exporter Configuration

Command Syntax

dscp *dscp_value*

no dscp *dscp_value*

default dscp *dscp_value*

Parameters

dscp_value the DSCP value assigned to the exporter. Value ranges from ***0*** to ***63***. Default value is ***0***.

Example

These commands configure a DSCP value of ***10*** for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```

20.3.7.4 exporter

The **exporter** command places the switch in sampled flow tracking exporter configuration mode for the specified exporter and creates the exporter if it does not yet exist.

The **no exporter** and **default exporter** commands remove the specific exporter from ***running-config***.

Command Mode

Sampled Flow Tracking Tracker Configuration

Command Syntax

exporter *exporter_name*

no exporter *exporter_name*

default exporter *exporter_name*

Parameters

exporter_name the name of the exporter.

Example

These commands create exporter ***exp1*** for the flow tracker ***ftr1*** and place the switch in configuration mode for that exporter.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#
```

20.3.7.5 flow tracker sampled

The **flow tracker sampled** command configures an interface to be part of a flow tracker. An interface can belong to only one flow tracker.

The **no flow tracker sampled** and **default flow tracker sampled** commands remove the specified interface from the specified tracker.

Command Mode

Interface-Ethernet Configuration

Command Syntax

flow tracker sampled *tracker_name*

no flow tracker sampled *tracker_name*

default flow tracker sampled *tracker_name*

Parameters

tracker_name the name of the flow tracker to which the interface is to be added.

Example

This command configures ***interface ethernet 1*** to participate in the flow tracker ***ftr1***.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#flow tracker sampled ftr1
switch(config-if-Et1)#
```

20.3.7.6 flow tracking sampled

The **flow tracking sampled** command places the switch in sampled flow tracking configuration mode. Sampled flow tracking configuration mode is a group-change mode; changes made in a group-change mode are saved by exiting the mode.

The **no flow tracking sampled** and **default flow tracking sampled** commands remove all sampled flow tracking configuration from ***running-config***.

Command Mode

Global Configuration

Command Syntax

flow tracking sampled

no flow tracking sampled

default flow tracking sampled

Commands Available in Sampled Flow Tracking Configuration Mode

- **abort** exits mode without saving changes
- **exit** exits mode and saved changes
- **sample** configures sample parameters
- **shutdown (sampled flow tracking)** enables or disables sampled flow tracking
- **tracker** configures a flow tracker

Example

This command places the switch in the ***sampled flow tracking*** configuration mode.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)#
```

20.3.7.7 format ipfix version

The **format ipfix version** command configures the IPFIX version and maximum packet size for a specific exporter.

The **no format ipfix version** and **default format ipfix version** commands remove the previously configured IPFIX version and the maximum packet size value from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

format ipfix version *ipfix_version* [max-packet-size *max-packet-size value*]

no format ipfix version *ipfix_version* [max-packet-size]

default format ipfix version *ipfix_version* [max-packet-size]

Parameters

- ***ipfix_version*** the IPFIX version. Default value is *10*.
- **max-packet-size *max-packet-size value*** the IPFIX maximum packet size. Value ranges from ***512*** to ***65472***. Default value is ***9152***.

Example

These commands configure an IPFIX version of ***10*** and a maximum packet size of ***854*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# format ipfix version 10
max-packet-size 854
```

20.3.7.8 local interface

The **`local interface`** command configures the local source interface for the specific exporter.

The **`no local interface`** and **`default local interface`** commands remove the local interface for the specific exporter from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`local interface` *interface*

`no local interface`

`default local interface`

Parameters

interface Interface type and numbers. Options include:

- **Ethernet *eth_num*** displays the information of the specified Ethernet interface. The value ranges from ***1*** to ***64***.
- **Loopback *lb_num*** displays the information of the specified loop back interface. The value ranges from ***0*** to ***2100***.
- **Management *m_num*** displays the information of the specified Management interface. The management port number ranges from ***1*** to ***2***.
- **Port-Channel *pc_num*** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from ***1***-***1000*** and ***1***-***2000***, ***1***-***4094*** respectively.
- **Tunnel *t_num*** displays the information of the specified tunnel. The value ranges from ***0*** to ***255***.
- **Vlan *vlan_num*** displays the information of the specified VLAN interface. The value ranges from ***1*** to ***4094***.

Example

These commands configure the local source ***interface Ethernet1*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

20.3.7.9 record export on inactive timeout

The **record export on inactive timeout** command configures the interval at which inactive flow records time out and are exported for a flow tracker.

The **no record export on inactive timeout** and **default record export on inactive timeout** commands remove the timeout interval from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

record export on inactive timeout *timeout_value*

no record export on inactive timeout

default record export on inactive timeout

Parameters

timeout_value the flow record inactive export timeout value in milliseconds. Value ranges from ***3000*** to ***900000***. The default value is ***15000*** milliseconds.

Example

These commands configure an inactive record interval of ***6000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on inactive
 timeout
6000
```

20.3.7.10 record export on interval

The **`record export on interval`** command configures the interval at which active flow records are exported for a flow tracker.

The **`no record export on interval`** and **`default record export on interval`** commands remove the interval from ***running-config***.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`record export on interval` *interval_value*

`no record export on interval`

`default record export on interval`

Parameters

interval_value the flow record export interval in milliseconds. Value ranges from ***5000*** to ***36000000***. The default value is ***300000*** milliseconds.

Example

- These commands configure an active record interval of ***9000*** for the exporter ***exp1***.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval
 9000
```

20.3.7.11 sample

The **sample** command enables the sample rate for a specific sampled flow tracker.

The **no sample** and **default sample** commands remove the sample rate configured for a specific sampled flow tracker from ***running-config***.

Command Mode

Sampled Flow Configuration

Command Syntax

sample *sample_rate*

no sample

default sample

Parameters

sample_rate the sample flow tracking rate to be assigned for a sampled flow tracker. Value ranges from ***1024*** to ***16777216***. Default value is ***1048576***.

Example

These commands configure a sample rate of ***2056*** for the sampled flow tracker.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#sample 2056
```

20.3.7.12 show flow tracking sampled counters

The **show flow tracking sampled counters** command displays information about the flow tracking counters of a specific tracker and the counters of a specified exporter within that tracker.

Command Mode

EXEC

Command Syntax

show flow tracking sampled counters [tracker *tracker_name* [exporter *exporter_name*]]

Parameters

- **tracker *tracker_name*** the specific flow tracker.
- **exporter *exporter_name*** the specific exporter within the tracker.

Example

This command displays the flow tracking counter information of the tracker ***ftr1*** and the exporter ***exp1***.

```
switch# show flow tracking sampled counters tracker ftr1 exporter exp1
Tracker: ftr1
  1 flows, 22 RX packets
  Flows created: 1, expired: 0
  Group: IPv4
  1 flows, 22 RX packets
  Group: IPv6
  0 flows, 0 RX packets
  Exporter: exp1 (IPFIX)
  Collector: 172.31.24.133 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
  Collector: 172.31.22.131 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
```

20.3.7.13 show flow tracking sampled flow-table

The **show flow tracking sampled flow-table** command displays information about the active flows maintained in the EOS.

Command Mode

EXEC

Command Syntax

show flow tracking sampled flow-table [detail | dst-ip | dst-port | group | interface | protocol | src-ip | src-port | tracker | vlan | vrf]

Parameters

- **detail** displays detailed flow records.
- **dst-ip** displays flow records based on destination IPv4 or IPv6 address.
- **dst-port** displays flow records based on a specified destination port.
- **group** displays flow records based on IPv4 or IPv6 flow groups.
- **interface** displays flow records based on ingress interface.
- **protocol** displays flow records based on the flow IP protocol.
- **src-ip** displays flow records based on source IPv4 or IPv6 address.
- **src-port** displays flow records based on a specified source port.
- **tracker** displays flow records based on flow tracker.
- **vlan** displays flow records based on a specified flow VLAN ID.
- **vrf** displays flow records based on flow VRF.

Examples

- This command displays information about the active flows on the device.

```
switch#show flow tracking sampled flow-table
Tracker: ftr1, Flows: 1
 Group: IPv4, Flows: 1
 VRF  VLAN   Source        Destination   Protocol   Start Time            Pkts   Bytes
 ---- ------ ------------- ------------- ---------- --------------------- ------ ------
 red  42     10.10.1.1:0   10.20.1.2:0   UDP        2019-04-18 15:06:50    7      700
```

- This command displays detailed information about the active flows on the device.

```
switch#show flow tracking sampled flow-table detail
Tracker: ftr1, Flows: 1
  Group: IPv4, Flows: 1
  Flow: UDP 10.10.1.1:0 - 10.20.1.2:0, VRF: red, VLAN: 42
  Start time: 2019-04-18 15:06:50.268734, Last packet time: 2019-04-18
 15:07:03.607900
  Packets: 15, Bytes: 1500, TOS: 0, TCP flags: none
  Source MAC: 001c.73ee.bfe4, Destination MAC: 001c.7374.3b85
  Ingress Interface: 'Ethernet1', Egress VLAN: routed, Egress
 Interface: CPU
  Next hop: unknown, BGP next hop: unknown (AS unknown), Source AS:
 unknown
  Source prefix length: 24, Destination prefix length: 32
```

20.3.7.14 show flow tracking sampled ipfix options-table

The **show flow tracking sampled ipfix options-table** command displays information about the sampled IPFIX options table available.

Command Mode

EXEC

Command Syntax

show flow tracking sampled ipfix options-table tracker [flow-key | flow-tracker | interface | vrf]

Parameters

- **tracker** displays the output for a specific flow tracker.
- **flow-key** displays the flow keys options table.
- **flow-tracker** displays the flow tracker options table.
- **interface** displays the interface options table.
- **vrf** displays the VRF options table.

Example

This command displays the sampled IPFIX options table for the tracker ***ftr1***.

```
switch# show flow tracking sampled ipfix options-table
Tracker: ftr1
  Observation domain: ftr1, ID: 1
  Active interval: 30sec
  Inactive timeout: 120sec
  Selector algorithm: random(3)
  Sampling: 1/1024
  Flow tracking type: sampled(1)
  VRF Table, Template ID: 256, Scope: ingressVRFID
  VRF ID VRF Name
  -------------- --------
  0 default
  1 red
  16777215
  Interface Table, Template ID: 257, Scope: ingressInterface
  Interface ID Interface Name
  ------------------ ----------------
  0 unknown
  3013 Ethernet1
  3014 Ethernet2

  1073741823 CPU
  1073741824 discard
  1074029945 Ethernet3/36/1.1
  1074292089 Ethernet3/36/1.2
  2147483648 multicast
  Flow Keys Table, Template ID: 258, Scope: templateId
  Template ID Flow Key Indicator
  ---------------- ------------------
  261 0x7f
  262 0x7f
```

20.3.7.15 show flow tracking sampled ipfix template

The **show flow tracking sampled ipfix template** command displays information about the exported IPFIX data templates and options templates.

Command Mode

EXEC

Command Syntax

show flow tracking sampled ipfix template [data | options | tracker]

Parameters

- **data** displays the data templates.
- **options** displays the flow options template.
- **tracker** displays the flow tracker template.

Example

This command displays the sampled IPFIX options table for the tracker ***ftr1***.

```
switch# show flow tracking sampled ipfix template
Tracker: ftr1
  Data Template, Group: IPv4, Fields: 26, Template ID: 261
    ingressVRFID (234), 4 bytes
    vlanId (58), 2 bytes
    sourceIPv4Address (8), 4 bytes
    destinationIPv4Address (12), 4 bytes
    protocolIdentifier (4), 1 bytes
    sourceTransportPort (7), 2 bytes
    destinationTransportPort (11), 2 bytes
    sourceMacAddress (56), 6 bytes
    postDestinationMacAddress (57), 6 bytes
    octetDeltaCount (1), 8 bytes
    packetDeltaCount (2), 8 bytes
    flowStartMilliseconds (152), 8 bytes
    flowEndMilliseconds (153), 8 bytes
    flowEndReason (136), 1 bytes
    tcpControlBits (6), 2 bytes
    ingressInterfaceType (368), 4 bytes
    ingressInterface (10), 4 bytes
    postVlanId (59), 2 bytes
    egressInterface (14), 4 bytes
    ipClassOfService (5), 1 bytes
    bgpSourceAsNumber (16), 4 bytes
    bgpDestinationAsNumber (17), 4 bytes
    bgpNextHopIPv4Address (18), 4 bytes
    ipNextHopIPv4Address (15), 4 bytes
    sourceIPv4PrefixLength (9), 1 bytes
    destinationIPv4PrefixLength (13), 1 bytes

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

20.3.7.16 show flow tracking sampled

The **show flow tracking sampled tracker** command displays information about the status of a specific tracker and the status of a specified exporter within that tracker. If no tracker is specified in the command, then all information about all trackers is displayed.

Command Mode

EXEC

Command Syntax

show flow tracking sampled [tracker *tracker_name* [exporter *exporter_name*]]

Parameters

- **tracker *tracker_name*** the specific flow tracker.
- **exporter *exporter_name*** the specific exporter within the tracker.

Example

This command displays the status information of the tracker ***ftr1*** and the exporter ***exp1***.

```
switch#show flow tracking sampled tracker ftr1 exporter exp1
Flow tracking status
 Type: Sampled
 Running: yes
 Sample rate: 1024
 Tracker: ftr1
 Active interval: 30000ms
 Inactive timeout: 120000ms
 Groups: IPv4, IPv6
 Exporter: exp1
 VRF: default
 Local interface: Management1 (172.30.150.179)
 Export format: IPFIX version 10, MTU 1500
 DSCP: 48
 Template interval: 3600000ms
 Collectors:
 172.31.22.131 port 4739
 Active interfaces:
 Et1
```

20.3.7.17 shutdown (sampled flow tracking)

The **shutdown** command disables sampled flow tracking for the specific exporter.

The **no shutdown** command enables sampled flow tracking for the specific exporter.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

These commands enable sampled flow tracking for the specific exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#no shutdown
```

20.3.7.18 template interval

The **`template interval`** command configures the interval at which templates are exported for a specific exporter. The default template interval is ***3600000*** milliseconds.

The **`no template interval`** and **`default template interval`** commands reset the interval rate to the default.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

`template interval` *interval*

`no template interval`

`default template interval`

Parameters

interval the interval rate in milliseconds. The value ranges between ***5000*** and ***3600000*** milliseconds. The default rate is ***3600000*** milliseconds.

Example

This command configures the interval of ***3400000*** milliseconds for the exporter ***exp1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-exp-ftr1-exp1)#template interval 3400000
```

20.3.7.19 tracker

The **tracker** command configures a sampled flow tracker for a device.

The **no tracker** and **default tracker** commands remove the sampled flow tracker from the ***running config***.

Command Mode

Sampled Flow Configuration

Command Syntax

tracker *tracker_name*

no tracker *tracker_name*

default tracker *tracker_name*

Parameters

tracker_name the flow tracker name.

Example

These commands configure the sampled flow tracker ***ftr1***.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
```

20.4 sFlow

This chapter describes Arista's implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- sFlow Conceptual Overview
- sFlow Configuration Procedures
- sFlow Subinterfaces
- QinQ L3 Subinterfaces
- sFlow Configuration Commands

20.4.1 sFlow Conceptual Overview

20.4.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow is a statistical sampling technology that is designed to be deployed on all ports within a network to provide end to end visibility.
- sFlow exports packet samples and topology meta data to a centralized collector application
- sFlow is scalable to operate on all switch ports simultaneously.
- sFlow is implemented on all devices, without requiring additional memory or CPU and does not impact dataplane forwarding
- sFlow is an industry standard (***RFC 3176***).

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

20.4.1.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.

20.4.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents.

Arista switches reference a collectors IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

20.4.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet's header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

20.4.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- **global**: sFlow and BGP sFlow export are globally disabled.
- **Ethernet and port channel interfaces**: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the **dangerous** keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.

The following lists describe sFlows sampling behavior relative to different packet types:

- Packets that are sampled:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
  - Multicast packets
- Packets that are not sampled:
  - LACP frames
  - LLDP frames
  - STP BPDUs
  - IGMP packets
  - PAUSE frames
  - PIM hello packets
  - CRC error frames

- Packets dropped by ACLs or due to VLAN violations

20.4.1.3 sFlow and Mirroring

The sFlow and Mirroring is supported using the same interface for both a mirroring session and sFlow at the same time. But when sFlow and mirroring is configured on the same interface, the TAP Aggregation is not supported. And when TAP Aggregation mode is enabled, the interface configured as a source for both a mirroring session and sFlow will only mirror packets, and sFlow samples are not produced.

The sFlow and Mirroring are supported on the following switch series:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, DCS-7500E, DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, and DCS-7300X.

However, the following switches have a limitation:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, and DCS-7500E.

When a mirroring session and sFlow is configured on a same interface for the above devices, the following packet types are not sampled though they are sampled with only sFlow.

- STP BPDUs
- LACP frames
- LLDP frames
- OSPF packets
- PIM HELLO packets
- Packets dropped due to VLAN violations

20.4.1.4 Hardware accelerated sFlow

The hardware-accelerated sFlow is supported on compatible platforms. Without hardware acceleration, all sFlow processing is done in software, so performance is dependent on the capabilities of the host CPU. Aggressive sampling rates also decrease the amount of processing time available for other EOS applications.

With hardware acceleration, all sFlow processing is done in hardware using specialized chips, called accelerators. These accelerators process sampled packets and send out sFlow datagrams similarly as the software agent. Involvement from the CPU is very little and the chips are dedicated to sFlow, performance is higher and the CPU has more availability for other tasks, even with high sampling rates.

The Hardware accelerated sFlow is supported on the following switch series:

DCS-7280R3, DCS-7280SR2A-48YC6, DCS-7280CR2-60, DCS-7280CR2A-60, DCS-7280CR2K-60, DCS-7280CR2-30, DCS-7280CR2A-30, DCS-7280SRAM-48C6, DCS-7280SR2K-48C6, DCS-7500R3, DCS-7500R2A-36CQ-LC, DCS-7500R2AK-36CQ-LC, DCS-7500R2AM-36CQ-LC, DCS-7500R2AK-48YCQ-LC. and DCS-7800R3

However, the following switches have a limitation:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, and DCS-7500E.

Before enabling hardware-accelerated sFlow, the following requirements must be fulfilled:

- sFlow must be running globally.
- Routing must be enabled in any VRF. This is required for sFlow datagrams to be routed to the collector(s).

The following command enables or disables hardware-accelerated sFlow in configuration mode.

```
switch(config)#[no|default] sflow hardware acceleration
```

The following command disables hardware-accelerated sFlow on a particular LineCard.

```
switch(config)#no sflow hardware acceleration module Linecard3
```

The following command revertshardware-accelerated sFlow on a particular LineCard.

```
switch(config)#sflow hardware acceleration module Linecard3
```

Example

The following example enables routing on the switch, activates sFlow, and enables hardware acceleration globally, but forces software sFlow on Linecard3.

```
switch(config)#ip routing
switch(config)#sflow run
switch(config)#sflow hardware acceleration
switch(config)#sflow source 10.10.10.1
switch(config)#sflow destination 10.10.10.2
switch(config)#sflow hardware acceleration sample 1024
switch(config)#no sflow hardware acceleration module Linecard3
```

Example

The following example is for IPv6 configuration. Hardware accelerated sFlow enables either IPv4 or IPv6 collectors. IPv6 configuration takes precedence over IPv4 configuration and IPv4 collectors will be disabled.

```
switch(config)#ipv6 unicast-routing
switch(config)#ip routing
switch(config)#sflow run
switch(config)#sflow hardware acceleration
switch(config)#sflow source-interface Ethernet1/1
switch(config)#sflow destination 10.10.10.2
switch(config)#sflow hardware acceleration sample 1024
switch(config)#no sflow hardware acceleration module Linecard3
```

Example

The command **show sflow hardware status** displays the current status of hardware acceleration for sFlow for fixed system.

```
switch(config)#show sflow hardware status
Status
——
Hardware Acceleration On: No
       - sFlow must be enabled
       - sFlow hardware acceleration must be enabled in the CLI
       - routing must be enabled in any VRF
Sample Rate: None
```

Example

The command **show sflow hardware status** displays the current status of hardware acceleration for sFlow for modular system.

```
switch(config)#show sflow hardware status
Status
——
Hardware Acceleration On: Yes
Sample Rate: 1048576
                        sFlow Mode
Module          Active                  Configured             Has sFlow
 accelerators
——————      ————————            —————————         ————————
Linecard3       Software                Hardware-accelerated        No
Linecard4       Software                Hardware-accelerated        No
Linecard5       Hardware-accelerated    Hardware-accelerated        Yes
Linecard6       Hardware-accelerated    Hardware-accelerated        No
```

Example

The command **show sflow hardware counters** displays counters that are specific to sFlow acceleration.

```
switch(config)#show sflow hardware counters
———————
SflowAccelFpga7:0
———————
Incoming Packet Count :
Outgoing Sflow Datagram Count : 0
Outgoing Flow Sample Count : 0
Incoming Processed Packet Count : 0
Receive Packet Drop Count : 0
Packet Truncated Count : 0
Incoming Packet Error Count : 0
Outgoing Processed Datagram Count : 0
Sample Pool : 0
———————
SflowAccelFpga7:1
———————
Incoming Packet Count : 0

Incoming Processed Packet Count : 0
Receive Packet Drop Count : 0
Packet Truncated Count : 0
Incoming Packet Error Count : 0
Outgoing Processed Datagram Count : 0
Sample Pool : 0
```

Example

The command **show sflow hardware accelerators** displays a list of all hardware accelerators currently present in the system.

```
switch(config)#show sflow hardware accelerators
Slice     sFlow Accelerator    Type    PCI Address    Direct
 Connections
_____________________________
Linecard7 SflowAccelFpga7:0   halo    0000:85:00.0     Jericho7/0
Linecard9 SflowAccelFpga9:0   halo    0000:a6:00.0     Jericho9/0
```

Example

The command **show sflow hardware mapping** displays hardware accelerator performs sFlow processing for each switch chip in the system. Hardware acceleration needs to be enabled and running, otherwise the output of the command will be empty.

```
switch(config)#show sflow hardware mapping
Chip          sFlow Accelerator       Direct Connection

Jericho6/1    SflowAccelFpga9:0       False
Jericho7/0    SflowAccelFpga7:0       True
Jericho9/0    SflowAccelFpga9:0       True
```

20.4.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the **sflow sample** command, and to include BGP information in samples whose destination is a BGP route using the **sflow extension bgp** command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

Platform-specific Considerations

When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Configuring the Collector Location

The **sflow destination** command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example

This command configures the switch to send sFlow data to collectors at ***10.42.15.12***, port ***6100*** and ***10.52.12.2*** port ***6343*** (the default sFlow port).

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#sflow destination 10.52.12.2
switch(config)#
```

Configuring the Agent Source Address

The **sflow source** command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

This command configures ***10.2.9.21*** as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```

The **sflow source-interface** command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example

This command configures ***interface vlan 25*** as the sFlow source interface. The switch enters the IP address for ***vlan 25*** in the source field of sFlow datagrams.

```
switch(config)#sflow source-interface vlan 25
switch(config)#
```

running-config cannot simultaneously contain **sflow source** and **sflow source-interface** commands.

Configuring the Polling Interval

The **sflow polling-interval** command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

Example

This command configures the switch to send sFlow data every ***10*** seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```

Configuring the Sampling Rate and Sample Contents

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of ***16384*** corresponds to an average sample of one per ***16384*** packets. The default rate is ***1048576***.

Example

This command configures the sFlow sampling rate as ***65536*** (one per ***65536*** packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the **[no] sflow sample output interface** command.

Example

These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

```
switch(config)#no sflow sample output interface
switch(config)#sflow sample rewrite dscp
switch(config)#
```

Enabling BGP sFlow Export

The **sflow extension bgp** command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of ***0***.

On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as ***0***.

Note: A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol (BGP) chapter for details.

Example

These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

Extended Switch and Router Information

By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:

- source and destination VLANs and priorities

Extended router information includes the following:

- IP version and address of next-hop router
  - source and destination mask lengths

The **no** form of **sflow extension switch** and **no** form of **sflow extension router** commands prevent the addition of extended switch and router information to sFlow sample packets.

Example

These commands prevent extended switch and router information from being added to sFlow sample packets.

```
switch(config)#no sflow extension switch
switch(config)#no sflow extension router
switch(config)#
```

Enabling sFlow

The **sflow run** command globally enables sFlow on the switch. The **sflow enable** command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The **sflow enable** command has no effect when sFlow is globally disabled.

Example

These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```
switch(config)#sflow run
switch(config)#interface ethernet 10
switch(config-if-Et10)#no sflow enable
switch(config)#
```

20.4.3 sFlow Subinterfaces

The **sflow sample [input | output] subinterface** command configures ifIndex values for subinterfaces on input and output ports to be included in the flow sample. These values are in place of the default parent port ifIndex value. Enabling this feature changes all sFlow samples generated by the switch from the compact to the expanded format.

Configuring sFlow Subinterface

The following configures subinterfaces on the switch for sampling.

```
switch (config)# sflow run
switch (config-if-Et1)# sflow sample input subinterface
switch (config)# sflow sample output subinterface
```

The following file extract displays the output from a **show sflow detail** command.

```
switch# show sflow detail
...
Status
------
...
Sample Switch Extension: Yes
Sample Router Extension: Yes
Sample Tunnel IPv4 Egress Extension: No
Sample Input Subinterface: Yes
Sample Output Subinterface: Yes
Port Channel Output Interface Index: portchannel
```

```
Sample Encoding Format: expanded
...
```

Limitations

- The feature is supported only on some hardware platforms.
- Only L3 subinterfaces and QinQ L3 subinterfaces support the sFlow output subinterface.
- Tunneled packets such as GRE, MPLSoGRE, and IPinIP are not supported.

20.4.4 QinQ L3 Subinterfaces

QinQ L3 subinterfaces divide a single Ethernet or port-channel interface into multiple logical L3 interfaces based on a combination of two 802.1q tags (VLAN ID) in the incoming traffic. QinQ L3 subinterfaces are commonly used in the L2/L3 boundary device, but they are also used to isolate traffic with a combination of two 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

QinQ L3 subinterfaces are similar to regular L3 subinterfaces, with the only difference being the number of tags being used to isolate traffic. While L3 subinterfaces use a single 802.1q tag (VLAN ID) in the incoming traffic, QinQ L3 subinterfaces use a combination of two 802.1q tags outer, and inner, in the incoming traffic.

All restrictions that are applicable to L3 subinterfaces are also applicable to QinQ L3 subinterfaces including the following:

- PBR service policy.
- ACL logging.
- Tunneling features including VxLAN, MPLS EVPN, MPLS VPN, and Pseudowire.
- QinQ subinterfaces with Algomatch ACLs.
- QinQ subinterfaces with flex-route configuration with optimization for non-nibble aligned prefix length.
- QoS service policy on QinQ subinterfaces with TCAM profiles that have **`feature qos subintf ip/ipv6`**.
- On a routed port, a single tag L3 subinterface and a QinQ L3 subinterface with the same outer tag in the dot1q encapsulation configuration are not supported simultaneously.
- On a routed port ***Et1***, if ***Et1*** has a dot1q encapsulation of ***100***, and if ***Et1.2*** has a dot1q encapsulation of <***100,200*** outer tag ***100***, inner tag ***200***, then ***Et1.1*** and ***Et1.2*** are not supported simultaneously.

20.4.4.1 Configuring QinQ L3 Subinterfaces

The following commands assign packets ingressing on ***Ethernet interface 1/1*** (routed port) with two dot1q tags (VLAN ID) - outer tag ***100*** and inner tag ***200*** to ***Ethernet subinterface 1/1.1***, making ***Ethernet1/1.1*** a QinQ L3 subinterface.

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
witch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#no switchport
switch(config-if-Et1/1)#no shutdown
```

2. Configure a VLAN on the subinterface. The encapsulation dot1q vlan command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)#interface Ethernet1/1.1
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100 inner 200
switch(config-if-Et1/1.1)#
```

3. Configure IPv4, and IPv6 ACL on QinQ subinterface.

```
switch(config)#interface ethernet1/1.1
switch(config-if-Et1/1.1)#ip access-group acl_1 in
switch(config-if-Et1/1.1)#ipv6 access-group acl_v6_1 in
```

4. Configure the subinterface counters to ingress and egress.

```
switch(config)#hardware counter feature subinterface in
switch(config)#hardware counter feature subinterface out
```

To confirm the status of the subinterfaces you can use the **show interface status sub-interfaces** command as shown in the following example.

```
switch(config)#show interface status sub-interfaces
Port       Name    Status       Vlan     Duplex Speed  Type
  Flags  Encapsulation
Et1.1              connect      routed   full   10G    dot1q-encapsu
lation        100,200
Et1.2              connect      routed   full   10G    dot1q-encapsu
lation        102
switch>
```

To confirm the status of the **show interface et1.1 counters** command, use the ingress and egress counters as shown in the following example.

```
switch(config)#show interface et1.1 counters
L3 Interface                   InOctets          InPkts
Et1.1                                 0               0
L3 Interface                  OutOctets         OutPkts
Et1.1                                 0               0
```

20.4.5 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

Global Configuration Commands

- sflow extension bgp
- sflow extension router
- sflow extension switch
- sflow destination
- sflow polling-interval
- sflow run
- sflow sample
- [no] sflow sample output interface
- sflow source
- sflow source-interface

Interface Configuration Commands

- sflow enable

Privileged EXEC Command

- clear sflow counters

sFlow Display Commands

- show sflow
- show sflow interfaces

20.4.5.1 clear sflow counters

The **clear sflow counters** command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The **show sflow** command displays global sFlow statistics.

Command Mode

Privileged EXEC

Command Syntax

clear sflow counters

Example

This command resets the sFlow counters.

```
switch#clear sflow counters
switch#
```

20.4.5.2 [no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The **no sflow sample output interface** command prevents sFlow from including that information.

Command Mode

Global Configuration

Command Syntax

no sflow sample output interface

Example

This command configures sFlow to not include output interface information in samples.

```
switch(config)#no sflow sample output interface
switch(config)#
```

20.4.5.3 sflow destination

The **sflow destination** command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in ***running-config***.

The **no sflow destination** and **default sflow destination** commands remove the specified sFlow collector IP address by deleting the corresponding **sflow destination** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

sflow destination *dest_addr* [**UDP_PORT**]

no sflow destination *dest_addr* [**UDP_PORT**]

default sflow destination *dest_addr* [**UDP_PORT**]

Parameters

- ***dest_addr*** sflow collectors IP address.
- **UDP_PORT** sFlow collectors data reception port. Options include:
  - ***no parameter*** port number ***6343*** (default).
  - ***port_num*** port number. Value ranges from ***0*** to ***65535***.

Example

This command configures the switch to send sFlow data to the collector located at ***10.42.15.12***; the collector receives the data through UDP port ***6100***.

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#
```

20.4.5.4 sflow enable

The **sflow enable** command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (**sflow run**). The **sflow enable** command is required only when ***running-config*** contains a **no sflow enable** statement for the specified interface.

The **no sflow enable** command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in ***running-config*** but has no effect on switch operation.

The **default sflow enable** command removes the corresponding **no sflow enable** command from ***running-config*** enabling sFlow capability on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

sflow enable

no sflow enable

default sflow enable

Examples

- These commands enable sFlow on the switch and disable sFlow on ***interface ethernet 12***.

```
switch(config)#sflow run
switch(config)#interface ethernet 12
switch(config-if-Et12)#no sflow enable
switch(config-if-Et12)#
```

- This command removes the **no sflow enable** command for ***interface ethernet 12*** from ***running-config***, enabling sFlow on the interface whenever sFlow is globally enabled.

```
switch(config-if-Et12)#sflow enable
switch(config-if-Et12)#
```

20.4.5.5 sflow extension bgp

The **sflow extension bgp** command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

next hop IP

- AS numbers
- AS system path to the destination
- communities
- local pref

The **no sflow extension bgp** and **default sflow extension bgp** commands disable BGP export to sFlow by deleting the corresponding **sflow extension bgp** command from ***running-config***.

Note: A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol chapter for details.

Command Mode

Global Configuration

Command Syntax

sflow extension bgp

no sflow extension bgp

default sflow extension bgp

Guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of ***0***.
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as ***0***.
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Example

These commands configure a BGP instance in ***AS 50*** and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

20.4.5.6 sflow extension router

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The **no** version of the **sflow extension router** command prevents this information from being included in sFlow packets.

The **sflow extension router** and **default sflow extension router** commands restore the default behavior by deleting the corresponding **no sflow extension router** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

sflow extension router

no sflow extension router

default sflow extension router

Example

This command prevents the switch from including extended router information in sFlow packets.

```
switch(config)#no sflow extension router
switch(config)#
```

20.4.5.7 sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The **no** version of the **`sflow extension switch`** command prevents this information from being included in sFlow packets.

The **`sflow extension switch`** and **`default sflow extension switch`** commands restore the default behavior by deleting the corresponding **`no sflow extension switch`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow extension switch`

`no sflow extension switch`

`default sflow extension switch`

Example

This command prevents the switch from including extended switch information in sFlow packets.

```
switch(config)#no sflow extension switch
switch(config)#
```

20.4.5.8 sflow polling-interval

The **sflow polling-interval** command specifies the counters polling interval. The switch uses this interval to schedule a ports counter data transmissions to the sFlow collector.

The default interval is two seconds.

The **no sflow polling-interval** and **default sflow polling-interval** commands revert the polling interval to the default of two seconds by removing the **sflow polling-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

sflow polling-interval *interval_period*

no sflow polling-interval

default sflow polling-interval

Parameters

interval_period polling interval (seconds). Value ranges from ***0*** to ***3600*** (***60*** minutes). Default is ***2***.

Example

This command configures the switch to send sFlow counter data every ***10*** seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```

20.4.5.9 sflow run

The **`sflow run`** command globally enables sFlow on the switch. The default sFlow global setting is ***disabled***. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The **sflow enable** interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The **`no sflow run`** and **`default sflow run`** commands globally disable sFlow on the switch.

Command Mode

Global Configuration

Command Syntax

`sflow run`

`no sflow run`

`default sflow run`

Examples

- This command enables sFlow on the switch.

```
switch(config)#sflow run
switch(config)#
```

- This command globally disables sFlow.

```
switch(config)#no sflow run
switch(config)#
```

20.4.5.10 sflow sample

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of ***16384*** corresponds to an average sample of one per ***16384*** packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per ***16384*** packets. Higher sampling rates can be specified with the **dangerous** option.

By default, samples include information about the output interface. To remove this information, use the **[no] sflow sample output interface** command.

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The **no sflow sample** and **default sflow sample** commands reset the packet sampling rate to the default of ***1048576*** and remove output interface and traffic class information from samples by removing the **sflow sample** command from the configuration.

Command Mode

Global Configuration

Command Syntax

sflow sample **TRUNCATE SAMPLE_RATE**[rewrite dscp]

no sflow sample

default sflow sample

Parameters

SAMPLE_RATE size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:

- ***recommended_rate*** Integer between to ***16777215***.
  - **dangerous** ***any_rate*** permits overriding the recommended range of sampling rates. The ***any_rate*** value range varies by platform:
    - **fm6000** ***1*** to ***65535***.
    - **trident** ***1*** to ***16777216***.
- **rewrite dscp** configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.
- **TRUNCATE** sFlow sample truncation size between the range of ***128*** to ***512***. By default, the sFlow sample truncate size is set to ***128***. Note, this option is hidden.

Examples

- This command configures the sFlow sampling rate as ***65536*** (one per ***65536*** packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

- This command configures the sFlow sampling rate as ***256*** (one per ***256*** packets).

```
switch(config)#sflow sample dangerous 25
switch(config)#
```

- This command configures sFlow to include traffic class information in samples.

```
switch(config)#sflow sample rewrite dscp
switch(config)#
```

20.4.5.11 sflow source

The **`sflow source`** command specifies the IP address used in the **Agent** address filed of the IPv4 sFlow datagram that the switch sends to the collector. This command cannot be used if ***running-config*** contains an **sflow source-interface** command.

The **`no sflow source`** and **`default sflow source`** commands remove the **`sflow source`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow source` *source_addr*

`no sflow source`

`default sflow source`

Parameters

source_addr source IP address (dotted decimal notation).

Example

This command configures ***10.2.9.21*** as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```

20.4.5.12 sflow source-interface

The **`sflow source-interface`** command specifies the source IP address that is set to the IP's of the specified interfaces that the switch sends to the collector. Both, the Agent address in the IPv4 sFlow datagram as well as the source IP address sent to the collector are specified in sFlow packet. This command cannot be used if ***running-config*** contains an **sflow source** command.

The **`no sflow source-interface`** and **`default sflow source-interface`** commands remove the **`sflow source-interface`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`sflow source-interface` **INT_NAME**

`no sflow source-interface`

`default sflow source-interface`

Parameters

INT_NAME Interface type and number. Options include:

- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command configures the sFlow source address as the IP address assigned to the ***loopback 0*** interface.

```
switch(config)#sflow source-interface loopback 0
switch(config)#
```

20.4.5.13 show sflow interfaces

The **show sflow interfaces** command displays the interfaces where sFlow is enabled.

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

Command Mode

EXEC

Command Syntax

show sflow interfaces

Examples

- This command displays the show sflow interface message when sFlow is globally disabled.

```
switch#show sflow interfaces
sFlow Interface (s):
--------------------
sFlow is not running
```

- This command displays the show sflow interface message when sFlow is globally enabled and enabled on all interfaces.

```
switch(config)#sflow run
switch(config)#show sflow interfaces
Default sFlow configuration for an interface: Disable
sFlow Interface (s):
--------------------
Ethernet1  running(Counter)
Ethernet2  running(Counter)
Ethernet3  running(Flow,Counter)
Ethernet4  running(Flow,Counter)
Ethernet5  running(Flow,Counter)
```

20.4.5.14 show sflow

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

The **show sflow interfaces** command displays the interfaces where sFlow is enabled.

Command Mode

EXEC

Command Syntax

show sflow [detail]

Parameters

detail adds hardware sampling status and number of discarded samples to the information displayed.

Examples

- This command displays the base sFlow information.

```
switch#show sflow
! Displaying counters that may be stale

20.5 SNMP

This chapter describes the Arista switch SNMP agent and contains these sections:

- SNMP Introduction
- SNMP Conceptual Overview
- Configuring SNMP
- SNMP Commands

20.5.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures.

With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

20.5.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

20.5.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, refer to the release notes for the specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.

20.5.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A ***trap*** is an unsolicited notification. An ***inform*** (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, refer to the release notes for the specific EOS version.

20.5.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in ***RFC 1157***. Security is based on community strings.

- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in ***RFC 1901***, ***RFC 1905***, and ***RFC 1906***. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in ***RFC 2273*** to ***RFC 2275***.

20.5.2.4 SNMP Authentication and Encryption Methods

The following are the SNMP stronger Authentication and Encryption methods:

- **Authentication**
  - MD5
  - SHA-1
  - SHA-224
  - SHA-256
  - SHA-384
  - SHA-512
- **Encryption**
  - AES
  - DES
  - AES-192
  - AES-256

Note: Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperablity issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

20.5.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- Enabling and Disabling SNMP
- Enabling SNMP in a VRF
- Configuring Community Access Control
- Configuring SNMP Parameters
- Configuring the Agent to Send Notifications
- Extending the SNMP Agent Through Runtime Scripts
- SNMP Traps for MAC Move, Learn, and Age Events
- SNMP IP Address ACL Support

20.5.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any **snmp-server community** or **snmp-server user** command. The **no snmp-server** command disables SNMP agent operation by removing all non-default **`snmp-server`** commands from ***running-config***.

20.5.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the **default** VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the **snmp-server vrf** command.

20.5.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch's community strings.

The **snmp-server community** command configures the community string.

Example

This command adds the community string ***ab_1*** to provide read-only access to the switch agent.

```
switch(config)#snmp-server community ab_1 ro
switch(config)#
```

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The **snmp-server view** command configures the community string.

Examples

- These commands create a view that includes all objects in the ***system*** group except for those in ***system.2***.

  ```
  switch(config)#snmp-server view sys-view system include
  switch(config)#snmp-server view sys-view system.2 exclude
  switch(config)#
  ```

- This command adds the community string ***lab_1*** to provide read-only access to the switch agent for the previously defined view.

  ```
  switch(config)#snmp-server community lab_1 view sys-view
  switch(config)#
  ```

20.5.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Specifying the Source Interface
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

20.5.3.4.1 Configuring the Engine ID

The **`snmp-server engineID remote`** command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the **`snmp-server engineID local`** command for the local engine.

A remote agent's engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

Note: When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

Example

This command configures ***DC945798CAB4*** as the name of the remote SNMP engine located at ***12.23.104.25***, UDP ***port 162***

```
switch(config)#snmp-server engineID remote 10.23.104.25 udp-port
 DC945798CA
switch(config)#
```

20.5.3.4.2 Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The **snmp-server group** command configures a new SNMP group.

This command configures ***normal_one*** as an SNMPv3 group (authentication and encryption) that provides access to the ***all-items*** read view.

```
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```

20.5.3.4.3 Configuring the User

Members of SNMP groups are called ***users***. The **snmp-server user** command allows a new user to be added an SNMP group and configures that user's parameters. Remote users are configured by specifying the IP address or port number that accesses the user's SNMP agent.

Example

- This command configures the local SNMPv3 user ***tech-1*** as a member of the SNMP group ***tech-sup***.

  ```
  switch(config)#snmp-server user tech-1 tech-sup v3
  switch(config)#
  ```

- This command configures the remote SNMPv3 user ***tech-2*** as a member of the SNMP group ***tech-sup***. The remote user is on the agent located at ***13.1.1.4***.

  ```
  switch(config)#snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
  switch(config)#
  ```

20.5.3.4.4 Configuring the Host

The **snmp-server host** command configures an SNMP host (to which SNMP traps will be sent). The **`snmp-server host`** command sets the community string if it was not previously configured.

Example

This command adds a v2c inform notification recipient at ***12.15.2.3*** using the community string ***comm-1***.

```
switch(config)#snmp-server host 12.15.2.3 informs version 2c comm-1
switch(config)#
```

20.5.3.4.5 Enabling Link Trap Generation

The **snmp trap link-change** command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration. The **show snmp notification** command displays the SNMP link trap generation information.

Example

This command disables SNMP link trap generation on the ***interface ethernet 5***.

```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```

20.5.3.4.6 Specifying the Source Interface

The snmp-server local-interface command specifies the interface from where an SNMP trap originates. The show snmp local-interface command displays the interface of the IP address for SNMP traps.

Example

This command configures the *Ethernet 1* interface as the source of SNMP traps and informs.

```
switch(config)#snmp-server local-interface ethernet 1
switch(config)#
```

20.5.3.4.7 Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The **snmp-server chassis-id** command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The **show snmp** command displays the chassis ID.

Example

This command configures *xyz-1234* as the chassis-ID string, then displays the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234  <---chassis ID
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
```

```
SNMP agent enabled
switch(config)#
```

20.5.3.4.8 Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The **snmp-server contact** command configures the system contact string. The contact string is displayed by the **show snmp** and **show snmp v2-mib contact** commands.

Example

These commands configure ***Bonnie H at 3-1470*** as the contact string.

```
switch(config)#snmp-server contact Bonnie H at 3-1470
switch(config)#
```

20.5.3.4.9 Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The **snmp-server location** command configures the system location string. By default, the system location string is not set.

Example

These commands configure ***lab-25*** as the location string.

```
switch(config)#snmp-server location lab_25
switch(config)#show snmp v2-mib location
Location: lab_25
switch(config)#
```

20.5.3.5 Configuring the Agent to Send Notifications

The following tasks are mandatory when setting up the SNMP agent to send notifications:

1. Configure the remote engine ID.
2. Configure the group.
3. Configure the user.
4. Configure the host.
5. Enable link trap generation on the interfaces.

Configuring SNMP Parameters describes each of these tasks.

20.5.3.6 Extending the SNMP Agent Through Runtime Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space.

Scripts run under one of two operational modes:

- **Normal mode** scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- **One-shot mode** scripts process a single object, then terminate execution; requires the **one-shot** keyword.

Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The **snmp-server extension** command configures the execution of user-supplied scripts to service portions of the OID space. Use the **one-shot** keyword to specify one-shot execution.

Examples

- This command specifies the file ***normal-example.sh***, located in flash as the script file that services the specified OID space in normal mode.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:normal-
example.sh
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
while read cmd; do
   case $cmd in
      PING)
      printf "PONG\n"      ;;
      get)
      read oid
      printf "$oid\n"
      printf "integer\n"
      printf "42\n"      ;;      *)
      printf "NONE\n"
      ;;    esac
done
```

- Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
switch(config)#
```

- This command specifies the file ***one-shot-example.sh***, located in flash as the script file that services the specified OID space in one-shot mode, executing once and then exiting.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2
flash:one-shot-example.sh one-shot
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
oid="$2"
printf "$oid\n"
printf "integer\n"
printf "42\n"
```

- Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
```

20.5.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through **stdin**/**stdout**. Before each request, the script is sent the string **PING\n** on **stdin**. The expected response from the script is printing **PONG\n** to **stdout**.

GET and GETNEXT Requests

For **GET** and **GETNEXT** requests, the script is passed two lines on **stdin**, the command (**get** or **getnext**) and the requested OID. The expected response from the script is the printing of three lines to **stdout**: the OID for the result varbind, the **TYPE**, and the **VALUE** itself.

Table 75: Extension Script Type and Encoding lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print **NONE\n** to **stdout** and continue running; this results in an SNMP **`noSuchName`** error or a **`noSuchInstance`** exception.

Table 75: Extension Script Type and Encoding

Type string	SNMP type	Encoding for script
integer	Integer32	integer
unsigned	Unsigned32	integer
gauge	Gauge32	integer
counter	Counter32	integer
counter64	Counter64	integer
timetick	TimeTicks	integer
ipaddress	IpAddress	a.b.c.d
objectid	ObjectID	1.3.6.1.42.99.2468
octet	OctetString	hexadecimal string
opaque	Opaque	hexadecimal string
string	OctetString	ascii string

SET Requests

For **SET** requests, script is passed three lines on stdin: the command (set), and the requested OID, and the **TYPE** and **VALUE**, both on the same line. If the assignment is successful, the expected script response is to print **DONE\n** to **stdout**. Indicated errors by writing one of the error strings described in **Set Request Error Strings** In each case, the command should continue running.

Table 76: Set Request Error Strings

authorization-error	no-access	too-big
bad-value	no-creation	undo-failed
commit-failed	no-such-name	wrong-type
gen-error	not-writable	wrong-length
inconsistent-name	read-only	wrong-encoding
inconsistent-value	resource-unavailable	wrong-value

20.5.3.6.2 One-Shot Script Behavior

The command should exit after it finishes processing a single object.

GET and GETNEXT

For each **GET** or **GETNEXT** request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for **GET** or -n for **GETNEXT**, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP **noSuchName** error, or a **noSuchInstance** exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn't correspond to a valid instance for a **GET** request.
- There were no following instances for a **GETNEXT**.

SET

A SET request results in the command being called with the arguments: -s, **OID**, **TYPE** and **VALUE**, where **TYPE** is a listed token. **Normal Script Behavior** indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (**Normal Script Behavior**); the agent generates the appropriate error response.

20.5.3.7 SNMP Traps for MAC Move, Learn, and Age Events

This feature adds three new SNMP traps for MAC move, learn, and age events: aristaMacMove, aristaMacLearn, and aristaMacAge, respectively. These are defined in the ARISTA-BRIDGE-EXT-MIB.

20.5.3.7.1 Platform Compatibility

SNMP traps for MAC move, learn, and age events are supported on all platforms.

20.5.3.7.2 Configuration

The aristaMacMove, aristaMacLearn, and aristaMacAge traps are disabled, by default. They may be enabled, like all traps, with the **`snmp-server enable traps`** command. They are grouped under the “bridge” category, so all can be enabled at once using the **`snmp-server enable traps bridge`** command, or each be enabled or disabled individually, as shown below:

```
switch(config)#snmp-server enable traps bridge ?
  arista-mac-age    Enable aristaMacAge trap
  arista-mac-learn  Enable aristaMacLearn trap
  arista-mac-move   Enable aristaMacMove trap
switch(config)#snmp-server enable traps bridge arista-mac-age
switch(config)#no snmp-server enable traps bridge arista-mac-le
arn
```

In the above example, ***aristaMacAge*** traps are enabled, ***aristaMacLearn*** traps are disabled, and ***aristaMacMove*** traps have their default value, which is disabled.

20.5.3.7.3 Show Commands

You can display the enabled/disabled status of each trap type using the **`show snmp notification`** command. Continuing with the example from above:

```
switch(config)#show snmp notification | grep bridge
bridge             arista-mac-age                          Yes
bridge             arista-mac-learn                        No
bridge             arista-mac-move                         No
 (aristaMacMove default disabled)
```

20.5.3.8 SNMP IP Address ACL Support

SNMP IP address ACL support provides the ability to add access-lists to limit the source addresses that can be used to query the SNMP server. The access-lists are reachable on the switch through the access SNMP data (***port 161***). The access-lists contain standard **`permit`** and **`deny`** commands.

20.5.3.8.1 Configuration

Use the following command to add SNMP IP address ACL support:

`[no | default] snmp-server` **[[ipv4 access-list *IP4_ACL*]** | **[ipv6 access-list *IP6_ACL*]][vrf *VRF*]**

When the ***VRF*** is not specified, **`default`** is assumed.

20.5.3.8.2 Show Commands

Use the **`show snmp ipv4 access-list summary`** command to display an abreviated output of an IPv4 access-list.

Example

```
switch#show snmp ipv4 access-list summary
IPv4 ACL Permit169
 Total rules configured: 2
Configured on VRFs: red VRF

IPv4 ACL Permit168
Total rules configured: 2
Configured on VRFs: default VRF
Active on VRFs: default VRF
```

Use the **`show snmp ipv4 access-list detail`** command to display a detailed output of an IPv4 access-list.

Example

```
switch#show snmp ipv4 access-list detail
IP Access List Permit169
10 permit ip 192.169.199.0/24 any [match 7 packets, 0:19:56 ago]
20 deny ip any any [match 13 packets, 0:03:56 ago]
Total rules configured: 2
Configured on VRFs: red VRF
```

```
IP Access List Permit168
10 permit ip 192.168.199.0/24 any [match 7 packets, 0:27:00 ago]
20 deny ip any any [match 13 packets, 0:04:30 ago]
Total rules configured: 2
Configured on VRFs: default VRF
Active on VRFs: default VRF
```

Use the **`show snmp ipv4 access-list IPv4ACL`** command to display a configured access-list. In this example, the configured access-list is ***Permit169***.

Example

```
switch#show snmp ipv4 access-list Permit169
IP Access List Permit169
10 permit ip 192.169.199.0/24 any [match 7 packets, 0:20:12 ago]
20 deny ip any any [match 13 packets, 0:04:12 ago]
Total rules configured: 2
Configured on VRFs: red VRF
```

Use the **`show snmp ipv4 access-list summary`** command to display a summary of an active access-list.

Example

```
switch#show snmp ipv4 access-list summary
! Same ACL configured in multiple VRFs. Both VRFs are listed in
 both the configured
! and the active sessions
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
         red VRF
Active on VRFs: default VRF
 red VRF
```

Use the **`show snmp ip access-list summary`** command to display a short output of the active access-lists.

Example

```
switch#show snmp ip access-list summary
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
         red VRF
Active on VRFs: default VRF
```

20.5.4 SNMP Commands

Global Configuration Commands

- no snmp-server
- snmp-server chassis-id
- snmp-server community
- snmp-server contact
- snmp-server enable traps
- snmp-server enable traps bridge
- snmp-server engineID local
- snmp-server engineID remote
- snmp-server extension
- snmp-server group
- snmp-server host
- snmp-server local-interface
- snmp-server location
- snmp-server qosmib counter-interval
- snmp-server user
- snmp-server view
- snmp-server vrf

Interface Configuration Commands

- snmp trap link-change

Display Commands

- show snmp
- show snmp community
- show snmp engineID
- show snmp group
- show snmp local-interface
- show snmp mib
- show snmp notification host
- show snmp notification
- show snmp notification | grep bridge
- show snmp user
- show snmp v2-mib chassis
- show snmp v2-mib contact
- show snmp v2-mib location
- show snmp view

20.5.4.1 no snmp-server

The **no snmp-server** and **default snmp-server** commands disable Simple Network Management Protocol (SNMP) agent operation by removing all **snmp-server** commands from ***running-config***.

SNMP is enabled with any **snmp-server community** or **snmp-server user** command.

Command Mode

Global Configuration

Command Syntax

no snmp-server

default snmp-server

Example

This command disables SNMP agent operation on the switch.

```
switch(config)#no snmp-server
switch(config)#
```

20.5.4.2 show snmp community

The **show snmp community** command displays the Simple Network Management Protocol (SNMP) community access strings configured by the **snmp-server community** command.

Command Mode

EXEC

Command Syntax

show snmp community

Example

This command displays the list of community access strings configured on the switch.

```
switch>show snmp community
Community name: public
switch>
```

20.5.4.3 show snmp engineID

The **show snmp engineID** command displays the local SNMP engine information configured on the switch.

Command Mode

EXEC

Command Syntax

show snmp engineID

Example

This command displays the ID of the local SNMP engine.

```
switch>show snmp engineid
Local SNMP EngineID: f5717f001c730436d700
switch>
```

20.5.4.4 show snmp group

The **show snmp group** command shows the names of configured SNMP groups along with the security model, and view status of each group.

Command Mode

EXEC

Command Syntax

show snmp group [**GROUP_LIST**]

Parameters

GROUP_LIST the name of the group.

- ***no parameter*** displays information about all groups.
- ***group_name*** the name of the group.

Field Descriptions

- **groupname** name of the SNMP group.
- **security model** security model used by the group: ***v1***, ***v2c***, ***orv3***.
- **readview** string identifying the group's read view. Refer to the **show snmp view** comaand.
- **writeview** string identifying the group's write view.
- **notifyview** string identifying the group's notify view. This command displays the groups configured on the switch.

Example

```
switch>show snmp group
groupname : normal                          security model:v3 priv
readview  : all                             writeview: <no writeview
 specified>
notifyview: <no notifyview specified>
switch>
```

20.5.4.5 show snmp local-interface

The **show snmp local-interface** command displays the interface whose IP address is the source address for SNMP traps.

Command Mode

EXEC

Command Syntax

show snmp local-interface

Example

This command displays the source interface for the SNMP notifications.

```
switch>show snmp local-interface
SNMP source interface: Ethernet1
switch>
```

20.5.4.6 show snmp mib

The **show snmp mib** command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

Command Mode

EXEC

Command Syntax

show snmp mib **OBJECTS**

Parameters

OBJECTS object identifiers for which the command returns data. Options include:

- **get *oid_1*** [***oid_2 ... oid_x***] values associated with each listed OID.
- **get-next *oid_1*** [***oid_2 ... oid_x***] values associated with subsequent OIDs relative to listed OIDs.
- **table *oid*** table associated with specified OID.
- **translate *oid*** object name associated with specified OID.
- **walk *oid*** objects below the specified subtree.

Example

- This command uses the get option to retrieve information about the ***sysORID.1 OID***.

```
switch#show snmp mib get sysORID.1
SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
```

- This command uses the get-next option to retrieve information about the OID that is after ***sysORID.8***.

```
switch#show snmp mib get-next sysORID.8
SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP
implementations
```

20.5.4.7 show snmp notification host

The **show snmp notification host** command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

Command Mode

EXEC

Command Syntax

show snmp notification host

Field Descriptions

- **Notification host** IP address of the host.
- **udp-port** port number.
- **type** notification type.
- **user** access type of the user.
- **security model** SNMP version used.
- **traps** details of the notification.

Example

This command displays the hosts configured on the switch.

```
switch>show snmp notification host
Notification host: 172.22.22.20    udp-port: 162   type: trap
user: public                       security model: v2c
switch>
```

20.5.4.8 show snmp notification

The **show snmp notification** command displays the SNMP trap generation information.

Command Mode

EXEC

Command Syntax

show snmp notification

Example

This command displays the SNMP traps configured on the switch.

```
switch>show snmp notification
  Type                       Name                                 Enabled
-------------------------- ------------------------------------ -------------
  entity                     entConfigChange                      Yes (default)
  entity                     entStateOperDisabled                 Yes (default)
  entity                     entStateOperEnabled                  Yes (default)
  lldp                       lldpRemTablesChange                  Yes (default)
  msdpBackwardTransition     msdpBackwardTransition               Yes
  msdpEstablished            msdpEstablished                      Yes
  snmp                       linkDown                             Yes
  snmp                       linkUp                               Yes
  snmpConfigManEvent         aristaConfigManEvent                 Yes (default)
  switchover                 aristaRedundancySwitchOverNotif      Yes
  test                       aristaTestNotification               Yes
switch>
```

20.5.4.9 show snmp notification | grep bridge

Use the **show snmp notification | grep bridge** command to display the enabled or disabled status of each trap type.

Command Mode

EXEC

Command Syntax

show snmp notification | grep bridge

Example

```
switch(config)#show snmp notification | grep bridge
bridge     arista-mac-age          Yes
bridge     arista-mac-learn        No
bridge     arista-mac-move         No (aristaMacMove default disabled)
```

20.5.4.10 show snmp user

The **show snmp user** command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information

Command Mode

EXEC

Command Syntax

show snmp user [**USER_LIST**]

Parameters

USER_LIST the name of the group.

- ***no parameter*** displays information about all users.
- ***user_name*** specifies name of displayed user.

Example

This command displays information about the users configured on the switch.

```
switch>show snmp user
User name: test
Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
switch>
```

20.5.4.11 show snmp v2-mib chassis

The **show snmp v2-mib chassis** command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the **snmp-server chassis-id** command.

Command Mode

EXEC

Command Syntax

show snmp v2-mib chassis

Example

This command displays the chassis ID string.

```
switch>show snmp v2-mib chassis
Chassis: JFL08320162
switch>
```

20.5.4.12 show snmp v2-mib contact

The **show snmp v2-mib contact** command displays the Simple Network Management Protocol (SNMP) system contact string configured by the **snmp-server contact** command. The command has no effect if a contact string was not previously configured.

Command Mode

EXEC

Command Syntax

show snmp v2-mib contact

Example

This command displays the contact string contents.

```
switch>show snmp v2-mib contact
Contact: John Smith
switch>
```

20.5.4.13 show snmp v2-mib location

The **show snmp v2-mib location** command displays the Simple Network Management Protocol (SNMP) system location string. The **snmp-server location** command configures system location details. The command has no effect if a location string was not previously configured.

Command Mode

EXEC

Command Syntax

show snmp v2-mib location

Example

This command displays the location string contents.

```
switch>show snmp v2-mib location
Location: santa clara
switch>
```

20.5.4.14 show snmp view

The **show snmp view** command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the **snmp-server view** command.

Command Mode

EXEC

Command Syntax

show snmp view [**VIEW_LIST**]

Parameters

VIEW_LIST the name of the view.

- ***no parameter*** displays information about all views.
- ***view_name*** the name of the view.

Field Descriptions

- **First column** view name.
- **Second column** name of the MIB object or family.
- **Third column** inclusion level of the specified family within the view.

Example

These commands configure an SNMP view, then displays that view.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#show snmp view
sys-view system - included
sys-view system.2 - excluded
```

20.5.4.15 show snmp

The **show snmp** command displays SNMP information including the SNMP counter status and the chassis ID string.

Command Mode

EXEC

Command Syntax

show snmp

Example

This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    38132599 Number of requested variables
    0 Number of altered variables
    563934 Get-request PDUs
    148236 Get-next PDUs
    0 Set-request PDUs
2329437 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    2329135 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```

20.5.4.16 snmp trap link-change

The **snmp trap link-change** command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration to re-enable link-trap generation.

The **no snmp trap link-change** command disables SNMP link trap generation on the configuration mode interface.

The **snmp trap link-change** and **default snmp trap link-change** commands restore the default behavior by removing the **no snmp trap link-change** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration Interface-VXLAN Configuration

Command Syntax

snmp trap link-change

no snmp trap link-change

default snmp trap link-change

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

Example

This command disables SNMP link trap generation on the ***interface ethernet 5***.

```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```

20.5.4.17 snmp-server chassis-id

The **snmp-server chassis-id** command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The **show snmp** command displays the chassis ID.

The **no snmp-server chassis-id** and **default snmp-server chassis-id** commands restore the default chassis ID string by removing the **snmp-server chassis-id** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server chassis-id *id_text*

no snmp-server chassis-id

default snmp-server chassis-id

Parameters

id_text chassis ID string

Example

These commands configure *xyz-1234* as the chassis-id string, then display the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234<---chassis ID
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
SNMP agent enabled
switch(config)#
```

20.5.4.18 snmp-server community

The **snmp-server community** command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The **no snmp-server community** and **default snmp-server community** commands remove the community access string from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server community *string_text* [**MIB_VIEW**][**ACCESS**][**ACL_NAMES**]

no snmp-server community *string_text*

default snmp-server community *string_text*

Parameters

- ***string_text*** community access string.
- **MIB_VIEW** community access availability. Options include:
  - ***no parameter*** community string allows access to all objects.
  - **view *view_name*** community string allows access only to objects in the ***view_name*** view.
- **ACCESS** community access availability. Options include:
  - ***no parameter*** read-only access (default setting).
  - **ro** read-only access.
  - **rw** read-write access.
- **ACL_NAMES** community access availability. Options include:
  - ***no parameter*** community string allows access to all objects.
  - ***list_v4*** IPv4 ACL list.
  - **ipv6** ***list_v6*** IPv6 ACL list.
  - **ipv6** ***list_v6 list_v4*** IPv4 and IPv6 ACL list.

Example

This command adds the community string ***lab_1*** to provide read-only access to the switch agent.

```
switch(config)#snmp-server community lab_1 ro
switch(config)#
```

20.5.4.19 snmp-server contact

The **snmp-server contact** command configures the system contact string. The contact is displayed by the **show snmp** and **show snmp v2-mib contact** commands.

The **no snmp-server contact** and **default snmp-server contact** commands remove the **snmp-server contact** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server contact *contact_string*

no snmp-server contact

default snmp-server contact

Parameters

contact_string system contact string.

Example

These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
24 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
SNMP agent enabled
switch(config)#
```

20.5.4.20 snmp-server enable traps

The **snmp-server enable traps** command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the **snmp-server host** command to specify which will receive SNMP notifications. Sending notifications requires at least one **snmp-server host** command.

The **snmp-server enable traps** and **no snmp-server enable traps** commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The **default snmp-server enable traps** command resets notification generation to the default setting for the specified MIB.

Command Mode

Global Configuration

Command Syntax

snmp-server enable traps [*trap_type*]

no snmp-server enable traps [*trap_type*]

default snmp-server enable trap [*trap_type*]

Parameters

trap_type controls the generation of informs or traps for the specified MIB:

- ***no parameter*** controls notifications for MIBs not covered by specific commands.
- **entity** controls entity-MIB modification notifications.
- **lldp** controls LLDP notifications.
- **msdpBackwardTransition** controls msdpBackwardTransition notifications.
- **msdpEstablished** controls msdpEstablished notifications.
- **snmp** controls SNMP-v2 notifications.
- **switchover** controls switchover notifications.
- **snmpConfigManEvent** controls snmpConfigManEvent notifications.
- **test** controls test traps.

Examples

- These commands enables notification generation for all MIBs except spanning tree.

```
switch(config)#snmp-server enable traps
switch(config)#no snmp-server enable traps spanning-tree
switch(config)#
```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.

```
switch(config)#snmp-server enable traps spanning-tree
switch(config)#
```

- This command resets the spanning-tree MIB notification generation to follow the default setting.

```
switch(config)#default snmp-server enable traps spanning-tree
switch(config)#
```

- This command enables switchover MIB notification generation, regardless of the default setting.

```
switch(config)#snmp-server enable traps switchover
switch(config)#
```

- This command resets the switchover MIB notification generation to follow the default setting.

```
switch(config)# default snmp-server enable traps switchover
```

```
switch(config)#
```

20.5.4.21 snmp-server enable traps bridge

The aristaMacMove, aristaMacLearn, and aristaMacAge traps are disabled by default. You can enable them, like all traps, using the **snmp-server enable traps** command. They are grouped under the **bridge** category, so you enble all of them at once using the **snmp-server enable traps bridge** command.

Command Mode

Configuration mode

Command Syntax

snmp-server enable traps bridge [arista-mac-age | arista-mac-learn | arista-mac-move]

no snmp-server enable traps bridge [arista-mac-age | arista-mac-learn | arista-mac-move]

Parameters

- **arista-mac-age** Enables aristaMacAge trap.
- **arista-mac-learn** Enables aristaMacLearn trap.
- **arista-mac-move** Enables aristaMacMove trap.

Examples

In the following example, ***aristaMacAge*** traps are enabled, ***aristaMacLearn*** traps are disabled, and ***aristaMacMove*** traps have their default value, which is disabled.

```
switch(config)#snmp-server enable traps bridge ?
  arista-mac-age    Enable aristaMacAge trap
  arista-mac-learn  Enable aristaMacLearn trap
  arista-mac-move   Enable aristaMacMove trap
switch(config)#snmp-server enable traps bridge arista-mac-age
switch(config)#no snmp-server enable traps bridge arista-mac-learn
```

20.5.4.22 snmp-server engineID local

The **snmp-server engineID local** command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The **show snmp engineID** command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

Note: Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The **no snmp-server engineID** and **default snmp-server engineID** commands restore the default engineID by removing the **snmp-server engineID** command from the ***running-config***

Command Mode

Global Configuration

Command Syntax

snmp-server engineID local *engine_hex*

no snmp-server engineID local

default snmp-server engineID

Parameters

engine_hex the switch name for the local SNMP engine (hex string).

The string must consist of at least ten characters with a maximum of ***64*** characters.

Example

This command configures DC945798CAB4 as the name of the local SNMP engine.

```
switch(config)#snmp-server engineID local DC945798CAB4
switch(config)#
```

20.5.4.23 snmp-server engineID remote

The **snmp-server engineID remote** command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the **show snmp engineID** command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

Note: Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The **no snmp-server engineID remote** and **default snmp-server engineID remote** commands remove the **snmp-server engineID remote** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server engineID remote *engine_addr* [**PORT**] *engine_hex*

no snmp-server engineID remote *engine_addr* [**PORT**]

default snmp-server engineID remote *engine_addr* [**PORT**]

Parameters

- ***engine_addr*** location of remote engine (IP address or host name).
- **PORT** udp port location of the remote engine. Options include:
  - ***no parameter*** port number ***161*** (default).
  - **udp-port** ***port_num*** port number. Ranges from *0* to ***65535***.
- ***engine_hex*** the switch's name for the remote SNMP engine (hex string).

  The string must have at least ten characters and can contain a maximum of ***64*** characters.

Example

This command configures DC945798CA as the engineID of the remote SNMP engine located at ***10.23.10.25***, UDP ***port 162***.

```
switch(config)#snmp-server engineID remote 10.23.10.25 udp-port 162
 DC945798CA
switch(config)#
```

20.5.4.24 snmp-server extension

The **snmp-server extension** command configures the execution of user supplied scripts to service portions of the OID space.

The **no snmp-server extension** and **default snmp-server extension** commands deletes the **snmp-server extension** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server extension *OID_space* **FILE_PATH** [**DURATION**]

Parameters

- ***OID_space*** OID branch serviced by the script, in numerical format.
- **FILE_PATH** path and name of the script file. Options include:
  - **file:** file is located in the switch file directory.
  - **flash:** file is located in flash memory.
- **DURATION** the execution scope of the script.
  - ***no parameter*** script runs after initial request to process subsequent requests.
  - **one-shot** script processes a single object (runs once), then terminates.

Examples

This command specifies the file example.sh, located in flash, as the script file that services the listed OID space.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example
.sh
```

20.5.4.25 snmp-server group

The **snmp-server group** command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item of may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The **no snmp-server group** and **default snmp-server group** commands delete the specified group by removing the corresponding **snmp-server group** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server group *group_name* **VERSION** [**CNTX**][**READ**][**WRITE**][**NOTIFY**]

no snmp-server group *group_name* **VERSION**

default snmp-server group *group_name* **VERSION**

Parameters

- ***group_name*** the name of the group.
- **VERSION** the security model utilized by the group.
  - **v1** SNMPv1. Uses a community string match for authentication.
  - **v2c** SNMPv2c. Uses a community string match for authentication.
  - **v3 no auth** SNMPv3. Uses a username match for authentication.
  - **v3 auth** SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - **v3 priv** SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- **CNTX** associates the SNMP group to an SNMP context.
  - ***no parameter*** command does not associate group with an SNMP context.
  - **context** ***context_name*** associates group with context specified by ***context_name***.
- **READ** specifies read view for SNMP group.
  - ***no parameter*** command does not specify read view.
  - **read** ***read_name*** read view specified by ***read_name*** (string maximum 64 characters).
- **WRITE** specifies write view for SNMP group.
  - ***no parameter*** command does not specify write view.
  - **write** ***write_name*** write view specified by ***write_name*** (string maximum 64 characters).
- **NOTIFY** specifies notify view for SNMP group.
  - ***no parameter*** command does not specify notify view.
  - **notify** ***notify_name*** notify view specified by ***notify_name*** (string maximum 64 characters).

Example

This command configures ***normal_one*** as SNMP version 3 group (authentication and encryption) that provides access to the **all-items read view**.

```
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```

20.5.4.26 snmp-server host

The **snmp-server host** command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a trap is an unsolicited notification; an inform is a trap that includes a request for a confirmation that the message is received

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- **snmp-server host host-1 version 2c comm-1**
- **snmp-server host host-1 informs version 2c comm-2**
- **snmp-server host host-1 version 2c comm-3 udp-port 666**
- **snmp-server host host-1 version 3 auth comm-3**

The **no snmp-server host** and **default snmp-server host** commands remove the specified host by deleting the corresponding **snmp-server host** statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

Command Mode

Global Configuration

Command Syntax

snmp-server host *host_id* [**VRF_INST**][**MESSAGE**][**VERSION**] *comm_str* [**PORT**]

no snmp-server host *host_id* [**VRF_INST**][**MESSAGE**][**VERSION**] *comm_str* [**PORT**]

default snmp-server host *host_id* [**VRF_INST**][**MESSAGE**][**VERSION**] *comm_str* [**PORT**]

Parameters

- ***host_id*** hostname or IP address of the SNMP host.
- **VRF_INST** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - **vrf *vrf_name*** changes are made to the specified user-defined VRF.
- **MESSAGE** message type that is sent to the host.
  - ***no parameter*** sends SNMP traps to host (default).
  - **informs** sends SNMP informs to host.
  - **traps** sends SNMP traps to host.
- **VERSION** SNMP version. Options include:
  - ***no parameter*** SNMPv2c (default).
  - **version 1** SNMPv1; option not available with informs.
  - **version 2c** SNMPv2c.
  - **version 3 noauth** SNMPv3; enables user-name match authentication.
  - **version 3 auth** SNMPv3; enables MD5 and SHA packet authentication.
  - **version 3 priv** SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- ***comm_str*** community string to be sent with the notification as a password.

  Arista recommends setting this string separately before issuing the **snmp-server host** command. To set the community string separately, use the **snmp-server community** command.
- **PORT** port number of the host.
  - ***no parameter*** socket number set to ***162*** (default).
  - **udp-port *p-name*** socket number specified by ***p-name***.

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

Example

This command adds a **version 2c** inform notification recipient.

```
switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```

20.5.4.27 snmp-server local-interface

The **snmp-server local-interface** command specifies the interface where SNMP originates informs and traps.

The **no snmp-server local-interface** and **default snmp-server local-interface** commands remove the inform or trap source assignment by removing the **snmp-server local-interface** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server local-interface INTERFACE

no snmp-server local-interface

default snmp-server local-interface

Parameters

INTERFACE Interface type and number. Values include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vrf *vrf_name*** The VRF in which SNMP is enabled. The keyword **default** specifies the default VRF.

Example

This command configures ***interface ethernet 1*** as the source of SNMP traps and informs.

```
switch(config)#snmp-server local-interface ethernet 1
switch(config)#
```

20.5.4.28 snmp-server location

The **snmp-server location** command configures the system location string. By default, no system location string is set.

The **no snmp-server location** and **default snmp-server location** commands delete the location string by removing the **snmp-server location** command from the configuration.

Command Mode

Global Configuration

Command Syntax

snmp-server location *node_locate*

no snmp-server location

default snmp-server location

Parameters

node_locate system location information (string).

Example

These commands configure ***lab-east*** as the location string.

```
switch(config)#snmp-server location lab_east
switch(config)#
```

20.5.4.29 snmp-server qosmib counter-interval

The **snmp-server qosmib counter-interval** command configures the interval (in seconds) after which the QoS counters are updated periodically. By default the counter updates are disabled.

Command Mode

Global Configuration

Command Syntax

snmp-server qosmib counter-interval *timer_interval*

no snmp-server qosmib counter-interval

default snmp-server qosmib counter-interval

Parameter

timer_interval Update interval for refreshing QoS counters (in seconds) between (***10***-***600***).

Example

The following command configures a interval of *50* seconds after which the QoS counters are updated periodically.

```
switch(config)#snmp-server qosmib counter-interval 50
```

20.5.4.30 snmp-server user

The **snmp-server user** command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user's parameters.

To configure a user, the IP address or port number of the device where the user's remote SNMP agent resides must be specified. A user's authentication come from the engine ID and the user's password. Remote user configuration commands fail if the remote engine ID is not configured first.

The **no snmp-server user** and **default snmp-server user** commands remove the user from an SNMP group by removing the user command from ***running-config***.

Note: Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperablity issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

Command Mode

Global Configuration

Command Syntax

snmp-server user *user_name group_name* [**AGENT**] **VERSION** [**ENGINE**][**SECURITY**]

no snmp-server user *user_name group_name* [**AGENT**] **VERSION**

default snmp-server user *user_name group_name* [**AGENT**] **VERSION**

Parameters

- ***user_name*** name of user.
- ***group_name*** name of group to which user is being added.
- **AGENT** Options include:
  - ***no parameter*** local SNMP agent.
  - **remote *addr*** [**udp-port *p_num***] remote SNMP agent location.
- ***addr*** denotes the IP address; ***p_num*** denotes the udp port socket (default port is ***162***).
- **VERSION** SNMP version; options include:
  - **v1** SNMPv1.
  - **v2c** SNMPv2c.
  - **v3** SNMPv3.
- **ENGINE** engine ID used to localize passwords. Available only if **VERSION** is **v3**.
  - ***no parameter*** Passwords localized by SNMP copy specified by ***agent***.
  - **localized *engineID*** octet string of engineID.
- **SECURITY** Specifies authentication and encryption levels. Available only if **VERSION** is **v3**. Encryption is available only when authentication is configured.
  - ***no parameter*** no authentication or encryption.
  - **auth *a_meth a_pass*** [**priv *e_meth e_pass***] authentication parameters.
  - ***a_meth*** authentication method: options are **md5** (HMAC-MD5-96) and **sha** (HMAC-SHA-96).
  - ***a-pass*** authentication string for users receiving packets.
  - ***e-meth*** encryption method: Options are **aes** (AES-128) and **des** (CBC-DES).
  - ***e-pass*** encryption string for the users sending packets.

Example

This command configures the remote SNMP user ***tech-1*** to the ***tech-sup*** SNMP group.

```
switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
```

20.5.4.31 snmp-server view

The **snmp-server view** command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The **no snmp-server view** command deletes a view entry by removing the corresponding **snmp-server view** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

snmp-server view *view_name family_name* **INCLUSION**

no snmp-server view *view_name* [*family_name*]

default snmp-server view *view_name* [*family_name*]

Parameters

- ***view_name*** Label for the view record that the command updates. Other commands reference the view with this label.
- ***family_name*** name of the MIB object or family.

  MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.
- **INCLUSION** inclusion level of the specified family within the view. Options include:
  - **include** view includes the specified subtree.
  - **exclude** view excludes the specified subtree.

Example

These commands create a view named **sys-view** that includes all objects in the **system subtree** except for those in ***system.2***.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
```

20.5.4.32 snmp-server vrf

The **snmp-server vrf** command enables SNMP in the specified VRF. By default, SNMP is enabled only in **default** VRF.

- User-defined VRFs: The **no snmp-server vrf** command disables SNMP in the specified VRF by removing the corresponding **snmp-server vrf** command from the ***running-config***.
- Default VRF: The **no snmp-server vrf** command disables SNMP in the VRF by adding a **no snmp-server vrf default** statement to the ***running-config*.**

Command Mode

Global Configuration

Command Syntax

snmp-server vrf *vrf_name*

no snmp-server vrf *vrf_name*

default snmp-server vrf *vrf_name*

Parameters

vrf_name The VRF in which SNMP is enabled. The keyword **default** specifies the default VRF.

Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the **snmp-server vrf** command.

Example

These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named ***magenta*** and ***columbia***.

```
switch(config)#no snmp-server vrf default
switch(config)#snmp-server vrf magenta
switch(config)#snmp-server vrf columbia
switch(config)#
```

20.6 VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- VM Tracer Introduction
- VM Tracer Description
- VM Tracer Configuration Procedures
- VM Tracer Commands

20.6.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.

20.6.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A Virtual Machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a Virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch's Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0– 7.0. The vSphere features include Distributed Virtual Switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

- Monitoring VLAN Based Configurations
- Monitoring VXLAN Based Configurations

20.6.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. The network topology of this configuration is displayed below.

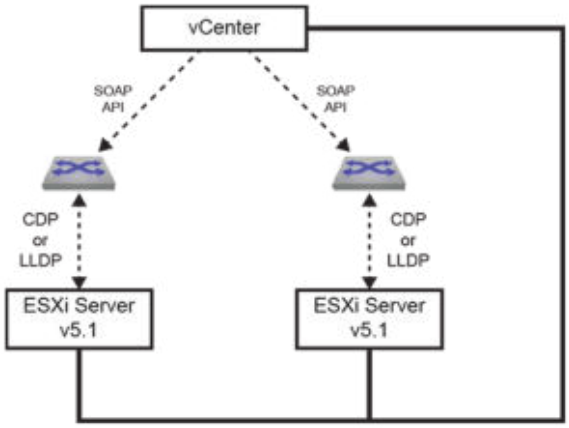

Figure 143: VM Tracer Topology – Monitoring VLAN Based Configurations

VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects, and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

20.6.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in **Monitoring VLAN Based Configurations**. Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model.

The network topology of this configuration is displayed below.

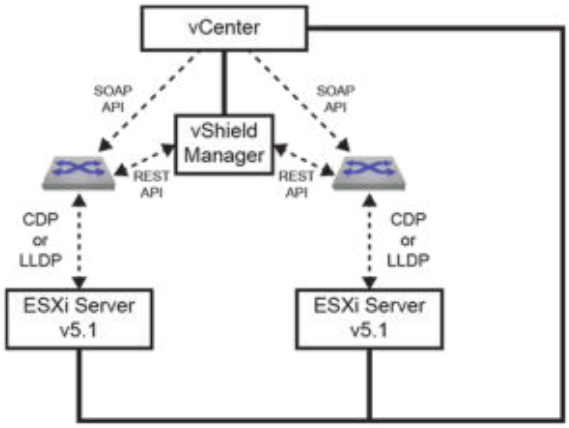

Figure 144: VM Tracer Topology – Monitoring VXLAN Based Configurations

20.6.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines the ***vmtracer*** configuration mode and VMtracer mode:

- ***vmtracer*** configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.

20.6.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch's ports. The switch supports four VM Tracer sessions.

The switch is placed in the ***vmtracer*** configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **`vmtracer session`** command places the switch in the ***vmtracer*** configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

Example

This command enters the ***vmtracer*** configuration mode for the ***system_1*** session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

In vmtracer configuration mode, the **`url (vmtracer mode)`**, **`username (vmtracer mode)`**, and **`password (vmtracer mode)`** commands specify the location and the account information that authenticates the switch. The URL parameter must reference a fully formed secure URL.

Example

These commands specify the IANA url along with the username and password that allow the switch to access the location.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The **autovlan disable** command prevents auto-segmentation, regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

Examples

- This command disables auto-segmentation.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.

```
switch(vmtracer-system_1)#no autovlan disable
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The **exit** command returns the switch to the ***global*** configuration mode and enables the VM Tracer session. The ***vmtracer*** configuration mode can be re-entered for this session to edit session parameters.

Example

This command exits vmtracer configuration mode.

```
switch(vmtracer-system_1)#exit
switch(config)#
```

The **no vmtracer session** command disables the session and removes it from ***running-config***.

Example

This command disables and deletes the ***system_1*** VM Tracer session.

```
switch(config)#no vmtracer session system_1
switch(config)#
```

20.6.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). The ***vmtracer-vxlan*** configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in the ***vmtracer*** configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The **vxlan (vmtracer mode)** command is executed from the ***vmtracer*** mode for a specified session and places the switch in the ***vmtracer-vxlan*** configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

Example

These commands create the vShield instance for the VMTracer session named ***vnet-1***.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

In the ***vmtracer-vxlan*** configuration mode, the **url (vmtracer-vxlan mode)**, **username (vmtracer-vxlan mode)**, and **password (vmtracer-vxlan mode)** commands specify

the vShield server's location and the account information that authenticates the switch to the vShield server. The url parameter must reference a fully formed secure url, such as **`https://vcshield.democorp.com/sdk`**.

Example

These commands specify the vShield's URL along with the username and password that allow the switch to access the vShield server.

```
switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.comp
any1.org/sdk
switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
switch(config-vmtracer-vnet-1-vxlan)#password home
switch(config-vmtracer-vnet-1-vxlan)#
```

20.6.3.3 Enabling VMtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The **`vmtracer`** command enables VMtracer mode on the configuration mode interface.

Examples

- These commands enable VMtracer mode on the Ethernet 3 interface.

```
switch(config)#interface Ethernet3
switch(config-if-Et3)#vmtracer vmware-esx
switch(config-if-Et3)#
```

  The **`no vmtracer`** command disables vmtracer mode on the configuration mode interface.
- This command disables vmtracer mode on the ***interface ethernet 3***.

```
switch(config-if-Et3)#no vmtracer vmware-esx
switch(config-if-Et3)#
```

20.6.3.4 Displaying VM Tracer Data

20.6.3.4.1 Displaying Session Status

The **`show vmtracer session`** command displays information about the specified session.

Without the **detail** parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

Example

This command displays connection parameters for the vCenter associated with the system_1 session.

```
switch#show vmtracer session system_1
    vCenter URL https://vmware-vcenter1/sdk
    username arista
    password arista
    Session Status Disconnected
```

With the **detail** parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

Example

This command displays connection parameters and message details for the vCenter associated with the ***system_1*** session.

```
switch#show vmtracer session system_1 detail
    vCenter URL https://vmware-vcenter1/sdk
    username arista
    sessionState Connected
    lastStateChange 19 days, 23:03:59 ago
    lastMsgSent CheckForUpdatesMsg
    timeOfLastMsg 19 days, 23:14:09 ago
    resonseTimeForLastMsg 0.0
    numSuccessfulMsg 43183
    lastSuccessfulMsg CheckForUpdatesMsg
    lastSuccessfulMsgTime 19 days, 23:14:19 ago
    numFailedMsg 1076
    lastFailedMsg CheckForUpdatesMsg
    lastFailedMsgTime 19 days, 23:14:09 ago
    lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
    "End of file or no input: Operation interrupted or timed out after
 600s send
or     600s receive delay"
    Detail: [no detail]
    CheckForUpdates:
```

20.6.3.4.2 Displaying VM Interfaces

The show vmtracer interface command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer interface

Ethernet8 : example.com
    VM Name VM Adapter VLAN Status
    esx3.aristanetworks.com vmk0 0 Up/Down
    vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.om
    VM Name VM Adapter VLAN Status
    Openview Network adapter 1 123 Up/Down
    VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
    VM Name VM Adapter VLAN Status

Ethernet24 : example.com
    VM Name VM Adapter VLAN Status
```

20.6.3.4.3 Displaying VMs

The **show vmtracer vm** command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

- This command displays the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm
    VM Name VM Adapter Interface VLAN
```

```
    Openview Network adapter 1 Et15 123
    vspheremanagement Network adapter 1 Et8 0
    VmTracerVm Network adapter 1 Et15 123
    example.com vmk0 Et8 0
```

- This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm detail
VM Name Openview
   intf : Et15
   vnic : Network adapter 1
   mac : 00:0c:29:ae:7e:90
   portgroup : dvPortGroup
   vlan : 123
   switch : vds
   host : example.com
```

20.6.4 VM Tracer Commands

Global Configuration Commands

- vmtracer session

Interface Configuration (Ethernet and Port Channel) Commands

- vmtracer

VMTracer Configuration Commands

- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- source-interface
- url (vmtracer mode)
- username (vmtracer mode)
- vrf (vmtracer mode)
- vxlan (vmtracer mode)

VMTracer-VXLAN Configuration Commands

- password (vmtracer-vxlan mode)
- url (vmtracer-vxlan mode)
- username (vmtracer-vxlan mode)

VM Tracer Display Commands

- show vmtracer all
- show vmtracer interface
- show vmtracer session
- show vmtracer session vcenter
- show vmtracer session vsm
- show vmtracer vm
- show vmtracer vm detail
- show vmtracer vnic counters
- show vmtracer vxlan segment
- show vmtracer vxlan vm

20.6.4.1 allowed-vlan

The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the vmtracer mode. By default, all VLANs are allowed.

Command Mode

Vmtracer Configuration

Command Syntax

allowed-vlan [**VLAN_LIST**]

no allowed-vlan

default allowed-vlan vlan

Parameters

VLAN_LIST The VLAN list or the edit actions to the current VLAN list. Valid ***v_range*** formats include number, or number range.

- ***v_range*** The list consists of the ***v_range*** VLANs.
- **add *v_range*** The ***v_range*** VLANs are added to the current VLAN list.
- **all** The list consists of all VLANs (***1***-***4094***).
- **except *v_range*** The list consists of all VLANs except for those specified by ***v_range***.
- **none** The list of VLANs is empty.
- **remove *v_range*** The ***v_range*** VLANs are removed from the current VLAN list.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Examples

- This command sets the list of allowed VLANs to ***1*** through ***2000***.

```
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

- This command adds VLANs to ***2501*** through ***3000***.

```
switch(vmtracer-system_1)#allow-vlan add 2051-3000
switch(vmtracer-system_1)#
```

20.6.4.2 autovlan disable

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The **autovlan disable** command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The **no autovlan disable** command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

Command Mode

Vmtracer Configuration

Command Syntax

autovlan disable

no autovlan disable

default autovlan disable

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

20.6.4.3 password (vmtracer mode)

The **password** command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

Command Mode

Vmtracer Configuration

Command Syntax

password [**ENCRYPTION**] [*password*]

Parameters

- **ENCRYPTION** encryption level of the password.
  - ***no parameter*** password is a clear-text string.
  - ***0*** the password is a clear-text string. Equivalent to ***no parameter***.
  - **7** the password is an encrypted string.
- ***password*** text that authenticates the username.
  - ***password*** is a clear-text string if **ENCRYPTION** specifies clear text.
  - ***password*** is an encrypted string if **ENCRYPTION** specifies an encrypted string.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command configures **abode** as the clear-text string that authorizes the username ***a-switch_01*** located at **example.com/sdk**.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

20.6.4.4 password (vmtracer-vxlan mode)

The **password** command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The **password** statement is replaced in ***running-config*** for the configuration mode interface by a subsequent **password** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in vmtracer configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

password [**ENCRYPTION**] *password*

Parameters

- **ENCRYPTION** encryption level of the password.
  - ***no parameter*** password is a clear-text string.
  - ***0*** the is a clear-text string. Equivalent to ***no parameter***.
  - ***7*** the password is an encrypted string.
- ***password*** text that autorizes the username.
  - ***password*** is a clear-text string if **ENCRYPTION** specifies clear text.
  - ***password*** is an encrypted string if **ENCRYPTION** specifies an encrypted string.

Related Commands

vxlan (vmtracer mode) places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

- This command configures ***5678*** as the clear-text string that authorizes the username **admin** to the NSX-V located at **https://example.com/sdk**.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#password 5678
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
      username admin
      password 7 s2Xq4GSBlYU=
switch(config-vmtracer-vnet-1)#
```

20.6.4.5 show vmtracer all

The **show vmtracer all** command displays VM Tracer data for all switches with the vSphere scope.

Command Mode

EXEC

Command Syntax

show vmtracer all

Example

This command displays data for both switches in the vSphere scope.

```
switch>show vmtracer all
Switch : a109(10.10.30.109)
Ethernet49     : 10.102.28.3/10G
   VM Name             VM Adapter          VLAN      Status    State
   ABCD                Network adapter 2   native    Up/--     --

Switch : a164(10.10.30.(172.22.30.164)
Ethernet49     : 10.102.28.3/10G Storage Network/dvUplink1
   VM Name             VM Adapter          VLAN      Status    State
   WXYZ                Network adapter 2   native    Up/--     --
switch>
```

20.6.4.6 show vmtracer interface

The **show vmtracer interface** command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

Command Mode

EXEC

Command Syntax

show vmtracer interface [**INT_NAME**] [**INFO_LEVEL**]

Parameters

- **INT_NAME** the interfaces to be configured. Values include:
  - ***no parameter*** command returns information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range.
  - **port-channel *p_range*** Port Channel interface range.

    Valid ***e_range*** and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** connection parameters and status for VM associated to specified sessions.
  - **detail** connection status and data concerning messages the VM.
  - **host** name of the connected host.

Examples

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer interface

Ethernet8 : example.com
    VM Name                     VM Adapter          VLAN     Status
    esx3.aristanetworks.com     vmk0                0        Up/Down
    vspheremanagement           Network adapter 1   0        Up/Down

Ethernet15 : example.com
    VM Name                     VM Adapter          VLAN      Status
    Openview                    Network adapter 1   123       Up/Down
    VmTracerVm                  Network adapter 1   123       Down/Down

Ethernet23 : example.com
    VM Name                     VM Adapter          VLAN       Status
switch>
```

- This command displays the Vnics connected to the Ethernet 8 interface.

```
switch>show vmtracer interface Ethernet8

Ethernet8 : example.com
    VM Name                     VM Adapter          VLAN      Status
    example.com                 vmk0                0         Up/Down
    vspheremanagement           Network adapter 1   0         Up/Down
switch>
```

20.6.4.7 show vmtracer session vcenter

The **show vmtracer session vcenter** command displays vCenter information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

show vmtracer session *session_name* vcenter [**INFO_LEVEL**]

Parameters

- ***session_name*** VM Tracer sessions for which the command returns information.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** displays connection and status information for the specified vCenter.
  - **detail** displays connection, status, and history information for the specified vCenter.

Examples

- This command displays connection parameters for the vCenter associated to the abcde session.

```
switch>show vmtracer session abcde vcenter

Session           abcde
vCenter URL       https://vmware-vcenter5.1/sdk
username          Administrator
autovlan          enabled
allowed-vlans     1-4094
sessionState      Connected
switch>
```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

```
switch>show vmtracer session abcde vcenter detail

Session                         abcde
vCenter URL                     https://vmware-vcenter5.1/sdk
username                        Administrator
autovlan                        enabled
allowed-vlans                   1-4094
SessionState                    Connected
lastStateChange                 2:46:50 ago
lastMsgSent                     Query network hint message
timeOfLastMsg                   0:00:20 ago
responseTimeForLastMsg          0.000102301000479
numSuccessfulMsg                998
lastSuccessfulMsg               Query network hint message
lastSuccessfulMsgTime           0:00:20 ago
numFailedMsg                    0
lastFailedMsg                   --
lastFailedMsgTime               never
lastErrorCode                   --
switch>
```

20.6.4.8 show vmtracer session vsm

The **show vmtracer session vsm** command displays NSX-V information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

show vmtracer session *session_name* vsm [**INFO_LEVEL**]

Parameters

- ***session_name*** VM Tracer sessions for which the command returns information.
- **INFO_LEVEL** specifies information that the command returns.
  - ***no parameter*** connection and status information for the specified NSX-V.
  - **detail** connection, status, and history information for the specified NSX-V.

Examples

- This command displays connection parameters for the NSX-V associated to the ***abcde*** session.

```
switch>show vmtracer session abcde vsm

Session           abcde
VShield URL       https://example.com/sdk
username          admin
sessionState      Connected
switch>
```

- This command displays connection parameters and history details from the vShield Manager associated to the ***abcde*** session.

```
switch>show vmtracer session abcde vsm detail

Session                       abcde
VShield URL                   https://vmware-vshield5.1/
username                      admin
SessionState                  Connected
LaststateChange               19 days, 23:14:19 ago
LastMsgSent                   /api/2.0/vdn/scopes
timeOfLastMsg                 1 days, 13:22:09 ago

                              The given remote host was not resolved.
switch>
```

20.6.4.9 show vmtracer session

The **`show vmtracer session`** command displays vCenter and vShield connection information for a specified VM Tracer session.

Command Mode

EXEC

Command Syntax

`show vmtracer session` [**SESSION_LIST**]

Parameters

SESSION_LIST VM Tracer sessions for which the command returns information.

- ***no parameter*** all configured VM Tracer sessions.
- ***session_name*** name of one VM Tracer session.

Example

This command displays connection parameters associated to the ***abcde*** session.

```
switch>show vmtracer session abcde
Session abcde
vCenter URL       https://example.com/sdk
username                      Administrator
autovlan                      enabled
allowed-vlans     1-4094
sessionState      Connected
VShield URL       https:/vmware-vshield5.1.xyz.abcde.com
username                  admin
sessionState      Connected

switch>
```

20.6.4.10 show vmtracer vm detail

The **show vmtracer vm detail** command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

Command Mode

EXEC

Command Syntax

show vmtracer vm [**VM_LIST**] **detail**

Parameters

VM_LIST The virtual machines for which the command displays information. Options include:

- ***no parameter*** command returns information for all present VMs.
- ***vm_name*** command returns information only for specified VM.

Examples

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch#show vmtracer vm vmcenter1
VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5
switch>
```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm detail
VM Name  vCenter1 Server App
  Interface   :     Po45
  vNIC        :     Network adapter 1
  MAC         :     00:31:22:8e:b8:41
  Portgroup   :     VM Network
  VLAN        :     native
  Switch      :     Switch2
  Status      :     Down/Down
  Host        :     10.22.18.28
  Data Center :     vcenter-5

VM Name  vCenter2 Server App
  Interface   :     Po45
  vNIC        :     vmk0
  MAC         :     00:33:23:3c:e1:4e
  Portgroup   :     Management Network
  VLAN        :     native

switch>
```

20.6.4.11 show vmtracer vm

The **show vmtracer vm** command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

Command Mode

EXEC

Command Syntax

show vmtracer [**INT_NAME**] vm [**VM_LIST**]

Parameters

- **INT_NAME** the interfaces name Values include:
  - ***no parameter*** command returns information for all interfaces.
  - **interface ethernet *e_range*** Ethernet interface range.
  - **interface port-channel *p_range*** Port Channel interface range.

    Valid ***e_range*** and ***p_range*** formats include a number, number range, or comma-delimited list of numbers and ranges.
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - ***no parameter*** command returns information for all present VMs.
  - ***vm_name*** command returns information only for specified VM.

Related Commands

show vmtracer vm detail displays connection information for one or more specified VMs.

Example

This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name              Esx Host          Interface  VLAN     Status

vCenter1             172.22.28.8       Po45       native   Down/Down
vCenter2             172.22.28.8       Po45       native   Up/Up
vCenter3             172.22.28.8       Po45       11       Down/Down
vCenter4             172.22.28.8       Po45       native   Down/Down
VMKernel                               Po43       native   Up/Up
demo vcenter 5 clone                   Po43       native   Up/Up
switch>
```

20.6.4.12 show vmtracer vnic counters

The **show vmtracer interface vnic counters** command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

Command Mode

EXEC

Command Syntax

show vmtracer [**ENTITY**] vnic counters

Parameters

ENTITY the virtual machine or interface over which statistics are gathered and displayed.

- ***no parameter*** command returns information for all active VMs.
- **interface ethernet *e_range*** Ethernet interface range.
- **interface port-channel *p_range*** Port Channel interface range.
- **vm *vm_name*** command returns information for specified VM.

  Valid ***e_range*** and ***p_range*** formats include a number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the Vnics connected to ***interface ethernet 24***.

```
switch>show vmtracer interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
VM Name         vNic                  Input Pkt/Byte/%          Output Pkt/Byte/%
vCenter1        Network adapter 2     2550/   187175/  0.6     6/         360/  0.0
vCenter2        Network adapter 2     418615/ 30678024/ 99.4   1904439/ 1145654613/100.0
Summary                               421165/ 30865199/100.0   1904445/ 1145654973/100.0
switch>
```

20.6.4.13 show vmtracer vxlan segment

The **`show vmtracer vxlan segment`** command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

Command Mode

EXEC

Command Syntax

`show vmtracer segment` **ENTITY**

Parameters

ENTITY specifies the information that the command displays. Options include:

- ***no parameter*** displays information for VXLAN segments.
- **pool** displays resource pools available to segments.
- **pool *pool_name*** displays connection information about the specified pool.
- **range** displays the VNI range of the managed segments.

Examples

- This command displays the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan segment
Name                  VNI     Multicast IP     Network Scope
------------------------------------------------------------
Eng Wire              5002    237.0.0.1        abcde
HR Wire               5000    237.0.0.2        abcde

switch>
```

- This command displays the resource pools available to the VXLANs.

```
switch>show vmtracer vxlan segment pool
Name                   Description                      Segments
-------------------------------------------------------------------
--------
abcde                  Spans Cluster 1 and Cluster 2   Eng Wire, HR
 Wire

switch>
```

- This command displays connection and packet information for the ***abcde*** pool.

```
switch>show vmtracer vxlan segment pool abcde
Name:          abcde
Description:   Spans Cluster 1 and Cluster 2
Segments:      Eng Wire, HR Wire

Vxlan Segment  Cluster   Host                VTEP IP           DVS       VLAN  MTU
Eng Wire       Cluster2  test2.example.com   10.168.200.1/24  dvs-test2  200   1600
Eng Wire       Cluster1  test2.example.com   10.168.100.1/24  dvs-test1  100   1600
HR Wire        Cluster1  test2.example.com   10.168.100.1/24  dvs-test1  100   1600
HR Wire        Cluster2  test2.example.com   10.168.200.1/24  dvs-test2  200   1600
switch>
```

- This command displays the VNI range of the VXLAN segments.

```
switch>show vmtracer vxlan segment range

VNI Range             Multicast IP Range
-----------------------------------------
5000 - 5024           237.0.0.1 - 237.0.0.117
```

```
Name                  VNI     Multicast IP     Network Scope
-------------------------------------------------------------
HR Wire               5002    237.0.0.1        abcde

Eng Wire              5000    237.0.0.2        abcde
switch>
```

20.6.4.14 show vmtracer vxlan vm

The **show vmtracer vxlan vm** command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

Command Mode

EXEC

Command Syntax

show vmtracer vxlan vm

Example

This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan vm
Vxlan Segment       VTEP IP            VLAN  VMs
Eng Wire            192.168.200.1/24   200   Eng VM3, Eng VM2
Eng Wire            192.168.100.1/24   100   Eng VM1
HR Wire             192.168.100.1/24   100   HR VM2, HR VM1
HR Wire             192.168.200.1/24   200   --
switch>
```

20.6.4.15 source-interface

The **source-interface** command allows you to connect to a remote vCenter endpoint by using the primary address of the interface as the source IP address. If the interface is not specified, the source IP address is determined by the routing table.

The **no source-interface** and **default source-interface** commands restore default behavior by removing the **source-interface** command from the ***running-config***.

Command Mode

Vmtracer Configuration

Command Syntax

source-interface [**INTERFACE_NAME**]

no source-interface

default source-interface

Parameters

INTERFACE_NAME specifies the interface for which the information is displayed. Options include:

- **Ethernet *e_num*** specifies the Ethernet interface number.
- **Loopback *l_num*** specifies the loopback interface number. Value ranges from ***0*** to ***2100***.
- **Management *m_num*** specifies the management interface number. The values are ***1*** or ***2***.
- **Port-Channel** {***lag_num*** | ***lag_num.sub_num***} specifies the port-channel interface number. Value of interface ranges from ***1*** to ***2000***. Value of sub-interface ranges from ***1*** to ***4094***.
- **Tunnel *tunnel_num*** specifies the tunnel interface number. Value ranges from ***1*** to ***255***.
- **UnconnectedEthernet *port_num*** specifies the unconnected Ethernet port number. Value ranges from ***1*** to ***8***.
- **VLAN *vlan_num*** specifies the VLAN interface number. Value ranges from ***1*** to ***4094***.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Examples

- This command configures VM Tracer to use ***interface Ethernet 17*** to derive the source address for session packets.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Ethernet 17
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface Loopback 0*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Loopback 0
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface management 1*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface management 1
switch(config-vmtracer-session-system_1)#
```

- This command configures ***port-channel 10*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface port-channel
 10
```

```
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface tunnel 25*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface tunnel 25
switch(config-vmtracer-session-system_1)#
```

- This command configures unconnected ***interface Ethernet 1*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface unconnected
 Ethernet 1
switch(config-vmtracer-session-system_1)#
```

- This command configures ***interface vlan 25*** for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface vlan 25
switch(config-vmtracer-session-system_1)#
```

20.6.4.16 url (vmtracer mode)

The **url** command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

Command Mode

Vmtracer Configuration

Command Syntax

url *url_name*

Parameters

url_name location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command specifies the location of the vCenter monitored by the ***system_1*** VM Tracer session.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#
```

20.6.4.17 url (vmtracer-vxlan mode)

The **url** command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The **url** statement is replaced in running-config for the configuration mode session by a subsequent **url** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in ***vmtracer*** configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

url *url_name*

Parameters

url_name location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

Related Commands

vxlan (vmtracer mode) places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

This command configures the location of the NSX-V monitored by the ***vnet-1*** VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
switch(config-vmtracer-vnet-1)#
```

20.6.4.18 username (vmtracer mode)

The **username** command identifies the switch's account name on the vCenter server. The switch uses this user name to access vCenter information.

Command Mode

Vmtracer Configuration

Command Syntax

username *name_string*

Parameters

name_string vCenter account user name. Parameter must match the user name configured on the vCenter.

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Example

This command configures the user name for the vCenter associated with the ***system_1*** session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#
```

20.6.4.19 username (vmtracer-vxlan mode)

The **username** command identifies the switch's account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The **username** statement is replaced in ***running-config*** for the configuration mode interface by a subsequent **username** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in the ***vmtracer*** configuration mode.

Command Mode

Vmtracer-vxlan Configuration

Command Syntax

username *name_string*

Parameters

name_string NSX-V account user name. Parameter must match a user name configured on the NSX-V.

Related Commands

vxlan (vmtracer mode) places the switch in the ***vmtracer-vxlan*** configuration mode.

Example

This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
   allowed-vlan 1-4094
   vxlan
      url https://example.com/sdk
      username admin
switch(config-vmtracer-vnet-1)#
```

20.6.4.20 vmtracer session

The **vmtracer session** command places the switch in the ***vmtracer*** mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in the ***vmtracer*** mode. Parameters configured in the ***vmtracer*** mode include the vCenter location and dynamic VLAN usage.

The **no vmtracer session** and **default vmtracer session** commands disable the session and remove its configuration from ***running-config***.

Command Mode

Global Configuration

Command Syntax

vmtracer session *name*

no vmtracer session *name*

default vmtracer session *name*

Parameters

name The label assigned to the VM Tracer session.

Commands Available in vmtracer Configuration Mode

- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- url (vmtracer mode)
- username (vmtracer mode)
- vxlan (vmtracer mode)

Examples

- This command enters vmtracer mode for the ***system_1*** session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

- This command disables the system_1 VM Tracer session. The system_1 session and all of its parameters are removed from ***running-config***.

```
switch(config)#no vmtracer session system_1
switch(config)#
```

20.6.4.21 vmtracer

The **vmtracer** command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The **no vmtracer** and **default vmtracer** commands disable vmtracer mode on the configuration mode interface by removing the corresponding **vmtracer** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration Interface-Port-channel Configuration

Command Syntax

vmtracer HOST_TYPE

no vmtracer HOST_TYPE

default vmtracer HOST_TYPE

Parameters

HOST_TYPE the type of hypervisor that controls the vSwitch to which the interface connects.

- **vmware-esx** ESX or ESXI hypervisor (VMware).

Examples

- These commands enable the ***vmtracer*** mode on the ***interface Ethernet 3***.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#vmtracer vmware-esx
switch(config-if-Et3)#
```

- This command disables the ***vmtracer*** mode on the ***interface Ethernet 3***.

```
switch(config-if-Et3)#no vmtracer vmware-esx
switch(config-if-Et3)#
```

20.6.4.22 vrf (vmtracer mode)

The **vrf** command allows the switch to communicate with a vCenter server by enabling VmTracer configuration mode. By default, VmTracer is enabled only in the **default vrf** command.

Command Mode

Vmtracer Configuration

Command Syntax

vrf *vrf_name*

Parameters

vrf_name specifies information of the corresponding VRF.

Example

These commands place the VRF ***vrf1*** in the ***vmtracer*** configuration mode.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#vrf vrf1
switch(config-vmtracer-session-system_1)#
```

20.6.4.23 vxlan (vmtracer mode)

The **vxlan** command places the switch in the ***vmtracer-vxlan*** configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). The ***vmtracer-vxlan*** configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode ***vmtracer*** session. Each VM Tracer session can be associated with one NSX-V instance.

The **no vxlan** and **default interface vxlan** commands delete the NSX-V instance from the configuration mode ***vmtracer*** session by removing all of the ***vmtracer-vxlan*** mode commands from ***running-config***.

Command Mode

Vmtracer Configuration

Command Syntax

vxlan

no vxlan

default vxlan

Related Commands

vmtracer session places the switch in the ***vmtracer*** configuration mode.

Commands Available in vmtracer-vxlan Configuration Mode

- password (vmtracer mode)
- url (vmtracer mode)
- username (vmtracer mode)

Example

These commands create the vShield instance for the VMTracer session named ***vnet-1***.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

20.7 MapReduce Tracer

This section describes Arista's implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this section include:

- MapReduce Tracer Introduction
- MapReduce Tracer Configuration
- Displaying MapReduce Tracer Results
- MapReduce Tracer Commands

20.7.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch's DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.

20.7.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

20.7.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

20.7.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

20.7.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.

MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of five clusters are supported per switch.

20.7.2 MapReduce Tracer Configuration

The ***MapReduce Tracer*** configuration commands are structured into two configuration levels:

- The ***monitor-hadoop*** configuration mode is a child of ***global*** configuration mode and controls the ***global MapReduce Tracer*** settings.
- The ***monitor-hadoop-cluster*** configuration mode is a child of the ***monitor-hadoop*** configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- MapReduce Tracer Global Configuration
- Hadoop Cluster Access Configuration
- MapReduce Tracer Example

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

20.7.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in the ***monitor-hadoop*** configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

Entering the Monitor-Hadoop Configuration Mode

The ***monitor-hadoop*** configuration mode is entered by monitor hadoop. Monitor-hadoop configuration mode is not a group change mode; statements are stored in the ***running-config*** when they are entered through the CLI. The **exit** command returns the switch to global configuration mode.

Examples

- These commands place the switch in the ***monitor-hadoop*** configuration mode.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits the ***monitor-hadoop*** mode.

```
switch(config-monitor-hadoop)#exit
switch(config)#
```

- This command deletes all previously configured ***monitor-hadoop*** configuration mode commands.

```
switch(config)#no monitor hadoop
switch(config)#
```

Globally Enabling MapReduce Tracer

MapReduce Tracer is globally enabled by the **no** version of the shutdown (Monitor-Hadoop). MapReduce Tracer is globally disabled by default.

Example

These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
 monitor hadoop
   no shutdown
switch(config-monitor-hadoop)#
```

Creating a Cluster Monitor

A cluster monitor is created by entering the ***monitor-hadoop-cluster*** mode with **cluster (Monitor Hadoop)**. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor's parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

Example

These commands enter the **monitor-hadoop-cluster** mode to edit a cluster monitor. The monitor's cluster-id is ***CL2***.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in the ***monitor-hadoop-cluster*** configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The **cluster (Monitor Hadoop)** command places the switch in the ***monitor-hadoop-cluster*** mode for the specified monitor, where a cluster's connection parameters are specified. The ***monitor-hadoop-cluster*** mode is not a group change mode.

A cluster monitor is enabled by using the **no** version of the **shutdown (Monitor-Hadoop)** when MapReduce Tracer is globally enabled.

20.7.2.2.1 JobTracker Configuration

A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes. The **jobtracker (Monitor Hadoop Cluster)** command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is ***8021***. Location and username parameters do not have default values and must be explicitly configured.

Example

For the ***CL2*** monitor, these commands configure connection parameters to a JobTracker node at ***10.4.4.4*** with the username ***account1***. The default RPC port (***8021***) is implicitly specified.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4
 username account1
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
      jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2.2 TaskTracker Configuration

The tasktracker (Monitor Hadoop Cluster) command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker.

The default TaskTracker HTTP port is ***50060***.

Examples

- For the ***CL2*** monitor, these commands configure a TaskTracker access port of ***51000***.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP access port address of ***50060***.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
  cluster CL2
    jobtracker rpc-port 8021
    tasktracker http-port 50060
    interval 10
    shutdown
switch(config-monitor-hadoop-CL2)#
```

20.7.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster's JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The **interval (Monitor Hadoop Cluster)** command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is ***10*** seconds.

Example

This command sets the JobTracker polling interval to ***25*** seconds for the cluster monitored by the ***CL2*** MapReduce Tracer configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
      interval 25
switch(config-monitor-hadoop-CL2)#
```

20.7.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- Cluster ID: ***CL_1***
  - Jobtracker: IP address: ***10.15.2.2***; RPC port: ***8021***; username: ***xyz1***
  - TaskTracker: HTTP address ***54000***
  - JobTracker polling interval: ***10*** seconds (default)
- Cluster ID: ***CL_2***
  - Jobtracker: IP address: ***10.21.5.2***; RPC port: ***9521***; username: ***qrst4***
  - TaskTracker: HTTP address ***50060*** (default)
  - JobTracker polling interval: ***5*** seconds

Example

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL_1

switch(config-monitor-hadoop-CL_1)#jobtracker host 10.15.2.2
 username xyz1
switch(config-monitor-hadoop-CL_1)#tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)#no shutdown
switch(config-monitor-hadoop-CL_1)#exit

switch(config-monitor-hadoop)#cluster CL_2
switch(config-monitor-hadoop-CL_2)#jobtracker host 10.21.5.2 rpc-
port 9521
switch(config-monitor-hadoop-CL_2)#interval 5
switch(config-monitor-hadoop-CL_2)#no shutdown
switch(config-monitor-hadoop-CL_2)#exit

switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
 monitor hadoop
   no shutdown
   cluster CL_1
      jobtracker host 10.15.2.2 user xyz1
      tasktracker http-port 54000
      no shutdown
   !
   cluster CL_2
      jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
      interval 5
      no shutdown

switch(config-monitor-hadoop)#show active all
 monitor hadoop
   no shutdown
   cluster CL_1
      jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
      tasktracker http-port 54000
      interval 10
      no shutdown
   !
   cluster CL_2
      jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
      tasktracker http-port 50060
      interval 5
```

```
      no shutdown
switch(config-monitor-hadoop)#exit
switch(config)#
```

20.7.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

This section contains the following topics:

- MapReduce Tracer Status
- Cluster Configuration and Connections
- Job Lists
- Job Data
- TaskTracker Lists
- TaskTracker Connection and Activity
- Data Bursts
- Low-memory Mode

20.7.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through **show monitor hadoop status**. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status

Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                          : Enabled
  Operational status                    : Enabled
  Number of clusters configured         : 3
  Number of local TaskTrackers          : 4
  Number of jobs running locally        : 4

switch>
```

20.7.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- show monitor hadoop cluster all: Configuration and connection data for all monitored clusters.
- show monitor hadoop cluster status: Configuration and connection data for a specified cluster.
- show monitor hadoop tasktracker status: Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface.

Example

This command displays configuration and connection data for the ***Cluster0*** cluster.

```
switch>show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster:  Cluster0
  Admin status                 : Enabled
  JobTracker host              : host0
  JobTracker RPC port          : 9000
  JobTracker user              : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port        : 8800
  Operational status           : Enabled
  Active TaskTrackers          : 31
  Blacklisted TaskTrackers     : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval      : 20.0
  Map slots (used/total)       : 10/100
  Reduce slots (used/total)    : 11/110
  JobTracker heap size         : 1.04GB (max: 2.08GB)

switch>
```

20.7.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- show monitor hadoop: Jobs running on all monitored Hadoop clusters.
- show monitor hadoop cluster counters: Jobs running on a specified cluster and byte counter data.
- show monitor hadoop cluster history: Jobs that previously ran on a specified cluster.
  - clear monitor hadoop job-history: Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared.
- show monitor hadoop cluster jobs: Jobs running on a specified cluster.
- show monitor hadoop history: Jobs that ran on all configured clusters is accessed through.
  - clear monitor hadoop job-history: Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared.
- show monitor hadoop tasktracker counters: Jobs running on a specified TaskTracker and byte counter data.

Examples

- This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4

20.7.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- show monitor hadoop cluster history jobs: Data consumption, start and stop times, and JobTracker ID for a specific job.
- show monitor hadoop cluster jobs <job number>: Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job.

- show monitor hadoop cluster jobs counter: HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job.
- show monitor hadoop counters: Data through and start time for jobs running on all monitored clusters.
- show monitor hadoop tasktracker jobs: Progress statistics and start times are available for jobs running on specified TaskTracker.
- show monitor hadoop tasktracker running-tasks: Job progress and byte counts of jobs running on a specified Hadoop cluster .
- show monitor hadoop tasktracker running-tasks cluster job task: Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job.
- show monitor hadoop tasktracker counters: Data consumption and start times for jobs running on a specified TaskTracker.

Examples

- This command displays information about ***job 1*** that ran on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
  Cluster                 : Cluster0

switch>
```

20.7.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

- show monitor hadoop cluster tasktracker: TaskTrackers on a specified cluster.
- show monitor hadoop tasktracker all: TaskTrackers on all monitored clusters.

Example

This command displays the TaskTrackers on the ***Cluster0*** cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address  Interface      Maps   Reduces
------------- ----------- -------------- ------ -------
TaskTracker1  10.100.0.1   Ethernet7       4      0
TaskTracker2  10.100.0.2   Port-Channel7   4      0

switch>
```

20.7.3.6 TaskTracker Connection and Activity

The following TaskTracker connection and activity data is available through these commands:

- show monitor hadoop tasktracker status: Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface.
- show monitor hadoop tasktracker all counters: Data consumption for TaskTrackers connected to monitored clusters.

Example

This command displays connection and activity data for TaskTracker on the ***TaskTracker1*** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 status

Last updated: 2013-10-06 18:14:23
  TaskTracker          : TaskTracker1
  IP Address           : 10.100.0.1
```

```
  Interface           : Ethernet7
  State               : active
  Running jobs        : 2
  Running tasks       : 4
  Map Tasks           : 4
  Reduce Tasks        : 0
  Total bytes read    : 2.08GB
  Total bytes written : 4.24MB

switch>
```

20.7.3.7 Data Bursts

The **show monitor hadoop traffic burst** command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

Example

This command displays traffic burst data for all running jobs that are accessible through ***port channel interface 7***.

```
switch>show monitor hadoop traffic burst interface Port-Channel 7

Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Port-Channel7' in cluster: Cluster0
Top 2 input bursts:
JobId       Job Name              Burst     Time
----------- --------------------- ----------- -------------
------
 1           ShortName             3.07GB    2013-10-06 17:57:43

             gNameForAJob

Top 2 output bursts:
JobId       Job Name              Burst     Time
----------- --------------------- ----------- -------------
------
 1           ShortName             4.10GB    2013-10-06 17:55:13
 2           ReallyAVeryLon\       8.20GB    2013-10-06 17:36:03
             gNameForAJob
```

20.7.3.8 Low-memory Mode

Switch behavior can be improved using the **memory exhaustion** command when the switch gets low on available memory. This low-memory or Out-of-Memory (OOM) state is caused by a number of individual or a combination of factors including the one listed below:

- Memory leaks in EOS or customer user processes.
- Process leaks to too many processes or scripts running at one time.
- Over configuration of the system requiring more memory than available.
- Large number of temporary (tmpfs) files such as logs.
- Large number of CLI sessions.
- Any event or agents that can consume more memory than available in the system.

Once the low-memory state is reached, the system uses the **oom_score**, which depends on the value of the **oom_score_adj** parameter to kill processes to free up available memory. The value for the parameter ranges from ***-1000*** (will not be shut down) to ***1000*** (will be shut down first) during an OOM state. Non-essential agents are assigned **oom_score_adj** values of ***900*** or greater.

When enabled, the system implements the following:

- Non-essential agents shut down by Linux are not restarted.
- CLI is restarted, and a message: "Restarting CLI due to memory exhaustion on the system" is sent to all login sessions in the switch.
- CLI Scheduler is disabled.

The system requires manual intervention through **reset system memory exhaustion** command to exit the mode and restart the agents that were shut down.

Configuring Low-memory Mode

The following examples are applicable to all platforms.

Example

These commands configure the low-memory mode.

```
switch(config)#monitor system
switch(config-monitor-system)#memory exhaustion
switch(config-monitor-system-memory)#action agent non-critical
 hold-down
```

Example

The following command disables low-memory mode in ***config-monitor-system-memory***.

```
switch(config-monitor-system-memory)#no action agent non-critical
 hold-down
```

The following command exits low-memory mode after an OOM event has occurred and agents have been shut down. The command restarts the agents being held down and reenables the CLI scheduler.

```
switch(config-monitor)#reset system memory exhaustion
```

The **show monitor system** command shows the state of the system with the following information:

- If the feature is enabled.
- If the system is in low-memory mode (featured enabled and system experiencing OOM).
- How many times the system entered low-memory mode.
- Last time the system entered low-memory mode (if applicable).
- Last time the system exited low-memory mode (if applicable).

Example

```
switch#show monitor system
```

The following output is for a system where the feature is disabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: False
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion:
```

The following output is for a system where the feature is enabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: True
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:00:07 ago
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode once, and has exited the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:01:00 ago
Last time exited from Memory Exhaustion: 0:00:05 ago
```

Configuring oom_score_adj for a daemon agent

To configure the ***oom_score_adj*** of any configured daemon, use the following command:

```
switch(config-daemon-<daemon_name>)# oom score adjustment <score>
```

Note: Similar to change the daemon heartbeat value, the new ***oom_score_adj*** value for the daemon is in effect after restarting the daemon by using **shutdown** command followed by a **no shutdown** command.

```
switch(config)# daemon daemonName
switch(config-daemon-daemonName)# oom score adjustment -200
switch(config-daemon-daemonName)# shutdown
switch(config-daemon-daemonName)# no shutdown
```

20.7.4 MapReduce Tracer Commands

Global Configuration Commands

- monitor hadoop

Clear Hadoop Monitor Commands

- clear monitor hadoop burst-counters
- clear monitor hadoop job-history

Display Commands

- show agent oom scores
- show monitor hadoop
- show monitor hadoop cluster all
- show monitor hadoop cluster counters
- show monitor hadoop cluster history
- show monitor hadoop cluster history jobs
- show monitor hadoop cluster jobs
- show monitor hadoop cluster jobs <job number>
- show monitor hadoop cluster jobs counter
- show monitor hadoop cluster status
- show monitor hadoop cluster tasktracker
- show monitor hadoop counters
- show monitor hadoop history
- show monitor hadoop status
- show monitor hadoop tasktracker all
- show monitor hadoop tasktracker all counters
- show monitor hadoop tasktracker counters
- show monitor hadoop tasktracker jobs
- show monitor hadoop tasktracker running-tasks
- show monitor hadoop tasktracker running-tasks cluster job task
- show monitor hadoop tasktracker status
- show monitor hadoop traffic burst
- show monitor system

Hadoop Commands

- cluster (Monitor Hadoop)
- shutdown (Monitor-Hadoop)

Hadoop-Cluster Commands

- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)

20.7.4.1 clear monitor hadoop burst-counters

The **clear monitor hadoop burst-counters** command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

Command Mode

Privileged EXEC

Command Syntax

clear monitor hadoop burst-counters [**CLUSTERS**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.

Example

This command clears the burst counters for all jobs running on ***CL2*** cluster.

```
switch#clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```

20.7.4.2 clear monitor hadoop job-history

The **clear monitor hadoop job-history** command resets the job history database for all specified clusters.

Command Mode

Privileged EXEC

Command Syntax

clear monitor hadoop job-history [**CLUSTERS**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.

Example

This command clears the job history on the ***CL2*** cluster.

```
switch#clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```

20.7.4.3 cluster (Monitor Hadoop)

The **cluster** command is a monitor-hadoop command that places the switch in the ***monitor-hadoop-cluster mode*** for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

The ***monitor-hadoop-cluster*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***monitor-hadoop-cluster*** mode does not affect ***running-config***. The **exit** command returns the switch to the ***monitor-hadoop*** configuration mode.

The configuration mode monitor is enabled by the **no** version of the shutdown (Monitor Hadoop Cluster). Enabling a monitor also requires that MapReduce Tracer is globally enabled (shutdown (Monitor Hadoop Cluster).

The **no cluster** and **default cluster** commands remove the specified Hadoop cluster configuration from ***running-config***.

Command Mode

Monitor-hadoop Configuration

Command Syntax

cluster *cluster_name*

no cluster *cluster_name*

default cluster *cluster_name*

Parameters

cluster_name Hadoop cluster name.

Related Commands

monitor hadoop places the switch in the ***monitor-hadoop*** configuration mode.

Commands Available in Monitor-hadoop-cluster Configuration Mode

- description (Monitor Hadoop Cluster)
- interval (Monitor Hadoop Cluster)
- jobtracker (Monitor Hadoop Cluster)
- shutdown (Monitor Hadoop Cluster)
- tasktracker (Monitor Hadoop Cluster)

Examples

- These commands create the CL2 monitor and enters the ***monitor-hadoop-cluster*** mode for the monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#
```

- These commands exit the ***monitor-hadoop-cluster*** mode.

```
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
 monitor hadoop
   cluster CL2
switch(config-monitor-hadoop)#
```

- These commands remove the CL2 monitor.

```
switch(config-monitor-hadoop)#no cluster CL2
switch(config-monitor-hadoop)#show active
switch(config-monitor-hadoop)#
```

20.7.4.4 description (Monitor Hadoop Cluster)

The **description** command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The **no description** and **default description** commands remove the text string from the configuration mode monitor by removing the corresponding **description** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

description *label_text*

no description

default description

Parameters

label_text Character string assigned to the monitor configuration.

Related Commands

cluster (Monitor Hadoop) places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Example

These commands add description text to the ***CL2*** monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
   cluster CL2
      description First Cluster
      jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```

20.7.4.5 interval (Monitor Hadoop Cluster)

The **interval** command specifies the polling interval between queries to the Hadoop cluster JobTracker specifed by configuration mode statements. The switch polls a cluster's JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is ***10*** seconds.

The **no interval** and **default interval** commands restore the default interval of ***10*** seconds by removing the **interval** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

interval *period*

no interval

default interval

Parameters

period Interval (seconds) between JobTracker polls. Value ranges from ***1*** to ***600***. Default is ***10***.

Related Commands

cluster (Monitor Hadoop) places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Example

This command sets the JobTracker polling interval to ***25*** seconds for the ***CL2*** cluster configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
      interval 25
switch(config-monitor-hadoop-CL2)#
```

20.7.4.6 jobtracker (Monitor Hadoop Cluster)

The **jobtracker** command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is ***8021***. Location and username parameters do not have default values and must be explicity configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding **jobtracker** statement in ***running-config***.

The **no jobtracker** and **default jobtracker** commands perform the following:

- removes the **jobtracker** statement from ***running config*** when it lists all command parameters.
- modifies the existing **jobtracker** statement when it lists a subset of command parameters.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

jobtracker [**LOCATION**][**PORT**][**USER**]

no jobtracker[**LOCATION**][**PORT**][**USER**]

default jobtracker [**LOCATION**][**][USER**]

All parameters may be placed in any order.

Parameters

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - ***no parameter*** Location remains undefined or unchanged from a previous configuration.
  - **host *ipv4_addr*** IPv4 address of master (JobTracker) node.
  - **host *hostname*** Hostname of master (JobTracker) node.
- **PORT** JobTracker RPC port number. Default value is ***8021***. Options include:
  - ***no parameter*** Port number remains unchanged from previous configuration.
  - **rdp-port *port_num*** Port number of master (JobTracker) node. Value ranges from ***1*** to ***65535***.
- **USER** Username that accesses JobTracker node. Options include:
  - ***no parameter*** Username remains undefined or unchanged from previous configuration.
  - **username *name_string*** JobTracker username.

Related Commands

cluster (Monitor Hadoop) places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at ***10.4.4.4*** with the username ***account1***. The default RPC port (***8021***) is implicitly specified.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username
 account1
switch(config-monitor-hadoop-CL2)#show active

monitor hadoop
   cluster CL2
      jobtracker host 10.4.4.4 user account1
```

```
switch(config-monitor-hadoop-CL2)#
```

- These commands modify the JobTracker configuration to specify an RPC port of ***9000***.

```
switch(config-monitor-hadoop-CL2)#jobtracker rpc-port 9000
switch(config-monitor-hadoop-CL2)#show active

monitor hadoop
   cluster CL2
      jobtracker host 10.4.4.4 rpc-port 9000 user account1

switch(config-monitor-hadoop-CL2)#
```

20.7.4.7 monitor hadoop

The **monitor hadoop** command places the switch in the ***monitor-hadoop*** configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster.
- compile a list of jobs the nodes are running.
- download progress of the running jobs.

The ***monitor-hadoop*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***monitor-hadoop*** configuration mode does not affect the ***running-config***. The **exit** command returns the switch to the ***global*** configuration mode. MapReduce Tracer is enabled in the ***monitor-hadoop*** mode through the **no** version of the **shutdown (Monitor Hadoop Cluster)** command.

The **no monitor hadoop** and **default monitor hadoop** commands delete previously configured **monitor hadoop mode** configuration commands.

Command Mode

Global Configuration

Command Syntax

monitor hadoop

no monitor hadoop

default monitor hadoop

Commands Available in Monitor-hadoop Configuration Mode

- **cluster (Monitor Hadoop)**
- **shutdown (Monitor Hadoop Cluster)**

Examples

- These commands place the switch in the ***monitor-hadoop*** configuration mode.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits ythe *monitor-hadoop* mode.

```
switch(config-monitor-hadoop)#exit
switch(config)#
```

- This command deletes all previously configured ***monitor-hadoop*** configuration mode commands.

```
switch(config)#no monitor hadoop
switch(config)#
```

20.7.4.8 show agent oom scores

The **show agent oom scores** command displays information for each agent if specified.

Command Mode

EXEC

Command Syntax

show agent [agentName] *oom scores*

Parameters

- **Display Values**
  - **Agent name** Name(s) of agent(s) - processes.
  - **RssAnon** Size of the resident anonymous memory for the given process.
  - **VmSize** Current total virtual memory size for the process.
  - **Max VmSize** Peak value of total virtual memory for the process.
  - **oom_score** Parameter used in determining which process to hold down.
  - **oom_score_adj** Parameter used to adjust ***oom_score*.**

This command displays the information for SNMP and Sysdb.

```
switch#show agent Snmp Sysdb oom scores
Agent Name  RssAnon  VmSize  Max VmSize  oom_score oom_score_adj

----------- --------- ------- ----------  --------- ------------
Snmp          34.8MB  536.1MB   541.9MB      911          900
Sysdb         102.3MB 597.5MB   597.5MB      0           -500
```

20.7.4.9 show monitor hadoop cluster all

The **show monitor hadoop cluster all** command displays configuration and connection information for all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster all

Example

This command displays configuration and connection data for all connected Hadoop clusters.

```
switch>show monitor hadoop cluster all

Total number of clusters configured: 3
  Cluster                      : Cluster0

  Operational status           : Disabled
```

20.7.4.10 show monitor hadoop cluster counters

The **show monitor hadoop cluster counters** command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* counters

Parameters

c_name Cluster name.

Example

This command displays jobs running on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 counters

Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0
JobId   Job Name          User Bytes In Bytes   Out Start  Time
------- ----------------- ---------- ---------- ---------- -------------------
2       ShortName2        JobUser2   37.36GB    76.29MB     2013-10-06 17:37:43
1       ReallyAVeryLon\   JobUser1   37.36GB    76.29MB     2013-10-06 17:56:03
        gNameForAJob1

switch>
```

20.7.4.11 show monitor hadoop cluster history jobs

The **show monitor hadoop cluster history jobs** command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* history jobs *job_number*

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays information about ***job 1*** that ran on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
  Cluster               : Cluster0
  Job Id                : 1
  JT Id                 : 201310110013
  User                  : HistoryUser1
  Job start time        : 2013-10-06 17:57:43
  Job end time          : 2013-10-08 00:31:03

Per Interface job counters:
Interface       TaskTracker        Bytes In       Bytes Out
--------------- ------------------ -------------- ---------
Ethernet7       TaskTracker2       26.08GB        13.04GB

switch>
```

20.7.4.12 show monitor hadoop cluster history

The **show monitor hadoop cluster history** command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (**clear monitor hadoop job-history**), or MapReduce Tracer was enabled.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* history

Parameters

c_name Cluster name.

Example

This command displays the jobs that were ran on the cluster named ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 history

Jobs history on cluster: Cluster0
JobId    Job Name           Start Time    End Time       Bytes In     Bytes Out
-------- ------------------ ------------- -------------- ------------ ---------
2        AReallyBigHist\    2013-10-06    2013-10-09     26.08GB      13.04GB
         oricalJobName      17:41:03      06:47:43
2        AReallyBigHist\    2013-10-06    2013-10-09     26.08GB      13.04GB
         oricalJobName      17:41:03      06:47:43
1        HistoryJob1        2013-10-06    2013-10-08     26.08GB      13.04GB
                            17:57:43      00:31:03

switch>
```

20.7.4.13 show monitor hadoop cluster jobs counter

The **show monitor hadoop cluster jobs counter** command displays data consumption and progress statistics for the specified job.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* [jobs *job_number*] counter

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays byte counters for the job named ***1*** that is running on the cluster named ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 jobs 1 counters

Last updated: 2013-10-06 18:14:23
Cluster : Cluster0
Job Name : ReallyAVeryLongNameForAJob1
Job Id : 1
Interface          HDFS Bytes Read    HDFS Bytes Written    Reduce Shuffle Bytes
------------------ ------------------ --------------------- --------------------
Port-Channel8      4.14GB             8.48MB                12.72MB

switch>
```

20.7.4.14 show monitor hadoop cluster jobs <job number>

The **show monitor hadoop cluster jobs*job number*** command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* [jobs *job_number*]

Parameters

- ***c_name*** Cluster name.
- ***job_number*** Job number. Value ranges from ***0*** to ***2147483647***.

Example

This command displays information about ***job 1*** that is running on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on cluster:
 Cluster0
  Cluster : Cluster0
  Id                     : 1

  Map Progress           : 12.34%
  Reduce Progress        : 13.45%
  Cleanup Progress       : 14.56%
  Setup Progress         : 15.67%

switch>
```

20.7.4.15 show monitor hadoop cluster jobs

The **`show monitor hadoop cluster jobs`** command displays a list of jobs that are running on the specified cluster.

Command Mode

EXEC

Command Syntax

`show monitor hadoop cluster` *c_name* jobs

Parameters

c_name Cluster name.

Example

This command displays the list of jobs running on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 jobs

Last updated: 2013-10-06 18:14:23
Currently running jobs on cluster: Cluster0
JobId    Job Name           User        Maps    Reduces     Start Time

switch>
```

20.7.4.16 show monitor hadoop cluster status

The **show monitor hadoop cluster status** command displays configuration and connection information for the specified cluster.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* status

Parameters

c_name Cluster name.

Example

This command displays configuration and connection data for the ***Cluster0*** cluster.

```
switch>show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster: Cluster0
  Admin status                  : Enabled
  JobTracker host               : host0
  JobTracker RPC port           : 9000
  JobTracker user               : user0
  JobTracker polling interval   : 100 seconds
  TaskTracker HTTP port         : 8800
  Operational status            : Enabled
  Active TaskTrackers           : 31
  Blacklisted TaskTrackers      : 1
  Decommissioned TaskTrackers   : 1
  Tracker expiry interval       : 20.0
  Map slots (used/total)        : 10/100
  Reduce slots (used/total)     : 11/110
  JobTracker heap size          : 1.04GB (max: 2.08GB)

switch>
```

20.7.4.17 show monitor hadoop cluster tasktracker

The **show monitor hadoop cluster tasktracker** command displays a list of TaskTrackers in the specified cluster. The IP address and access interface is included in the table.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* tasktracker

Parameters

c_name Cluster name.

Example

This command displays the TaskTrackers on the ***Cluster0*** cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address   Interface      Maps   Reduces
------------- ------------ -------------- ------ -------
TaskTracker1   10.100.0.1   Ethernet7      4      0
TaskTracker2   10.100.0.2   Port-Channel7  4      0

switch>
```

20.7.4.18 show monitor hadoop counters

The **show monitor hadoop counters** command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

Command Mode

EXEC

Command Syntax

show monitor hadoop counters

Example

This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch>show monitor hadoop counters

Last updated: 2013-10-06 18:14:23
Counters for running jobs:
JobId   Job Name          Cluster    Bytes In   Bytes Out   Start Time
------- ----------------- ---------- ---------- ----------- -------------------
510002  ShortName12       Cluster1   37.36GB    76.29MB     2013-10-06 17:37:43

        gNameForAJob1

switch>
```

20.7.4.19 show monitor hadoop history

The **show monitor hadoop history** command displays jobs that ran on clusters for which MapReduce Tracer is configured. The list includes all jobs that ran since the switch was reloaded, MapReduce Tracer was enabled, or the job history was cleared (**clear monitor hadoop job-history**).

Command Mode

EXEC

Command Syntax

show monitor hadoop history

Example

This command displays data that jobs that previously ran on connected Hadoop clusters.

```
switch>show monitor hadoop history

Job history for all clusters:
JobId  Job Name          Cluster   Start Time  End Time     Bytes In   Bytes Out
------ ---------------- --------- ----------- ------------ ---------- ---------
2      AReallyBigHist\  Cluster0  2013-10-06  2013-10-09   26.08GB    13.04GB

switch>
```

20.7.4.20 show monitor hadoop status

The **show monitor hadoop status** command displays system status for MapReduce Tracer.

Command Mode

EXEC

Command Syntax

show monitor hadoop status

Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                   : Enabled
  Operational status             : Enabled
  Number of clusters configured  : 3
  Number of local TaskTrackers   : 4
  Number of jobs running locally : 4

switch>
```

20.7.4.21 show monitor hadoop tasktracker all counters

The **show monitor hadoop tasktracker all counters** command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker all counters

Example

This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters

Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:
Node             IP Address     Interface         Bytes Read      Bytes Written
---------------- -------------- ----------------- --------------- -------------
TaskTracker1     10.100.0.1     Ethernet7         2.08GB          4.24MB
TaskTracker3     10.100.0.3     Ethernet8         6.23GB          12.72MB
TaskTracker2     10.100.0.2     Port-Channel7     4.15GB          8.48MB
TaskTracker4     10.100.0.4     Port-Channel8     8.30GB          16.95MB

switch>
```

20.7.4.22 show monitor hadoop tasktracker all

The **show monitor hadoop tasktracker all** command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker all

Examples

Example

This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch>show monitor hadoop tasktracker all

Last updated: 2013-10-06 18:14:23
All local TaskTrackers:
Node             Cluster      IP Address     Interface          Maps     Reduces
---------------- ------------ -------------- ------------------ -------- -------
TaskTracker1     Cluster0     10.100.0.1      Ethernet7          4        0

switch>
```

20.7.4.23 show monitor hadoop tasktracker counters

The **show monitor hadoop tasktracker counters** command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker **NODES** counters

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- • This command displays the jobs running on the TaskTracker on the ***TaskTracker1*** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 counters

Last updated: 2013-10-06 18:14:23

```

20.7.4.24 show monitor hadoop tasktracker jobs

The **show monitor hadoop tasktracker jobs** command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker NODES jobs [**CLUSTERS**]

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - ***no parameter*** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c_name*** TaskCluster on specified **NODE** must be in named cluster.

Examples

- This command displays data for jobs running on ***TaskTracker1***.

```
switch>show monitor hadoop tasktracker host TaskTracker1 jobs

Last updated: 2013-10-06 18:14:23

20.7.4.25 show monitor hadoop tasktracker running-tasks cluster job task

The **show monitor hadoop tasktracker running-tasks cluster job task** command displays detailed data for the specified task.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker NODE [running-tasks cluster *name*][job *jnum*][task *tnum*]

Parameters

- **NODE** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- ***name*** Cluster name.
- ***jnum*** Job number. Value ranges from ***0*** to ***2147483647***.
- ***tnum*** Task number. Value ranges from ***0*** to ***2147483647***.

Examples

- This command displays data for ***task 1*** of ***job 1*** on ***TaskTracker1*** of ***Cluster0***.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks
 cluster Cluster0 job 1 task 1

20.7.4.26 show monitor hadoop tasktracker running-tasks

The **show monitor hadoop tasktracker running-tasks** command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

Command Mode

EXEC

Command Syntax

show monitor hadoop tasktracker **NODES** **running-tasks** [**CLUSTERS**][**JOBS**]

Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - ***no parameter*** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c_name*** TaskCluster on specified **NODE** must be in named cluster.
- **JOBS** Job list. Options include:
  - ***no parameter*** all jobs.
  - **job *0*** to ***2147483647*** Specifies number of single job.

Examples

- This command displays data for tasks running on TaskTracker named ***TaskTracker1***.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks

Last updated: 2013-10-06 18:14:23

20.7.4.27 show monitor hadoop tasktracker status

The **show monitor hadoop tasktracker status** command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- **show monitor hadoop cluster *c_name* tasktracker status**: TaskTrackers on specified cluster.
- **show monitor hadoop tasktracker *node* status**: TaskTrackers on specified nodes or interfaces.
- **show monitor hadoop tasktracker all status**: all connected TaskTrackers.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster *c_name* tasktracker **status**

show monitor hadoop tasktracker **NODES** **status**

show monitor hadoop tasktracker all **status**

Parameters

- *c_name* Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces ***7*** and ***8***.

```
switch>show monitor hadoop tasktracker interface Ethernet7,8 status

20.7.4.28 show monitor hadoop traffic burst

The **show monitor hadoop traffic burst** command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

Command Mode

EXEC

Command Syntax

show monitor hadoop [**CLUSTERS**] **traffic burst** [**NODE**]

Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - ***no parameter*** All clusters.
  - **cluster *c_name*** Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p_range*** Port channel interfaces through which node connects.

Examples

- This command displays traffic burst data for all running jobs.

```
switch>show monitor hadoop traffic burst

20.7.4.29 show monitor hadoop

The **show monitor hadoop** command displays a list of jobs that are running on all monitored Hadoop clusters.

Command Mode

EXEC

Command Syntax

show monitor hadoop

Example

This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId  Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
-----  ---------------- --------- ---------- ------------- -------------------
1      ReallyAVeryLon\  Cluster0  2/12.34%   0/13.45%      2013-10-06 17:56:03

switch>
```

20.7.4.30 show monitor system

The **show monitor system** command displays information about the memory usage status of the system including when low-memory situations have led to out-of-memory (OOM) events.

Command Mode

EXEC

Command Syntax

show monitor system

Examples

The following output is for a system where the feature is disabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: False
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

The following output is for a system where the feature is enabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: True
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:00:07 ago
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode once, and has exited the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Last time entered in Memory Exhaustion: 0:01:00 ago
Last time exited from Memory Exhaustion: 0:00:05 ago
```

20.7.4.31 shutdown (Monitor Hadoop Cluster)

The **shutdown** command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (**show monitor hadoop**) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The **no shutdown** command configures the MapReduce Tracer setting as **enabled** for the configuration mode cluster. The **shutdown** and **default shutdown** commands disable MapReduce Tracer for the cluster by removing the corresponding **no shutdown** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Commands

cluster (Monitor Hadoop) places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- These commands globally enable MapReduce Tracer, then enables it for the ***CL2*** cluster.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#no shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
      no shutdown
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
 monitor hadoop
   no shutdown
   cluster CL2
      no shutdown
switch(config-monitor-hadoop)#
```

- These commands disable MapReduce Tracer for the ***CL2*** cluster. MapReduce Tracer remains globally enabled.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
 monitor hadoop
   no shutdown
   cluster CL2
switch(config-monitor-hadoop)#
```

20.7.4.32 shutdown (Monitor-Hadoop)

The **shutdown** command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster thorough the **shutdown (Monitor Hadoop Cluster)** command. By default, MapReduce Tracer is globally disabled.

The **no shutdown** command globally enables MapReduce Tracer. The **shutdown** and **default shutdown** commands globally disable MapReduce Tracer by removing the corresponding **no shutdown** command from ***running-config***.

Command Mode

Monitor-hadoop Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Commands

monitor hadoop places the switch in the ***monitor-hadoop*** configuration mode.

Examples

- These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
 monitor hadoop
   no shutdown
switch(config-monitor-hadoop)#
```

- This command globally disables MapReduce Tracer.

```
switch(config-monitor-hadoop)#shutdown
switch(config-monitor-hadoop)#show active
switch(config-monitor-hadoop)#
```

20.7.4.33 tasktracker (Monitor Hadoop Cluster)

The **tasktracker** command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker (**jobtracker (Monitor Hadoop Cluster)**). The default TaskTracker HTTP port is ***50060***.

The **no tasktracker** and **default tasktracker** commands restore the configuration mode TaskTracker HTTP port to ***50060*** by removing the corresponding **tasktracker** command from ***running-config***.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

tasktracker http-port *port_number*

no tasktracker http-port

default tasktracker http-port

Parameters

port_num TaskTracker HTTP port number. Value ranges from ***1*** to ***65535***. Default value is ***50060***.

Related Commands

cluster (Monitor Hadoop) places the switch in the ***monitor-hadoop-cluster*** configuration mode.

Examples

- These commands specify a TaskTracker HTTP port address of ***51000***.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
      tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP port address of ***50060***.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
   cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
   cluster CL2
      jobtracker rpc-port 8021
      tasktracker http-port 50060
      interval 10
      shutdown
switch(config-monitor-hadoop-CL2)#
```

20.8 Transceiver Performance Monitoring

- Overview
- Configuration
- Limitations
- Show Commands
- Commands

20.8.1 Transceiver Performance Monitoring Overview

The Transceiver Performance Monitoring and Enhanced Diagnostics enables viewing of the Digital Optical Monitoring (DOM) parameters for the optics that support enhanced diagnostics using the CLI. The show commands are used to view the instantaneous values for various PAM4 parameters like Signal-To-Noise Ratio, Residual Inter Symbol Interference, PAM4 Level Transition Parameters, etc. that such optics support.

With Performance Monitoring feature EOS collects and maintains certain performance statistics over a user-defined time period. EOS stores data for two intervals, the current interval and the most recently completed interval. When the current interval completes, the data is saved as the previous interval so a new current interval may be started. The old previous interval data is discarded.

20.8.2 Configuring Transceiver Performance Monitoring

The Digital Optical Monitoring (DOM) is always enabled on all interfaces and can't be disabled via any configuration command.

The Performance Monitoring is disabled on all interfaces by default. The **`performance-monitoring transceiver default`** configuration command is used to enable Performance Monitoring on all interfaces across the system.

```
switch(config)#performance-monitoring transceiver default
```

The Performance Monitoring can also be enabled on a per interface basis using the **`performance-monitoring transceiver`** configuration command.

```
switch(config)#interface Ethernet8/1
switch(config-if-Et8/1)#performance-monitoring transceiver
```

The Performance Monitoring period can be configured using the **`performance-monitoring period <period>`** configuration command.

```
switch(config)#performance-monitoring period 60s
```

The above command configures the performance monitoring period to ***60*** seconds across the system. This command supports configuring the performance monitoring period in units of either seconds, minutes, hours or days. For example, use performance-monitoring period ***30*** minutes to configure the period as ***30*** minutes, performance-monitoring period ***2*** hours to configure the period as ***2*** hours and so on. The default performance-monitoring period is ***15*** minutes.

Use the **no** form of these commands to revert configuration.

20.8.3 Transceiver Performance Monitoring Limitations

100GBASE-FR, 100GBASE-LR and 100GBASE-DR do not have thresholds of enhanced Digital Optical Monitoring (DOM) parameters, so these parameters and their thresholds will not be displayed in the output of CLI command **`show interfaces transceiver dom thresholds`**.

```
switch#show interfaces Ethernet8/1 transceiver dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

```

The Indicator column in the output above gives an indication of where the value lies with respect to its thresholds. Nothing is shown when the parameter is in the expected range between the Low Warn and High Warn thresholds. If the value is greater than or equal to the High Alarm or less than or equal to the Low Alarm, **`ALARM`** is shown. If the value is greater than or equal to the High Warn (but less than the High Alarm) or less than or equal to the Low Warn (but greater than the Low Alarm), **`WARN`** is shown.

- The **`show interfaces transceiver performance-monitoring`** command is used to display the performance monitoring statistics from the CLI. This command will display data only if the feature has been enabled using the configuration command performance-monitoring transceiver as described in the Configuration section.

```
switch#show interfaces Ethernet8/1 transceiver performance-monitoring

Performance Monitoring Period: 0:15:00

This indicates the length of one Performance Monitoring period. ***0:15:00*** specifies a period of ***15*** minutes, which is the default value for this parameter. The Performance Monitoring period can be configured using the **`performance-monitoring period`** configuration command as described in the Configuration section.

Started: 0:00:12 ago

This indicates the time the host started the performance monitoring interval.

Last Update: 0:00:02 ago

This indicates the last time the host read the diagnostic parameters from the module. The host samples values every six seconds.

Pre-FEC BER avg, Uncorrected BER avg

This is the average value so far in the indicated performance monitoring interval.

Pre-FEC BER min, Uncorrected BER min

This is the minimum value so far in the indicated performance monitoring interval.

Pre-FEC BER max, Uncorrected BER max

This is the maximum value so far in the indicated performance monitoring interval.

Pre-FEC BER high warn exceeded, Uncorrected BER high warn exceeded, Pre-FEC BER high alarm exceeded, Uncorrected BER high alarm exceeded

This is the number of times the host read a value which was greater than the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Please note that this provides only an indication of the actual exceeded count.

Temperature warn exceeded, Temperature alarm exceeded

This is the number of times the host read a value which was outside the range of the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Please note that this provides only an indication of the actual exceeded count.

- The **`show interfaces transceiver performance-monitoring thresholds`** command is used to display the performance monitoring statistics and their thresholds from the CLI. This command will display data only if the feature has been enabled using the configuration command performance-monitoring transceiver as described in the Configuration section.

20.8.5 Transceiver Performance Monitoring Commands

Global Configuration Commands

- performance-monitoring period
- performance-monitoring transceiver default

Interface Configuration Command

- performance-monitoring transceiver

Show Commands

- show interfaces transceiver dom
- show interfaces transceiver dom thresholds
- show interfaces transceiver performance-monitoring
- show interfaces transceiver performance-monitoring thresholds

20.8.5.1 performance-monitoring period

The **performance-monitoring period** command configures Performance Monitoring Period across the system.

The **no performance-monitoring period** command removes the Performance Monitoring Period configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

performance-monitoring period *period*

no performance-monitoring period *period*

Parameter

period performance monitoring period in units of either seconds, minutes, hours or days. The default performance-monitoring period is ***15*** minutes.

Example

This command configures the performance monitoring period to ***60*** seconds across the system.

```
switch(config)#performance-monitoring period 60s
```

20.8.5.2 performance-monitoring transceiver

The **performance-monitoring transceiver** command enable Performance Monitoring on per interface basis.

The **no performance-monitoring transceiver** command removes the Performance Monitoring configuration from the ***running-config***.

Command Mode

Interface Configuration Mode

Command Syntax

performance-monitoring transceiver

no performance-monitoring transceiver

Example

This command enables the Performance Monitoring on a per interface basis.

```
switch(config)#interface Ethernet8/1
switch(config-if-Et8/1)#performance-monitoring transceiver
```

20.8.5.3 performance-monitoring transceiver default

The **performance-monitoring transceiver default** command enable Performance Monitoring on all interfaces across the system.

The **no performance-monitoring transceiver default** command removes the Performance Monitoring configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

performance-monitoring transceiver default

no performance-monitoring transceiver default

Example

This command enables the Performance Monitoring on all interfaces across the system.

```
switch(config)#performance-monitoring transceiver default
```

20.8.5.4 show interfaces transceiver dom

The **show interfaces transceiver dom** command displays the Digital Optical Monitoring (DOM) parameters from the CLI. The displayed parameters are the most recently read, 'instantaneous' values.

Command Mode

Privileged EXEC

Command Syntax

show interfaces INTERFACE transceiver dom

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the Digital Optical Monitoring (DOM) parameters.

```
switch#show interfaces Ethernet8/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Ethernet8/1
Last update: 0:00:03 ago
Parameter             Ch     Value Unit
-----------------------------------------
Temperature            -     58.97 C
Voltage                -      3.28 V

                       2   -365.70 mA
Frequency error        1     -0.48 GHz
                       2      0.00 GHz
Pre-FEC BER            -  1.53e-03
Uncorrected BER        -  0.00e+00
```

20.8.5.5 show interfaces transceiver dom thresholds

The **`show interfaces transceiver dom thresholds`** command displays the Digital Optical Monitoring (DOM) parameters and their thresholds from the CLI.

Command Mode

Privileged EXEC

Command Syntax

`show interfaces` **INTERFACE** **`transceiver dom thresholds`**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the Digital Optical Monitoring (DOM) parameters and their thresholds.

```
switch#show interfaces Ethernet8/1 transceiver dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

```

Command Output

The Indicator column in the output above gives an indication of where the value lies with respect to its thresholds. Nothing is shown when the parameter is in the expected range between the Low Warn and High Warn thresholds. If the value is greater than or equal to the High Alarm or less than or equal to the Low Alarm, **`ALARM`** is shown. If the value is greater than or equal to the High Warn (but less than the High Alarm) or less than or equal to the Low Warn (but greater than the Low Alarm), **`WARN`** is shown.

20.8.5.6 show interfaces transceiver performance-monitoring

The **show interfaces transceiver performance-monitoring** command displays the performance monitoring statistics from the CLI. This command will display data only if the Performance Monitoring has been enabled using the configuration command **performance-monitoring transceiver**.

Command Mode

Privileged EXEC

Command Syntax

show interfaces **INTERFACE** **transceiver performance-monitoring**

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the performance monitoring statistics from the CLI.

```
switch#show interfaces Ethernet8/1 transceiver performance-monitoring
Ch: Channel, N/A: not applicable

Performance monitoring period : 0:15:00
Ethernet8/1
Parameter                                      Ch        Value

Command Output

Performance Monitoring Period: 0:15:00

This indicates the length of one Performance Monitoring period. ***0:15:00*** specifies a period of ***15*** minutes, which is the default value for this parameter. The Performance Monitoring period can be configured using the **`performance-monitoring period configuration`** command as described in the Configuration section.

Started: 0:00:12 ago

This indicates the time the host started the performance monitoring interval.

Last Update: 0:00:02 ago

This indicates the last time the host read the diagnostic parameters from the module. The host samples values every six seconds.

Pre-FEC BER avg, Uncorrected BER avg

This is the average value so far in the indicated performance monitoring interval.

Pre-FEC BER min, Uncorrected BER min

This is the minimum value so far in the indicated performance monitoring interval.

Pre-FEC BER max, Uncorrected BER max

This is the maximum value so far in the indicated performance monitoring interval.

Pre-FEC BER high warn exceeded, Uncorrected BER high warn exceeded, Pre-FEC BER high alarm exceeded, Uncorrected BER high alarm exceeded

This is the number of times the host read a value which was greater than the indicated threshold. The host reads values and checks exceeded thresholds every ***6*** seconds. Please note that this provides only an indication of the actual exceeded count.

Temperature warn exceeded, Temperature alarm exceeded

This is the number of times the host read a value which was outside the range of the indicated threshold. The host reads values and checks exceeded thresholds every six seconds. Note that this provides only an indication of the actual exceeded count.

20.8.5.7 show interfaces transceiver performance-monitoring thresholds

The **show interfaces transceiver performance-monitoring thresholds** command displays the performance monitoring statistics and their thresholds from the CLI.

Command Mode

Privileged EXEC

Command Syntax

show interfaces INTERFACE transceiver performance-monitoring thresholds

Parameter

INTERFACE Ethernet interface name.

Example

This command displays the performance monitoring statistics and their thresholds from the CLI.

```
switch#show interfaces Ethernet8/1 transceiver performance-monitoring thresholds
Ch: Channel, N/A: not applicable

Performance monitoring period : 0:00:30

Ethernet8/1

EOS: The Next Generation Extensible Operating System

Performance, resiliency and programmability across the entire network are now fundamental business requirements for next generation cloud and enterprise data center networks. The need for agility and deployment at scale with regards to provisioning and network operations requires a new level of automation and integration with current data center infrastructure. The underlying design of the network operating system provides the architectural foundation to meet these requirements.

Arista Networks has designed and delivered EOS (Extensible Operating System), the industry-leading, Linux-based network operating system, to address these requirements. EOS is a robust, programmable and innovative operating system, featuring a single software image that runs across the entire portfolio of Arista's award-winning network switches as well as in a virtual machine instance (vEOS). This guarantees consistent operations, workflow automation and high availability, while significantly reducing data center operational expenses.

This whitepaper discusses current network operating systems and explains how Arista's EOS architecture uniquely support next generation data centers.

Limitations of Legacy Network Operating Systems

Traditional enterprise data center networks have long been susceptible to software crashes and unplanned outages. Multiple, different software releases across switch platforms made deploying new features and services a lengthy and time-consuming process. Combined with error-prone manual configuration, inevitably network uptime was compromised.

At the core of this problem was the aging monolithic software that still runs on most of today's networking equipment. This presents a fundamental limitation to very high network reliability. The reality is that a single bug or defect anywhere in these shared-memory systems exposes the entire network to disruption, since there is no mechanism for software fault containment. At the same time, with no isolation between multiple tasks, it is difficult to scale these operating systems from a performance perspective or to reliably add new functionality. The fragile nature of this legacy software inherently prevents the extension of the network operating system to implement new capabilities such as integration with customer specific management processes or other systems and services deployed in modern data center environments.

Earlier network operating systems were incrementally built on top of customized kernels with state information arbitrarily distributed throughout the system or worse still, embedded into the kernel itself. In these environments all processes typically run in a common address space, which results in risky fate sharing – a single defect could crash the whole system and result in a severe network outage. The software state is maintained using synchronous or asynchronous polling, an inefficient mechanism that typically checks state every few milliseconds or seconds on every interface and internal data structure, resulting in wasted cycles, possible deadlocks and race conditions with multiple concurrent events.

Any changes in state are handled by fragile, carefully crafted code-paths so that software processes react in

a tightly ordered sequence depending on the underlying event. Testing all possible code-paths in such architectures results in complexity, long development and extended customer test and qualification cycles.

Additionally, the software functionality is layered with matrixed messaging occurring between processes, resulting in a maze of inter process communications and system complexity, as shown in the simplified Figure [1]:

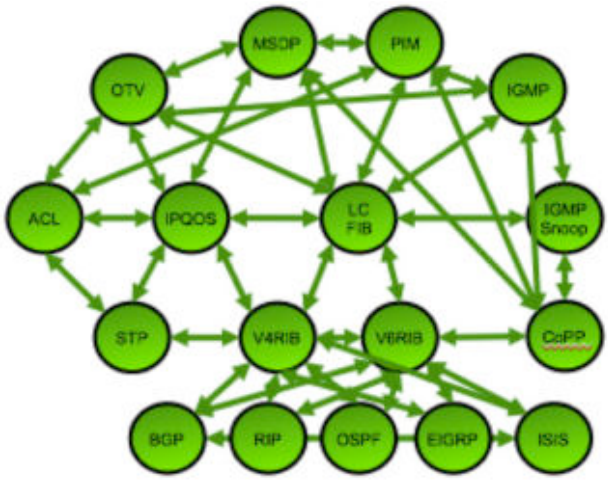

Figure 1: Legacy Network Operating Systems Communications (circa 2000-2010)

Finally, the internal state cannot be exposed to users and applications and the only programmability that is possible in these stacks is via high-level API wrappers, which may provide the same information as SNMP or the CLI in text or XML formats for monitoring purposes.

Building cloud networks and software-defined data centers is impossible with such sub-optimal software architectures.

Arista EOS: The Modern Solution

In order to address the needs of public/private/hybrid cloud networks, while enabling new applications and ushering in the era of Software Defined Networks (SDN), Arista's Extensible Operating System (EOS) has been designed from the ground-up and is optimized for these demanding new data center environments.

Arista's Extensible Operating System is the industry's most advanced network operating system. It combines modern-day software and operating system (O/S) concepts, transparently restartable processes, open platform development, an un-modified Linux kernel, and a stateful publish/subscribe database model.

In order to fully understand the benefits a true and open operating system provides and explore the potential of a comprehensive automation solution, a detailed review of the underlying architecture of EOS is required. In the following sections we will examine the key components and attributes of EOS architecture as well as the rich array of network services built on top of EOS.

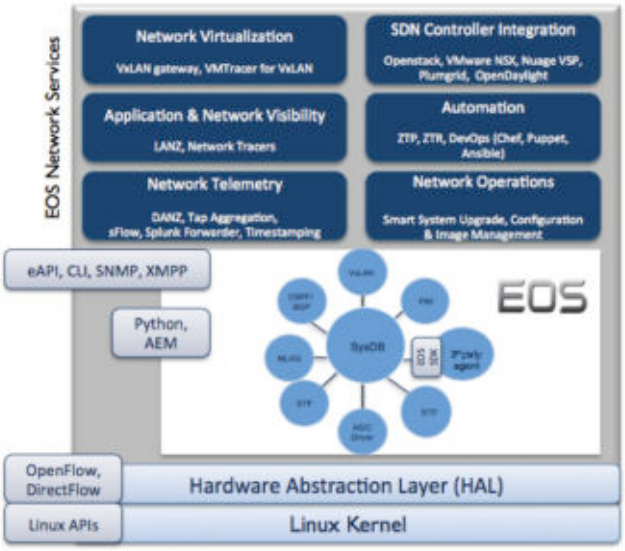

Figure 2: Arista EOS Architecture

Arista EOS: Use of Linux Kernel

At the underpinnings of Arista EOS is an unmodified Linux kernel. The main advantages of using a Linux kernel are:

- It resides in the public domain
- Hundreds of contributors, and millions of users contribute to its stability, capabilities and feature set
- It is extremely stable and modular in nature
- Availability of packages, application repositories and access to the source code
- Linux is pervasively used and therefore very widely accepted across many different systems and environments

Arista EOS: SYSDB

Separating functional control of the system into multiple processes greatly enhances resiliency and fault isolation, but requires a mechanism for coordinating actions within the system. This is the role of Sysdb.

As figure 2 shows, at the core of EOS is the system database. Sysdb is an in-memory database (machine generated at run time), which runs in user space and contains the complete state of the system. Like traditional databases, Sysdb does not contain any application logic and is only responsible for keeping state. However rather than being optimized for transactions, Sysdb is designed for synchronizing state among processes, also called 'agents', by notifying interested processes or agents when there is a change.

All agents in the system mount their configuration and status from Sysdb. This is very much like a file-system mount where read-only or read-write permissions are specified for each mount point. When an agent mounts from Sysdb, it receives its own local copy of all of the state in that mount point. As Sysdb is maintained in RAM, once the switch is turned off or restarted, information is lost.

Sysdb is like an event-driven publish/subscribe model. If the state of an agent changes, Sysdb will send an event notification to that agent, which will then update its local copy. Similarly when the agent writes to the mount point, it only changes its local copy and the write returns immediately.

Each EOS agent subscribes to Sysdb to be notified when the states of other agents change in Sysdb. When the state of an agent has been changed, this change notification is buffered and asynchronously sent to Sysdb, which then notifies all other agents who have subscribed to the changed agent.

This centralized database approach to passing state throughout the system, and the automated way the Sysdb code is generated reduces risk and error, improves software feature velocity, and provides flexibility for customers who can use the same APIs to receive notifications from Sysdb to customize and extend switch features.

Arista EOS: Key Advantages

EOS provides extremely robust and reliable data center communication services while preserving the Linux heritage of security, stability, openness, modularity, and extensibility. This combination is unique in the industry and offers the opportunity to significantly advance the functionality and evolution of next generation data center networks.

- Arista EOS is a unique multi-process state sharing architecture that separates state information from the processes itself. This reflects Arista's core software design philosophy and enables fault recovery and real- time software updates on a process-level basis without affecting the running state of the system.
- In addition, protocol processing, security functions, management services, and even device drivers run in user address space, not in the kernel itself. This greatly increases overall stability, and by maintaining the design discipline of keeping the Linux environment pure, Arista is able to easily extend the operating system with additional functionality.

- The same binary image of EOS can be deployed across any family of products. This improves the testing depth on each platform and keeps features and bug resolution compatibility across all platforms. It also makes it much simpler for users to deploy, certify and validate new releases in their data center environment.
- Most importantly, by providing users unrestricted access to the Linux shell, users can now start to leverage true data center automation features. Users are able to gain access to write Shell or Python scripts to start to leverage the network in a similar fashion other parts of the IT organization.
- Security, EOS supports authentication mechanisms such as TACACS+ and RADIUS AAA features, which allows any enterprise to fully lock down any switch for authorized & secure access.
- EOS provides a development framework, which enables the core concept of extensibility. An open foundation, and best-in-class software development models deliver feature velocity, improved uptime, easier maintenance, and a choice in tools and options.

Arista EOS: Resiliency

This section details how the EOS multi-process state-sharing architecture results in higher availability, reduced maintenance windows, improved manageability, and tighter security.

The key to high system availability is fault containment and software self-healing. On most embedded platforms, any software fault results in a reload, resulting in seconds or even minutes of downtime. Under EOS, any fault is contained within the agent or driver where the fault originated. If the fault causes the agent to crash, then the EOS process manager (ProcMgr) restarts it immediately. If the fault causes the agent to hang or loop, ProcMgr detects the condition and restarts the agent. Thus, faults within EOS are self-healing. This process is shown in Figure [3] below.

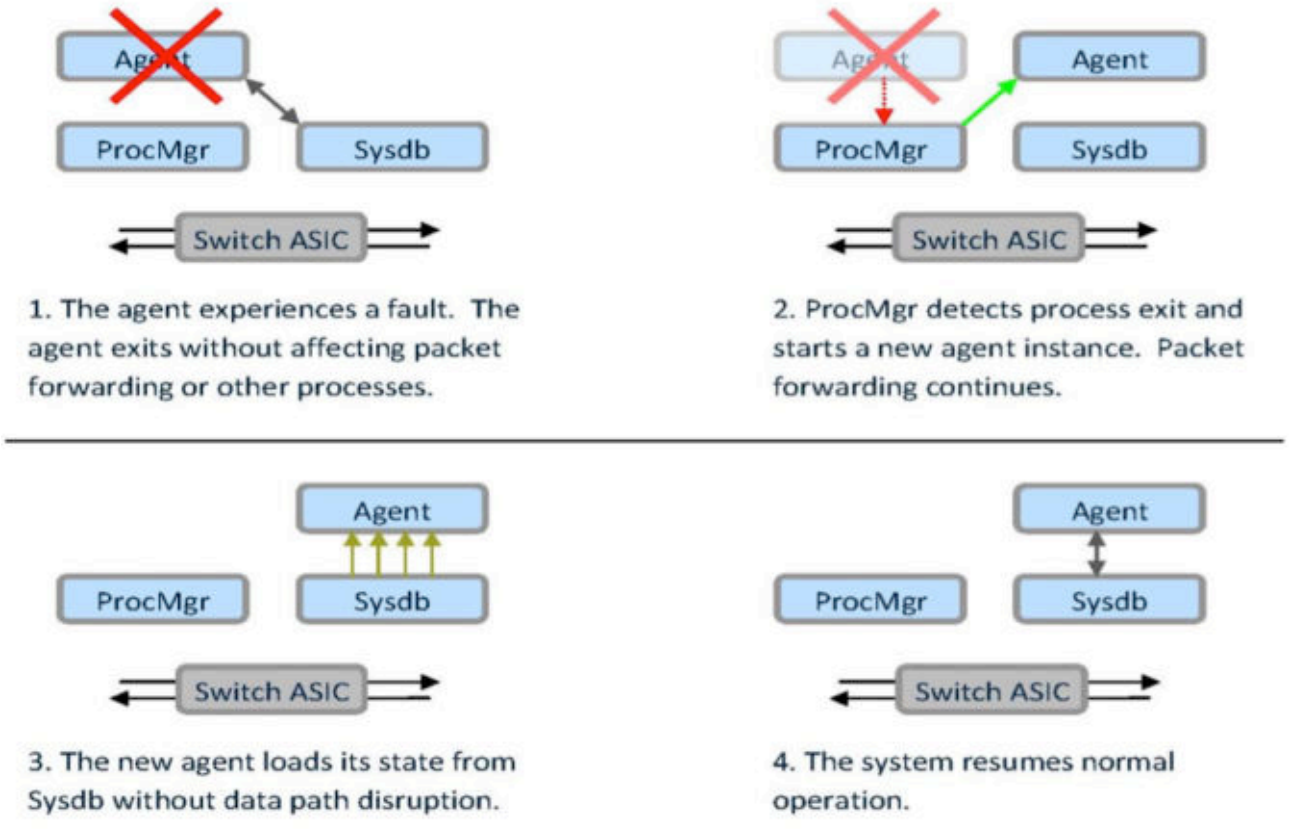

Figure 3: EOS Fault Containment and Self-Healing

The EOS multi-process state-sharing architecture is also the key to reducing maintenance windows by allowing more maintenance tasks to be performed during normal switch operation. Any EOS agent can be patched live and can be restarted without disrupting switch operation. Data flow is unaffected by the module upgrade process, so there is no user-perceptible downtime.

The key to improved operations is the capability to support third-party management and orchestration integration and task automation software. Because EOS provides a robust, protected environment for subsystems and agents, it is safe to run validated third-party agents as well, tailoring switch behavior to optimize manageability or automating common tasks within a specific customer environment. Therefore Arista EOS customers can deploy with confidence knowing that their network operating system will protect against any third party software problems.

The key to improved security is containing the impact of a security vulnerability within the vulnerable agent. For example, if the SNMP subsystem has a vulnerability, then the exploit may read all SNMP-accessible state; however, the exploit will not be able to create additional user accounts, reconfigure interfaces, or run external software. In other words, just as the EOS architecture contains faults to a single module, it also contains the impact of security vulnerabilities. Finally, through the same extensibility mechanisms that improve management and orchestration support, third-party software may implement custom security policies or intrusion detection to further enhance security.

Arista EOS: Programmability and Extensibility

EOS is programmable across all layers – Linux kernel, hardware forwarding tables, switch configuration and CLI, switch control plane as well as management layer. This programmability of EOS enables rapid integration with a wide range of third-party applications for virtualization, management, automation, orchestration and network services. Arista EOS offers a rich set of programmable interfaces including:

- Linux shell access and APIs
- OpenFlow, DirectFlow
- Sysdb APIs
- Python, Perl scripting, Advanced Event Management (AEM)
- EOS SDK
- JSON based eAPIs, CLI, SNMP , XMPP

Arista EOS has full Linux shell access for root-level administrators and makes a broad suite of Linux based tools available. OpenFlow and DirectFlow allow customers to program the forwarding state of the switch in order to fine- tune packet forwarding based on application needs. Sysdb APIs provide access to all internal state, including low- level counters, temperature measurements, power supply status and all other parameters necessary to monitor and manage the system natively. JSON-based EOS APIs (eAPI) provide easy web-based integration with tools that are commonly used to manage compute and storage resources as well as orchestration systems. Even the CLI written in Python is customizable. Scripts based on Python, Perl, etc., can also be developed as third party or native integration with virtual and physical applications, SDN-type controller platforms and Layer 4-7 services.

With EOS Software Development Kit (SDK), customers can develop their own customized EOS applications in C++ or Python. This EOS development model allows these third party applications to be first-class citizens of EOS along with other EOS agents. The SDK provides programming language bindings to software abstractions available in Arista EOS, so third party agents can access switch state and react to network events. These applications can, for example, manage interfaces, IP and MPLS routes, Access Control Lists (ACLs), as well as use a range of APIs to communicate between the switch and monitoring or network controllers. The SDK targets both long-running processes requiring event-driven notifications and scripts requiring high-performance interactions with other EOS agents. The state separation through Sysdb and the inherent fault isolation enabled by the modular architecture is what enables customers to develop and install their own applications without fear of disrupting the entire system.

This rich programmability can be leveraged by customers to build customized applications, integrate with ecosystem tools or even address feature gaps with a quick turnaround time that truly makes EOS the right network OS for modern, agile, Cloud Data Centers.

Arista EOS: Network Services

On top of the industry-leading foundation of EOS, Arista has added a comprehensive suite of network services including rich Layer2/Layer3 functionality, network virtualization support, network visibility and telemetry, automation, SDN Controller integration. All these services capitalize on the rich extensibility that EOS offers to integrate with third party tools and take a pragmatic, network-wide approach at addressing some of the customer pain points. E.g. ZTP helps automate and templatize the provisioning for large number of switches, Smart System Upgrade (SSU) helps perform non-disruptive software upgrades, CloudVision enables network wide integration with SDN controllers using OVSDB, eAPI or OpenFlow.

Arista EOS: Smart System Upgrade

One example of a network service is Smart System Upgrade (SSU). SSU delivers graceful software upgrades for the network. The ability to perform non-disruptive system software upgrades to introduce new network services or bug fixes is critical to maintaining the availability levels that data center environments demand.

Earlier network operating systems typically followed a telco-like model of in-service software upgrades (ISSU), where a single platform in production would at best be able to cut over to an incrementally higher version of code, perhaps containing a few new features or fixes. The traditional ISSU approach has historically been burdened by the significant amount of complex software development required. Special ISSU code had to be written to account for all possible checks and balances while the system attempts to maintain and convert all hardware and software state as it jumps between two different versions of software. This challenge is increased as the feature-set increases, features interact with each other, and the associated state information grows. The side effect of this complexity is that corner cases are common and it is not possible to address all scenarios. Even additional testing cycles, which further add an 'ISSU tax' to the release timeline, are not guaranteed to catch all cases

Leveraging the superior architecture of an open, programmable EOS and direct integration with other applications and infrastructure components, SSU takes a more holistic network perspective to software maintenance by allowing a network element to be transparently removed or added while traffic is either diverted or impact is altogether avoided. Designed to be a complete solution for data center infrastructure maintenance, Arista's SSU provides the following key benefits:

- Intelligent insertion and removal of network elements, customized to the spine role or the leaf role
- Programmatic upgrade to new software releases without causing systemic outages
- Open integration with all application and infrastructure elements
- Simplified solution: Intentionally avoids the complexity of heavy state maintenance and state conversion process needed with other approaches

Therefore Arista's provisioning model allows for an initial deployment or replacement of switches via Zero Touch Provisioning (ZTP) or Zero Touch Replacement (ZTR), after which the SSU framework ensures continuous operation by supporting seamless upgrades either at the Leaf or Spine layer as appropriate.

Arista vEOS: EOS as a Virtual Machine

Arista vEOS extends the EOS software platform running on the physical switches to a virtual machine-based offering. vEOS inherits all the EOS architecture attributes and benefits discussed in this paper. vEOS is an actual EOS image, not a simulator.

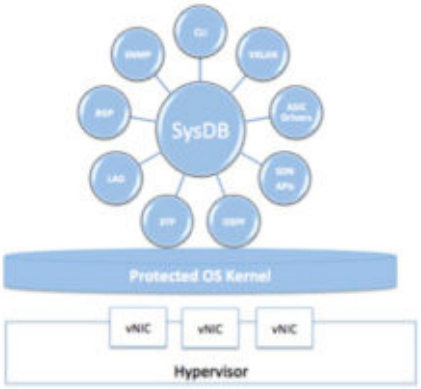

Figure 4: vEOS

vEOS can be used to build virtual network topologies and validate new EOS features and functionality. Customers leveraging the rich programmable interfaces of EOS can use vEOS for development and testing of their scripts or applications without the need for physical switches. vEOS also makes it easy for a wide array of Arista partners to access EOS to design, build and test extensions that enable best-of-breed integrations for our customers. vEOS is also an effective training tool – the simplicity and flexibility of a VM-based image provides an easy approach to familiarize with EOS and learn various EOS features, tools and troubleshooting techniques.

EOS Architecture Summary

Event-driven Architecture: All state-changes trigger a notification through Sysdb to all processes registered for that event. This allows the system to operate under intense load with great efficiency and higher resiliency.

Granular Modularity & Self-Healing Resiliency: EOS provides software fault containment and stateful fault repair of individual modules for superior system stability. EOS also allows in-service software upgrades of individual modules without any impact to application traffic.

Rich Network Features: EOS consists of rich, industry-leading Layer 2, Layer 3, Quality of Service (QoS), Access Control List (ACL), manageability, security and virtualization features.

Programmatic across all layers: EOS is programmable across all layers – Linux kernel, hardware forwarding tables, switch configuration and CLI, switch control plane as well as management layer for automation or network monitoring or integration with third party tools and orchestration systems. A wide range of programmatic interfaces from eAPI to Linux APIs or OpenFlow and DirectFlow to EOS SDK that interface with the system state can be utilized to develop custom applications, interface with third party tools or management systems or even influence switch forwarding behavior.

Extensibility: The state separation through Sysdb allows users to run their own applications directly on the Arista portfolio for native integration with Linux, and in-house tools, scripts and applications. Scripts based on Python, Perl, etc., can be developed as third party or native integration with virtual and physical applications, SDN-type Controller platforms and Layer 4-7 services.

Smart System Upgrade: The Smart Systems Upgrade (SSU) application within EOS allows for graceful insertion and removal of switches from a network, for a zero-downtime upgrade of the network by taking advantage of network-redundancy and integration with advanced ECMP and MLAG topologies.

Network Visibility: Tracer and monitoring capabilities for Big Data/Hadoop (MapReduce Tracer), Virtualization (VM Tracer), Network Path (Path Tracer), Latency Analysis (LANZ) and overall system health monitoring.

Network Telemetry: Network TAP Aggregation and Data Analysis (DANZ) allow for traffic mirroring and monitoring of the network without any impact to user-traffic. Integration with Splunk, sFlow-based collectors, and application monitoring tools such as Corvil or ExtraHop provide traffic visibility.

Network Automation: EOS natively supports Puppet, Chef, CFEngine and Ansible, which enables network configuration in the same manner as servers and storage within data center environments. In addition, EOS supports tools that greatly reduce network operational costs. For example Zero Touch Provisioning (ZTP) automates the provisioning of network infrastructure and speeds time to production for new services while eliminating the risk of human error and Zero Touch Replacement (ZTR) provides automated provisioning of replacement switches, significantly reducing mean-time-to-replacement of a failed switch.

Network Virtualization: Virtualized environments such as NSX from VMware, System Center from Microsoft, KVM with OpenStack, as well as bare-metal physical servers can all be interconnected through EOS. Overlay technologies such as VXLAN allow for a larger scale, multi-tenant network in a mixed environment containing virtual and physical network infrastructure.

vEOS: Arista vEOS extends the EOS software platform running on the physical switches to a virtual machine-based offering. It enables network design and validation, provides an easy way to develop and test extensions and applications on EOS and is an effective training tool to increase familiarity with the features and tools that EOS has to offer.

Conclusion

Arista's EOS Software is the key foundation for deploying Cloud Data Centers. It is the most advanced, resilient and programmable operating system and provides industry leading network services, operational innovations and integration capabilities.

MEMORY	128 GB, 256 GB, 384 GB, 512 GB, 768 GB, 1024 GB, 1536 GB, 2048 GB
NETWORK CONNECTIONS	
Server-board	[1] 1GbE Dedicated IPMI[2] 10GbE SFP+[2] 10GBaseT (IPMI Failover)

MODEL	Nutanix : Per Node (per Block) NX-8155-G8 (Configure to Order)
Network Card	[0, 1, 2, 3] x 10GBaseT 4P NIC [0, 1, 2, 3] x 10GbE 4P NIC [0, 1, 2, 3] x 25GbE 2P NIC [0, 1, 2, 3] x 100GbE 2P NIC
GPU	N/A
CERTIFICATIONS	Energy Star, CSAus, FCC, CSA, UL, cUL, ICES, CE, UKCA, KCC, RCM, VCCI-A, BSMI, EAC, SABS, S-MARK, UKRSEPRO, BIS, SII, RoHS, Reach, WEEE
DIMENSIONS (PER BLOCK)	Height: 3.47" (88.10 mm) Width: 17.36" (440.90 mm) Depth: 29.18" (741.10 mm) Rack Units: 2U1N
WEIGHT (PER BLOCK)	Standalone: 59.52 lbs.(27.0 kg) Package: 80.01 lbs.(36.29 kg)
SYSTEM COOLING	4x 80 mm heavy duty fans with PWM fan speed controls
OPERATING ENVIRONMENT (PER BLOCK)	Op Temp Range: 50° to 95°F(10° to 35°C) Non-Op Temp Range: -49° to 158°F(-45° to 70°C) Op Humidity Range (non-condensing): 68° to 194°F(20° to 90°C) Non-Op Humidity Range: 41° to 203°F(5° to 95°C)
POWER CONSUMPTION	Typical: 822W Maximum: 1175W
POWER SUPPLY (DUAL SUPPLY / BLOCK)	1.0kW Output @100-127V, 11.0-14.0A, 50-60Hz 1.8kW Output @180-220V, 11.0-14.0A, 50-60Hz 2.0kW Output @220-240V, 9.8-10.0A, 50-60Hz Energy Star 80+ Titanium
THERMAL DISSIPATION	Typical: 2806.0 BTU/hr Maximum: 4007.0 BTU/hr
OPERATING REQUIREMENTS (PER BLOCK)	Input Voltage: 100-240V AC auto-range, Input Frequency: 50-60Hz

** Number of cores per CPU socket.

Processor models 6342, 6348, 8358, 8360Y, 8380 have a maximum operating temperature of 30C.

The number of HDDs should be twice or more the number of SSDs.
18TB HDD configurations are for Files and Objects use cases only.

Processor models 6342, 6348, 8358, 8360Y, 8380 have a maximum operating temperature of 30C.

PREPARE TO UPGRADE YOUR CLUSTER

The Upgrade Guide for Nutanix cluster and IT administrators describes how to upgrade your Prism Element or Prism Central cluster. This guide describes upgrade best practices, limitations, and upgrade work flows as recommended by Nutanix.

This guide describes how to upgrade software and firmware installed on your cluster and consists of these major sections.

Resources, Requirements, and Recommendations

This collection of topics describes what you must know before upgrading and where to find more information.

Use Life Cycle Manager to Upgrade All Software and Firmware (Select All Method)

Use LCM to Upgrade All Software and Firmware (Select All) on page 20 describes using Life Cycle Manager (LCM) to upgrade all Prism Element or Prism Central cluster software or firmware at once (the **Select All** method). The **Select All** method is the preferred method for upgrading Prism Element and Prism Central clusters.

LCM can inventory your cluster and present you with recommend updates to Foundation, AOS, AHV, Nutanix Cluster Check (NCC), firmware, and other cluster components. Nutanix has designed LCM to automatically consider upgrade dependencies and upgrade available software and firmware components in the appropriate order.

Nutanix recommends performing as many upgrades as possible through LCM in the web console and by using the **Select All** method.

Nutanix also recommends that you update all other Prism Element and Prism Central cluster software and firmware first before updating add-on software like Calm, Files, Karbon, and Objects.

Use Life Cycle Manager to Upgrade Specific Software or Firmware (Select Some Method)

Use LCM to Upgrade Specific Software and Firmware (Select Some) on page 26 describes using LCM in the web console to upgrade specific components individually.

If you use the **Select Some** method, make sure you read the Recommended Upgrade Order on page 27 topic.

Nutanix recommends performing as many upgrades as possible through LCM in the web console, especially when you choose the **Select Some** method. Use the **Select Some** method when you need to perform a targeted upgrade of a few components (for example, a hypervisor or adapter firmware).

Depending on your LCM, AOS, or Prism Central version, you can also upgrade certain cluster software components through the web console **Settings** > **Upgrade Software** panel, also known informally as the 1-click upgrade panel. For Prism Element clusters, you can upgrade AOS, Nutanix Files, non-AHV hypervisors, NCC, and Foundation. For Prism Central clusters, you can upgrade Prism Central and NCC.

Use Upgrade Software for Specific Software (Legacy 1-Click Upgrade)

Use Upgrade Software in the Web Console (Legacy 1-Click Upgrade) on page 34 describes how to upgrade the following software by using the **Upgrade Software** page in the web console when you cannot or choose not to use LCM. If you use this method, make sure you read the Recommended Upgrade Order on page 27 topic.

Prism Element Web Console

- AOS
- File Server (Nutanix Files)
- VMware ESXi or Microsoft Hyper-V hypervisors (You must use LCM to upgrade AHV)
- Nutanix Cluster Check (NCC)
- Foundation

Prism Central Web Console

- Prism Central
- NCC

What Is Not in This Guide

This guide does not describe how to do the following.

- Install or upgrade software or firmware on dark-site clusters (that is, clusters not connected to Internet). For dark-site clusters, see the Life Cycle Manager documentation, including the *LCM Dark Site Guide*.
- Initially install and deploy a Nutanix cluster.
- Install or upgrade software or firmware through a command line or by using API calls.
- Manually upgrade BMC or BIOS firmware.
- Downgrade a cluster. Nutanix does not support downgrades for any Nutanix software component (AOS, AHV, Prism Central, and so on). For example, you cannot downgrade a cluster from AOS 5.19 to AOS 5.18.
- Install or upgrade a Witness VM. See the Prism Web Console Guide for details about Witness VMs.

2

VIEW TASK STATUS

The web console displays detailed information about all tasks that have been performed on the cluster.

Task Page Navigation

- To view the Task dashboard, select **Home** > **Tasks**.
- An icon also appears in the main menu when one or more tasks are active (running or completed within the last 48 hours). The icon appears blue when a task runs normally, yellow when it generates a warning, or red when it fails. Clicking the icon displays a drop-down list of active tasks; clicking the **View All Tasks** button at the bottom of that list displays a details screen with information about all tasks for this cluster.

  > Note: The drop-down list of active tasks may include a **Clean Up** button (top right). Clicking this button removes from the list any tasks that are no longer running. However, this applies to the current session only. The full active list (including the non-running tasks) appears when you open a new Prism web console session.

- When multiple tasks are active, you can filter the list by entering a name in the filter by field.
- You can also filter the list by clicking the **Filters** button and selecting the desired filter options

Each task appears in the list for a minimum of one hour after completion, but how long that task remains in the list depends on several factors. In general, the maximum duration is two weeks. However, tasks are rotated off the list as new tasks arrive, so a task might disappear from the list much sooner when activity is high. In some cases a task appears for longer than two weeks because the last task for each component is retained in the listing.

View Task Status Dashboard

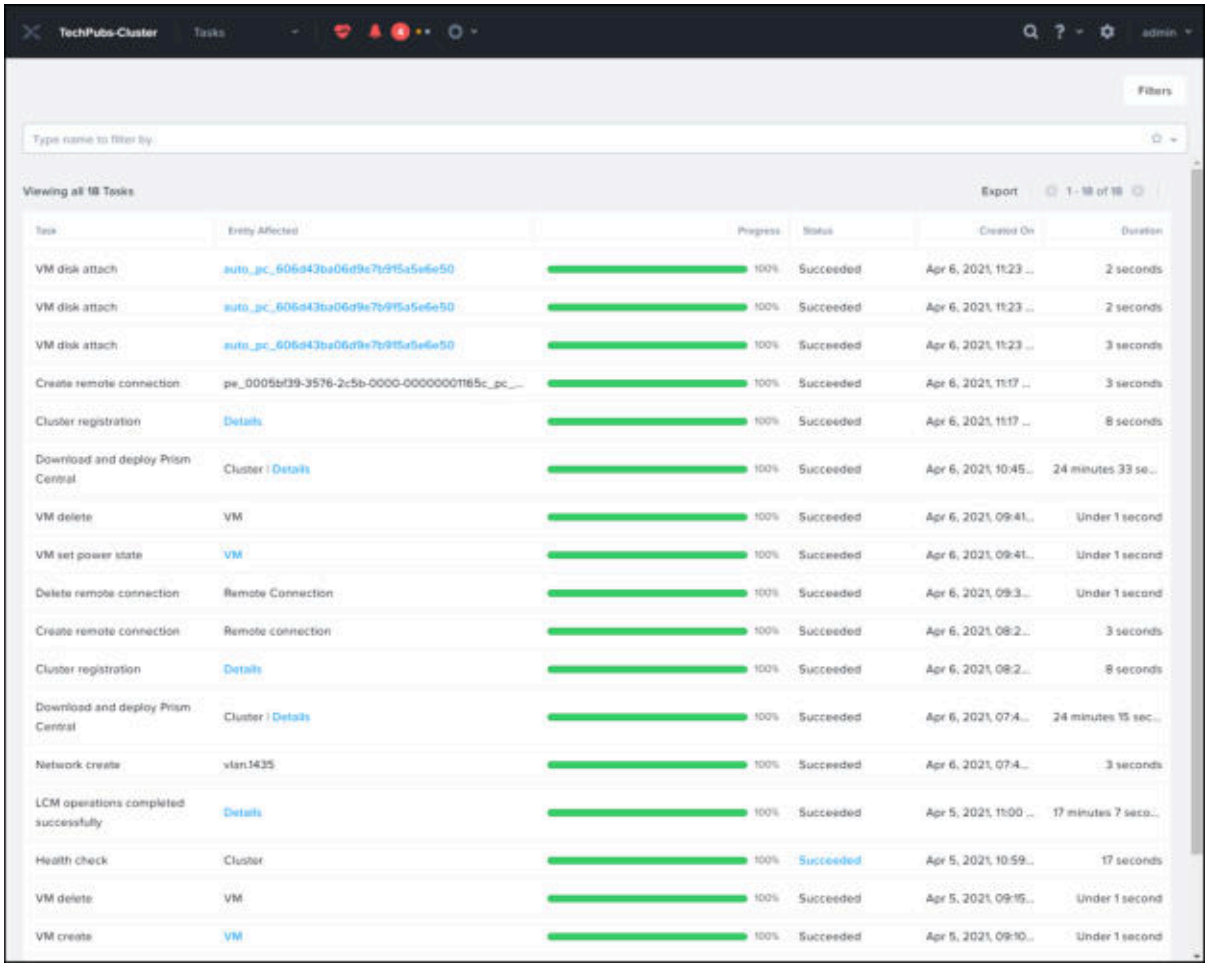

Figure 1: Task Dashboard

Table 1: Tasks List Fields

Parameter	Description	Values
Task	Specifies which type of operation the task is performing.	Any cluster operation you can perform in the web console
Entity Affected	Display the entity on which task has been performed. If the link appears on the entity, click it to display the details.	Entity description
Percent	Indicates the current percentage complete for the task.	0%-100%
Status	Indicates the task status, which can be pending, running, completed, or failed.	pending, running,completed,failed
Created On	Displays when the task began.	seconds, minutes, hours

Parameter	Description	Values
Duration	Displays how long the task took to complete.	seconds, minutes, hours

Viewing the Progress of the Download or Upgrade Process

About this task

> Note: As part of the AOS upgrade, the node where you have logged on and initiated the upgrade restarts. The web console appears unresponsive and might display the following message: `Unable to reach server. Check for internet connectivity`. Wait a few minutes and log on to the web console again.

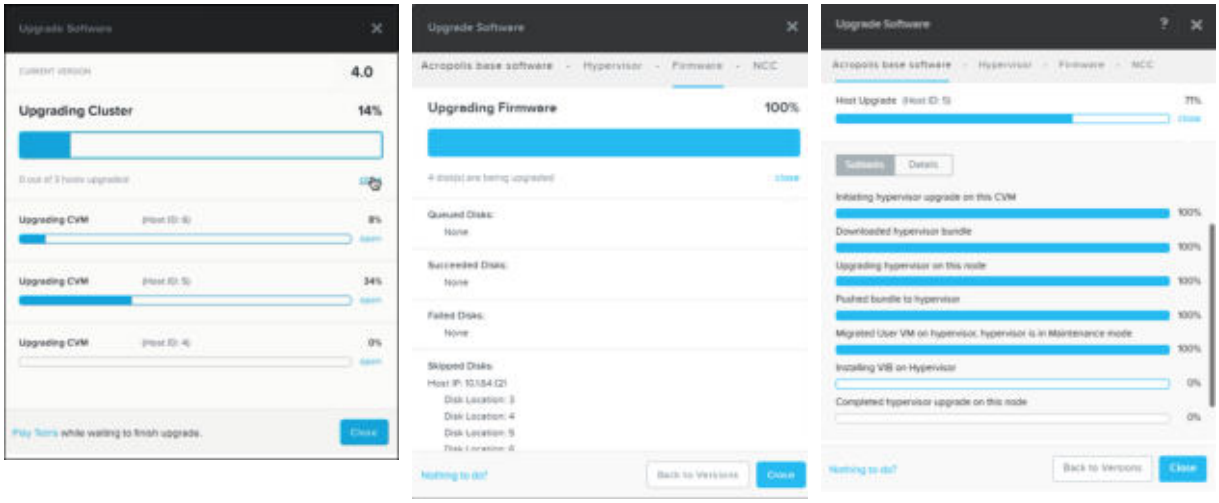
You can see the progress of the download or upgrade process through one of the following.

- LCM **Updates** page (not described in this topic)
- **Upgrade Software** dialog box
- **Alerts** summary on the main menu

Procedure

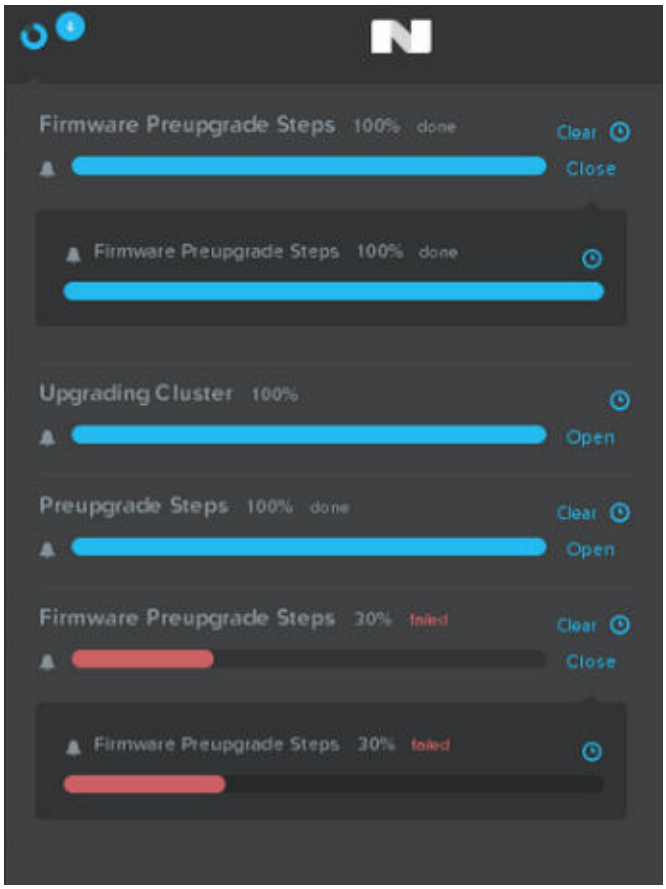
1. Under the **Upgrade Software** dialog box progress bar, click **Open**.
   The dialog box displays each Controller VM or disk as it progresses through the upgrade. For example:

   Table 2: Upgrade Progress

2. Click **open** to see progress including download, installation, and upgrade completion progress bars.
3. Click **Close** at any time; you can reopen the **Upgrade Software** dialog box from the main menu.
   If you click **Close**, the **Alerts** summary on the main menu also shows upgrade progress.
4. Click the **Alerts** summary on the main menu.

5. Click **Open** to see progress details, including download, installation, and upgrade completion progress bars.



6. Hover your mouse pointer over the clock icon to see timestamps related to the upgrade task.

Pausing an In-Progress Download

Procedure

1. If a software download is in progress, do one of the following:
   - » Open **Upgrade Software** from the **Settings** page in the Prism web console.
   - » Click the **Alerts** summary on the main menu.
2. Click **Open** near the download progress bar.
3. Click the **Pause** icon to temporarily stop the download.
4. Click the **Play** icon to resume.

Deleting a Downloaded Image

About this task

In some cases, you might need to delete a downloaded software image. A pre-upgrade check fails if a corrupted image exists (for example, corrupted as the result of a transient network glitch). You might also delete an image and download it again to clear a pre-upgrade check

error message. Another example is when you want to download the image again for any reason. The upgrade feature reports that you have already downloaded an image, preventing you from downloading it again.

Procedure

1. Log on to the Controller VM where the image has been downloaded by using a secure shell session (SSH).
2. Change to the `/home/nutanix/software_downloads/`*`download_type`* directory, where *`download_type`* is `software`, `hypervisor`, or `ncc`.
3. Delete the image and retry to download it.

3

RUN NCC CHECKS

Before doing any upgrade procedure, run Nutanix Cluster Check from Prism Element and Prism Central.

Run NCC on Prism Element Clusters

- For Prism Element clusters, run the NCC checks from the **Health** dashboard of the Prism Element web console. You can select to run all the checks at once, the checks that have failed or displayed some warning, or even specific checks of your choice. You can also log on to a Controller VM and run NCC from the command line.
- if you are running checks by using web console, you are unable to collect the logs at the same time.
- You can also log on to a Controller VM and run NCC from the `ncc` command line.

Run NCC on Prism Central

For Prism Central clusters, log on to the Prism Central VM through a secure shell session (SSH) and run the NCC checks using the `ncc` command line. You cannot run NCC from the Prism Central web console.

Running NCC (Prism Element)

About this task

Before doing any upgrade procedure, run Nutanix Cluster Check from the Prism Element web console or ncc command line.

Procedure

Do these steps to run NCC from the Prism Element web console.

a. In the Health dashboard, from the **Actions** drop-down menu, select **Run Checks**.

b. Select the checks that you want to run for the cluster.

- **All checks**. Select this option to run all the checks at once.
- **Only Failed and Warning Checks**. Select this option to run only the checks that failed or triggered a warning during the health check runs.
- **Specific Checks**. Select this option and type the check or checks name in the text box that appears that you want to run.

This field gets auto-populated once you start typing the name of the check. The **Added Checks** box lists all the checks that you have selected for this run.

c. Select the **Send the cluster check report in the email** option to receive the report after the cluster check.

   To receive the email, ensure that you have configured email configuration for alerts. For more information, see the *Web Console Guide*.

The status of the run (succeeded or aborted) is available in the **Tasks** dashboard. By default, all the event triggered checks are passed. Also, the **Summary** page of the **Health** dashboard updates with the status according to health check runs.

Run NCC from the Controller VM Command Line

Procedure

Do these steps to run NCC by using the `ncc` command.

a. Log on to a Controller VM.

b. Run NCC. See Displaying NCC Help on page 12 to display NCC help.

```
nutanix@cvm$ ncc health_checks run_all
```

If the check reports a status other than `INFO` or `PASS`, resolve the reported issues before proceeding. If you are unable to resolve the issues, contact Nutanix Support for assistance.

Running NCC (Prism Central)

About this task

Before doing any upgrade procedure, log on to the Prism Central VM and run the NCC checks from the ncc command line. You cannot run NCC from the Prism Central web console.

Procedure

1. Log on to the Prism Central VM through a secure shell session (SSH).

   - For single-VM deployments, use the Prism Central IP address.
   - For scale-out three-VM deployments, use the virtual IP address. If you did not configure a virtual IP address, use the Prism Central IP address of any of the Prism Central VMs.
   - If you do not know the PC VM IP address, contact your cluster administrator.

2. Run NCC. See Displaying NCC Help on page 12 to display NCC help.

   ```
   nutanix@pcvm$ ncc health_checks run_all
   ```

   If the check reports a status other than `INFO` or `PASS`, resolve the reported issues before proceeding. If you are unable to resolve the issues, contact Nutanix Support for assistance.

Displaying NCC Help

Get help about NCC from the command line. You can also run the NCC checks from the **Health** dashboard of the Prism web console. Click **Actions** > **Manage Checks**, then select an NCC check. Click the link to the Knowledge Base article for more information about that check.

Procedure

- Show top-level help about available health check categories.

  ```
  nutanix@cvm$ $ ncc health_checks
  ```

- Show top-level help about a specific available health check category. For example, `hypervisor_checks`.

```
nutanix@cvm$ ncc health_checks hypervisor_checks
```

- Show all NCC flags to set your NCC configuration. Use these flags under the direction of Nutanix Support.

```
nutanix@cvm$ ncc -help
```

4

UPGRADE OR INSTALL NUTANIX CLUSTER CHECK (NCC)

Upgrade NCC by using the web console, Life Cycle Manager, or installer file downloaded from the Nutanix Support Portal.

To help maintain cluster health and take advantage of the latest NCC technology, Nutanix recommends that you keep your NCC version current. You can upgrade NCC through the web console, Life Cycle Manager, or command line.

If you are adding one or more nodes to expand your cluster, the latest version of NCC might not be installed on each newly-added node. In this case, re-install NCC in the cluster after you have finished adding the one or more nodes.

> Note: To help ensure that Prism Central and each managed cluster are taking advantage of NCC features, ensure that:
>
> - Each node in your cluster is running the same NCC version.
> - Prism Central and each cluster managed by Prism Central are all running the same NCC version.

Upgrading NCC with Life Cycle Manager (LCM)

Upgrade NCC by using the Life Cycle Manager in the Prism Element or Prism Central web console.

Before you begin

See the Life Cycle Manager documentation for complete information about using LCM.

Procedure

1. Upgrade NCC on your Prism Element clusters.
2. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.
3. Click the gear icon in the main menu of the web console, then select **LCM** from the **Settings** drop-down menu.
4. To show current software versions, click **View By** > **Component**.
5. Click **Inventory** > **Perform Inventory** > **Proceed** to update the LCM framework (if needed) and to start the inventory.
   Life Cycle Manager checks for its own latest version as a first step, then downloads and installs the latest LCM framework before checking for other available software updates. Depending on your network bandwidth, this task can take a few minutes to complete. You might also need to refresh your browser to update the LCM page.

6. In the LCM sidebar under **Updates**, click **Software** to show the latest available NCC updates.
7. Select **NCC**, click **View Update Plan**, and click **Apply 1 Updates**.
   LCM updates NCC on the Prism Element cluster.
8. Repeat these steps for your Prism Central cluster. See Running NCC (Prism Central) on page 12 to run NCC checks on Prism Central.

Upgrading NCC on Prism Element Clusters

About this task

This topic describes how to install NCC software from the Prism Element web console.

Procedure

1. Run NCC as described in Run NCC Checks on page 11.
2. Log on to the web console for any node in the cluster and click the gear icon.
3. Click **Upgrade Software**, then click **NCC** in the dialog box.
4. If an update is available, click **Upgrade Available** and then click **Download**
5. When the download process is completed, click **Upgrade**, then click **Yes** to confirm.
   The **Upgrade Software** dialog box shows the progress of your selection.

   As part of installation or upgrade, NCC automatically restarts the cluster health service on each node in the cluster. You you might observe notifications or other slight anomalies as the service is restarting.

Upgrading NCC by Uploading Binary and Metadata Files

About this task

- Do the following steps to download NCC binary and metadata .JSON files from the Nutanix Support Portal, then upgrade NCC through **Upgrade Software** in the web console.
- Typically you must perform this procedure if your cluster is not directly connected to the Internet and you cannot download the binary and metadata .JSON files through the web console.

Procedure

1. Log on to the Nutanix Support portal and select **Downloads** > **NCC**.
2. Click the download link to save the binary gzipped TAR (.tar.gz) and metadata (.json) files on your local media.
3. Log on to the web console for any node in the cluster and click the gear icon.
4. Click **Upgrade Software**, then click **NCC** in the dialog box.
5. Click the **upload the NCC binary** link.
6. Click **Choose File** for the NCC metadata and binary files, respectively, browse to the file locations, and click **Upload Now**.

7. When the upload process completes, click **Upgrade**, then click **Yes** to confirm.
   The **Upgrade Software** dialog box shows the progress of your selection.

   As part of installation or upgrade, NCC automatically restarts the cluster health service on each node in the cluster. You might observe notifications or other slight anomalies as the service is restarting.

Upgrading NCC on Prism Central

Before you begin

To help ensure that Prism Central and each managed cluster are taking advantage of NCC features, ensure that:

- Each node in your cluster is running the same NCC version.
- Prism Central and each cluster managed by Prism Central are all running the same NCC version.

To check the currently-installed NCC version running on Prism Central:

- Log in to the Prism Central web console.
- From your user name link, click **About Nutanix**.

The pop-up window shows the installed NCC version.

About this task

This topic describes how to install NCC software from the Prism Central web console.

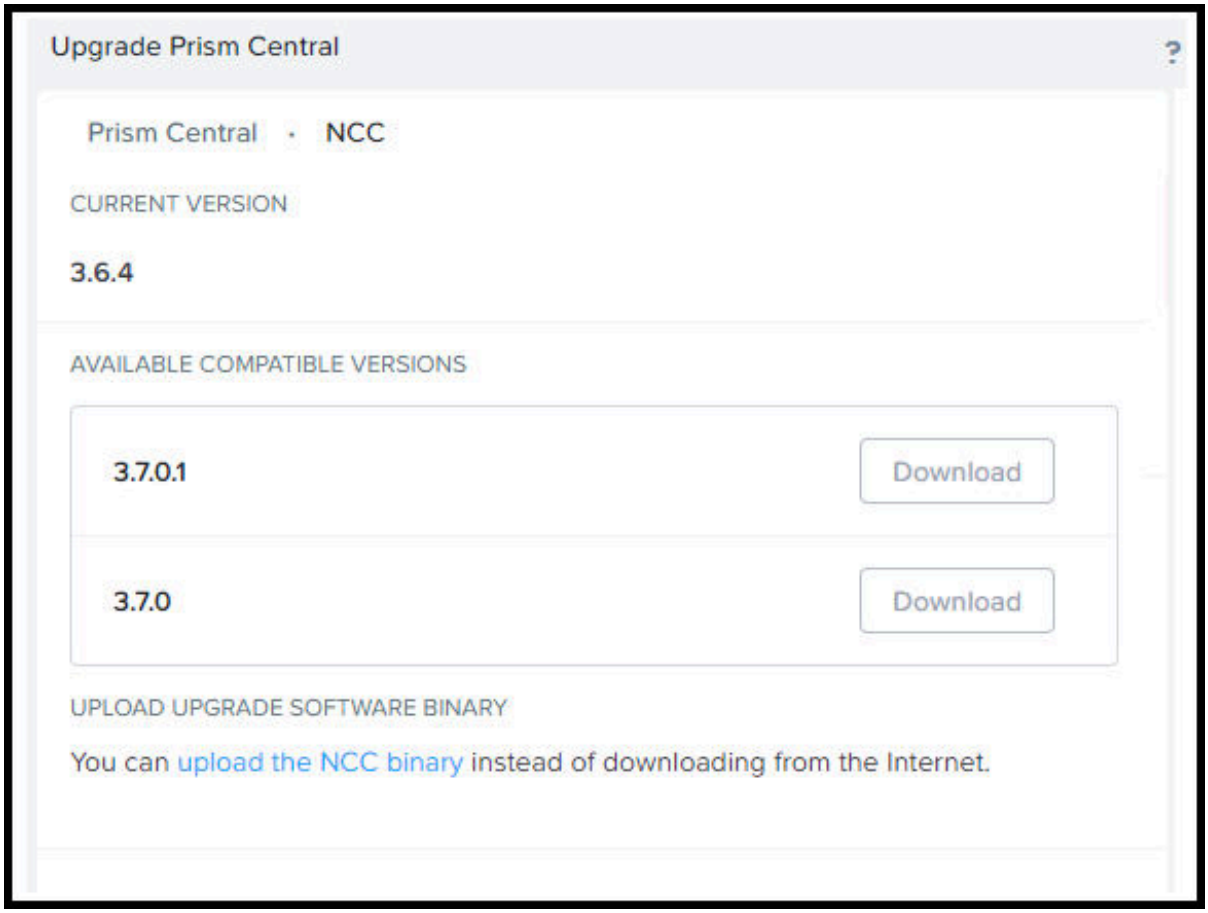


Figure 2: Upgrade Software: NCC

Procedure

1. Log on to the Prism Central web console as the `admin` user and click the gear icon.
2. Click **Upgrade Software**, then click **NCC** in the dialog box.
3. If an update is available, click **Upgrade Available** and then click **Download**
4. When the download process is completed, click **Upgrade**, then click **Yes** to confirm.
   The **Upgrade Software** dialog box shows the progress of your selection.

   As part of installation or upgrade, NCC automatically restarts the cluster health service on each node in the cluster, so you might observe notifications or other slight anomalies as the service is being restarted.

Upgrading NCC by Uploading Binary and Metadata Files

About this task

Do the following steps to download NCC binary and metadata .JSON files from the Nutanix Support Portal, then upgrade NCC through **Upgrade Software** in the Prism Central web console.

Procedure

1. Log on to the Nutanix support portal and select **Downloads** > **NCC**.

2. Click the NCC version download link to save the binary gzipped TAR (.tar.gz) and metadata (.json) files on your local media.
3. Log on to the Prism Central web console as the **admin** user and click the gear icon.
4. Click **Upgrade Software**, then click **NCC** in the dialog box.
5. Click the **upload the NCC binary** link.
6. Click **Choose File** for the NCC metadata and binary files, respectively, browse to the file locations, and click **Upload Now**.
7. When the upload process is completed, click **Upgrade**, then click **Yes** to confirm.
   The **Upgrade Software** dialog box shows the progress of your selection.

   As part of installation or upgrade, NCC automatically restarts the cluster health service on each node in the cluster, so you might observe notifications or other slight anomalies as the service is being restarted.

Installing NCC from an Installer File

Before you begin

- If you are adding one or more nodes to expand your cluster, the latest version of NCC might not be installed on each newly-added node. In this case, re-install NCC in the cluster after you have finished adding the one or more nodes.
- This topic describes how to install NCC from the command line by using a shell script downloaded from the Nutanix Support Portal. To upgrade NCC software from the web console, see Upgrading NCC on Prism Element Clusters on page 15 or Upgrading NCC on Prism Central on page 16.

  Note: To help ensure that Prism Central and each managed cluster are taking advantage of NCC features, ensure that:

  - Each node in your cluster is running the same NCC version.
  - Prism Central and each cluster managed by Prism Central are all running the same NCC version.

Procedure

1. From the Nutanix Support Portal **Downloads** > **NCC** page, download, save, and then copy the NCC installation shell file to any Controller VM in the cluster.

   - Make sure that the Controller VM directory where you copy the shell file exists on all nodes in the cluster. Nutanix recommends the **/home/nutanix** folder. This folder should be owned by any accounts that use NCC.
   - Note the MD5 value of the file as published on the Support Portal.

2. From the Controller VM, check the MD5 value of the file.

   ```
   nutanix@cvm$ md5sum ./ncc_installer_filename.sh
   ```

   It must match the MD5 value published on the Support Portal. If the value does not match, delete the file and download it again from the Support Portal.

3. Make the installation file executable.

```
nutanix@cvm$ chmod u+x ./ncc_installer_filename.sh
```

4. Install NCC.

```
nutanix@cvm$ ./ncc_installer_filename.sh
```

   The installation script installs NCC on each node in the cluster. NCC installation file logic tests the NCC file checksum and prevents installation if it detects file corruption.

   - If it verifies the file, the installation script installs NCC on each node in the cluster.
   - If it detects file corruption, it prevents installation and deletes any extracted files. In this case, download the file again from the Nutanix support portal.

5. Check the shell script output for any error messages.

   - If installation is successful, a `Finished Installation` message is displayed. You can check any NCC-related messages in `/home/nutanix/data/logs/ncc-output-latest.log`.
   - In some cases, output similar to the following is displayed. Depending on the NCC version installed, the installation file might log the output to `/home/nutanix/data/logs/` or `/home/nutanix/data/serviceability/ncc`.

```
Copying file to all nodes                                                    [ DONE ]
--------------------------------------------------------------------------------+
+---------------+
| State | Count |
+---------------+
| Total | 1     |
+---------------+
Plugin output written to /home/nutanix/data/logs/ncc-output-latest.log
[ info ] Installing ncc globally.
[ info ] Installing ncc on 10.130.45.72, 10.130.45.73
[ info ] Installation of ncc succeeded on nodes 10.130.45.72, 10.130.45.73.
```

What to do next

- As part of installation or upgrade, NCC automatically restarts the cluster health service on each node in the cluster, so you might observe notifications or other slight anomalies as the service is being restarted.

5

USE LCM TO UPGRADE ALL SOFTWARE AND FIRMWARE (SELECT ALL)

This section describes using Life Cycle Manager (LCM) to select all components to upgrade at once. Nutanix recommends this Select All method for performing most upgrades through LCM in the web console.

Nutanix recommends performing all upgrades automatically with LCM where possible.

- This section assumes you are using LCM at a site that has Internet access. To use LCM at a location without internet access, see the *Life Cycle Manager Dark Site Guide*.
- Nutanix has designed LCM to automatically consider upgrade dependencies and upgrade available software and firmware components in the appropriate order.
- LCM can inventory your cluster and present you with recommend updates to Foundation, AOS, AHV, Nutanix Cluster Check (NCC), firmware, and other software.
- LCM can then perform updates on the cluster. LCM updates are not reversible.

LCM Update Limitations and Recommendations

Nutanix recommends that you update your cluster to the most recent LCM framework and most recent version of Nutanix Foundation before performing any other updates with LCM.

For the latest and late-breaking information about LCM, see the Life Cycle Manager release notes.

- LCM supports software updates for all platforms that use Nutanix software.
- LCM supports firmware updates only for platforms listed in the Life Cycle Manager release notes.

  AHV Clusters

  After upgrading AHV, you might need to update admin and nutanix user credentials as described in the AHV Administration Guide topic *AHV Host Access*.

  Firewall

  Configure rules in your external firewall to allow LCM updates. See Firewall Requirements on page 100.

  Foundation

  Nutanix recommends that you update your cluster to the most recent LCM framework and most recent version of Nutanix Foundation before performing any other updates with LCM. See Recommended Upgrade Order on page 27. You can update Foundation through LCM or with the Prism Element 1-click update process.

  Single Node Clusters

  LCM cannot perform firmware upgrades on single-node clusters. Firmware updates usually require services to stop, and on a single-node cluster there is no other node to

take over the workload. This limitation does not apply to software updates, except for AHV and AOS, which both require guest VMs to stop during updates.

VLAN Traffic Filtering

LCM cannot operate when you have VLAN traffic filtering (such as VLAN trunking or virtual guest tagging) deployed on the **dvPortGroup** connected to the Controller VM `eth0` interface.

Affinity rules

Before LCM updates a node, AOS migrates virtual machines to other nodes in the cluster. If you have VM affinity rules configured on your cluster, particularly affinity rules that restrict which nodes the VM can migrate to, then LCM can run slowly while waiting for ADS to migrate the VMs.

If you have configured affinity rules that do not allow VMs to migrate, then the LCM precheck `test_esx_entering_mm_pinned_vms` fails and LCM updates cannot continue.

To avoid update failures or delays due to affinity rules, disable any VM affinity rules before beginning an LCM update and then enable the rules after performing the update.

Updating Nutanix Calm, Files, Karbon, Objects, and Other Services

Nutanix recommends that you update all other Prism Element and Prism Central cluster software and firmware first before updating add-on software like Calm, Files, Karbon, and Objects.

Performing Inventory With LCM

Use LCM to check for updates and to display current cluster software and firmware versions.

About this task

Inventory information for a node is persistent as long as the node remains in the chassis. When you remove a node from a chassis, LCM does not retain inventory information for that node. When you return the node to the chassis, you must perform the inventory operation again to restore the inventory information.

Procedure

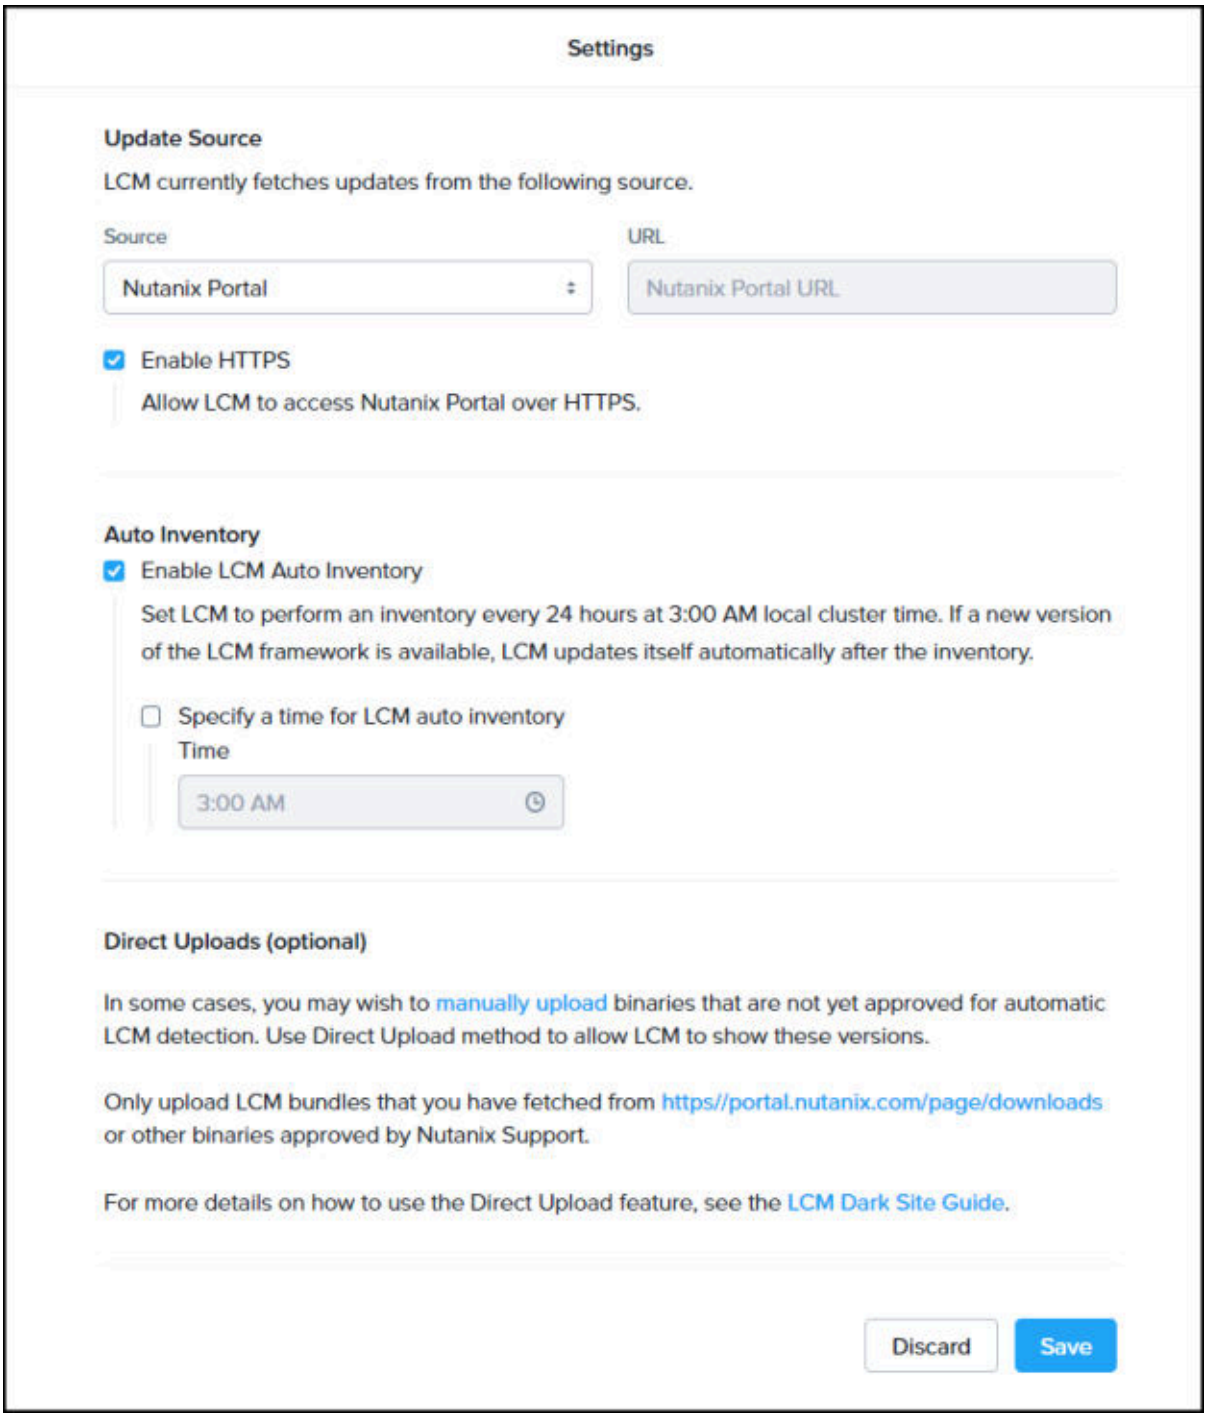
1. In the web console, open the LCM dashboard.
   a. Prism Element web console: From the pull-down list on the left side of the main menu, select **Settings** > **LCM**.
   b. Prism Central web console: From the entities menu on the left side of the main menu, select **Administration** > **LCM**

2. Click **Inventory** > **Perform Inventory** > **Proceed** to update the LCM framework (if needed) and to start the inventory.
   If you do not have auto-update enabled and a new version of the LCM framework is available, LCM shows the following warning message:

   Life Cycle Manager checks for its own latest version as a first step, then downloads and installs the latest LCM framework before checking for other available software updates. Depending on your network bandwidth, this task can take a few minutes to complete. You might also need to refresh your browser to update the LCM page.

3. After the inventory completes successfully, click **Back to Inventory**, where the new inventory appears on the **Inventory** page.
4. Use **View By** to show installed software.
   a. Select **Host (Default)** for a general display by host.
   b. Select **Component** to show installed software and firmware and associated versions.
5. Click **Export** to export the inventory as a spreadsheet.

6. To enable auto-inventory, click **Settings** and select **Enable LCM Auto Inventory** in the dialog box.



What to do next

- To update all components at once, see Use LCM to Upgrade All Software and Firmware (Select All) on page 20.
- To update one or more individual specific components only, see Use LCM to Upgrade Specific Software and Firmware (Select Some) on page 26.

Updating All Software or Firmware Components with LCM

After performing an inventory, use LCM to update cluster software or firmware.

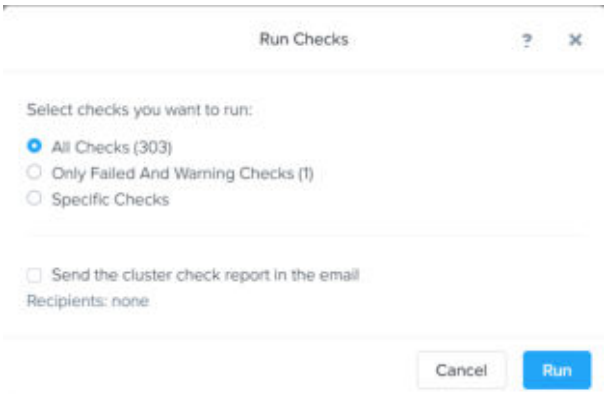
Before you begin

Nutanix recommends that you update all other Prism Element and Prism Central cluster software and firmware first before updating add-on software like Calm, Files, Karbon, and Objects. See also .

Procedure

1. In the web console, open the LCM dashboard.
   a. Prism Element web console: From the pull-down list on the left side of the main menu, select **Settings** > **LCM**.
   b. Prism Central web console: From the entities menu on the left side of the main menu, select **Administration** > **LCM**
2. In the LCM toolbar, click **Updates**, then select **Software** or **Firmware**.

   CAUTION: Nutanix Support recommends that you do not update any firmware as a first step if software updates are listed as available.
3. Select the updates you want to perform.
   a. Select the checkbox for the node you want to update, or select **All** to update the entire cluster.
   b. When you select a node, LCM selects all updateable components by default. Clear the check box of any component you do not want to update.
4. Click **NCC Check**.



5. Select the checks to run before updating and click **Run**.
6. When the checks are complete, click **View Update Plan**.

7. For ESXi hosts with active pinned VMs, LCM cannot place the hosts into maintenance mode. Before you can proceed with LCM updates, you must choose one of the following.

   » Select **Automatically shut down non-migratable VMs through LCM**.

   » Clear (unselect) **Automatically shut down non-migratable VMs through LCM** and handle pinned VMs manually by migrating them or shutting them down.

   » If you have a system configuration that can automatically handle pinned VMs, uncheck **Automatically shut down non-migratable VMs through LCM** and leave your system to handle them.

8. For AHV hosts with non-migratable VMs: LCM automatically shuts down any running VMs that cannot be live migrated before updating their host, and starts them again after completing the update. Non-migratable VMs include VMs with affinity set to a single host, VMs with GPUs, and agent VMs.

9. Click **Apply Updates**.
   LCM updates the selected components.

6

USE LCM TO UPGRADE SPECIFIC SOFTWARE AND FIRMWARE (SELECT SOME)

This section describes using Life Cycle Manager (LCM) to select one or more components to upgrade, referred to here as the Select Some method.

If you use the **Select Some** method, make sure you read the Recommended Upgrade Order on page 27 topic.

Nutanix recommends performing as many upgrades as possible through LCM in the web console, especially when you choose the **Select Some** method. Use the **Select Some** method when you need to perform a targeted upgrade of a few components (for example, a hypervisor or adapter firmware).

Nutanix has designed LCM to automatically consider upgrade dependencies. LCM can inventory your cluster and present you with recommend updates to Foundation, AOS, AHV, Nutanix Cluster Check (NCC), firmware, and other software. LCM can then perform updates on the cluster. LCM updates are not reversible.

> Note: Depending on your LCM, AOS, or Prism Central version, you can also upgrade certain cluster software components through the web console **Settings** > **Upgrade Software** panel, also known informally as the 1-click upgrade panel. For Prism Element clusters, you can upgrade AOS, Nutanix Files, non-AHV hypervisors, NCC, and Foundation. For Prism Central clusters, you can upgrade Prism Central and NCC. See Use Upgrade Software in the Web Console (Legacy 1-Click Upgrade) on page 34.

LCM Update Limitations and Recommendations

Nutanix recommends that you update your cluster to the most recent LCM framework and most recent version of Nutanix Foundation before performing any other updates with LCM.

For the latest and late-breaking information about LCM, see the Life Cycle Manager release notes.

- LCM supports software updates for all platforms that use Nutanix software.
- LCM supports firmware updates only for platforms listed in the Life Cycle Manager release notes.

  AHV Clusters

  After upgrading AHV, you might need to update admin and nutanix user credentials as described in the AHV Administration Guide topic *AHV Host Access*.

  Firewall

  Configure rules in your external firewall to allow LCM updates. See Firewall Requirements on page 100.

Foundation

Nutanix recommends that you update your cluster to the most recent LCM framework and most recent version of Nutanix Foundation before performing any other updates with LCM. See Recommended Upgrade Order on page 27. You can update Foundation through LCM or with the Prism Element 1-click update process.

Single Node Clusters

LCM cannot perform firmware upgrades on single-node clusters. Firmware updates usually require services to stop, and on a single-node cluster there is no other node to take over the workload. This limitation does not apply to software updates, except for AHV and AOS, which both require guest VMs to stop during updates.

VLAN Traffic Filtering

LCM cannot operate when you have VLAN traffic filtering (such as VLAN trunking or virtual guest tagging) deployed on the **dvPortGroup** connected to the Controller VM `eth0` interface.

Affinity rules

Before LCM updates a node, AOS migrates virtual machines to other nodes in the cluster. If you have VM affinity rules configured on your cluster, particularly affinity rules that restrict which nodes the VM can migrate to, then LCM can run slowly while waiting for ADS to migrate the VMs.

If you have configured affinity rules that do not allow VMs to migrate, then the LCM precheck `test_esx_entering_mm_pinned_vms` fails and LCM updates cannot continue.

To avoid update failures or delays due to affinity rules, disable any VM affinity rules before beginning an LCM update and then enable the rules after performing the update.

Updating Nutanix Calm, Files, Karbon, Objects, and Other Services

Nutanix recommends that you update all other Prism Element and Prism Central cluster software and firmware first before updating add-on software like Calm, Files, Karbon, and Objects.

Recommended Upgrade Order

This recommended upgrade order applies to Internet-connected clusters and unconnected (dark-site) clusters. Nutanix recommends performing most upgrades through Life Cycle Manager (LCM) in the web console. For example, Life Cycle Manager can inventory your cluster and recommend updates to Foundation, AOS, AHV, Nutanix Cluster Check (NCC), firmware, and other components. Nutanix has designed LCM to automatically consider upgrade dependencies and upgrade available software and firmware components in the appropriate order.

About this task

- If you choose to upgrade individual cluster software components, do these upgrade steps in Nutanix-recommended order for best results. Nutanix recommends that you read and follow the order listed in this topic.
- Otherwise, use LCM to upgrade your cluster and select all components presented by LCM where upgrades are available.
- Nutanix recommends that you update all other Prism Element and Prism Central cluster software and firmware first before updating add-on software like Calm, Files, Karbon, and Objects.
- See the Life Cycle Manager documentation, including the *LCM Dark Site Guide*.

CAUTION: Nutanix Support recommends that you do not update any firmware as a first step.

Procedure

1. On Prism Central clusters, do these steps.
   a. Perform an LCM inventory, which also updates the LCM framework. Do not upgrade any other software component except LCM in this step.
   b. Upgrade and run Nutanix Cluster Check (NCC) on Prism Central.
   c. Upgrade Prism Central.
2. On Prism Element clusters, upgrade LCM and NCC, then run NCC.
   a. Perform an LCM inventory, which also updates the LCM framework. Do not upgrade any other software component except LCM in this step.
   b. Upgrade and run NCC.
3. On Prism Element clusters, upgrade remaining software.
   a. If it has been more 24 hours since the last LCM inventory, perform an LCM inventory.
   b. Upgrade Foundation.
   c. Upgrade Cluster Maintenance Utilities.
   d. Upgrade AOS.
   e. Perform available firmware updates (BIOS/BMC/Host boot drive or other critical firmware as recommended by LCM).
   f. Upgrade AHV for AHV clusters, then perform an LCM inventory again and upgrade any available firmware.
      After upgrading AHV, you might need to update admin and nutanix user credentials as described in the AHV Administration Guide topic *AHV Host Access*.
   g. Upgrade cluster hypervisor hosts other than AHV, then perform an LCM inventory again and upgrade any available software (such as Files, License Manager (LM) agent, and other Nutanix software installed on the Prism Element cluster) or firmware.
   h. Run NCC again.

   Note:

   - If a SATA DOM model 3IE3 firmware update is available for your cluster, LCM might show that update as the only update available to apply. In this case, LCM will allow only that update to run. After updating SATA DOM firmware, LCM will unblock any blocked updates and you can continue upgrading the cluster.
   - For AHV clusters with GPU hardware and NVIDIA Grid vGPU host drivers for AHV installed, LCM might not present any available AHV upgrades. See KB article 8727 at the Nutanix Support portal for details, including how to uninstall the NVIDIA host drivers. The NVIDIA GRID Host Driver for Nutanix AHV Installation Guide describes how to install the NVIDIA GRID host driver on AHV hosts.
4. After performing the core upgrades on Prism Central and Prism element in the previous steps, on Prism Central, upgrade Services software such as Calm, Files, Karbon, Objects, and other Nutanix software installed on Prism Central.

About Witness VM Upgrades

About this task

- You can upgrade the Witness VM to the latest build available.
- The Witness VM version is independent of the cluster AOS and PC versions.
- You can upgrade the Witness VM at any time. It is not dependent on upgrade order when upgrading other cluster software components.

Performing Inventory With LCM

Use LCM to check for updates and to display current cluster software and firmware versions.

About this task

Inventory information for a node is persistent as long as the node remains in the chassis. When you remove a node from a chassis, LCM does not retain inventory information for that node. When you return the node to the chassis, you must perform the inventory operation again to restore the inventory information.

Procedure

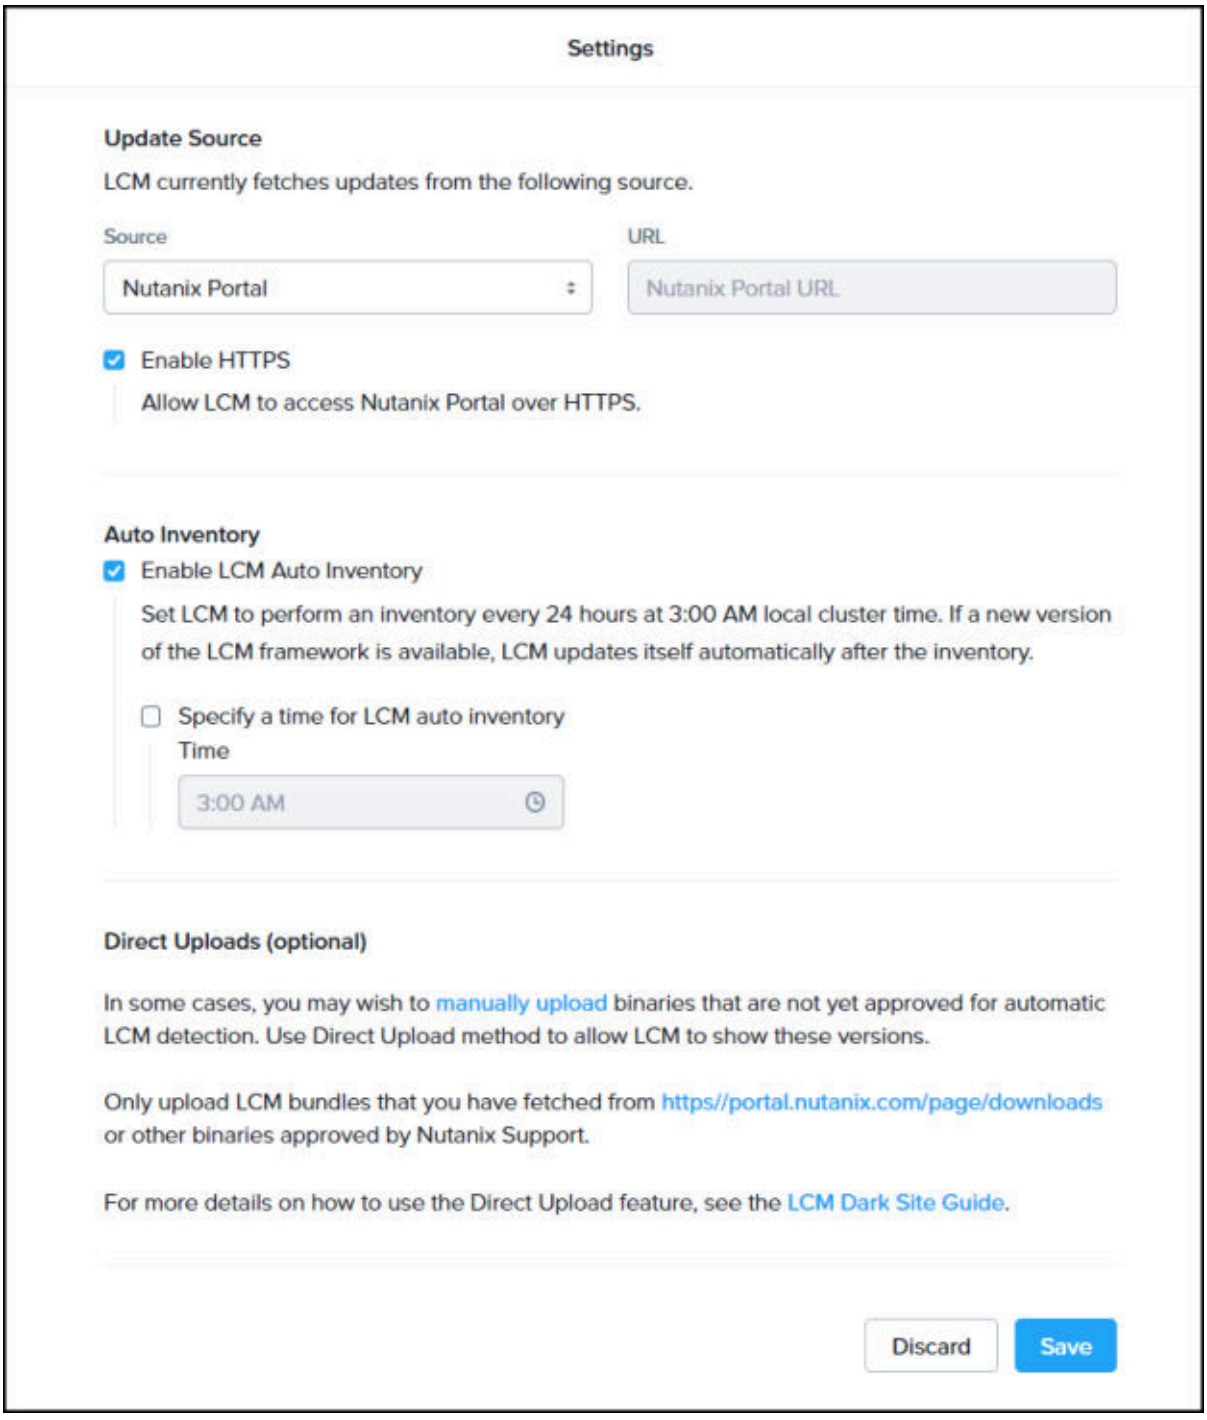
1. In the web console, open the LCM dashboard.
   a. Prism Element web console: From the pull-down list on the left side of the main menu, select **Settings** > **LCM**.
   b. Prism Central web console: From the entities menu on the left side of the main menu, select **Administration** > **LCM**

2. Click **Inventory** > **Perform Inventory** > **Proceed** to update the LCM framework (if needed) and to start the inventory.
   If you do not have auto-update enabled and a new version of the LCM framework is available, LCM shows the following warning message:

   Life Cycle Manager checks for its own latest version as a first step, then downloads and installs the latest LCM framework before checking for other available software updates. Depending on your network bandwidth, this task can take a few minutes to complete. You might also need to refresh your browser to update the LCM page.

3. After the inventory completes successfully, click **Back to Inventory**, where the new inventory appears on the **Inventory** page.
4. Use **View By** to show installed software.
   a. Select **Host (Default)** for a general display by host.
   b. Select **Component** to show installed software and firmware and associated versions.
5. Click **Export** to export the inventory as a spreadsheet.

6. To enable auto-inventory, click **Settings** and select **Enable LCM Auto Inventory** in the dialog box.



What to do next

- To update all components at once, see Use LCM to Upgrade All Software and Firmware (Select All) on page 20.
- To update one or more individual specific components only, see Use LCM to Upgrade Specific Software and Firmware (Select Some) on page 26.

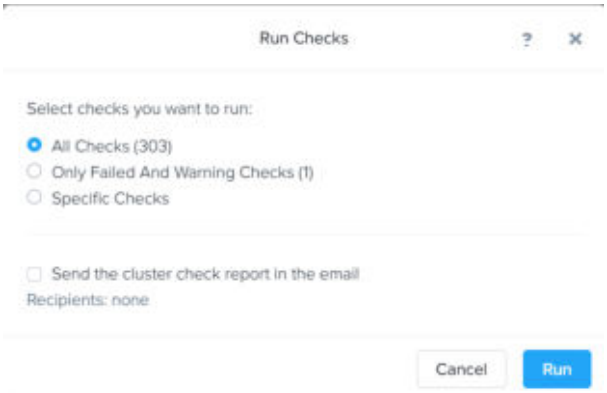
Updating One or More Software or Firmware Components with LCM

After performing an inventory, use LCM to update specific cluster software or firmware.

Procedure

1. In the web console, open the LCM dashboard.
   a. Prism Element web console: From the pull-down list on the left side of the main menu, select **Settings** > **LCM**.
   b. Prism Central web console: From the entities menu on the left side of the main menu, select **Administration** > **LCM**
2. In the LCM toolbar, click **Updates**, then select **Software** or **Firmware**.

   CAUTION: Nutanix Support recommends that you do not update any firmware as a first step if software updates are listed as available.
3. Select the updates you want to perform.
   a. Select the checkbox for the node you want to update, or select **All** to update the entire cluster.
   b. Select one or more components you want to update. When you select a node, LCM selects the checkboxes for all updateable components by default. Clear the checkbox of any component you do not want to update.
4. Click **NCC Check**.



5. Select the checks to run before updating and click **Run**.
6. When the checks are complete, click **View Update Plan**.

7. For ESXi hosts with active pinned VMs, LCM cannot place the hosts into maintenance mode. Before you can proceed with LCM updates, choose one of the following.

   » Select **Automatically shut down non-migratable VMs through LCM**.

   » Clear (unselect) **Automatically shut down non-migratable VMs through LCM** and handle pinned VMs manually by migrating them or shutting them down.

   » If you have a system configuration that can automatically handle pinned VMs, uncheck **Automatically shut down non-migratable VMs through LCM** and leave your system to handle them.

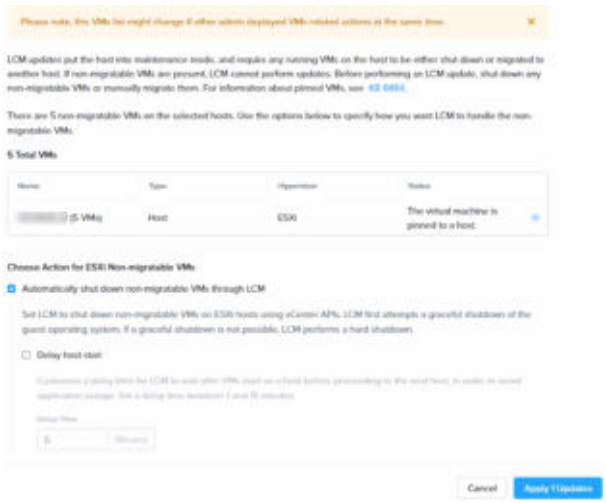


Figure 3: Applying updates on ESXi hosts

8. For AHV hosts with non-migratable VMs: LCM automatically shuts down any running VMs that cannot be live migrated before updating their host, and starts them again after completing the update. Non-migratable VMs include VMs with affinity set to a single host, VMs with GPUs, and agent VMs.

9. Click **Apply *x* Updates**, where *x* is the number of updates you selected.
   LCM updates the selected components.

7

USE UPGRADE SOFTWARE IN THE WEB CONSOLE (LEGACY 1-CLICK UPGRADE)

AOS and Prism Central support specific software upgrades that you can apply through the web console **Upgrade Software** feature (also known as 1-click upgrade).

You can view the available upgrade options, start an upgrade, and monitor upgrade progress through the web console. In the main menu, click the gear icon, and then select **Upgrade Software** or **Upgrade Prism Central** in the **Settings** panel to see the current status of your software versions (and start an upgrade if warranted).

This page enables you to upgrade the following software when you cannot or choose not to use LCM.

Prism Element Web Console

- AOS
- File Server (Nutanix Files)
- VMware ESXi or Microsoft Hyper-V hypervisors (use LCM to upgrade AHV)
- Nutanix Cluster Check (NCC)
- Foundation

Prism Central Web Console

- Prism Central
- NCC

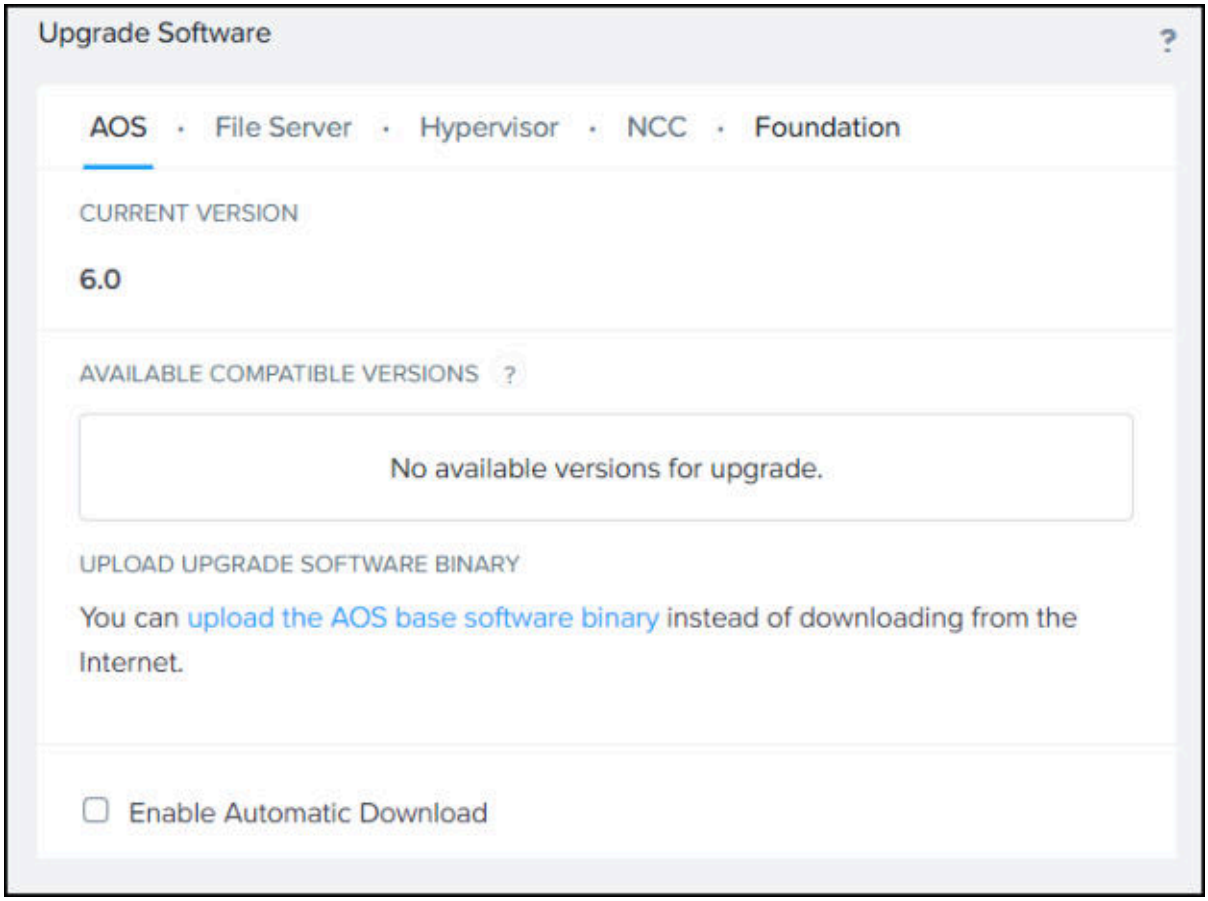

Figure 4: Prism Element Upgrade Software dialog

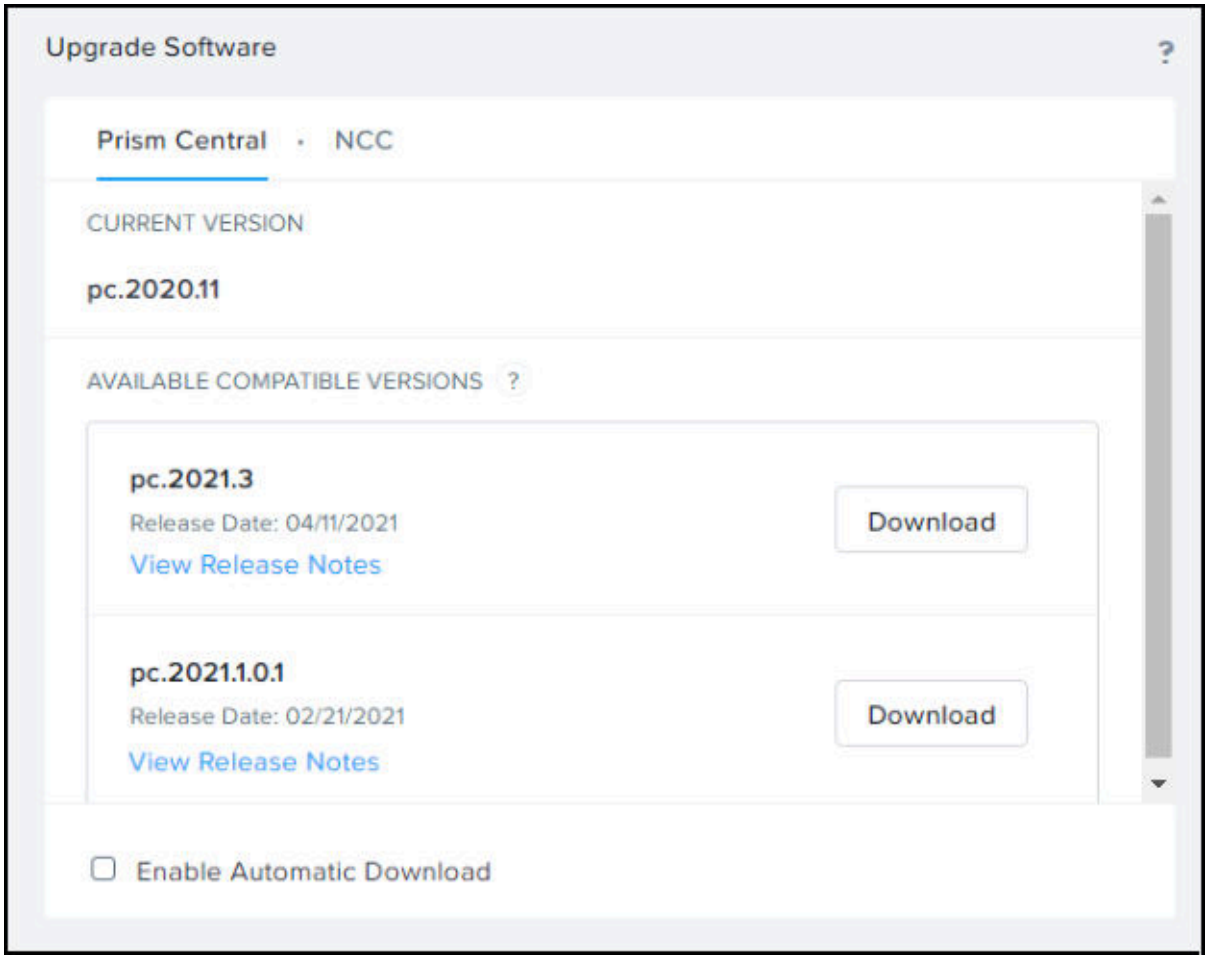

Figure 5: Upgrade Prism Central / Upgrade Software dialog

- **CURRENT VERSION** displays the version running currently in the cluster.
- **AVAILABLE COMPATIBLE VERSIONS** displays any versions to which the cluster can be updated.
- The **upload the AOS base software binary** link enables you to install from binary and metadata files, which might be helpful for updating isolated (dark-site) clusters not connected to the Internet.
- **Enable Automatic Download**. When you select **Enable Automatic Download**, the web console regularly checks for new versions and downloads the software package for you. You can then choose to install it.

Options for Downloading Updates

> Note: You must allow access to the upgrade URLs in your firewall, listed in Firewall Requirements on page 100.

Nutanix recommends performing most upgrades through Life Cycle Manager (LCM) in the web console. If you choose to upgrade individual cluster software components through **Settings** > **Upgrade Software** in the web console, see also Recommended Upgrade Order on page 27.

You can choose how to obtain the latest versions of the AOS or other software that Nutanix makes available on the Nutanix Support portals. You might need to download software from hypervisor vendor release web pages.,

Table 3: Software Download Options

Downloadable Component	Automatic/On-Demand 1-Click Upgrade	File Upload 1-Click Upgrade
• AOS	• Automatic: When you select **Enable Automatic Download** in **Upgrade Software**, the web console regularly checks for new versions and downloads the software package for you. You can then choose to install it. • On demand: When you clear **Enable Automatic Download** in **Upgrade Software**, you must click **Download** to retrieve the software package.	• Nutanix Support Portal lists binaries, metadata, and checksums when available. You can upload the binary and metadata files to upgrade clusters.
• File Server (Nutanix Files) • NCC (Nutanix Cluster Check) • Foundation	• On demand: The web console regularly checks for new versions and notifies you through **Upgrade Software** that a new version is available. Click **Download** to retrieve and install the software package.	• Nutanix Support Portal lists binaries, metadata, and checksums when available. You can upload the binary file and metadata to upgrade clusters.

Downloadable Component	Automatic/On-Demand 1-Click Upgrade	File Upload 1-Click Upgrade
• Hypervisor	• On demand AHV: For most AOS versions, upgrade AHV by using the LCM, linked from **Upgrade Software** in the web console. • On-demand is not available for ESXi. You can check the Nutanix Support portal for metadata JSONs for Nutanix-qualified ESXi versions. • On-demand is not available for Microsoft Hyper-V.	• Older AOS versions support AHV upgrades that you apply through **Settings** > **Upgrade Software** in the web console • Nutanix Support Portal lists binaries, metadata, and checksums when available. You can upload the binary and metadata files to upgrade clusters. • Other hypervisor metadata files and checksums required to install hypervisor software are listed when available. • Hypervisor vendor web site. Hypervisor vendors such as VMware provide upgrade packages. For example, you can download the metadata file from Nutanix and hypervisor binary package from VMware and then upload the files through **Upgrade Software** to upgrade cluster hosts. See Upgrading ESXi Hosts by Uploading Binary and Metadata Files on page 44 or Upgrading Hyper-V Hosts on page 50 for more information.

AOS Upgrade

Each node in a cluster runs AOS. When upgrades are available and you want to upgrade the cluster to a new AOS version, every node must be upgraded to that version. Nutanix provides a live upgrade mechanism that cluster availability while a rolling upgrade of the nodes starts in the background.

AOS supports upgrades that you can apply through the Prism Element web console **Upgrade Software** feature (also known as 1-click upgrade).

You can view the available upgrade options, start an upgrade, and monitor upgrade progress through the web console. In the main menu, click the gear icon, and then select **Upgrade Software** in the **Settings** panel. You can see the current status of your software versions and start an upgrade.

Before upgrading, see the Recommended Upgrade Order on page 27 topic.

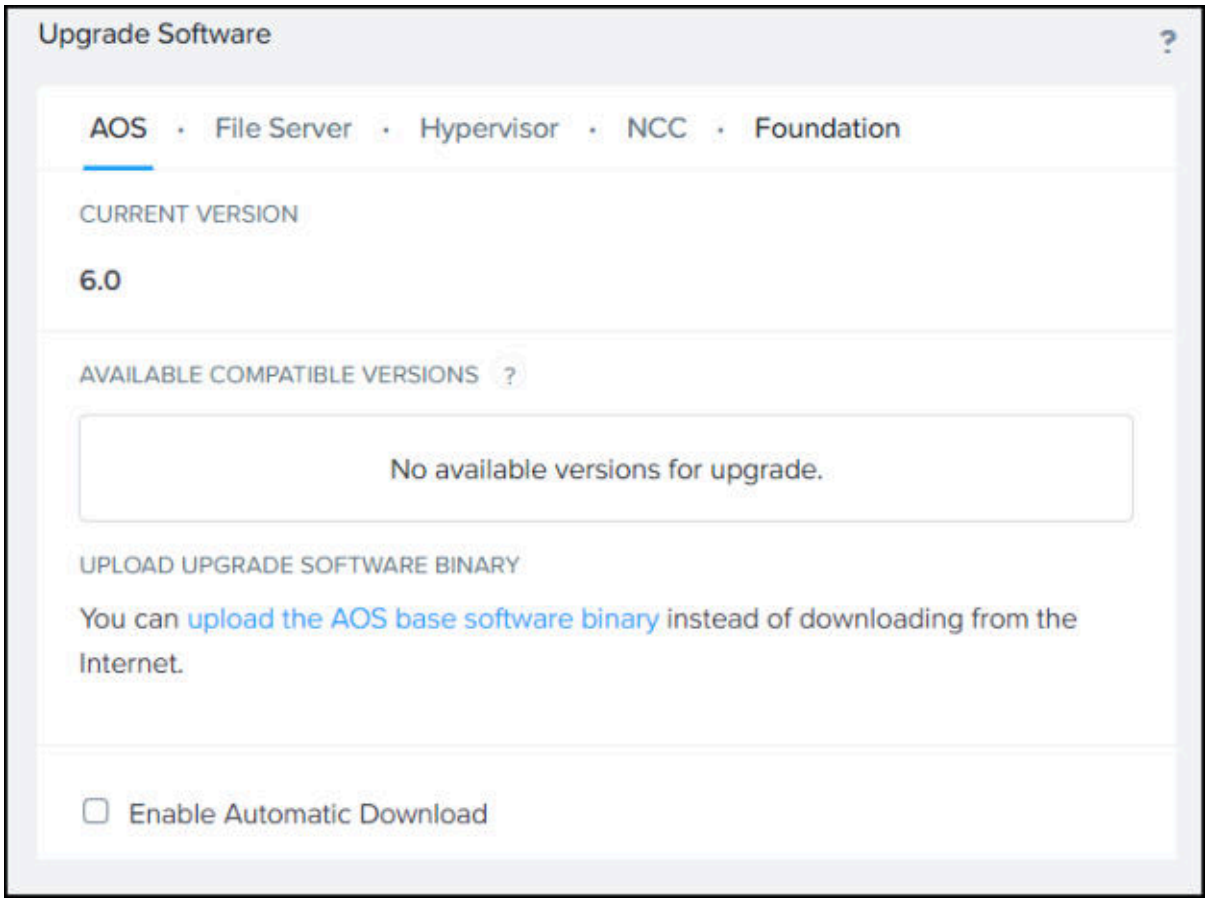

Figure 6: Upgrade Software dialog

For example:

- **CURRENT VERSION** displays the version running currently in the cluster.
- **AVAILABLE COMPATIBLE VERSIONS** displays any versions to which the cluster can be updated.
- The **upload the AOS base software binary** link enables you to install from binary and metadata files, which might be helpful for updating isolated (dark-site) clusters not connected to the Internet.

AOS Upgrade Recommendations and Requirements

Note: Nutanix does not support decreasing Controller VM memory below recommended minimum amounts needed for cluster and add-in features. Nutanix Cluster Checks (NCC), preupgrade cluster checks, and the AOS upgrade process detect and monitor Controller VM memory.

- Before upgrading, see the Recommended Upgrade Order on page 27 topic.
- For large clusters, an AOS upgrade might consume more storage space than expected during the upgrade process. To help avoid this issue, contact Nutanix Support for a

workaround. Typically, the Curator service helps return storage space usage to close to pre-upgrade levels approximately 6 to 12 hours after upgrading AOS.

- Do not edit or otherwise modify the Controller VM .vmx file. Each AOS version and upgrade includes a specific Controller VM virtual hardware configuration.
- Nutanix recommends that you upgrade to the latest supported AHV version as soon as possible if you upgrade AOS and are deploying an AHV environment. AHV is bundled with AOS and most versions are also available from the Nutanix Support portal.
- After upgrading AOS, your cluster can temporarily run the unsupported or older AHV version until you complete the AHV upgrade. See the Compatibility Matrix.
- You must allow access to required URLs in your firewall. See Firewall Requirements on page 100 for details.
- You can upgrade a node or cluster through Prism Central in some cases. See Prism Central-Managed Clusters Upgrade on page 52.
- If you had previously set the cluster's timezone by using the nCLI command **`ncli cluster set-timezone timezone=cluster_timezone`**, the timezone settings will persist after your cluster is upgraded. If you need to set or reset the cluster time zone, always use the nCLI command as shown above.

  If you set the timezone manually on a Controller VM through an SSH connection and copy command (**`cp`**) to each node in the cluster, the timezone will not persist and will be reset to the default PST timezone after the upgrade is completed. (For example, the timezone will not persist if you set the timezone by using `for i in `svmips`; do echo $i; ssh $i "sudo cp /usr/share/zoneinfo/Asia/Seoul /etc/localtime; date"; done`.)
- If you are adding a new node to a cluster, see *Expanding a Cluster* in the *Prism Web Console Guide* for information about upgrading a new node.
- As part of the AOS upgrade, the Controller VM where you have logged on and initiated the upgrade restarts. The web console appears unresponsive and might display the following message: **`Unable to reach server. Check for internet connectivity`**. Wait a few minutes and log on to the web console again.
- Upgrading AOS through the web console (1-click upgrade) is not supported for configurations where a single cluster is managed by multiple VMware vSphere vCenters.
- Pre-upgrade checks fail if the existing SNMP user, traps, or account are configured with MD5 authentication or DES encryption. Before upgrading, change the authentication type to SHA and remove the traps.
- Do not delete the eth2 interface that is created on the Controller VMs, even if you are not using the network segmentation feature.

Upgrading AOS

Before you begin

See Recommended Upgrade Order on page 27 and AOS Upgrade Recommendations and Requirements on page 39.

About this task

Do the following steps to download and upgrade AOS through **Upgrade Software** in the Prism Element web console.

Procedure

1. Before performing any upgrade procedure, make sure you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade NCC if necessary.
2. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.
3. Log on to the web console for any node in the cluster.
4. Click the gear icon in the main menu, select **Upgrade Software** in the **Settings** page, and then click the **AOS** tab.
5. [Optional] To run the pre-upgrade installation checks only on the Controller VM where you are logged on without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
6. Do one of the following:

   » If you previously selected **Enable Automatic Download** and the software package has been downloaded, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.

   » If **Enable Automatic Download** is cleared, click **Download**. When the download task is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.

   The **Upgrade Software** dialog box shows the progress of your selection, including pre-installation and cluster health checks. After the upgrade process is completed on a Controller VM, the Controller VM restarts. This restart is not disruptive to node operations.

What to do next

After upgrading AOS on each cluster, see Recommended Upgrade Order on page 27 for next steps for any other needed updates.

> Important: If you use SNMP to manage or collect information from the Nutanix cluster, as soon as the upgrade process is complete, update the Nutanix SNMP MIB file that is used by your network management system. Until the MIB file is updated, SNMP queries might return erroneous data or data of the wrong type. To download the latest SNMP MIB file, do the following:
>
> 1. In the web console, click the gear icon and then click **SNMP**.
> 2. In the **SNMP Configuration** dialog box, click **View MIB**.
>
>   The MIB contents are displayed in a new tab.
> 3. Right-click and select the appropriate download action for your browser and then copy `NUTANIX-MIB.txt` to your SNMP manager systems.

Upgrading AOS by Uploading Binary and Metadata Files

Before you begin

See Recommended Upgrade Order on page 27 and AOS Upgrade Recommendations and Requirements on page 39.

About this task

- Do the following steps to download AOS binary and metadata .JSON files from the Nutanix Support Portal, then upgrade AOS through **Upgrade Software** in the Prism Element web console.

- Typically you would need to perform this procedure if your cluster is not directly connected to the Internet and you cannot download the binary and metadata .JSON files through the web console.

Procedure

1. Before performing any upgrade procedure, make sure you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade NCC if necessary.
2. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.
3. Log on to the Nutanix support portal and select the AOS release from the Downloads page.
4. Download the AOS binary and metadata .JSON files on your local media. You can also copy these files to a USB stick, CD, or other media.
   a. Click the **Download** link to download the binary file for the desired upgrade version.
   b. Click the **Metadata** link to download the upgrade metadata JSON file.
5. Log on to the Prism Element web console for any node in the cluster.
6. Click the gear icon in the main menu, select **Upgrade Software** in the **Settings** page, and then click the **AOS** tab.
7. Click the **upload an AOS binary** link.
8. Click **Choose File** for the AOS metadata and binary files, respectively, browse to the file locations, and click **Upload Now**.
9. [Optional] When the file upload is completed, to run the pre-upgrade installation checks only on the Controller VM where you are logged on without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
10. When the upload process is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.
    The **Upgrade Software** dialog box shows the progress of your selection, including pre-installation and cluster health checks. After the upgrade process is completed on a controller VM, the controller VM restarts. This restart is not disruptive to node operations.

What to do next

After upgrading AOS on each cluster, see Recommended Upgrade Order on page 27 for next steps for any other needed updates.

> Important: If you use SNMP to manage or collect information from the Nutanix cluster, as soon as the upgrade process is complete, update the Nutanix SNMP MIB file that is used by your network management system. Until the MIB file is updated, SNMP queries might return erroneous data or data of the wrong type. To download the latest SNMP MIB file, do the following:
>
> 1. In the web console, click the gear icon and then click **SNMP**.
> 2. In the **SNMP Configuration** dialog box, click **View MIB**.
>
>   The MIB contents are displayed in a new tab.
> 3. Right-click and select the appropriate download action for your browser and then copy `NUTANIX-MIB.txt` to your SNMP manager systems.

ESXi Upgrade

These topics describe how to upgrade your ESXi hypervisor host through the Prism Element web console **Upgrade Software** feature (also known as 1-click upgrade). To install or upgrade VMware vCenter server or other third-party software, see your vendor documentation for this information.

AOS supports ESXi hypervisor upgrades that you can apply through the web console **Upgrade Software** feature (also known as 1-click upgrade).

You can view the available upgrade options, start an upgrade, and monitor upgrade progress through the web console. In the main menu, click the gear icon, and then select **Upgrade Software** in the **Settings** panel. You can see the current status of your software versions and start an upgrade.

VMware ESXi Hypervisor Upgrade Recommendations and Limitations

- To install or upgrade VMware vCenter Server or other third-party software, see your vendor documentation.
- Always consult the VMware web site for any vCenter and hypervisor installation dependencies. For example, a hypervisor version might require that you upgrade vCenter first.
- If you have not enabled DRS in your environment and want to upgrade the ESXi host, you need to upgrade the ESXi host manually. For more information about upgrading ESXi hosts manually, see *vSphere Administration Guide*.
- Disable Admission Control to upgrade ESXi on AOS; if enabled, the upgrade process will fail. You can enable it for normal cluster operation otherwise.

Nutanix Support for ESXi Upgrades

Nutanix qualifies specific VMware ESXi hypervisor updates and provides a related JSON metadata upgrade file on the Nutanix Support Portal for one-click upgrade through the Prism web console **Software Upgrade** feature.

Nutanix does not provide ESXi binary files, only related JSON metadata upgrade files. Obtain ESXi offline bundles (not ISOs) from the VMware web site.

Nutanix supports the ability to patch upgrade ESXi hosts with versions that are greater than or released after the Nutanix qualified version, but Nutanix might not have qualified those releases. See the Nutanix hypervisor support statement in our Support FAQ. For updates that are made available by VMware that do not have a Nutanix-provided JSON metadata upgrade file, obtain the offline bundle and md5sum checksum available from VMware, then use the web console **Software Upgrade** feature to upgrade ESXi.

Mixing nodes with different processor (CPU) types in the same cluster

If you are mixing nodes with different processor (CPU) types in the same cluster, you must enable enhanced vMotion compatibility (EVC) to allow vMotion/live migration of VMs during the hypervisor upgrade. For example, if your cluster includes a node with a Haswell CPU and other nodes with Broadwell CPUs, open vCenter and enable VMware enhanced vMotion compatibility (EVC) setting and specifically enable EVC for Intel hosts.

CPU Level for Enhanced vMotion Compatibility (EVC)

AOS Controller VMs and Prism Central VMs require a minimum CPU micro-architecture version of Intel Sandy Bridge. For AOS clusters with ESXi hosts, or when deploying Prism Central VMs on any ESXi cluster: if you have set the vSphere cluster enhanced vMotion compatibility (EVC) level, the minimum level must be **L4 - Sandy Bridge**.

vCenter Requirements and Limitations

> Note: *ENG-358564* You might be unable to log in to vCenter Server as the `/storage/seat` partition for vCenter Server version 7.0 and later might become full due to a large number of SSH-related events. See KB 10830) at the Nutanix Support portal for symptoms and solutions to this issue.

- If your cluster is running the ESXi hypervisor and is also managed by VMware vCenter, you must provide vCenter administrator credentials and vCenter IP address as an extra step before upgrading. Ensure that ports 80 / 443 are open between your cluster and your vCenter instance to successfully upgrade.
- If you have just registered your cluster in vCenter. Do not perform any cluster upgrades (AOS, Controller VM memory, hypervisor, and so on) if you have just registered your cluster in vCenter. Wait at least 1 hour before performing upgrades to allow cluster settings to become updated. Also do not register the cluster in vCenter and perform any upgrades at the same time.
- Cluster mapped to two vCenters. Upgrading software through the web console (1-click upgrade) does not support configurations where a cluster is mapped to two vCenters or where it includes host-affinity must rules for VMs.

  Ensure that enough cluster resources are available for live migration to occur and to allow hosts to enter maintenance mode.

Mixing Different Hypervisor Versions

For ESXi hosts, mixing different hypervisor versions in the same cluster is temporarily allowed for deferring a hypervisor upgrade as part of an add-node/expand cluster operation, reimaging a node as part of a break-fix procedure, planned migrations, and similar temporary operations.

Upgrading ESXi Hosts by Uploading Binary and Metadata Files

Before you begin

- See *General Hypervisor Upgrade Recommendations*, *VMware ESXi Hypervisor Upgrade Recommendations and Limitations*, and *Recommended Upgrade Order* topics in the *Acropolis Upgrade Guide*.
- To install or upgrade VMware vCenter server or other third-party software, see your vendor documentation.

About this task

Do the following steps to download Nutanix-qualified ESXi metadata .JSON files and upgrade the ESXi hosts through **Upgrade Software** in the Prism Element web console. Nutanix does not provide ESXi binary files, only related JSON metadata upgrade files.

Procedure

1. Before performing any upgrade procedure, make sure you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade NCC if necessary.
2. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.

3. Log on to the Nutanix support portal and navigate to the Hypervisors Support page from the **Downloads** menu, then download the Nutanix-qualified ESXi metadata .JSON files to your local machine or media.

   a. The default view is **All**. From the drop-down menu, select **Nutanix - VMware ESXi**, which shows all available JSON versions.

   b. From the release drop-down menu, select the available ESXi version. For example, **7.0.0 u2a**.

   c. Click Download to download the Nutanix-qualified ESXi metadata .JSON file.

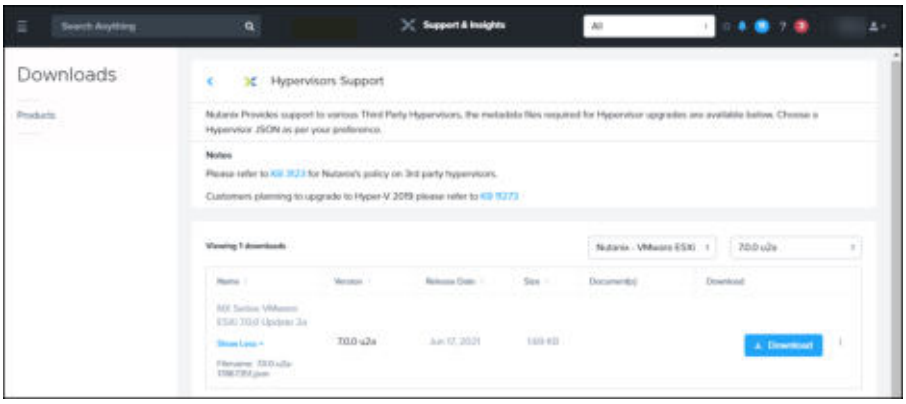

Figure 7: Downloads Page for ESXi Metadata JSON

4. Log on to the Prism Element web console for any node in the cluster.
5. Click the gear icon in the main menu, select **Upgrade Software** in the **Settings** page, and then click the **Hypervisor** tab.
6. Click the **upload the Hypervisor binary** link.
7. Click **Choose File** for the metadata JSON (obtained from Nutanix) and binary files (obtained from VMware), respectively, browse to the file locations, select the file, and click **Upload Now**.
8. When the file upload is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.

   [Optional] To run the pre-upgrade installation checks only on the Controller VM where you are logged on without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
9. Type your vCenter IP address and credentials, then click **Upgrade**.

   Ensure that you are using your Active Directory or LDAP credentials in the form of `domain\username` or `username@domain`.

   > Note: AOS can detect if you have uploaded software that is already installed or upgraded. In this case, the **Upgrade** option is not displayed, because the software is already installed.

   The **Upgrade Software** dialog box shows the progress of your selection, including status of pre-installation checks and uploads, through the **Progress Monitor**.

Upgrading ESXi by Uploading An Offline Bundle File and Checksum

About this task

- Do the following steps to download a non-Nutanix-qualified (patch) ESXi upgrade offline bundle from VMware, then upgrade ESXi through **Upgrade Software** in the Prism Element web console.
- Typically you perform this procedure to patch your version of ESXi and Nutanix has not yet officially qualified that new patch version. Nutanix supports the ability to patch upgrade ESXi hosts with versions that are greater than or released after the Nutanix qualified version, but Nutanix might not have qualified those releases.

Procedure

1. From the VMware web site, download the offline bundle (for example, `update-from-esxi6.0-6.0_update02.zip`) and copy the associated MD5 checksum. Ensure that this checksum is obtained from the VMware web site, not manually generated from the bundle by you.
2. Save the files to your local machine or media, such as a USB drive or other portable media.
3. Log on to the Prism Element web console for any node in the cluster.
4. Click the gear icon in the main menu of the Prism Element web console, select **Upgrade Software** in the **Settings** page, and then click the **Hypervisor** tab.
5. Click the **upload the Hypervisor binary** link.
6. Click **enter md5 checksum** and copy the MD5 checksum into the **Hypervisor MD5 Checksum** field.

7. Scroll down and click **Choose File** for the binary file, browse to the offline bundle file location, select the file, and click **Upload Now**.

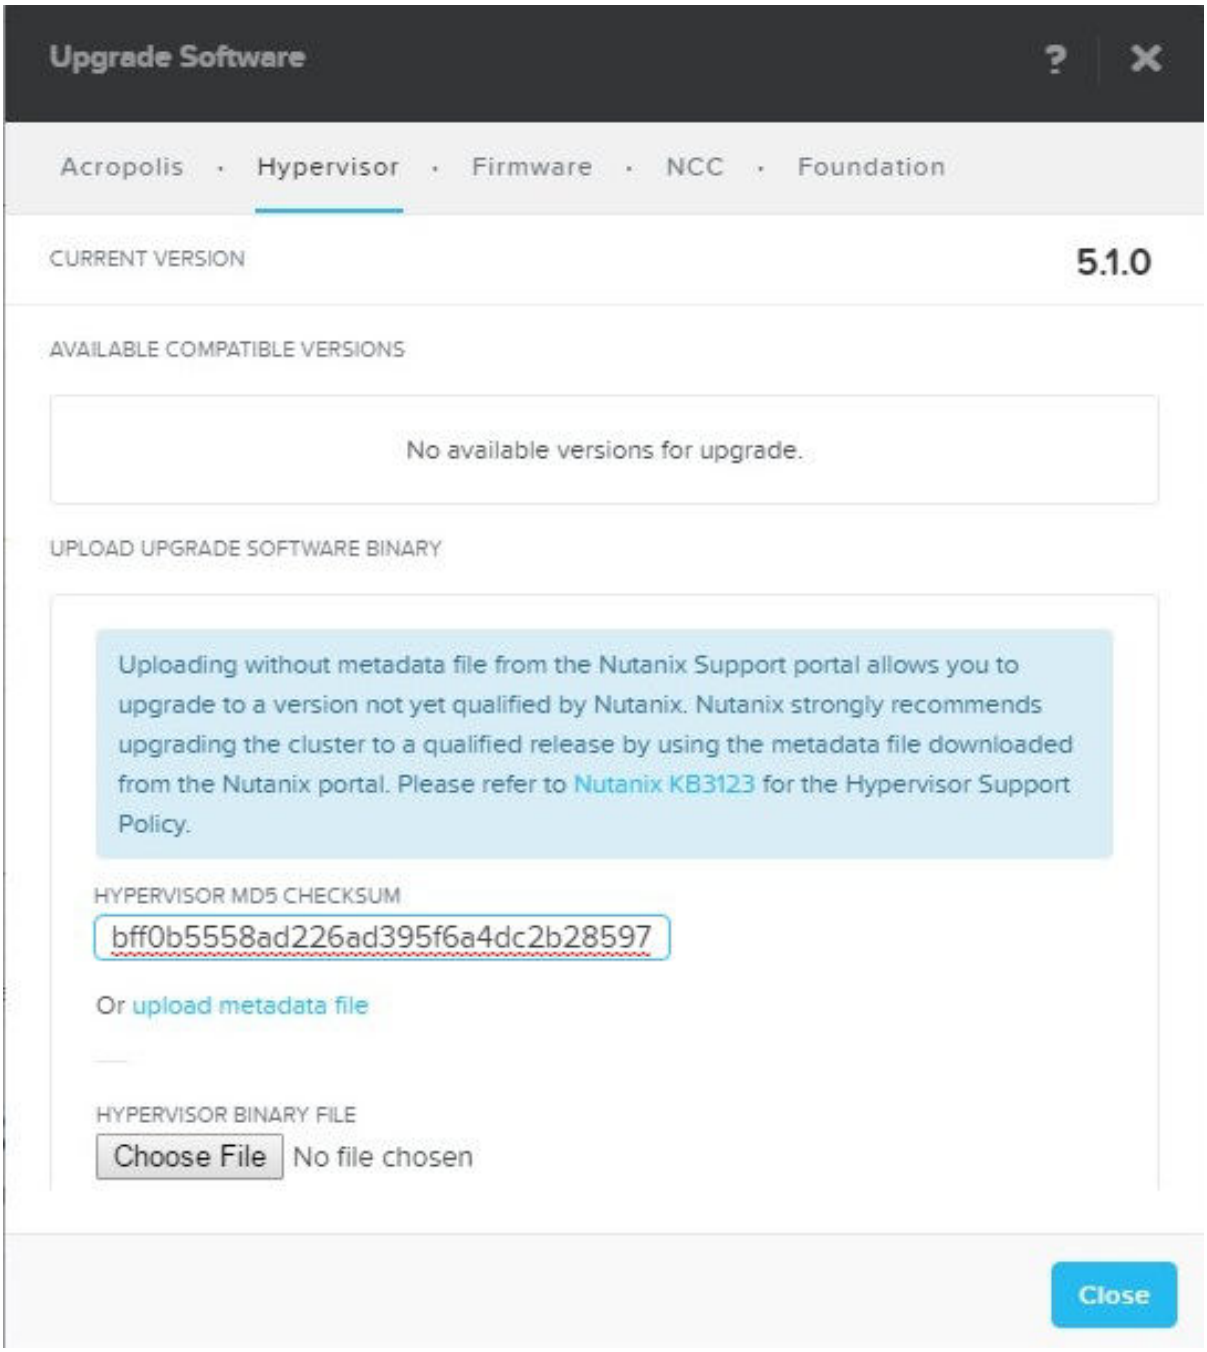

Figure 8: ESXi 1-Click Upgrade, Unqualified Bundle

8. When the file upload is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.
   [Optional] To run the pre-upgrade installation checks only on the Controller VM where you are logged on without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.

9. Type your vCenter IP address and credentials, then click **Upgrade**.

   Ensure that you are using your Active Directory or LDAP credentials in the form of `domain\username` or `username@domain`.

   > Note: AOS can detect if you have uploaded software that is already installed or upgraded. In this case, the **Upgrade** option is not displayed, because the software is already installed.

   The **Upgrade Software** dialog box shows the progress of your selection, including status of pre-installation checks and uploads, through the **Progress Monitor**.

Hyper-V Upgrade

AOS supports hypervisor upgrades that you can apply through the Prism Element web console **Upgrade Software** feature (also known as 1-click upgrade).

You can view the available upgrade options, start an upgrade, and monitor upgrade progress through the web console. In the main menu, click the gear icon, and then select **Upgrade Software** in the **Settings** panel that appears, to see the current status of your software versions (and start an upgrade if warranted).

Hyper-V Hypervisor Upgrade Recommendations, Requirements, and Limitations

This section provides the requirements, recommendations, and limitations to upgrade Hyper-V.

Recommendations

Nutanix recommends that you schedule a sufficiently long maintenance window to upgrade your Hyper-V clusters.

Budget sufficient time to upgrade: Depending on the number of VMs running on a node before the upgrade, a node could take more than 1.5 hours to upgrade. For example, the total time to upgrade a Hyper-V cluster from Hyper-V 2016 to Hyper-V 2019 is approximately the time per node multiplied by the number of nodes. Upgrading can take longer if you also need to upgrade your AOS version.

Requirements

Note:

- You can upgrade to Windows Server 2022 Hyper-V only from a Hyper-V 2019 cluster.
- Upgrade to Windows Server 2022 Hyper-V from an LACP enabled Hyper-V 2019 cluster is not supported.
- Direct upgrade to Windows Server 2022 Hyper-V from Hyper-V 2016 or Windows Server 2012 R2 is not supported.
- For Windows Server 2022 Hyper-V, only NX Series G6 and later models are supported.
- For Windows Server 2022 Hyper-V, SET is the default teaming mode. LBFO teaming is not supported on Windows Server 2022 Hyper-V.
- For Hyper-V 2019, if you do not choose LACP/LAG, SET is the default teaming mode. NX Series G5 and later models support Hyper-V 2019.
- For Hyper-V 2016, if you do not choose LACP/LAG, the teaming mode is Switch Independent LBFO teaming.

- For Hyper-V (2016 and 2019), if you choose LACP/LAG, the teaming mode is Switch Dependant LBFO teaming.

- The platform must not be a light-compute platform.
- Before upgrading, disable or uninstall third-party antivirus or security filter drivers that modify Windows firewall rules. Windows firewalls must accept inbound and outbound SSH traffic outside of the domain rules.
- Make sure that the host upgrade prerequisites are met. See *Host Upgrade Prerequisites* under *Upgrading to Windows Server 2016* in the Hyper-V Administration for Acropolis Guide.
- Enable Kerberos when upgrading from Windows Server 2012 R2 to Windows Server 2016. See *Enabling Kerberos for Hyper-V* in the *Hyper-V Configuration* chapter of the Hyper-V Administration for Acropolis Guide.

  Note: Kerberos is enabled by default when upgrading from Windows Server 2016 to Windows Server 2019.

- Enable virtual machine migration on the host. Upgrading reimages the hypervisor. Any custom or non-standard hypervisor configurations could be lost after the upgrade is completed.
- If you are using System Center for Virtual Machine Management (SCVMM) 2012, upgrade to SCVMM 2016 first before upgrading to Hyper-V 2016. Similarly, upgrade to SCVMM 2019 before upgrading to Hyper-V 2019 and upgrade to SCVMM 2022 before upgrading to Windows Server 2022 Hyper-V.
- Upgrade using ISOs and Nutanix JSON File

  - Upgrade using ISOs. The Prism Element web console supports 1-click upgrade (**Upgrade Software** dialog box) of Hyper-V 2016, 2019, or 2022 by using metadata upgrade JSON file. This file is available in the Nutanix Support portal Hypervisor Details page and the Microsoft Hyper-V ISO file.
  - The Hyper-V upgrade JSON file, when used on clusters where Foundation 4.0 or later is installed, is available for Nutanix NX series G4 and later, Dell EMC XC series, or Lenovo Converged HX series platforms. You can upgrade hosts to Hyper-V 2016, 2019 (except for NX series G4) on these platforms by using this JSON file.

Limitations

- When upgrading hosts to Hyper-V 2016, 2019, and later versions, the local administrator user name and password is reset to the default administrator name Administrator and password of nutanix/4u. Any previous changes to the administrator name and/or password are overwritten.
- VMs with any associated files on local storage are lost.

  - Logical networks are not restored immediately after upgrade. If you configure logical switches, the configuration is not retained and VMs could become unavailable.
  - Any VMs created during hypervisor upgrade (including as part of disaster recovery operations) and not marked as HA (High Availability) experiences unavailability.
  - Disaster recovery: VMs with the Automatic Stop Action property set to *Save* is marked as *CBR Not Capable* if they are upgraded to version 8.0 after upgrading the hypervisor.

Change the value of Automatic Stop Action to *ShutDown* or *TurnOff* when the VM is upgraded so that it is not marked as *CBR Not Capable*

- Enabling Link Aggregation Control Protocol (LACP) for your cluster deployment is supported when upgrading hypervisor hosts from Windows Server 2016 to 2019.

Upgrading Hyper-V Hosts

This procedure enables you to update Hyper-V through the Prism Element web console **Upgrade Software** dialog box.

Before you begin

- Before upgrading, see Recommended Upgrade Order on page 27, General Hypervisor Upgrade Recommendations on page 102 and Hyper-V Hypervisor Upgrade Recommendations, Requirements, and Limitations on page 48.

Procedure

1. Before performing any upgrade procedure, make sure you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade NCC if necessary.
2. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.
3. Download the Microsoft Hyper-V Windows Server .ISO file from the Microsoft web site.
4. Log on to the Nutanix support portal and select the hypervisor metadata .JSON file from the **Downloads** menu.
5. Save the files to your local machine or media, such as a USB drive or other portable media.
6. Click the gear icon in the main menu of the web console, select **Upgrade Software** in the **Settings** page, and then click the **Hypervisor** tab.
7. Click the **upload a Hypervisor binary** link.
8. Click **Choose File** for the metadata and binary files, respectively, browse to the file locations, select the file, and click **Upload Now**.
9. [Optional] When the file upload is completed, to run the pre-upgrade installation checks only on the Controller VM where you are logged on without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
10. When the file upload is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.

    Note: AOS can detect if you have uploaded software that is already installed or upgraded. In this case, the **Upgrade** option is not displayed, because the software is already installed.

    The **Upgrade Software** dialog box shows the progress of your selection, including status of pre-installation checks and uploads, through the **Progress Monitor**.

Upgrading Foundation

Before you begin

- Before upgrading, see Recommended Upgrade Order on page 27.

Procedure

1. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.
2. Log on to the Prism Element web console, click the gear icon in the main menu, select **Upgrade Software** in the **Settings** page, and then click the **Foundation** tab.
3. If an update is available, click **Upgrade Available** and then click **Download**.
4. When the download is complete, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.
   To run the pre-upgrade installation checks only on the Controller VM where you are logged on, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
   The **Upgrade Software** dialog box shows the progress of your selection, including pre-installation checks.

Upgrading Foundation by Uploading the Foundation Binary File

About this task

- Do the following steps to download the Foundation binary gzipped TAR (.tar.gz) file from the Nutanix Support Portal, then upgrade AOS through **Upgrade Software** in the Prism Element web console.
- Typically you would need to perform this procedure if your cluster is not directly connected to the Internet and you cannot download the binary file through the web console.

Procedure

1. Log on to the Nutanix Support portal and select **Downloads** > **Foundation**
2. Click **Download** for the **Foundation Upgrade for CVM or Standalone Foundation VM** file and save the binary gzipped TAR (.tar.gz) file on your local media.
   You can also copy these files to a USB stick, CD, or other media.
3. Log on to the Prism web console, click the gear icon in the main menu, select **Upgrade Software** in the **Settings** page, and then click the **Foundation** tab.
4. Click the **upload the Foundation binary** link.
5. Click **Choose File** for the binary file, browse to the file location, and click **Upload Now**.
6. When the upload process is complete, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm.
   To run the pre-upgrade installation checks only on the Controller VM where you are logged on, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
   The **Upgrade Software** dialog box shows the progress of your selection, including pre-installation checks.

8

PRISM CENTRAL-MANAGED CLUSTERS UPGRADE

You can upgrade AOS on some or all of clusters registered to and managed by Prism Central through the Prism Central web console.

You can upgrade AOS on some or all of clusters registered to and managed by Prism Central. The upgrade procedure, known as 1-click centralized upgrade, enables you to upgrade each managed cluster to a specific version compatible with Prism Central. Acropolis Upgrade Paths lets you check the upgrade path from your current version to your target version for AOS, Prism Central, and Nutanix Files.

Cluster Upgrade Requirements

- Upgrade clusters through the Prism Central web console.
- You can upgrade clusters if **Available Versions** is shown in the **Upgrade Software** dialog. It will display one or more AOS versions available to apply to clusters. If no versions are available (that is, none displayed), you might have to upgrade each cluster according to procedures described in this guide. Basically, if a version is available to Prism Central, it will be available to each cluster registered.
- Prism Central and each cluster (individually also known as Prism Element) must be connected to the Internet to access the Nutanix support portal.
- Prism Central and each cluster must be configured with a domain name server. See the *Prism Central Guide* and *Prism Web Console Guide* topic *Configuring Name Servers*.
- Dark-site (internet-disconnected) upgrades cannot be performed using this feature. In this case, upgrade each cluster according to procedures described in this upgrade section.
- You cannot initiate an upgrade on a cluster that has an upgrade that is in process or is not completed.

Cluster Upgrade Features

- Sequential upgrade, in order, one cluster at a time. Select the order in which clusters are upgraded. Upgrade one cluster, then the next cluster is upgraded until all upgrades are complete. The clusters waiting be upgraded are placed in a Queued status. If one cluster fails to upgrade for some reason, the upgrade is cancelled for all remaining queued clusters.
- Parallel upgrade. Upgrade all clusters at the same time. If one cluster fails to upgrade for some reason, it does not affect the upgrade status of the other clusters. The upgrade status of each cluster is independent from every other cluster.
- Labeled clusters. You can apply a label to selected clusters and upgrade just the labeled clusters. The label also enables you to filter clusters by label.

Upgrading One or More Managed Clusters

Procedure

1. Log in to the Prism Central web console.
2. From the hamburger menu, click **Hardware** > **Clusters**.
3. Click **List** and do one of the following:
   - » Select one or more clusters from the list.
   - » Click **Filters** and select a cluster label if you have already created a label to group specific clusters.

4. Click **Actions** > **Upgrade Software** to launch the Upgrade Software dialog box.
   a. **Available Versions** lists AOS versions available to apply to clusters
   b. **Upgrade Sequence** enables you to choose parallel upgrade (upgrade all selected clusters **At the same time**) or **One at a time (custom Order)** (upgrade one cluster at a time in order)
   c. List of clusters to select for upgrade order if you selected **Custom Order**

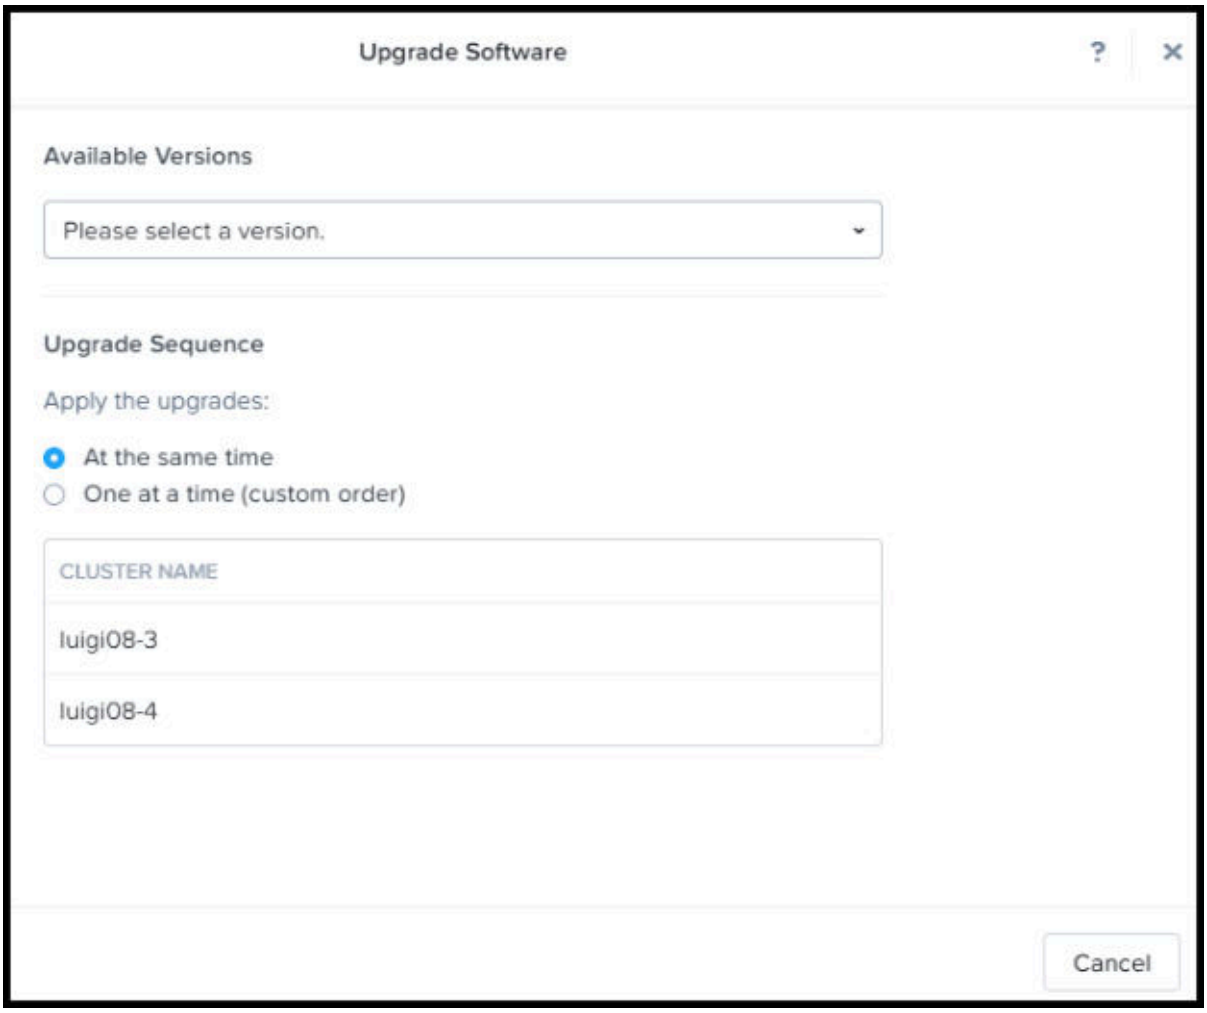

Figure 9: Upgrade Software

5. Select an AOS version and **Upgrade Sequence** choice, then click **Upgrade**.
   The upgrade begins. To view upgrade progress and status, click the blue task icon to open the **Tasks** page. The **Cluster** pane also displays **Upgrade Status**.

9

PRISM CENTRAL UPGRADE AND INSTALLATION

Before upgrading, see the Recommended Upgrade Order on page 27 topic.

A Prism Central instance consists of either a single VM or a set of VMs that functions as a multi-cluster monitoring and control interface.

Upgrade a Prism Central instance through the Prism Central web console **Settings** > **Upgrade Prism Central** panel.

Install or expand a Prism Central instance in the following ways:

- Open the Prism web console for an existing cluster and follow the prompts to create a Prism Central instance. This is the recommended method (see Installing Prism Central (1-Click Method) on page 58).
- Create a Prism Central instance from scratch. This option can be used whenever the first method is not available or desirable (see Installing Prism Central (Manual Method) on page 71).

Prerequisites and Requirements

- When using the 1-click method for installing Prism Central, you select from a set of preconfigured Prism Central VM sizes. The "Prism Central Scalability" section in the Prism Central Release Notes provides Prism Central VM resource and capacity specifications for the preconfigured sizes. In addition, certain optional features that you can enable such as application discovery and Calm require additional Prism Central VM resources (more memory and vCPUs). After installing Prism Central, you may need to increase the VM resources before enabling one or more of these optional features. The requirements for various feature combinations are listed in KB 8932.
- Before upgrading, see Recommended Upgrade Order on page 27.
- When upgrading Prism Central and AOS, upgrade Prism Central first, then upgrade AOS on the clusters managed by Prism Central. See Acropolis Upgrade Paths on the Nutanix Support portal to check the upgrade path from your current version to your target version for AOS and Prism Central.
- Prism Central and its managed clusters are not supported in environments deploying Network Address Translation (NAT).

- Do not use the AOS binary and metadata .json files to upgrade your existing Prism Central deployment.

  Prism Central requires the use of specific Prism Central binary and metadata .json for upgrades and deployments. Using AOS files to upgrade Prism Central from any version is not supported and can result in Prism Central unavailability.

  Do not use the Prism Central AHV / ESXi / Hyper-V components on the Nutanix support portal to upgrade an existing Prism Central instance.
- You can install Prism Central in either a Nutanix cluster or a non-Nutanix environment. However, there are some limitations when installing in a non-Nutanix environment: the 1-click method is not available, a 1-VM instance is the only option (multi-VM instances are not supported), the hypervisor must be ESXi, and some Prism Central features are not available such as Calm and Flow support.
- To help ensure that Prism Central and each managed cluster are taking advantage of NCC features, ensure that:

  - Each node in your cluster is running the same NCC version.
  - Prism Central and each cluster managed by Prism Central are all running the same NCC version.

  To check the NCC version and optionally upgrade the NCC software version on Prism Central, see Upgrading NCC on Prism Central on page 16.

Before you can install Prism Central by using the 1-click Internet method, expand Prism Central, or add a Prism Central VM, ensure you meet the following requirements:

- The specified gateway must be reachable.
- Ensure the port TCP port 2100 is open from the Prism Element cluster to the Prism Central VM IP address.
- Ensure network connectivity between the VM VLAN and portgroup of the Prism Element cluster Controller VM and the Prism Central VM VLAN and portgroup.
- No duplicate IP addresses can be used.
- The storage container used for deployment is mounted on all hypervisor hosts.
- When installing on an ESXi cluster:

  - vCenter and the ESXi cluster must be configured properly. See the *vSphere Administration Guide for Acropolis* for details.
  - vCenter must be registered in Prism.
  - DRS must be enabled in vCenter.
  - vCenter is up and reachable during the deployment.

Upgrading Prism Central

Before you begin

- See Recommended Upgrade Order on page 27 and Prerequisites and Requirements on page 55.
- See the Prism Central Release Notes for resource requirements and capacity specifications for the Prism Central VM.

- Do these steps to upgrade Prism Central through **Upgrade Software** in the Prism Central web console.

Procedure

1. Before performing any upgrade procedure, make sure that you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade NCC if necessary.
   To check the NCC version and optionally upgrade the NCC software version on Prism Central, see Upgrading NCC on Prism Central on page 16.
2. Run NCC as described in Run NCC Checks on page 11.
3. Log on to Prism Central through a web browser.
4. Click the gear icon in the main menu and then select **Upgrade Prism Central** in the Settings menu.
5. Do this step to download and automatically install the Prism Central upgrade files.
   a. Do one of the following:
      » If you previously selected **Enable Automatic Download** and the software has been downloaded, click **Upgrade**, then click **Yes** to confirm.
      » If **Enable Automatic Download** is cleared, click **Download** to check if there is software available. When the download task is completed, click **Upgrade**, then click **Yes** to confirm.
   b. [Optional] To run the pre-upgrade installation checks only without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
   The **Upgrade Software** dialog box shows the progress of your selection. When the upgrade process is complete, the Prism Central VM restarts. Wait a few minutes and log on again, as Prism Central might lose connectivity during the upgrade process.

   Note: If you are upgrading an older version of a Prism Central "large" VM that contains just a single vDisk, the upgrade process might add three new vDisks. This allows Prism Central to shard Cassandra metadata to improve performance. While the listed disk capacity of a Prism Central VM includes all the vDisks, the additional vDisks do not impact overall capacity. During the upgrade you can monitor progress ("VM disk attach" tasks) from the Tasks dashboard.
6. After the upgrade completes, run NCC as described in Running NCC (Prism Central) on page 12.
   The NCC health check pc_vm_resource_resize_check verifies that the configured amount of memory and vCPU on the Prism Central VM is adequate. If this check triggers a WARN alert, see the referenced Knowledge Base article to adjust Prism Central VM resources.
   After adjusting resources, run this check again to ensure a PASS status result: `nutanix@cvm$ ncc health_checks system_checks pc_vm_resource_resize_check`.

Upgrading Prism Central by Uploading Binary and Metadata Files

About this task

- Do these steps to download Prism Central binary and metadata .JSON files from the Nutanix Support Portal, then upgrade through **Upgrade Software** in the Prism Central web console.

- Typically you would need to perform this procedure if your cluster is not directly connected to the Internet and you cannot download the binary and metadata .JSON files through the Prism Central web console.

Procedure

1. Log on to the Nutanix support portal and go to **Downloads** > **Prism Central**.
2. Click **Download** to save the **Prism Central Upgrade** binary and metadata .JSON files on your local media.
   You can also copy these files to a USB stick, CD, or other media.
3. Log on to the Prism Central web console.
4. Click the gear icon in the main menu and then select **Upgrade Prism Central** in the Settings menu.
5. Click the **upload the Prism Central binary** link.
6. Click **Choose File** for the binary and upgrade metadata (.JSON) files that you previously downloaded, browse to the file locations, and click **Upload Now**.
7. [Optional] When the file upload is completed, to run the pre-upgrade installation checks only without upgrading, click **Upgrade** > **Pre-upgrade**. These checks also run as part of the upgrade procedure.
8. When the file upload is completed, click **Upgrade** > **Upgrade Now**, then click **Yes** to confirm. The **Upgrade Software** dialog box shows the progress of your selection, including pre-installation and cluster health checks. After the upgrade process is completed on a Prism Central VM, the Prism Central VM restarts. This restart is not disruptive to node operations.

Installing Prism Central (1-Click Method)

You can install a Prism Central VM using the "1-click" method. This method employs the Prism Element web console from a cluster of your choice and creates the Prism Central VM in that cluster.

- If the cluster has Internet access, see Installing Prism Central (1-Click Internet) on page 58.
- If the cluster does not have Internet access such as at a dark site, see Installing Prism Central (1-Click No Internet) on page 68.

The "1-click" method is the easiest method to install Prism Central in most cases. However, you cannot use this method when:

- The target cluster runs Hyper-V or mixed hypervisors
- You do not want to install the Prism Central VM in a Nutanix cluster
- You do not have access to a Nutanix cluster

In any of these cases, use the manual method (see Installing Prism Central (Manual Method) on page 71.

Installing Prism Central (1-Click Internet)

Before you begin

The following requirements must be met before you can install Prism Central (this procedure), expand Prism Central, or add a Prism Central VM:

- The specified gateway must be reachable.
- Ensure the port TCP port 2100 is open from the Prism Element cluster to the Prism Central VM IP address. For the complete list of required ports, see Port Reference.
- Ensure network connectivity between the VM VLAN and portgroup of the Prism Element cluster Controller VM and the Prism Central VM VLAN and portgroup.
- No duplicate IP addresses can be used.
- The storage container used for deployment is mounted on all hypervisor hosts.
- When installing on an ESXi cluster:
  - vCenter and the ESXi cluster must be configured properly. See the *vSphere Administration Guide for Acropolis (using vSphere Web Client)* for details.
  - vCenter must be registered in Prism.
  - DRS must be enabled in vCenter.
  - vCenter is up and reachable during the deployment.

About this task

To create a new Prism Central instance from an Internet-connected cluster, do the following:

Procedure

1. Log into the Prism Element web console for a cluster as the user `admin`.
2. Run NCC.
   a. In the Health dashboard, from the **Actions** drop-down menu, select **Run Checks**.
   b. Select **All checks**. Select this option to run all the checks at once.

3. Do one of the following:

   » On the **Home** dashboard, click **Register or create new** from the **Prism Central** widget.

   » Click the gear icon in the main menu and then select **Prism Central Registration** from the **Settings** menu.

Figure 10: Home Dashboard

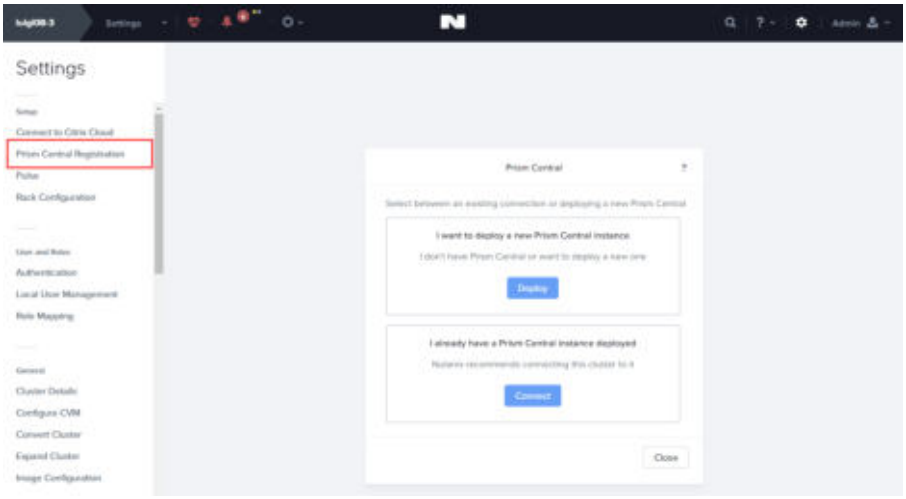

Figure 11: Settings Menu Launched from Gear Icon

4. In the first screen of the Prism Central dialog box, click the **Deploy** button.

   This screen includes two options, **Deploy** and **Connect**. This procedure describes how to deploy a new Prism Central instance. The "Register (Unregister) Cluster with Prism Central"

topic in the *Prism Central Guide* describes how to connect to an existing Prism Central instance.

> Note: On an ESXi cluster, you must first register a vCenter Server before you deploy a new Prism Central instance.

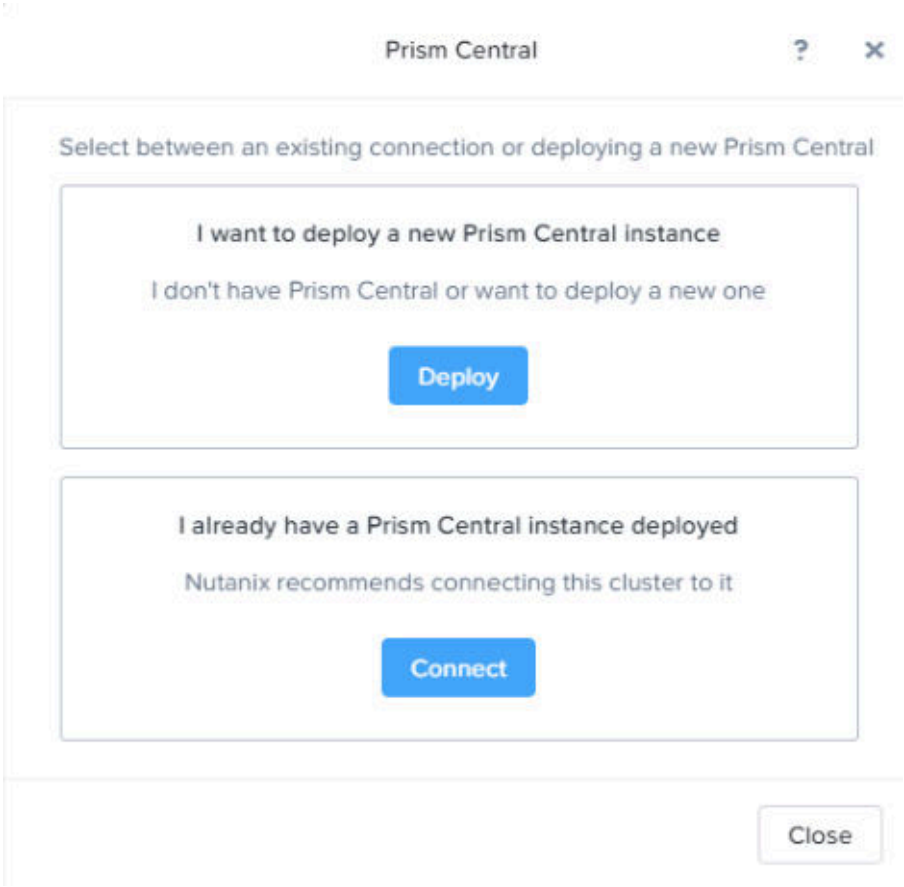

Figure 12: Prism Central Dialog Box (deploy/connect screen)

5. In the installation image screen, do one of the following:

   » Click the **Install** button to install that Prism Central version.

   » Click the **Download** button to download that Prism Central version from the Nutanix support portal. After it downloads, the button changes to **Install**. You can then install that Prism Central version.

   Note: If the Prism Central version you want to install does not appear in the list, typically because you do not have Internet access (such as at a dark site), you can click the **upload the Prism Central binary** link to upload an image from your local media.

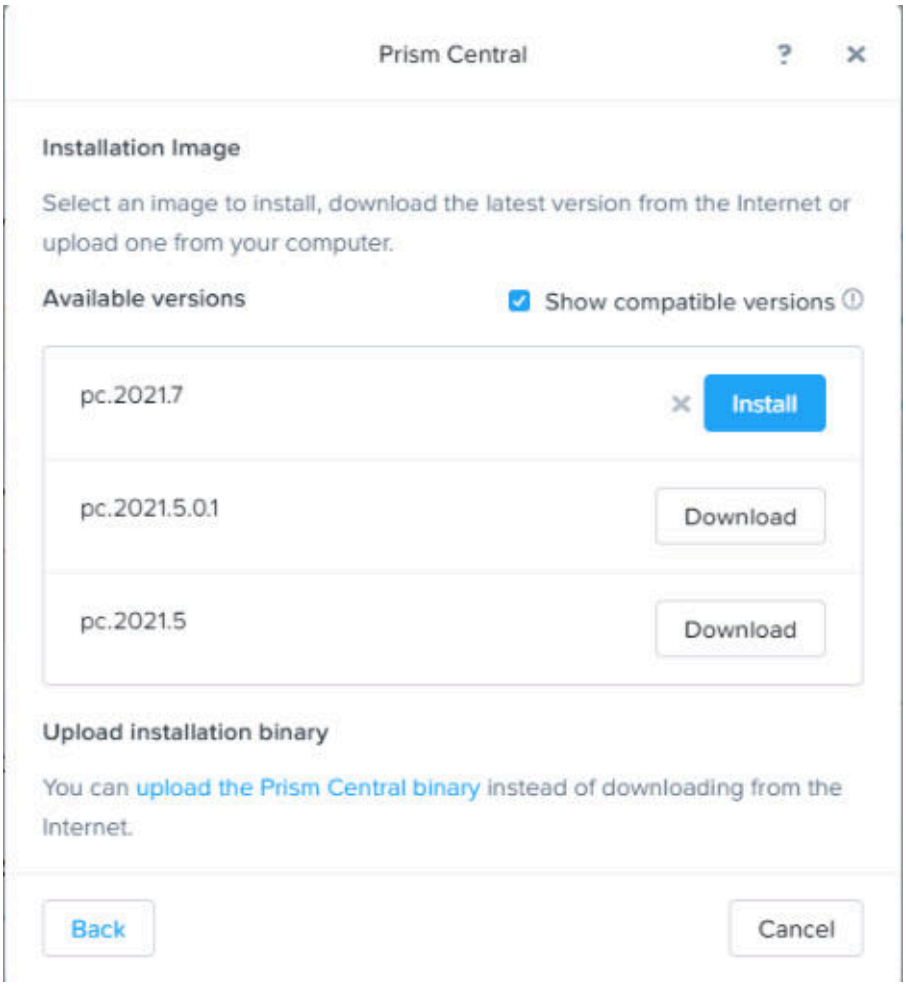

Figure 13: Prism Central Dialog Box (installation image screen)

6. In the deploy screen, do one of the following:

   » To deploy a 1-VM instance of Prism Central, click the **Deploy 1-VM PC** button.

   » To deploy a 3-VM instance of Prism Central, click the **Deploy 3-VM PC** button and then skip to step 8.

   A Prism Central instance can consist of either a single VM or a set of three VMs. A 3-VM instance increases both the capacity and resiliency of Prism Central at the cost of maintaining the additional VMs. In addition, each VM can be "small", "large", or "x-large" in size. Thus, you may choose from six configurations. (The x-large size is available only on

AOS 6.0.1 or later.) For information about supported capacities (guest VMs, nodes, and clusters) for each of the six configurations, see the "Prism Central Scalability" section in the release notes for the Prism Central version to be installed.

A small size VM is created with a single vDisk, but large and x-large VMs are created with three additional vDisks in order to shard Cassandra metadata to improve performance. While the listed disk capacity of a Prism Central VM includes all the vDisks, the additional vDisks do not impact overall capacity. During the installation you can monitor progress ("VM disk attach" tasks) from the Tasks dashboard.

Table 4: Prism Central Instance Configurations

VM Size	1-VM Instance	3-VM Instance
small	6 vCPUs, 26 GB of memory, and 500 GiB of storage.	18 vCPUs, 78 GB of memory, and 1500 GiB of storage (combined)
large	10 vCPUs, 44 GB of memory, and 2500 GiB of storage	30 vCPUs, 132 GB of memory, 7500 GiB of storage (combined)
x-large	14 vCPUs, 60 GB of memory, and 2500 GiB of storage.	42 vCPUs, 180 GB of memory, and 7500 GiB of storage (combined)

7. [1-VM instance only] In the general configuration screen, do the following in the indicated fields:

   a. **VM Name**: Enter a name for the Prism Central VM.

   b. **Select a Container**: Select a container for the Prism Central VM from the pull-down list.

   c. **VM Sizing**: Select (click the radio button for) the Prism Central VM size based on the number of guest VMs it must manage across all the registered clusters:

      - **SMALL** - manage up to 2500 VMs
      - **LARGE** - manage up to 12500 VMs
      - **X-LARGE** - manage up to 12500 VMs (same as large) with more vCPUs and memory to account for the ANC (Atlas Network Controller) service

   d. **Network**: Select an existing network for this Prism Central instance from the list.

      If the target network is not listed, click the **Create Network** link to create a new network. See the "Network Management" section in the *Prism Web Console Guide* for more information.

   e. **IP Address**: Enter a static IP address for the Prism Central VM.

   f. **Subnet Mask**: Enter the subnet mask value.

   g. **Default Gateway**: Enter the IP address of the gateway.

   h. **DNS Address(es)**: Enter the IP address for one or more DNS servers. Enter multiple addresses in a comma separated list.

   i. When all the fields are correct, click the **Deploy** button.

      This begins the deployment process. On the Home page, the Prism Central widget displays **Deploying** until the installation is completed, then it displays **OK**. Click **OK** to launch the Prism Central web console in your browser.

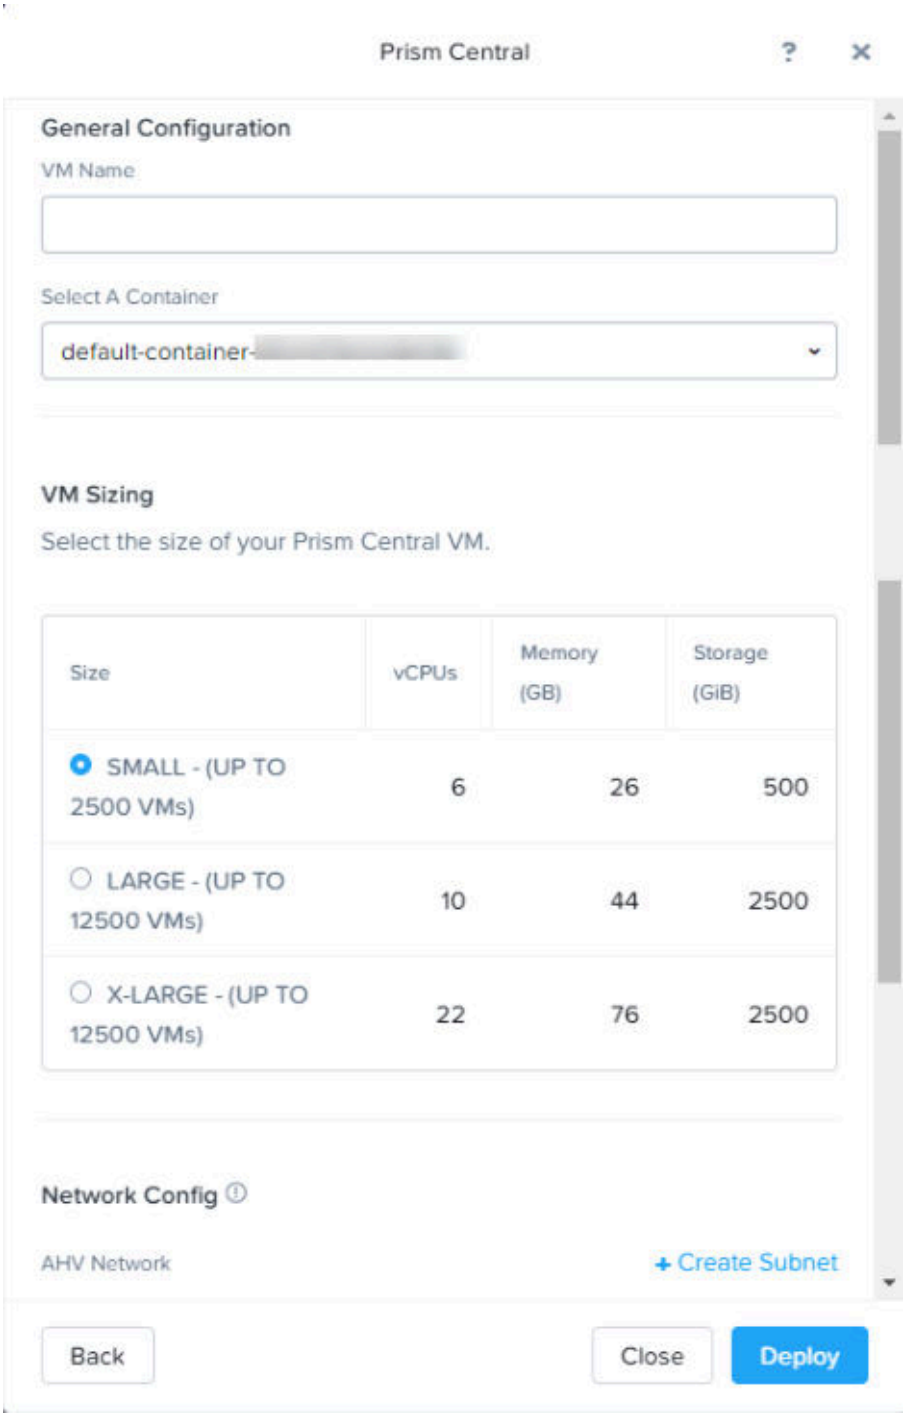

Figure 14: Prism Central Dialog Box (1-VM general configuration screen)

8. [3-VM instance only] In the deploy Prism Central screen, do the following in the indicated fields:

   a. **How many VMs will you support**: Select (click the radio button for) the Prism Central VMs size based on the number of guest VMs they must manage across all the registered clusters:

      - **Up to 5K VMs** (small) - manage up to 5000 VMs
      - **Up to 25K VMs** (large) - manage up to 25000 VMs
      - **Up to 25K VMs** (x-large) - manage up to 12500 VMs (same as large) with more vCPUs and memory to account for the ANC (Atlas Network Controller) service

   b. **Network**: Select an existing network for this Prism Central instance from the list.

      If the target network is not listed, click the **Create New Network** option to create a new network. See the "Network Management" section in the *Prism Web Console Guide* for more information.

   c. **Subnet Mask**: Enter the subnet mask value.

   d. **Gateway**: Enter the gateway IP address.

   e. **Virtual IP** (optional): Enter a virtual IP address for the Prism Central instance.

      A virtual IP can be used as a single point of access for Prism Central.

   f. **Select a Container**: Select a container for the Prism Central VMs from the pull-down list.

   g. **<*IP address*>**: Specify IP addresses for the three new Prism Central VMs.

      > Note: If you entered a virtual IP, the IP addresses for the three VMs are populated automatically. You can keep those addresses by change them as desired.

      1. Click the pencil icon for one of the new VMs. (The VM names are set automatically.) The **IP field** opens for editing. Enter the IP address and then click the green check mark icon to save that address.

         Figure 15: Edit IP Field

      2. Repeat this step for the other two VMs.

   h. **DNS Address(es)** (optional): Enter the IP addresses to one or more DNS servers. Enter multiple addresses in a comma separate list.

   i. When all the fields are correct, click the **Deploy** button.

      This begins the deployment process. On the Home page, the Prism Central widget displays **Deploying** until the installation is completed, then it displays **OK**. Click **OK** to launch the Prism Central web console in your browser.

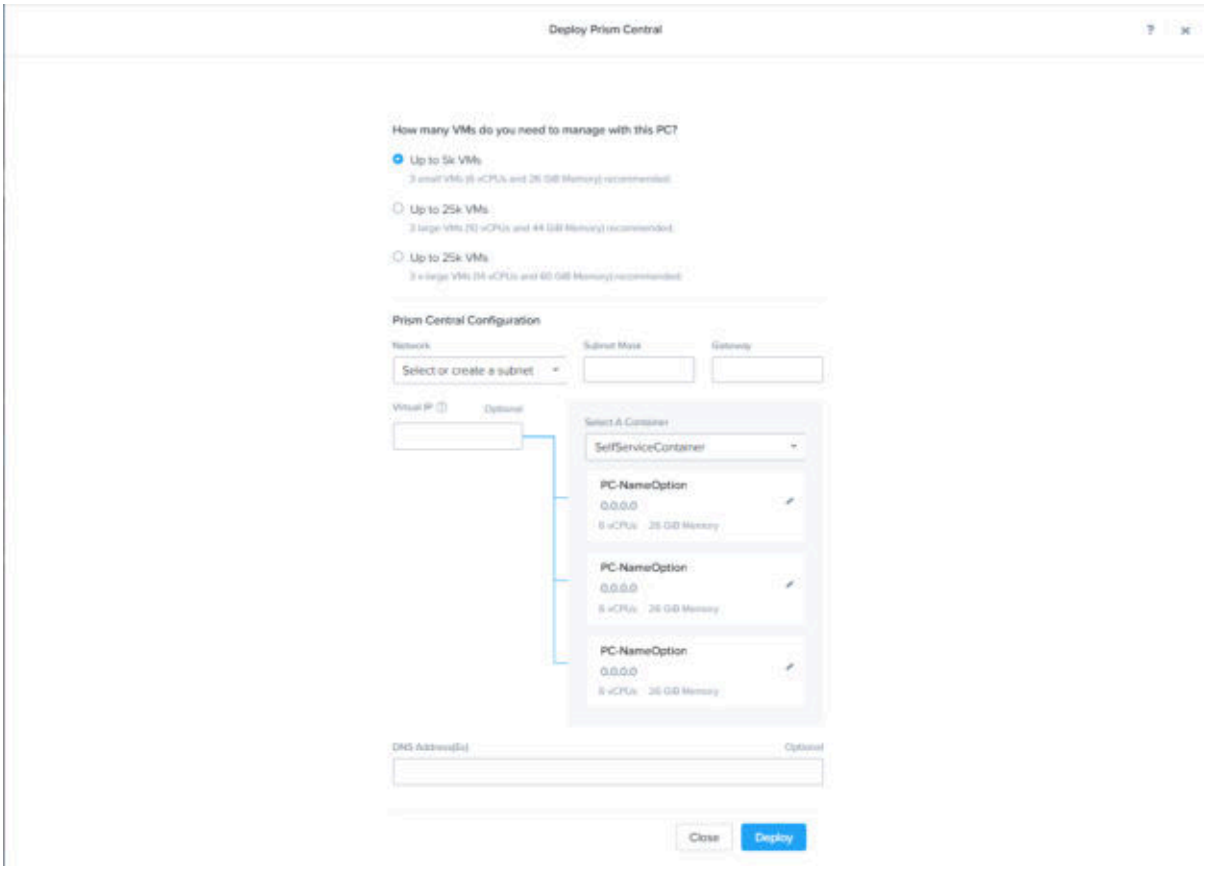

Figure 16: Deploy Prism Central Page (3 VM)

9. You can monitor the deployment progress (1-VM or 3-VM Prism Central instances) from the Tasks page and view information about the deployed VMs through the VM dashboard.

Figure 17: Tasks Page (Prism Central deployment)

Figure 18: VM Dashboard (Table View)

What to do next

Register this cluster with Prism Central. The management features are not available until Prism Central registers the cluster in which it is located. See "Register (Unregister) Cluster with Prism Central" in the *Prism Central Guide* for instructions on how to connect to an existing Prism Central instance.

Installing Prism Central (1-Click No Internet)

About this task

To create a new Prism Central instance from a cluster that does not have Internet access, do the following:

- Perform this procedure if your cluster is not directly connected to the Internet and you cannot download the binary .TAR and metadata .JSON files through the Prism web console.
- Do the following steps to download Prism Central binary .TAR and metadata .JSON files from the Nutanix Support portal from a connected machine, then upload the files and deploy Prism Central through a Prism Element web console.

> Note: Do not use the Prism Central OVA, ZIP, AHV image, or AOS binary .TAR.GZ and upgrade metadata JSON files from the Nutanix support portal to create this new Prism Central instance. Use the .TAR format binary and metadata .JSON files.

Procedure

1. Log on to the Nutanix support portal and click **Downloads** > **Prism Central**.
2. Click **Download** and **Metadata** to save the **Prism Central 1-click deploy from Prism Element** binary .TAR and metadata .JSON files, respectively, to your local media.

   You can also copy these files to a USB stick, CD, or other media.
3. Log in to the Prism Element web console as the user `admin` for your cluster.
4. Run NCC as described in *Run NCC Checks* topic in the *Acropolis Upgrade Guide*.

5. Do one of the following:

   » On the **Home** dashboard, click **Register or create new** from the **Prism Central** widget.

   » Click the gear icon in the main menu and then select **Prism Central Registration** from the **Settings** menu.

Figure 19: Home Dashboard

6. In the first screen of the Prism Central dialog box, click the **Deploy** button.

   This screen includes two options, **Deploy** and **Connect**. This procedure describes how to deploy a new Prism Central instance. The topic *Register (Unregister) Cluster with Prism*

Central in the *Prism Central Guide* describes how to connect to an existing Prism Central instance.

> Note: On an ESXi cluster, you must first register a vCenter Server before you deploy a new Prism Central instance.

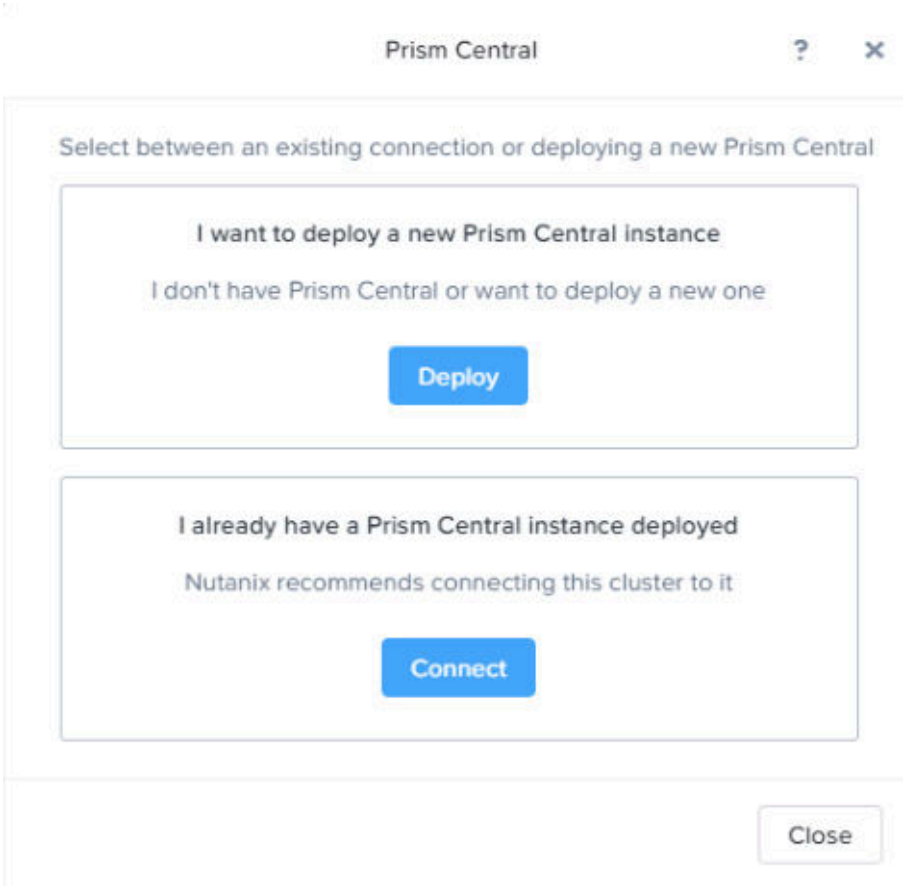

Figure 20: Prism Central Dialog Box (deploy/connect screen)

7. In the installation image screen, click the **upload the Prism Central binary** link.

   If there is already an image loaded, the installation image screen displays an **Install** button (as illustrated in the following example). If the cluster has Internet connectivity, the available images from the support portal appear with a **Download** button. However, no entries appear on this screen if there is no Internet connectivity and no image has been previously

uploaded. In this case you must click the **upload the Prism Central binary** link to upload an image from your local media.

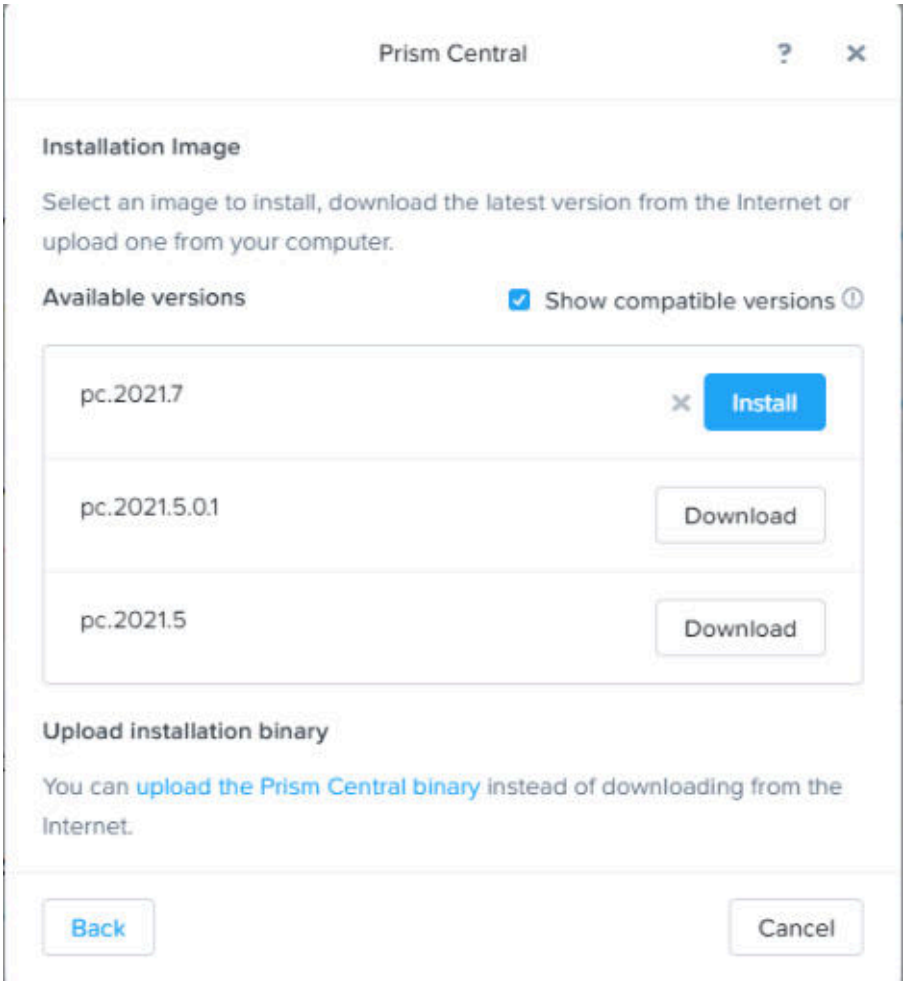

Figure 21: Prism Central Dialog Box (installation image screen)

8. In the file search pop-up window, select the files to upload:
   a. Click **Choose File**, browse to the metadata file location, and select the file.
   b. Click **Choose File** again, browse to the binary .TAR file location, and select the file.
   c. Click **Upload Now**.
9. The remaining steps are the same as for an Internet-connected cluster, so go to Installing Prism Central (1-Click Internet) on page 58 and continue from step 6.

Installing Prism Central (Manual Method)

When the Prism Central "1-click deployment" method is not available, use this manual method to install Prism Central.

In most cases you can install Prism Central using the "1-click" method, which is the recommended method (see Installing Prism Central (1-Click Method) on page 58). However, when that method is not an option, you can install a Prism Central VM manually. You can manually install the Prism Central VM on any supported hypervisor.

Note: Prism Central installation is supported for hardware running Intel CPUs only. It is not supported on AMD CPUs.

Downloading Prism Central VM Installation Files (Manual Method)

How to download Prism Central VM installation files for manual installation (when the Prism Central "1-click deployment" method is not available).

Procedure

1. Log on to the Nutanix Support portal and go to the Prism Central Downloads page.
   The page lists the latest available version. You can download previous release bits from the **Other Versions** tab.
2. Click **Download** to get the Prism Central VM files for your hypervisor deployment type, then save them to a folder, directory, or other location. Click the ellipsis menu to download the associated MD5 checksum. You can also copy the file download link URL, which is valid for approximately 10 hours.
   a. Hyper-V. Downloads a *pc_version*.zip file, where *pc_version* is the Prism Central version; for example, the downloaded file named `pc.2020.10.zip`.
   b. ESX. Downloads a *pc_version*.ova file, where *pc_version* is the Prism Central version; for example, the downloaded file named `pc.2020.10.ova`.
   c. AHV. Downloads a *pc_version*.tar file, where *pc_version* is the Prism Central version; for example, the downloaded file named `pc.2020.10.tar`.

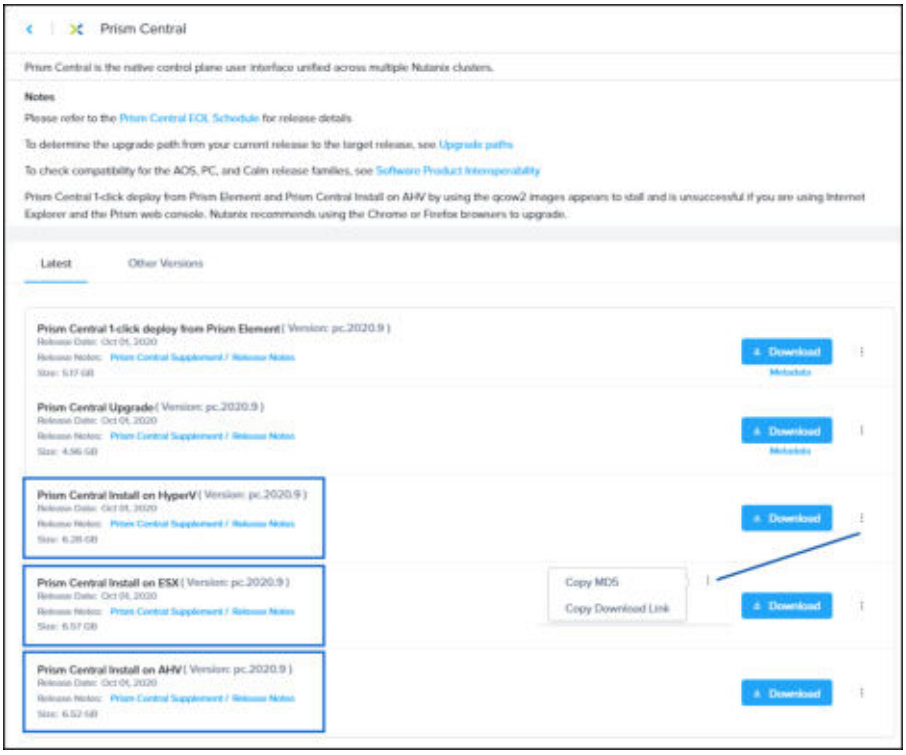

Figure 22: Prism Central Download Page

3. Extract the Prism Central files from the downloaded compressed file to a folder, directory, or other location, which is accessible when you manually install Prism Central.

   a. Hyper-V. After you extract the ZIP format file, the extracted files are VHDX format files: boot, home, and data virtual disks. For example, for pc.2020.9, the three files are:

      - `5.18-PrismCentral-boot.vhdx`
      - `5.18-PrismCentral-data.vhdx`
      - `5.18-PrismCentral-home.vhdx`

   b. ESX. Not necessary to extract a file. The downloaded file is in OVA format and is ready for use with the associated MD5 checksum.

   c. AHV. After you untar the TAR format file, the extracted files are QCOW format files: boot, home, and data virtual disks. For example, for pc.2020.9, the three files are:

      - `pc.2020.9-boot.qcow2`
      - `pc.2020.9-data.qcow2`
      - `pc.2020.9-home.qcow2`

   See Installing the Prism Central VM (AHV) on page 73, Installing the Prism Central VM (ESXi) on page 79, or Installing the Prism Central VM (Hyper-V) on page 83 to install the Prism Central VM.

Installing the Prism Central VM (AHV)

A special VM runs Prism Central from which you can monitor and manage multiple clusters. The installation uses three virtual disks.

About this task

To install the Prism Central VM on AHV, do the following:

> Note: See Installing the Prism Central VM (ESXi) on page 79 or Installing the Prism Central VM (Hyper-V) on page 83 to install the Prism Central VM on an ESXi or Hyper-V hypervisor.

Procedure

1. Download and extract the Prism Central files for AHV as described in Downloading Prism Central VM Installation Files (Manual Method) on page 72.
2. Copy the three virtual disks you extracted to your workstation or other accessible location.
   For example, for pc.2020.9, the three files are:

   - `pc.2020.9-boot.qcow2`
   - `pc.2020.9-data.qcow2`
   - `pc.2020.9-home.qcow2`

3. Log on to the Prism web console of the target cluster and select **Image Configuration** from the Settings menu available from the gear icon.
   The Image Configuration window appears. See the "Configuring Images" section in the *Prism Web Console Guide* for more detailed instructions about uploading and configuring an image file.

4. Click the **Upload Image** button.
   The Create Image window appears. Do the following in the indicated fields:

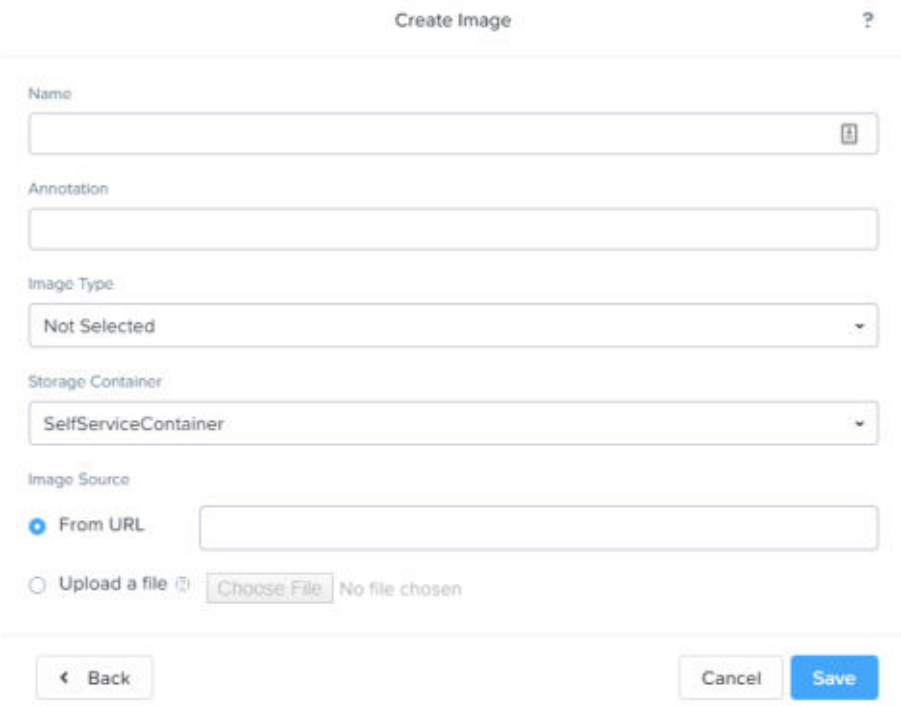

Figure 23: Create Image Window

   a. Enter a name, for example `pc_boot`, and optional description (annotation) for the boot image.
   b. Select **Disk** as the image type.
   c. Select a storage container to use from the pull-down list.
   d. Select **Upload a file** and select the boot image you downloaded.
   e. Click the **Save** button.
   f. Repeat this step for the home and data disk image files.

5. Create a new VM from the images as follows:
   The *Web Console Guide* includes more detailed instructions about creating a VM.

   a. In the VM dashboard, click the **Create VM** button.

   b. In the Create VM window, enter appropriate information in the name, compute details, and memory fields, and (if needed) click the **Add New NIC** button to create a network interface for the VM.

      Note:

      - The recommended VM size is 6 vCPUs, 26 GB of memory, and 500 GiB of storage for a "small" Prism Central VM or 10 vCPUs, 44 GB of memory, and 2500 GiB of storage for a "large" Prism Central VM.
      - Set the **Timezone** value to "**(UTC) Etc/UTC**" instead of the (default) local timezone. This ensures the Prism Central VM sets the system clock properly at boot up to GMT instead of the local timezone.

   c. Click the **Add New Disk** button and attach a boot disk.
      Enter the following information in the Add Disk window and then the click the **Add** button:

      - **Type**: Select **Disk**.
      - **Operation**: Select **Clone from Image Service**.
      - **Bus Type**: Select **SCSI**.
      - **Storage Container**: Select a storage container from the list of available for the Prism
      - **Image**: Select boot image file you saved from the list of images.
      - **Size (GiB)**: Enter the disk size (in GiB). This value is populated automatically from the selected image; do not change the value that appears in this field unless directed to do so by Nutanix customer support.

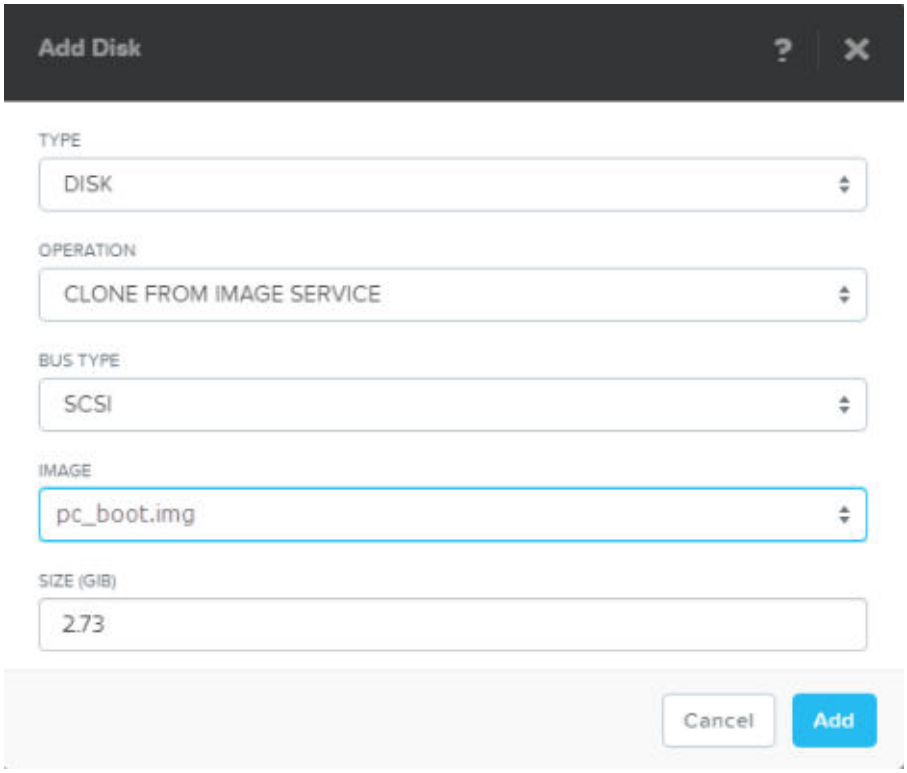

Figure 24: Add Disk Window

d. Click the **Add New Disk** button again and attach the home disk.

   The steps are the same as for the boot disk except the image file name. Choose the home image file.

e. Click the **Add New Disk** button again and attach the data disk.

   The steps are the same as for the boot disk except the image file name Choose the data image file.

f. When all the settings are correct, click the **Save** button to create the VM.

6. Go to the VM dashboard table view, select the new VM (in the table), and then click the **Power on** action link (below the table) to start up the VM.

   > Note: The **Power on** option may be disabled for the Prism Central VM. If you cannot power on the Prism Central VM through Prism, log on to any Controller VM in the cluster using SSH and power on the Prism Central VM through the aCLI.
   >
   > `nutanix@cvm$ acli vm.on pc_vm_name [host="host_name" ]`
   >
   > If no host is specified, the scheduler picks the one with the most available CPU and memory that can support the VM.

7. Launch the console (click the **Launch Console** action link) and log into the Prism Central VM (user name "`nutanix`" and password "`nutanix/4u`").

8. Assign a static IP address to the Prism Central VM as follows:

   a. Open the **ifcfg-eth0** file for editing.

      The following command opens the file using the **vi** editor:

      ```
      $ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth0
      ```

   b. Update the NETMASK, IPADDR, BOOTPROTO, and GATEWAY entries as needed.

      ```
      NETMASK="xxx.xxx.xxx.xxx"
      IPADDR="xxx.xxx.xxx.xxx"
      BOOTPROTO="none"
      GATEWAY="xxx.xxx.xxx.xxx"
      ```

      - Enter the desired netmask value in the NETMASK field. (Replace *xxx.xxx.xxx.xxx* with the appropriate value.)
      - Enter the appropriate static IP address (usually assigned by your IT department) for the Prism Central VM in the IPADDR field.
      - Enter none as the value in the BOOTPROTO field. (You might need to change the value from dhcp to none if you employ DHCP. Only a static address is allowed; DHCP is not supported.)
      - Enter the IP address for your gateway in the GATEWAY field.

        Warning: Carefully check the file to ensure there are no syntax errors, whitespace at the end of lines, or blank lines in the file.

   c. Save the changes.

   d. Remove any existing Nutanix Controller VM entries, that is ones which include "NTNX-*<number>*-CVM", from the **/etc/hosts** file. (Be careful that you do not remove any other entries from the file.)

      To edit the file using **vi**, enter

      ```
      $ sudo vi /etc/hosts
      ```

      When the Prism Central VM starts the first time and DHCP is enabled in the network, an entry similar to the following is added to the **/etc/hosts** file. This entry (if present) needs to be removed from the **/etc/hosts** file before restarting the Prism Central VM in the next step, which generates a new entry if DHCP is enabled.

      ```
      127.0.0.1 NTNX-10-3-190-99-A-CVM
      ```

   e. Restart the Prism Central VM.

      ```
      $ sudo reboot
      ```

9. Log on to the Prism Central VM again and then enter the following command to create a cluster:

   ```
   $ cluster --cluster_function_list="multicluster" -s static_ip_address create
   ```

   The *static_ip_address* is the Prism Central VM IP address.

10. [optional but recommended] Log on to Prism Central (GUI interface) as the **admin** user and do the following:

    a. Click the collapse menu icon ("hamburger" button) and select **Compute & Storage** > **VMs**.

    b. Select from the list (check the box for) the Prism Central VM and then select **Update** from the **Actions** pull-down menu.

    c. In the Update VM window, enter `NutanixPrismCentral` in the **Description** field and then click the **Save** button.

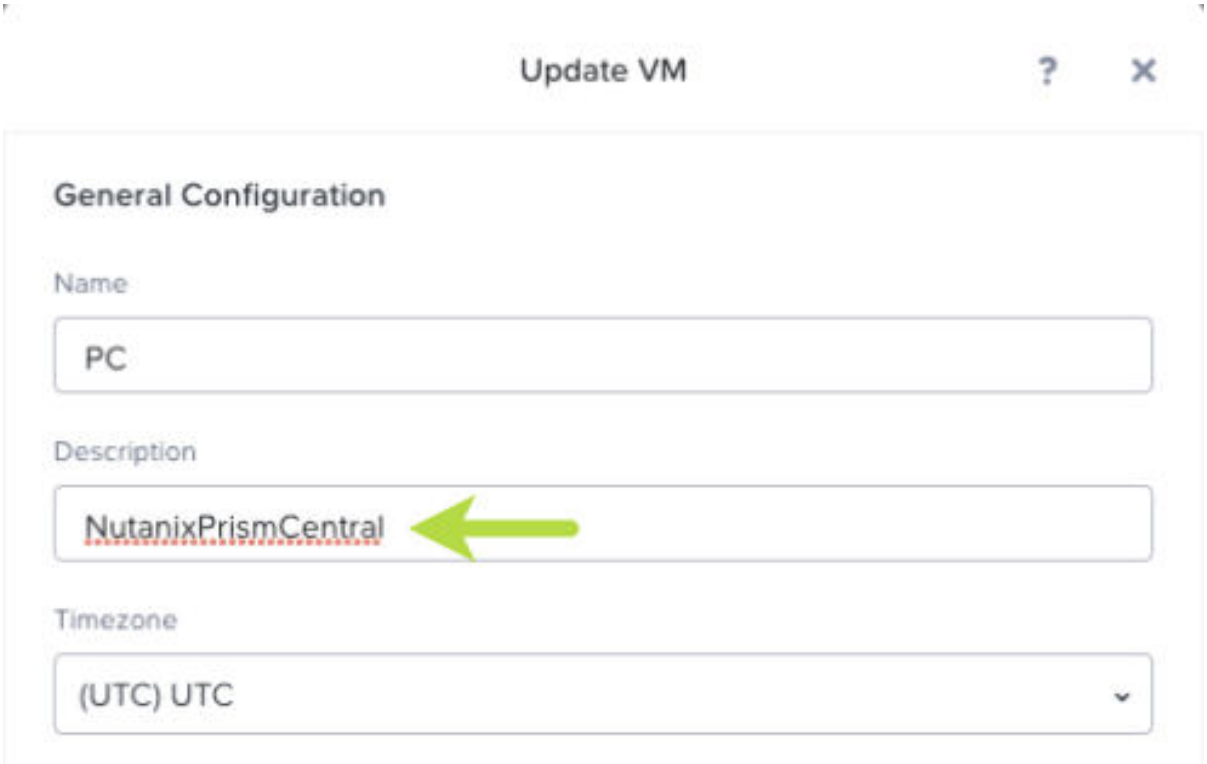

Figure 25: Update VM Window

Creating a Prism Central instance through a 1-click method enables automatically certain best practice restrictions on who can manage a Prism Central VM. This step enables the same set of best practice restrictions for a manually installed Prism Central VM. (Nonadministrators may not perform any operations while administrators may perform a limited set of permissions including launch console, power off or on, pause or resume, migrate, and configure VM host affinity.)

What to do next

This completes Prism Central installation. The next step is to register clusters with Prism Central. Port 9440 needs to be open in both directions between the Prism Central VM and any registered clusters. The topic "Register (Unregister) Cluster with Prism Central" in the *Prism Central Guide* describes how to connect to an existing Prism Central instance.

Installing the Prism Central VM (ESXi)

About this task

A special VM runs Prism Central from which you can monitor and manage multiple clusters. To install the Prism Central VM on an ESXi hypervisor, do the following:

> Note: See Installing the Prism Central VM (Hyper-V) on page 83 or Installing the Prism Central VM (AHV) on page 73 to install the Prism Central VM on a Hyper-V or Acropolis hypervisor.

> Note: You cannot deploy a large Prism Central VM using this manual method. You can only deploy a small Prism Central VM. For a small Prism Central VM, the recommended VM size is 6 vCPUs, 26 GB of memory, and 500 GiB of storage. Contact Nutanix Support if you require a large Prism Central VM.

Procedure

1. Download and extract the Prism Central files for ESXi as described in Downloading Prism Central VM Installation Files (Manual Method) on page 72.
2. Install the downloaded OVA file as follows:
   a. Connect to vCenter or an ESXi host using the vSphere client.
   b. Select the OVA file, deploy it.
      See your vSphere documentation for instructions on how to do this. The following vSphere client screen shot shows selecting an OVA file called `pc.2020.11.0.1.ova` to deploy from the download location on the workstation. In the OVA file, the version `2020.11.0.1` indicates the Prism Central version.

      > Note:
      >
      > - The recommended VM size is 6 vCPUs, 26 GB of memory, and 500 GiB of storage for a "small" Prism Central VM. Contact Nutanix Support if you require a large Prism Central VM.
      > - In the OVA deployment wizard using vSphere web client, Nutanix recommends that you manually select **Thin Provision** as the virtual disk format while

configuring the storage. Failing to manually select **Thin Provision** creates a thick provisioned VMDK in vSAN by default.

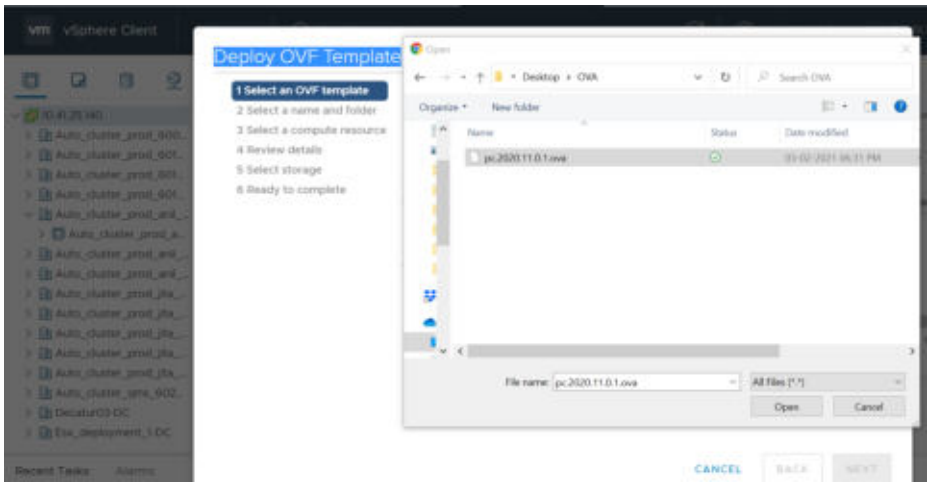

Figure 26: vSphere Client

3. Power on the Prism Central VM through the vSphere Client. Click **ACTIONS** > **Power** > **Power On** to start the VM.

   Note: The Prism Central VM is powered between five and six minutes if the Prism Central is either a ***master*** or has a version greater than or equal to ***pc.2020.11***. The VM is powered in approximately three minutes for other Prism Central versions.

4. Log into the Prism Central VM through the vSphere console (user name "**nutanix**" and password "**nutanix/4u**").

5. Assign a static IP address to the Prism Central VM as follows:

   a. Open the **ifcfg-eth0** file for editing.

      The following command opens the file using the **vi** editor:

      ```
      $ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth0
      ```

   b. Update the `NETMASK`, `IPADDR`, `BOOTPROTO`, and `GATEWAY` entries as needed.

      Note: Use the **route -n** command to retrieve the **NETMASK** and **GATEWAY** information. Ensure that the selected IP address is unreachable to the console IP address.

      ```
      NETMASK="xxx.xxx.xxx.xxx"
      IPADDR="xxx.xxx.xxx.xxx"
      BOOTPROTO="none"
      ```

```
GATEWAY="xxx.xxx.xxx.xxx"
```

- Enter the desired netmask value in the `NETMASK` field. (Replace *`xxx.xxx.xxx.xxx`* with the appropriate value.)
- Enter the appropriate static IP address (usually assigned by your IT department) for the Prism Central VM in the `IPADDR` field.
- Enter `none` as the value in the `BOOTPROTO` field. (You might need to change the value from `dhcp` to `none` if you employ DHCP. Only a static address is allowed; DHCP is not supported.)
- Enter the IP address for your gateway in the `GATEWAY` field.

> Warning: Carefully check the file to ensure there are no syntax errors, whitespace at the end of lines, or blank lines in the file.

c. Save the changes.

d. Remove any existing Nutanix Controller VM entries, that is ones which include "NTNX-*<number>*-CVM", from the **/etc/hosts** file. (Be careful that you do not remove any other entries from the file.)

To edit the file using **vi**, enter

```
$ sudo vi /etc/hosts
```

When the Prism Central VM starts the first time and DHCP is enabled in the network, an entry similar to the following is added to the **/etc/hosts** file. This entry (if present) needs to be removed from the **/etc/hosts** file before restarting the Prism Central VM in the next step, which generates a new entry if DHCP is enabled.

```
127.0.0.1 NTNX-10-3-190-99-A-CVM
```

e. Restart the Prism Central VM.

```
$ sudo reboot
```

> Note: The Prism Central VM is powered in approximately a minute.

6. Log on to the Prism Central VM again through the vSphere console and then enter the following command to create a cluster:

```
$ cluster --cluster_function_list="multicluster" -s static_ip_address create
```

The *`static_ip_address`* is the Prism Central VM IP address.

7. [optional but recommended] Log on to vCenter Server using an administrator account and do the following:

   a. Select the Prism Central VM.

   b. Right click **Edit Notes**.

   c. In the dialog box enter `NutanixPrismCentral` without any new line characters and then click **OK**.

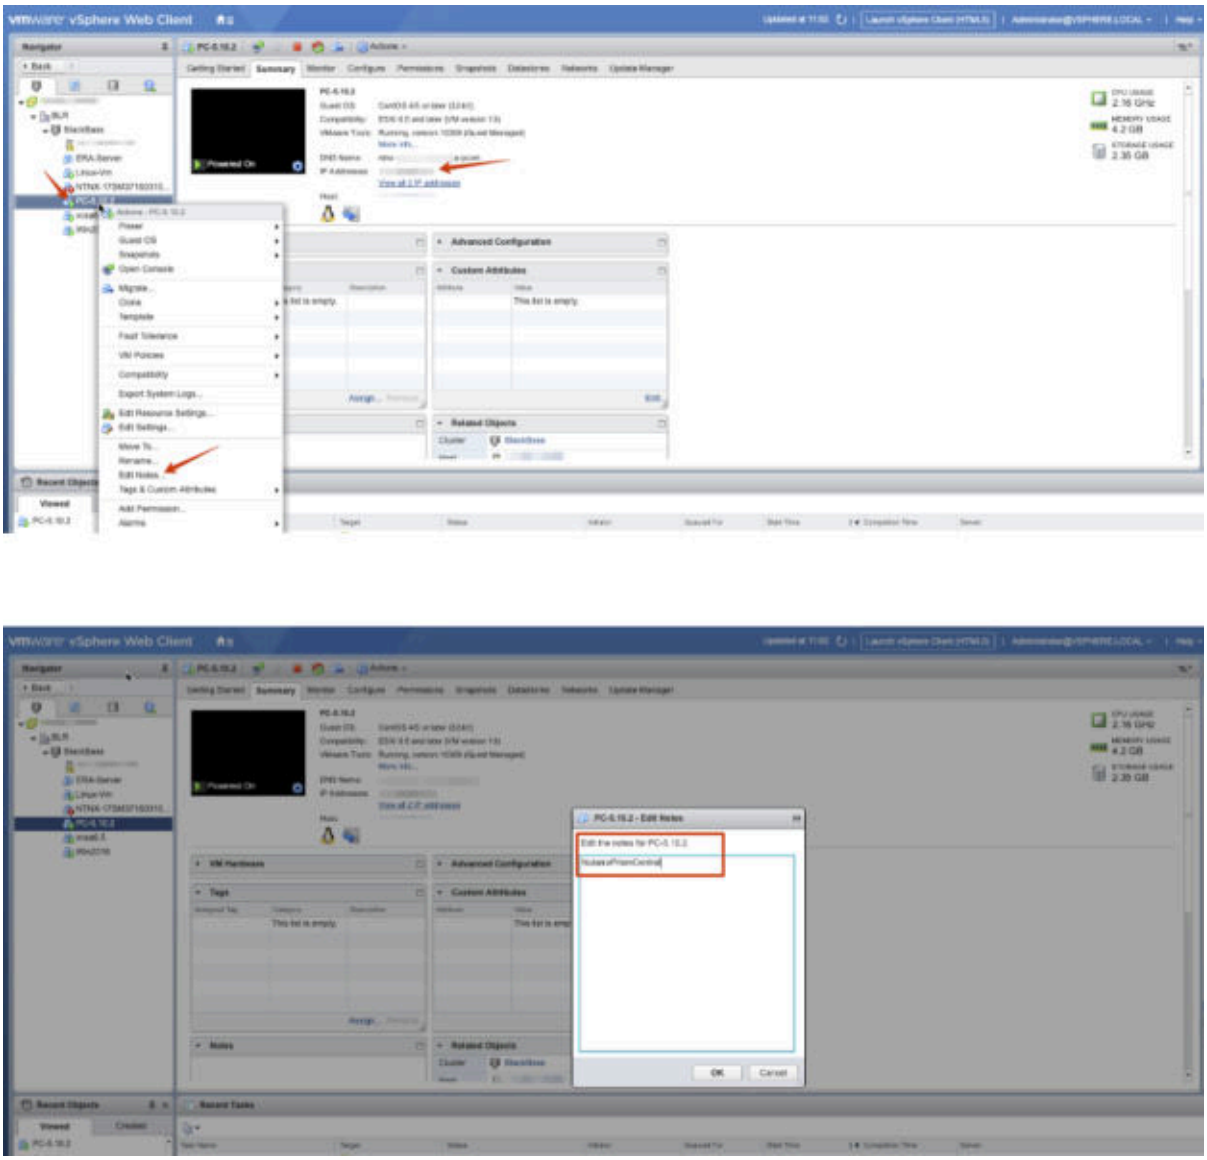

Figure 27: vSphere Web Client

Creating a Prism Central instance through a 1-click method enables automatically certain best practice restrictions on who can manage a Prism Central VM. This step enables the same set of best practice restrictions for a manually installed Prism Central VM. (Nonadministrators may not perform any operations while administrators may perform a limited set of permissions including launch console, power off or on, pause or resume, migrate, and configure VM host affinity.)

What to do next

This completes Prism Central installation. The next step is to register clusters with Prism Central. Port 9440 needs to be open in both directions between the Prism Central VM and any registered clusters. The topic "Register (Unregister) Cluster with Prism Central" in the *Prism Central Guide* describes how to connect to an existing Prism Central instance.

Installing the Prism Central VM (Hyper-V)

A special VM runs Prism Central from which you can monitor and manage multiple clusters.

About this task

To install the Prism Central VM on a Hyper-V hypervisor, do the following:

> Note: See Installing the Prism Central VM (ESXi) on page 79 or Installing the Prism Central VM (AHV) on page 73 to install the Prism Central VM on an ESXi or AHV.

Procedure

1. Download and extract the Prism Central files for Hyper-V as described in Downloading Prism Central VM Installation Files (Manual Method) on page 72.
2. Copy the extracted VHD files to either the storage container or SCVMM library.

   > Note: To enable fast copy, use the SCVMM library on the same cluster. Fast copy improves the deployment time.

3. Complete installation by following the Prism Central VM deployment steps for either SCVMM or Hyper-V Manager.

   - Deploying Prism Central (SCVMM) on page 83
   - Deploying Prism Central (Hyper-V Manager) on page 91

   > Note: Configure the VM to have at least 16 GB of memory, 4 vCPUs, and a NIC. This is the minimum recommended configuration for a Prism Central VM.

Deploying Prism Central (SCVMM)

This procedure describes how to deploy the Prism Central VM on Hyper-V through the System Center Virtual Machine Manager (SCVMM).

Before you begin

Complete Installing the Prism Central VM (Hyper-V) on page 83. In this procedure, the Prism Central VM deployment consists of three virtual disks, deployed in order. For example:

- Boot disk: `5.18-PrismCentral-boot.vhdx`
- Home disk: `5.18-PrismCentral-home.vhdx`
- Data disk: `5.18-PrismCentral-data.vhdx`

Procedure

1. Open SCVMM, go to the library where the VHD files were downloaded, select the Hyper-V Prism Central boot disk file (for example, (for example, 5.18-PrismCentral-boot.vhdx), right click to open the menu, and select **Create Virtual Machine**.

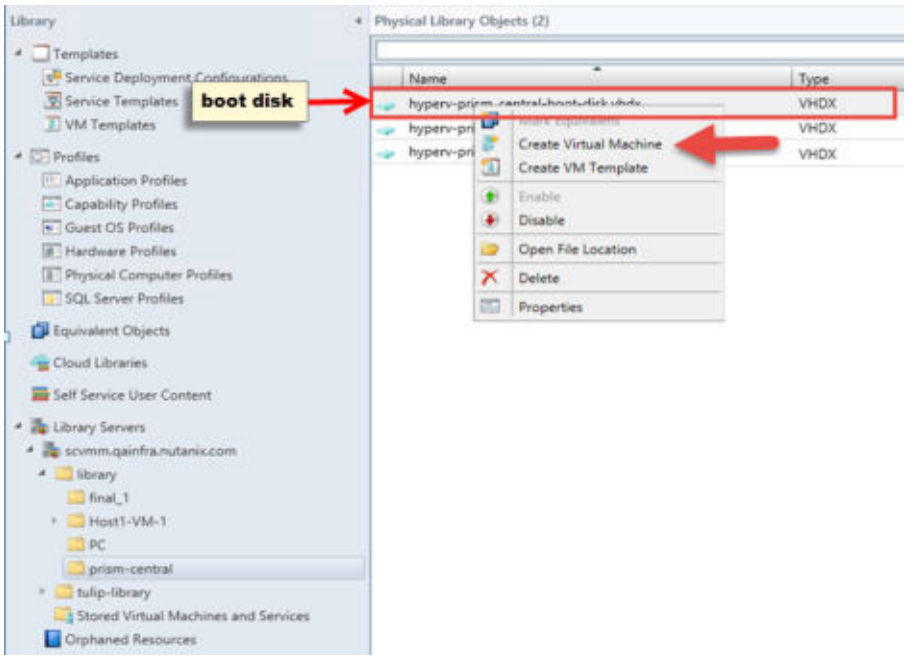

Figure 28: SCVMM File Menu

The Create Virtual Machine Wizard appears.

2. In the Identity screen, enter appropriate values in the **Virtual Machine Name** and **Generation** fields and then click the **Next** button (bottom right of screen).

   a. **Virtual Machine Name**: Enter the name of the VM.

   b. **Generation**: Select **Generation 1**.

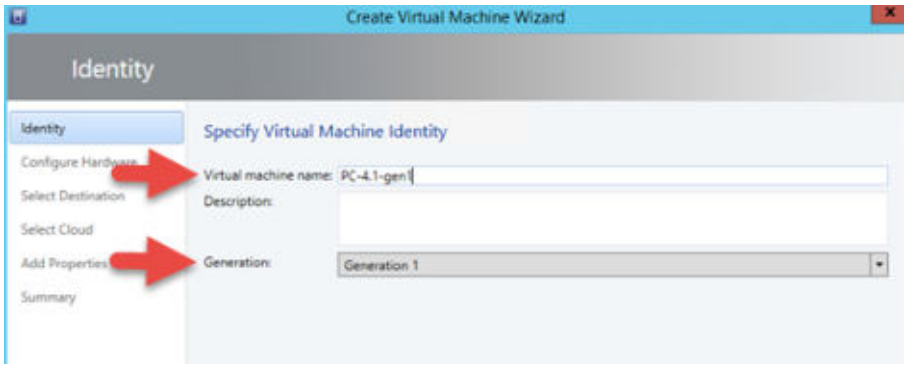

Figure 29: Create VM Wizard: Identity

3. In the Configure Hardware screen, do the following:

   a. Set the number of processors. The recommended number is 6 for a "small" Prism Central VM or 10 for a "large" Prism Central VM.

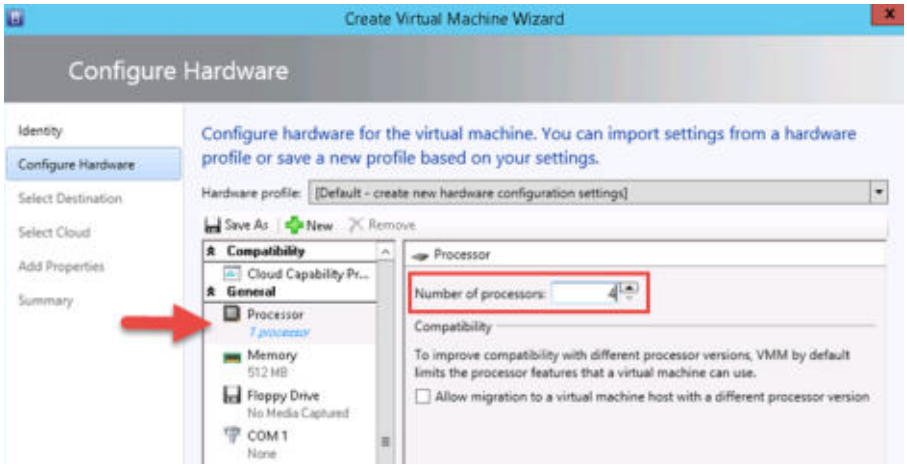

Figure 30: Create VM Wizard: Configure Hardware Processors

   b. Set the memory. The recommended size is 26 GB for a "small" Prism Central VM or 44 GB for a "large" Prism Central VM.

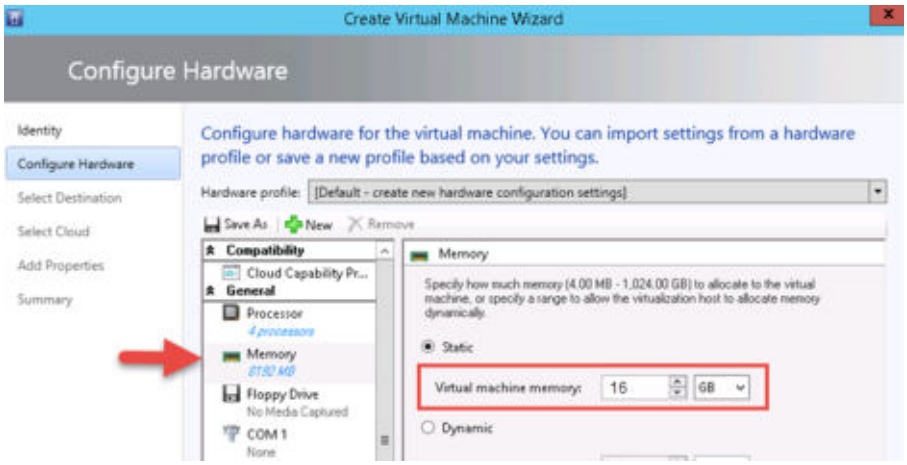

Figure 31: Create VM Wizard: Configure Hardware Memory

   c. Click the **New** > **Disk** button, click the **Use an existing virtual hard disk** option and click the **Browse** button, select the Hyper-V Prism Central home disk file from the list in the dialog box (for example, (for example, 5.18-PrismCentral-home.vhdx), and then click the **Next** button.

   d. Repeat for the data disk. Click the **New** > **Disk** button, click the **Use an existing virtual hard disk** option and click the **Browse** button, select the Hyper-V Prism Central data disk

file from the list in the dialog box (for example, 5.18-PrismCentral-data.vhdx), and then click the **Next** button.

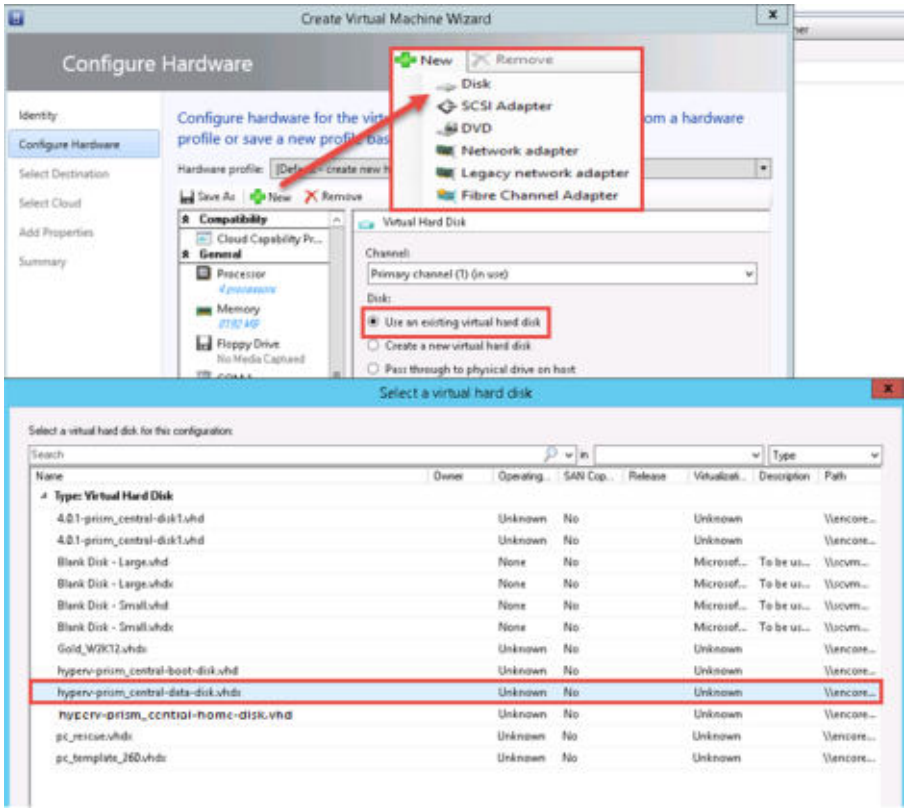

Figure 32: Create VM Wizard: Configure Virtual Disk

4. In the Select Host screen, select the host where the Prism Central VM is deployed and then click the **Next** button.

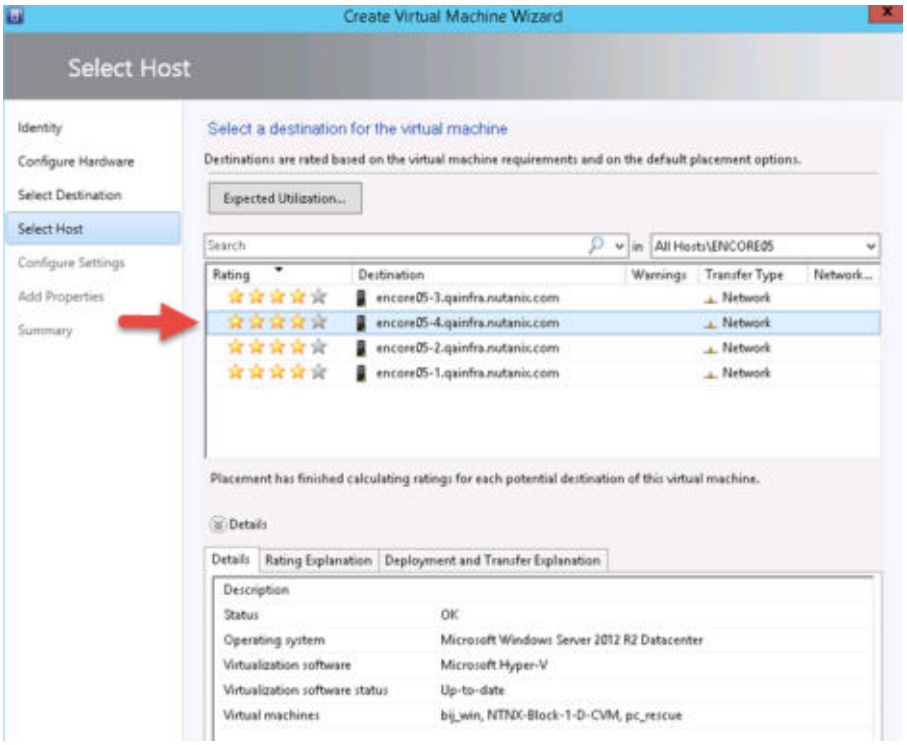

Figure 33: Create VM Wizard: Select Host

5. In the Select Network screen, select the appropriate VM network and then click the **Next** button.

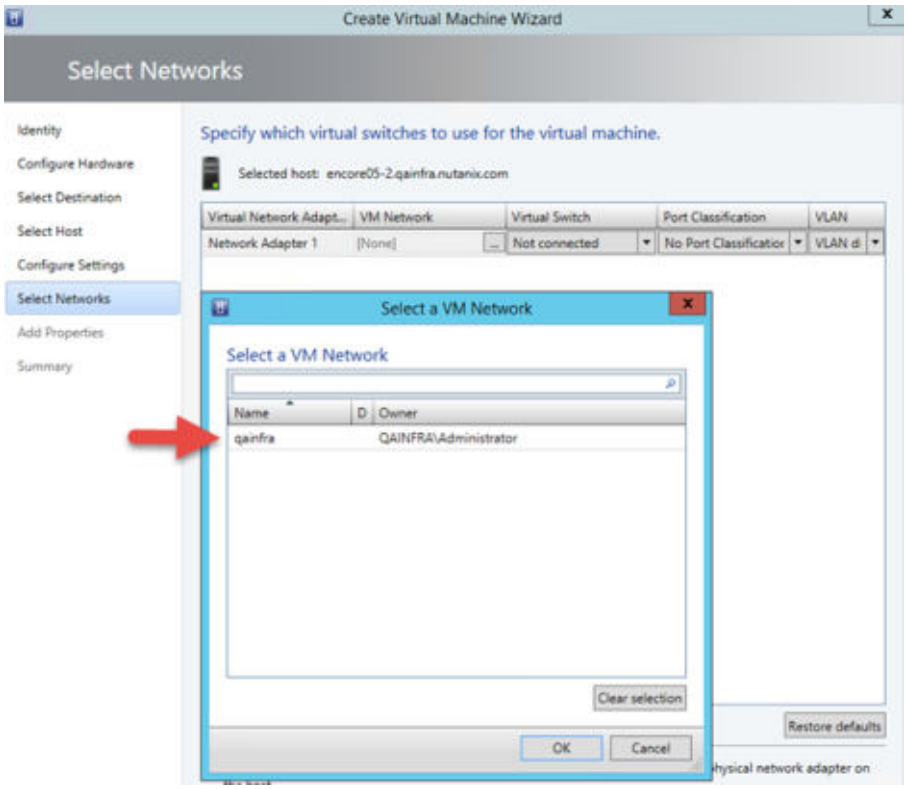

Figure 34: Create VM Wizard: Select Network

6. In the Add Properties screen, enter the specified values in the following fields and then click the **Next** button:

   a. Select **Always turn on the virtual machine** from the pull-down list with a **0** (zero) second delay in the first two fields.

   b. Select **Save state** from the pull-down list in the next field.

   c. Select **CentOS Linux 6 (64 bit)** from the pull-down list in the next field.

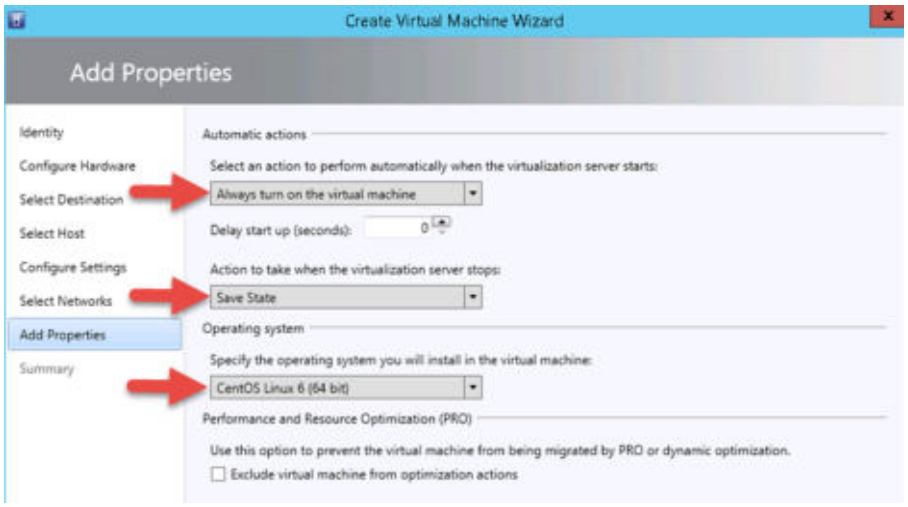

Figure 35: Create VM Wizard: Add Properties

7. In the Summary screen, verify all the settings are correct and then click the **Create Virtual Machine** button.

8. Select and right click the newly created Prism Central VM, and then select **Power On** from the pull-down menu.

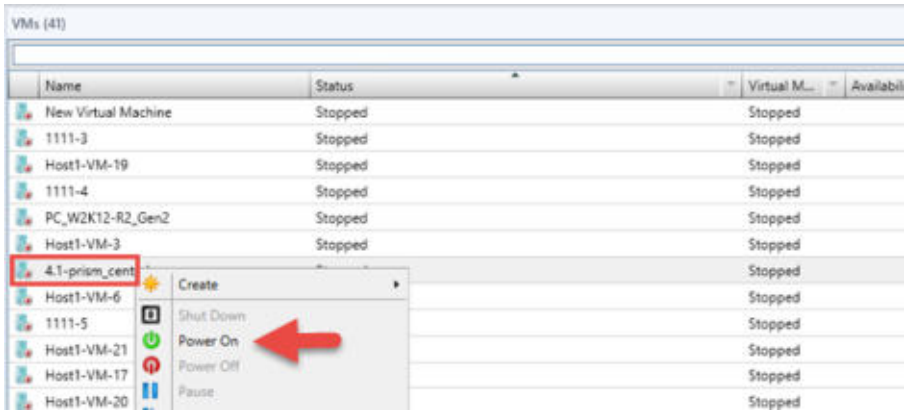

Figure 36: Virtual Machine List

9. Log into Prism Central VM through the SCVMM console (user name "`nutanix`" and password "`nutanix/4u`").

10. Assign a static IP address to the Prism Central VM as follows:

    a. Open the **ifcfg-eth0** file for editing.

    The following command opens the file using the **vi** editor:

    ```
    $ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth0
    ```

    b. Update the NETMASK, IPADDR, BOOTPROTO, and GATEWAY entries as needed.

    ```
    NETMASK="xxx.xxx.xxx.xxx"
    IPADDR="xxx.xxx.xxx.xxx"
    BOOTPROTO="none"
    GATEWAY="xxx.xxx.xxx.xxx"
    ```

    - Enter the desired netmask value in the NETMASK field. (Replace *xxx.xxx.xxx.xxx* with the appropriate value.)
    - Enter the appropriate static IP address (usually assigned by your IT department) for the Prism Central VM in the IPADDR field.
    - Enter none as the value in the BOOTPROTO field. (You might need to change the value from dhcp to none if you employ DHCP. Only a static address is allowed; DHCP is not supported.)
    - Enter the IP address for your gateway in the GATEWAY field.

    > Warning: Carefully check the file to ensure there are no syntax errors, whitespace at the end of lines, or blank lines in the file.

    c. Save the changes.

    d. Remove any existing Nutanix Controller VM entries, that is ones which include "NTNX-*<number>*-CVM", from the **/etc/hosts** file. (Be careful that you do not remove any other entries from the file.)

    To edit the file using **vi**, enter

    ```
    $ sudo vi /etc/hosts
    ```

    When the Prism Central VM starts the first time and DHCP is enabled in the network, an entry similar to the following is added to the **/etc/hosts** file. This entry (if present) needs to be removed from the **/etc/hosts** file before restarting the Prism Central VM in the next step, which generates a new entry if DHCP is enabled.

    ```
    127.0.0.1 NTNX-10-3-190-99-A-CVM
    ```

    e. Restart the Prism Central VM.

    ```
    $ sudo reboot
    ```

11. Log in to the Prism Central VM again and then enter the following command to create a cluster:

    ```
    $ cluster --cluster_function_list="multicluster" -s static_ip_address create
    ```

    The *static_ip_address* is the Prism Central VM IP address you assigned to the IPADDR parameter in step 4.

    This completes Prism Central installation. The next step is to register clusters with Prism Central. The topic *Register (Unregister) Cluster with Prism Central* in the *Prism Central Guide* describes how to connect to an existing Prism Central instance. Port 9440 needs to be open in both directions between the Prism Central VM and any registered clusters.

Deploying Prism Central (Hyper-V Manager)

This procedure describes how to deploy the Prism Central VM on Hyper-V through the Hyper-V Manager.

Before you begin

Complete Installing the Prism Central VM (Hyper-V) on page 83. In this procedure, the Prism Central VM deployment consists of three virtual disks, deployed in order. For example:

- Boot disk: `5.18-PrismCentral-boot.vhdx`
- Home disk: `5.18-PrismCentral-home.vhdx`
- Data disk: `5.18-PrismCentral-data.vhdx`

Procedure

1. Open Hyper-V Manager, right click the host where the Prism Central VM is deployed, and select **New** > **Virtual Machine**.

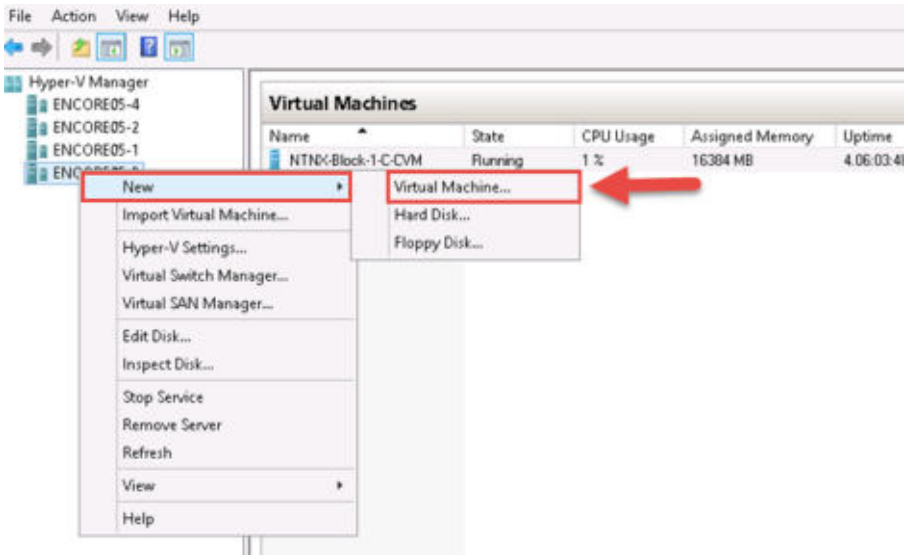

Figure 37: Hyper-V Manager: New Virtual Machine

The New Virtual Machine Wizard window appears.

2. In the Before You Begin screen, read the text and then click the **Next** button.

3. In the Specify Name and Location screen, enter the virtual machine name in the **Name** field and then click the **Next** button.

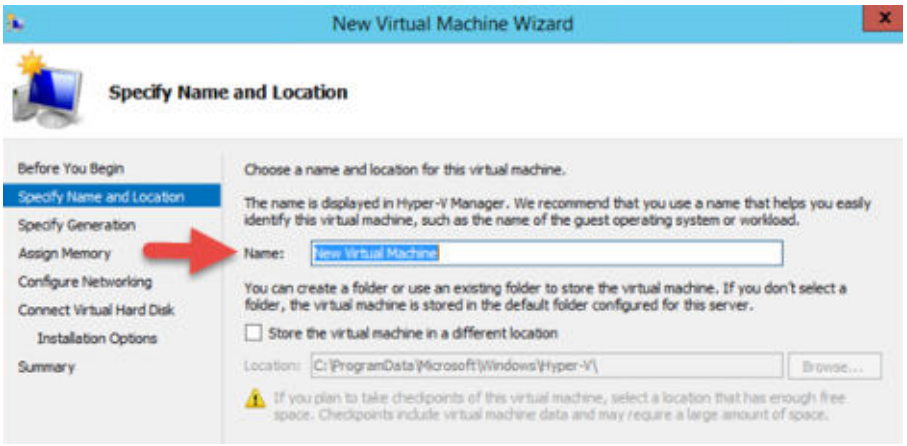

Figure 38: New Virtual Machine Wizard: Specify Name and Location

4. In the Specify Generation screen, click the **Generation 1** option and then click the **Next** button.

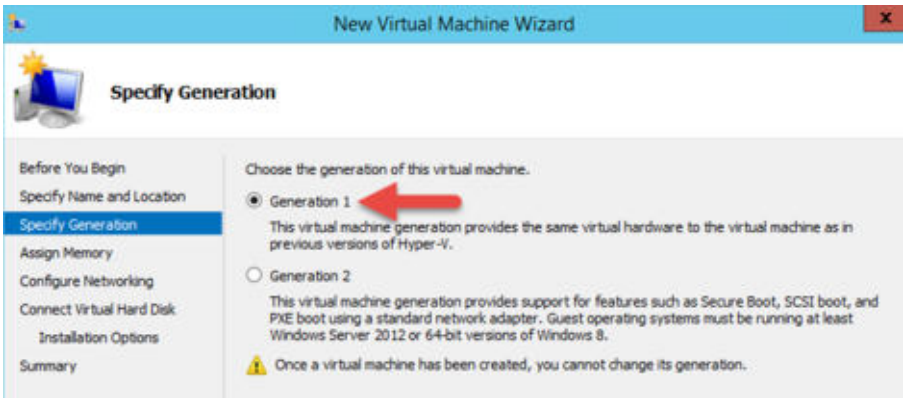

Figure 39: New Virtual Machine Wizard: Specify Generation

5. In the Assign Memory screen, enter the memory size (in MB) in the **Startup memory** field and then click the **Next** button. The recommended size is 26 GB for a "small" Prism Central VM or 44 GB for a "large" Prism Central VM.

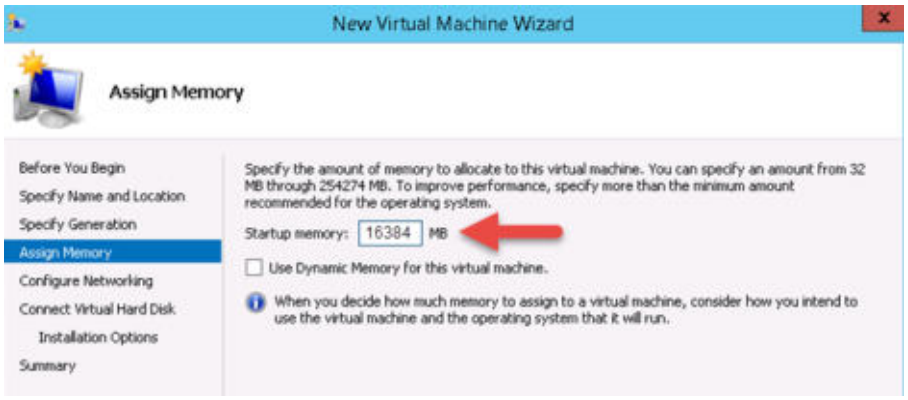

Figure 40: New Virtual Machine Wizard: Assign Memory

6. In the Configure Networking screen, select **ExternalSwitch** (not internal switch) in the **Connection** field and then click the **Next** button.

Figure 41: New Virtual Machine Wizard: Configure Networking

7. In the Connect Virtual Hard Disk screen, attach the virtual boot disk.

   a. Click the **Use an existing virtual hard disk** option and then the **browse** button, find the Hyper-V Prism Central boot disk file in the dialog box (for example, 5.18-PrismCentral-

boot.vhdx), click the **Open** button to select the file and close the window, and then click the **Next** button.

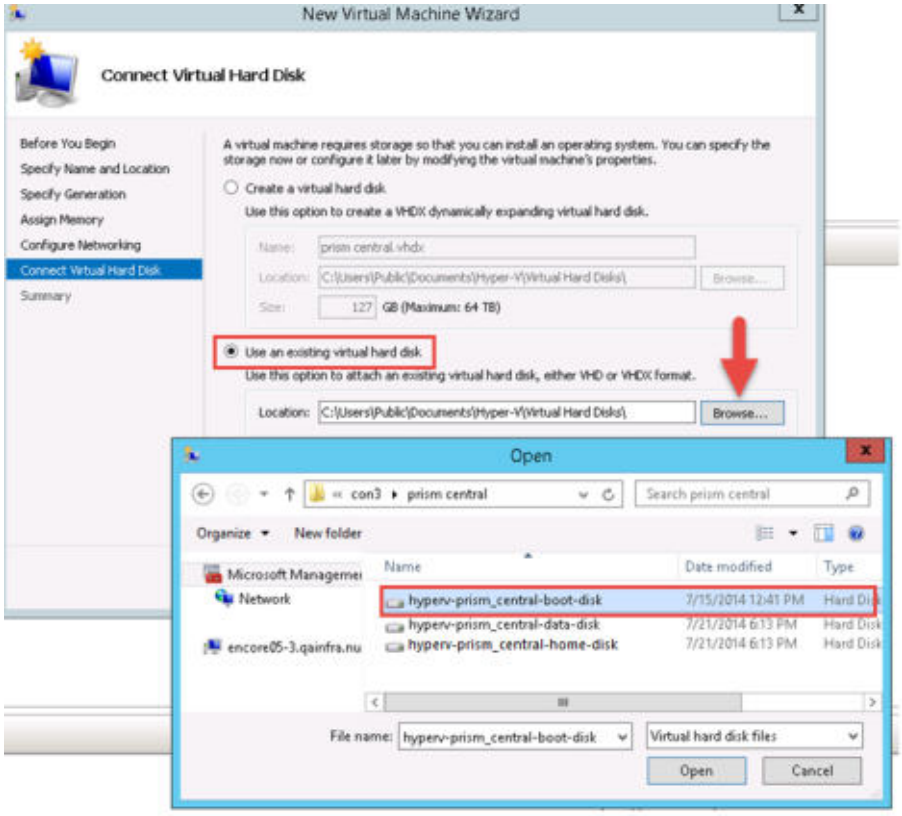

Figure 42: New Virtual Machine Wizard: Connect Virtual Hard Disk

b. In the Summary screen, verify all the settings are correct and then click the **Finish** button.

8. Right click the newly created Prism Central VM, and select **Settings** from the pull-down menu.

   Note: The following five steps apply to the Settings screen.

9. Select **Processor** in the Hardware section and set the number of processors. The recommended number is 6 for a "small" Prism Central VM or 10 for a "large" Prism Central VM.

10. Select **IDE Controller 0** in the Hardware section and **Hard Drive** in the IDE Controller section, and then click the **Add** button.

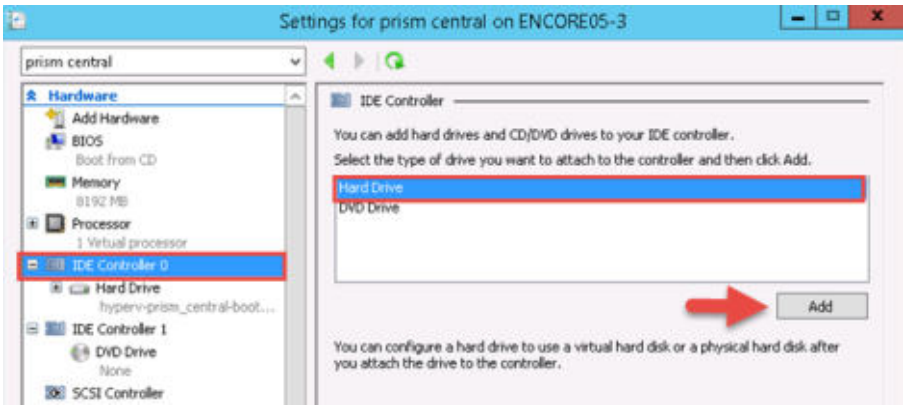

Figure 43: VM Settings Screen: IDE Controller

11. Add the Hyper-V Prism Central home disk (for example, 5.18-PrismCentral-home.vhdx). Select **Hard Drive** in the Hardware section and add the home disk. Select the following in the Hard Drive section:

    a. Select **IDE Controller 0** for the Controller field and **1 (in use)** for the Location field.

    b. Click the **Virtual hard disk** option and then the **browse** button, find the home disk file in the dialog box, and click the **Open** button to select the file and close the window.

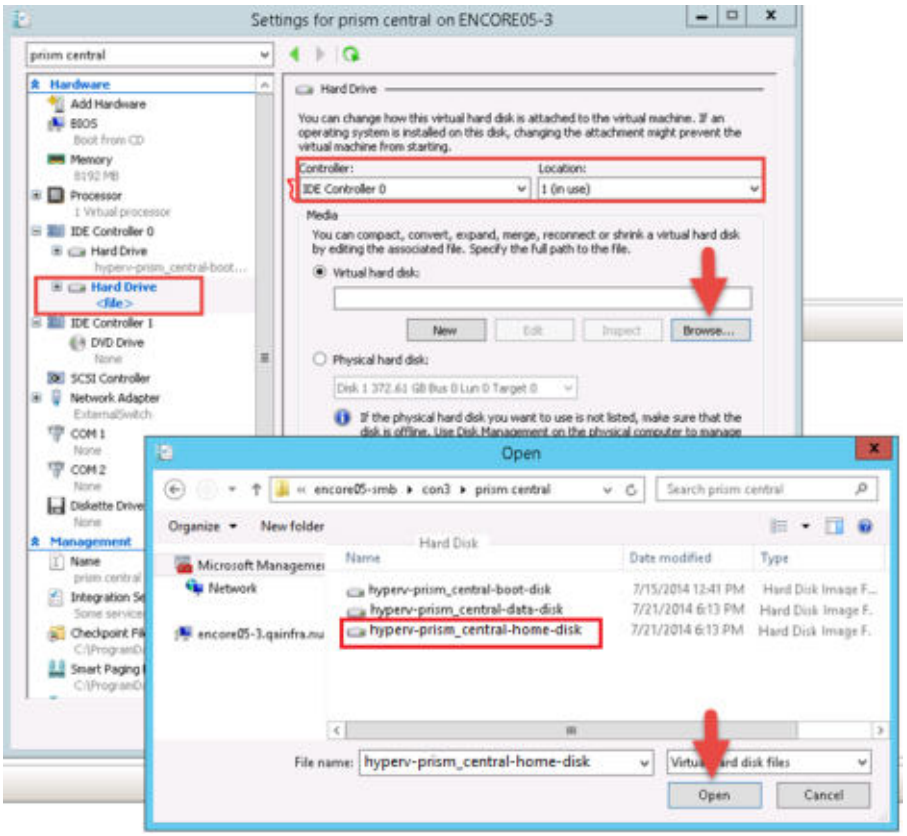

Figure 44: VM Settings Screen: Hard Drive

12. Add the Hyper-V Prism Central data disk (for example, 5.18-PrismCentral-data.vhdx). Select **Hard Drive** again in the Hardware section and add the data disk. Select the following in the Hard Drive section:

    a. Select **IDE Controller 1** for the Controller field and **1 (in use)** for the Location field.

    b. Click the **Virtual hard disk** option and then the **browse** button, find the data disk file in the dialog box, and click the **Open** button to select the file and close the window.

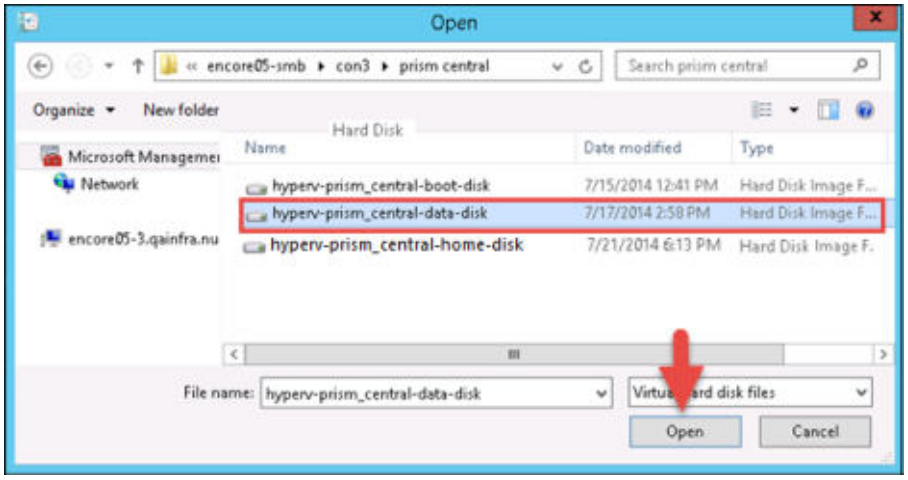

Figure 45: VM Settings Screen: Hard Drive

13. When the settings are correct, click the **Apply** button (lower right).

14. Start the Prism Central VM and log on through the Hyper-V Manager console (user name "`nutanix`" and password "`nutanix/4u`").

15. Assign a static IP address to the Prism Central VM as follows:

    a. Open the `ifcfg-eth0` file for editing.

    The following command opens the file using the `vi` editor:

    ```
    $ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth0
    ```

    b. Update the `NETMASK`, `IPADDR`, `BOOTPROTO`, and `GATEWAY` entries as needed.

    ```
    NETMASK="xxx.xxx.xxx.xxx"
    IPADDR="xxx.xxx.xxx.xxx"
    BOOTPROTO="none"
    ```

```
GATEWAY="xxx.xxx.xxx.xxx"
```

- Enter the desired netmask value in the `NETMASK` field. (Replace *xxx.xxx.xxx.xxx* with the appropriate value.)
- Enter the appropriate static IP address (usually assigned by your IT department) for the Prism Central VM in the `IPADDR` field.
- Enter `none` as the value in the `BOOTPROTO` field. (You might need to change the value from `dhcp` to `none` if you employ DHCP. Only a static address is allowed; DHCP is not supported.)
- Enter the IP address for your gateway in the `GATEWAY` field.

> Warning: Carefully check the file to ensure there are no syntax errors, whitespace at the end of lines, or blank lines in the file.

c. Save the changes.

d. Remove any existing Nutanix Controller VM entries, that is ones which include "NTNX-*<number>*-CVM", from the **/etc/hosts** file. (Be careful that you do not remove any other entries from the file.)

To edit the file using **vi**, enter

```
$ sudo vi /etc/hosts
```

When the Prism Central VM starts the first time and DHCP is enabled in the network, an entry similar to the following is added to the **/etc/hosts** file. This entry (if present) needs to be removed from the **/etc/hosts** file before restarting the Prism Central VM in the next step, which generates a new entry if DHCP is enabled.

```
127.0.0.1 NTNX-10-3-190-99-A-CVM
```

e. Restart the Prism Central VM.

```
$ sudo reboot
```

16. Log on to the Prism Central VM again and then enter the following command to create a cluster:

```
$ cluster --cluster_function_list="multicluster" -s static_ip_address create
```

The *static_ip_address* is the Prism Central VM IP address you assigned to the `IPADDR` parameter in step 4.

This completes Prism Central installation. The next step is to register clusters with Prism Central. Port 9440 needs to be open in both directions between the Prism Central VM and any registered clusters. The topic *Register (Unregister) Cluster with Prism Central* in the *Prism Central Guide* describes how to connect to an existing Prism Central instance.

10

RESOURCES, REQUIREMENTS, AND RECOMMENDATIONS

This collection of topics describes what you need to know before upgrading and where to find more information.

Learn About Upgrades: References and Resources

Start here to learn about upgrading your cluster. This section provides references and resources, an upgrade checklist, recommended order of upgrade, and a high-level, simplified description of what happens during the Nutanix upgrade process.

> CAUTION: Nutanix Support recommends that you do not update any firmware as a first step.

Nutanix recommends the following.

- Perform installation and upgrades during your scheduled maintenance window or outside your normal business hours.
- Apply upgrades to secondary or non-production environments before upgrading primary production systems.
- Perform upgrades through the web console by using Life Cycle Manager (LCM) whenever possible.
- If you choose to upgrade individual cluster software components, do the upgrade steps in Nutanix-recommended order for best results. Read and follow the order listed Recommended Upgrade Order on page 27.
- For dark sites, you can download most upgrade binaries and files onto secure computers with known secure portable media, according to your compliance policies. You can also update cluster software by LCM in a dark site mode, as described in the Life Cycle Manager Dark Site Guide.

Cluster Maintenance Window and Downtime

Nutanix recommends that you perform upgrades during your scheduled maintenance window or outside your normal business hours. If you cannot upgrade outside business hours, your users might experience some latency during the upgrade process. This latency might be noticeable for clusters that use only 1GbE network uplinks due to the limited bandwidth available for this configuration.

Guest VMs might live migrate between hosts depending on the upgrade being performed with little to no impact to their services. In this case, users can access their VMs and be able to work as normal during the upgrade.

For VMs that cannot live migrate, you might need to power down the VM or adjust its settings before upgrading. Typically this recommendation applies for any upgrade that requires a host reboot (like hypervisor upgrades). If you do not do this, an upgrade operation might stall when evacuating guest VMs.

When an Upgrade Fails an Upgrade Pre-check Test or Stalls

If a pre-upgrade check fails, please review any associated KB articles shown in the web console to resolve the issue. Once the issue is resolved, return to the web console and then try the upgrade again.

If the upgrade stalls (" is stuck"), please contact Nutanix Support for assistance. To help prevent cluster unavailability, Nutanix recommends that you do not attempt to solve this issue.

Compatibility

The table shown in *References and Resources* describes where you can find more information about upgrade paths, compatibility, and software interoperability ("what works with what"). This information is especially helpful if you are managing your clusters through Prism Element.

The Life Cycle Manager (LCM) panel or **Upgrade Software** panel in the web console lists software versions available for upgrade. If a version is listed, that version is compatible with your cluster and you can upgrade at any time to it.

If a version is not listed, it might not be available for "1-click" download. Depending on compatibility, you can still upgrade to these unlisted versions manually by downloading binaries and metadata files from the Nutanix Support portal and then uploading them through the web console. In some cases, you might need to upgrade to an intermediate version as part of a multi-step upgrade to upgrade to your desired version.

References and Resources

The Nutanix Support Portal contains references and resources to consult as you plan for your upgrade.

Table 5: Upgrade References and Resources

To learn about this topic	See this information
AOS Release Support Policy	The AOS release family supports short and long-term release types. • Short Term Support (STS) releases. STS releases have new features and also provide a regular upgrade path. • Long Term Support (LTS) releases. Nutanix maintains LTS release for a longer duration and primarily provide bug fixes for an extended period on a particular release family. Knowledge Base article KB 5505, Long Term Support (LTS) and Short Term Support (STS) Releases describes the Nutanix release and EOL support policies.

Compatibility and what works with what	• Hardware Model Compatibility Matrix. Hardware model Compatibility Matrix. Compatibility by Nutanix NX model, software-only model (Cisco UCS, Dell PowerEdge, and so on), AOS release, hypervisor, and feature (platform/cluster intermixing). • AHV guest OS Compatibility Matrix. Supported AHV guest OS compatibility matrix. Compatibility of the latest supported AHV guest VM OSes. • Nutanix Ready Solutions. Lists third-party solutions compatible with Nutanix software. • Software Product Interoperability Matrix. Software Product Operability matrix. Check "what works with what" for selected Nutanix software products, including version compatibility.
Software available at the Nutanix Support Portal	• Nutanix Support Portal Downloads page
Field and Security Advisories	Nutanix Support and Nutanix Security maintain a library of field and security advisories. Nutanix recommends that you check the most recent 3 months of advisories for any information relevant for your deployment.
Late-breaking release news	• All software documentation • NCC Guide and Release Notes • Prism Central Guides and Release Notes • Acropolis Family Release Notes • Life Cycle Manager documentation, including the LCM Dark Site Guide • AHV Guides and Release Notes
Supported Upgrade Paths	Acropolis Upgrade Paths lets you check the upgrade path from your current version to your target version for AOS, Prism Central, Calm, and Nutanix Files

Firewall Requirements

Available from the Nutanix Support portal, the *Port Reference* describes detailed port information (like protocol, service description, source, destination, and associated service) for

Nutanix products and services. It includes port and protocol information for 1-click upgrades and LCM updates.

Finding Your Cluster Software or Firmware Version

Use Life Cycle Manager (LCM) to see your cluster software and firmware versions.

Before you begin

If you want to quickly check your AOS or Prism Central, NCC, and LCM version, log on to the web console and select **About Nutanix** from the user menu under the user icon.

Procedure

1. In the web console, open the LCM dashboard.
   a. Prism Element web console: From the pull-down list on the left side of the main menu, select **Settings** > **LCM**.
   b. Prism Central web console: From the entities menu on the left side of the main menu, select **Administration** > **LCM**
2. Do one of these steps.
   a. If you have performed an inventory recently (24 hours or less), click **Inventory**.
      Inventory view shows the installed software and firmware versions, and the last time they were updated.
   b. If you have not performed an inventory recently, click **Perform Inventory**.
      See Performing Inventory With LCM on page 21 for the specific steps. After the inventory completes, you can see the installed versions.

Upgrade Recommendations and Requirements

Before upgrading your cluster, check these considerations and requirements, including but not limited to firewall requirements, download options, and general guidelines.

Nutanix Cluster Check

Before performing any upgrade procedure, make sure that you are running the latest version of the Nutanix Cluster Check (NCC) health checks and upgrade if necessary. To help maintain cluster health and take advantage of the latest NCC technology, Nutanix recommends that you keep your NCC version current. You can upgrade NCC through the web console, Life Cycle Manager, or command line. Then run the NCC checks. See Run NCC Checks on page 11.

Firmware

Nutanix Support recommends that you do not update any firmware as a first step. Depending on how you choose to upgrade, see Use LCM to Upgrade All Software and Firmware (Select All) on page 20 or Use LCM to Upgrade Specific Software and Firmware (Select Some) on page 26. Otherwise, see Recommended Upgrade Order on page 27.

Controller VM

- Do not upgrade VMware Tools on Nutanix Controller VMs.
- Do not edit or otherwise modify the Controller VM .vmx file. Each AOS version and upgrade includes a specific Controller VM virtual hardware configuration.

Let Upgrades Complete

Always wait for an upgrade operation to complete before attempting to perform any additional procedures or operations, including another upgrade procedure.

General Hypervisor Upgrade Recommendations

Make Sure Data Resiliency Status is OK

- If you have just upgraded your cluster AOS version, Nutanix recommends that you wait until the **Data Resiliency Status** is green or **OK** before upgrading your hypervisor. The Prism web console Home dashboard shows this status.

Perform Hypervisor Upgrades Through the Prism Element Web Console

- You cannot perform a hypervisor upgrade of nodes or clusters through Prism Central (if installed and configured). To upgrade your hypervisor, log on to the Prism web console for any node in the cluster you are upgrading.

General Workflow to Upgrade the Existing Hypervisor

- Check the AOS and AHV release notes for late-breaking upgrade information.
- Run the Nutanix Cluster Check (NCC) health checks from any Controller VM in the cluster.
- Download the available hypervisor software from the vendor and the metadata file (JSON) from the Nutanix Support portal. If you are upgrading AHV, you can download the binary bundle from the Nutanix Support portal.
- Upload the software and metadata through **Upgrade Software** in the Prism Element web console.

Hypervisor Versions in a Cluster

Ensure that all the hypervisors hosted in your cluster are running the same version (All ESXi hosts running the same version, all AHV hosts running the same version, and so on). Nutanix does not recommend running a major version like ESXi 6.5 on some hosts and running ESXi 6.0 on the remaining hosts in the same cluster for production use. The NCC check `same_hypervisor_version_check` returns a FAIL status in this case. Using the **Upgrade Software** (1-click upgrade) feature would not complete successfully in this case.

Mixing different hypervisor versions in the same cluster is temporarily allowed for deferring a hypervisor upgrade as part of an add-node/expand cluster operation, reimaging a node as part of a break-fix procedure, planned migrations, and similar temporary operations.

Guest VMs Running in an Affinity/Anti-Affinity Rules Environment

- Hypervisor upgrades might not complete successfully in environments where third-party or other applications apply affinity or anti-affinity rules. For example, some antivirus appliances or architectures might install an antivirus scanning guest VM on each node in your cluster. This guest VM might not be allowed to power off or migrate from the host being upgraded, causing maintenance mode to time out. In this case, disable such rules or power off such VMs before upgrading.

  Note: When performing one-click hypervisor upgrades in clusters where you are deploying Nutanix Files, disable the anti-affinity rules on all FSVMs. After the hypervisor successfully upgrades, enable the anti-affinity rules on the FSVMs.

Auto-provisioning Guest VMs

- Hypervisor upgrades might not complete successfully in environments where applications or scripts are configured to automatically provision guest VMs. For example, if VMware View Composer is configured to automatically provision guest VMs and attempts to place the VMs on a host being upgraded (and placed in maintenance mode), maintenance mode operations might time out, and prevent the upgrade operation. In this case, disable such applications or scripts before upgrading.

AHV Upgrade Recommendations

- Nutanix recommends that you upgrade to the latest supported AHV version as soon as possible if you upgrade AOS and are deploying an AHV environment. AHV is bundled with AOS and most versions are also available from the Nutanix support portal.
- After upgrading AOS, your cluster can temporarily run the unsupported or older AHV version until you complete the AHV upgrade. See the Compatibility Matrix.
- If you have VMs configured with host affinity to a single host, it is recommended that you shut down the VMs gracefully before starting the upgrade as such VMs cannot be migrated and will be powered off

Before You Upgrade AHV or Perform LCM Upgrades

If you have created or updated any guest VMs by using the aCLI `vm.create` or `vm.update` commands with the `ha_priority=-1` switch, Nutanix recommends that you instead update these guest VMs and add the agent VM option.

Setting `ha_priority=-1` prevents this VM from restarting in case of high availability events. Setting the guest VM as an agent VM ensures that this VM remains powered off during AHV or LCM upgrades.

Agent VMs are never migrated to any other host in the cluster. If an HA event occurs or the host is put in maintenance mode, agent VMs are powered off and are powered on on the same host once that host returns to a normal state. Do one of the following:

- In the Prism web console **Update VM** dialog box, select the **Use this VM as an agent VM** option in the dialog box for each VM where you applied the `ha_priority=-1` switch.
- From the `acli` command line, use the commands `vm.create` *`name_list`* `agent_vm=true` or `vm.update` *`name_list`* `agent_vm=true`, where *`name_list`* is a comma-separated list of VM names.

Firmware Upgrade Recommendations and Limitations

Use Life Cycle Manager (LCM) to update firmware for all hardware components in the cluster.

Before You Upgrade AHV or Perform LCM Upgrades

If you have created or updated any guest VMs by using the aCLI `vm.create` or `vm.update` commands with the `ha_priority=-1` switch, Nutanix recommends that you instead update these guest VMs and add the agent VM option.

Setting `ha_priority=-1` prevents this VM from restarting in case of high availability events. Setting the guest VM as an agent VM ensures that this VM remains powered off during AHV or LCM upgrades.

Agent VMs are never migrated to any other host in the cluster. If an HA event occurs or the host is put in maintenance mode, agent VMs are powered off and are powered on on the same host once that host returns to a normal state. Do one of the following:

- In the Prism web console **Update VM** dialog box, select the **Use this VM as an agent VM** option in the dialog box for each VM where you applied the `ha_priority=-1` switch.
- From the `acli` command line, use the commands `vm.create` *`name_list`* `agent_vm=true` or `vm.update` *`name_list`* `agent_vm=true`, where *`name_list`* is a comma-separated list of VM names.

Resources

> CAUTION: Nutanix Support recommends that you do not update any firmware as a first step as part of the upgrade process.

After upgrading AOS and before upgrading your hypervisor on each cluster, perform a Life Cycle Manager (LCM) inventory, update LCM, and upgrade any recommended firmware. See the Life Cycle Manager documentation for more information.

1. PE: Run and upgrade Life Cycle Manager (LCM):
   - Perform an LCM inventory (also updates LCM framework).
   - Upgrade SATA DOM firmware (for hardware using SATA DOMs) as recommended by LCM.
   - Upgrade all other firmware as recommended by LCM (BMC / BIOS / other).

For release-specific information (all branches), see the Life Cycle Manager Release Notes.

LCM performs two functions: taking inventory of the cluster and performing updates on the cluster.

Components

LCM update is not supported for single-node clusters, because firmware updates usually require services to be stopped. (In a single-node cluster there is no other node to take over the workload of the stopped node.) For a single-node cluster, you must update firmware manually, as described in the *Nutanix NX and SX Series Hardware Administration Guide: Manual Firmware Updates*.

BMC and BIOS firmware

Perform an LCM inventory to see if any BMC or BIOS updates are available.

> Note: BIOS and BMC updates take longer than other updates, because the process involves multiple reboots.

Hardware component firmware

Perform an LCM inventory to see if any firmware updates for hardware components are available.

> Note: LCM does not currently support firmware updates for network cards; these must be updated manually.

Upgrade Process - What Happens During an Upgrade

Start here for a high-level, simplified description of what happens during the Nutanix cluster upgrade process, including upgrading two-node clusters.

Life Cycle Manager

1. If updates for the LCM framework are available, LCM auto-updates its own framework, then continues with the operation.

2. After updating itself, if necessary, LCM runs the series of pre-checks. LCM runs a series of pre-checks before beginning an inventory or update operation. If a check fails, the operation does not run.
3. When the pre-checks are complete, LCM looks at the available component updates and batches them according to dependencies. LCM batches updates to reduce the cluster downtime. When updates are batched, LCM only performs the pre-update and post-update actions once. For example, on NX platforms, BIOS updates depend on BMC updates, so LCM batches them so the BMC always updates before the BIOS on each node.
4. After you choose to apply cluster component updates, LCM chooses a node and performs any necessary pre-update actions.
5. LCM performs the update.
6. LCM performs any necessary post-update actions.
7. When cluster data resiliency returns to **Normal**, LCM moves to the next node and repeats the process.

Nutanix Cluster Check (NCC)

If all Controller VMs or Prism Central VMs are up (all services running and UP status), the NCC upgrade can proceed.

1. The upgrade process copies NCC software to each Controller VM or Prism Central VM.
2. The cluster_health service, which is responsible for health monitoring and the logic underlying cluster alerts, restarts on each node. No services involved in the data path restart.

This process typically takes about 5 minutes.

Prism Central

1. Pre-upgrade checks run to help ensure you can upgrade your Prism Central cluster.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click **Back to Versions** and restart the upgrade. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
2. The process copies the Prism Central upgrade software to each Prism Central VM in the cluster.
3. For single-VM Prism Central deployments, the software is staged, then the Prism Central VM upgrades and effectively restarts. The web console is momentarily unavailable but has no effect on the Prism Element clusters managed by Prism Central. Log on again to the web console and ensure that all upgrade tasks have completed to 100 percent.

   This process takes approximately 25 minutes.
4. For three-VM Prism Central scale-out deployments, the first Prism Central VM upgrades and effectively restarts. The Prism Central VM upgrade and restart tasks process in a round-robin fashion for all Prism Central VMs. The web console is available during the upgrade. Ensure that all upgrade tasks have completed to 100 percent.

   This process takes approximately 1 hour.

Foundation Software

The Foundation service is typically only running if you are doing an LCM upgrade or expand cluster (add node) operation. If all Controller VMs are up (all services in UP status) and Foundation service is stopped, the Foundation binaries are updated for all nodes and the upgrade process completes in about 1 minute. Controller VMs, hypervisor hosts, and all other services continue running and are not restarted or rebooted.

AOS

> Note: For large clusters, an AOS upgrade might consume more storage space than expected during the upgrade process. To help avoid this issue, contact Nutanix Support for a workaround. Typically, the Curator service helps return storage space usage to close to pre-upgrade levels approximately 6 to 12 hours after upgrading AOS.

1. Pre-upgrade checks run to help ensure you can upgrade your Prism Element cluster.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click **Back to Versions** and restart the upgrade. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
2. The process copies the AOS upgrade software to each Controller VM in the cluster.
3. The first Controller VM is upgraded and restarts.

   Storage traffic from guest VMs redirects to other Controller VMs in the cluster during the upgrade. Guest VMs might experience minor latency while traffic is redirected.
4. The Controller VM upgrade and restart tasks process in a round-robin fashion for all Controller VMs.

   The entire process takes 15 minutes or so per node. Two-node clusters might take longer due to the additional step of synchronizing data while transitioning between single and two node state. Nevertheless, the cluster remains operational during upgrade.

AOS (Two-Node Clusters)

The Prism Web Console Guide includes more complete information about two-node-clusters, especially about failover and recovery scenarios. The upgrade process in a two-node cluster might take longer than the usual process due to the additional step of synchronizing data while transitioning between single and two node state. Nevertheless, the cluster remains operational during upgrade.

Because each node restarts during upgrade, the upgrade process for two-node clusters effectively triggers two failover and recovery events. As a result, you will see Alerts in the web console during the upgrade process:

- `Two node cluster changed state to stand-alone mode`
- `Node detached from metadata ring`
- `Two node cluster state change to preparing to go back to two-node mode`
- `Two node cluster state change to normal mode`

1. Pre-upgrade checks run to help ensure you can upgrade your Prism Element cluster.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click **Back to Versions** and restart the upgrade. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
2. The process copies the AOS upgrade software to each Controller VM in the cluster.
3. The first Controller VM upgrades and effectively restarts.

   During this time, the cluster behaves as if a node failure occurred and enters a failover state (stand-alone/single-node mode).
4. The cluster transitions to two-node cluster mode after the first Controller VM successfully completes the upgrade.
5. The process repeats for the next Controller VM: failover, transition to stand-alone/single-node mode, and so on.

6. The cluster transitions to two-node cluster mode after the second Controller VM successfully completes the upgrade.

Firmware

See Firewall Requirements on page 100 for LCM rules and Life Cycle Manager documentation (especially the release notes for any dependencies) for more information. Your cluster AOS and Foundation versions determine which components LCM can inventory or update.

1. Run an inventory to see a full list of available updates.
2. Pre-upgrade checks run to help ensure you can upgrade your cluster with LCM.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click run an inventory again. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
3. Except for certain modules for Dell platforms, all firmware updates performed through LCM require the hosts to boot into a CentOS-based staging area called Phoenix.

   LCM has built-in intelligence that tells it the order to do firmware updates, eliminating any user worry about choosing which updates to perform first. LCM automatically satisfies all dependencies between all installed firmware.

   If multiple hosts require firmware updates, LCM will evacuate guest VMs from the hosts one-at-a-time and boot them into the Phoenix staging area to perform the updates. Guest VMs are not powered off. Your workload should continue to be served without disruption.

   Depending on the firmware being upgraded, the hypervisor host might restart several times into Phoenix. This is expected behavior. In this case, do not intervene.
4. After firmware updates are completed. the node hypervisor host starts, followed by the node Controller VM, and ensures sure that all clusters services are up and running.
5. Finally, LCM ensures that the local hypervisor is schedulable and can host guest VMs before the upgrade continues to the next node.

This process typically takes 45 minutes per node for SATA DOM firmware upgrades. Otherwise, the amount of time depends on the number of firmware updates occurring on a node and how long it takes to evacuate guest VMs from each host.

Hypervisors

1. Pre-upgrade checks run to help ensure you can upgrade your Prism Element cluster.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click **Back to Versions** and restart the upgrade. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
2. The process selects a host and migrates guest VMs to other hypervisor hosts in the cluster. Once completed, process places the host (with its remaining Controller VM) into maintenance mode.
3. The process copies the hypervisor upgrade software to the host, stages it, then installs it.
4. The upgraded host is restarted, leaves maintenance mode, and starts the Controller VM.
5. After all Controller VM services successfully restart with a status of UP, the host rebalances guest VMs across the upgraded node.
6. This process repeats for each hypervisor host in the cluster until all hosts are upgraded.

This process takes approximately 30 to 45 minutes per node, depending on the amount of time it takes to migrate guest VMs to other hosts. See also General Hypervisor Upgrade Recommendations on page 102.

Nutanix Files (File Server VM)

1. Pre-upgrade checks run to help ensure you can upgrade your Prism Element cluster.

   If a check fails, the web console displays information about what caused the check to fail, then the upgrade process stops. Resolve the issue (perhaps with the help of Nutanix Support), then click **Back to Versions** and restart the upgrade. The Nutanix Support portal includes Knowledge Base articles describing pre-upgrade checks.
2. The process copies the Files upgrade software to file server VM (FSVM) in the cluster.
3. While an FSVM is unavailable during upgrade, users connected to shares hosted by this node might experience a temporary loss of connectivity - typically for 20 to 30 seconds. Another FSVM takes over hosting those shares, to provide continued user share access.
4. After each FSVM is updated successfully and restarts, the upgrade process ensures that the FSVM can once again host shares before starting to upgrade the next FSVM.
5. The process repeats until all FSVMs are upgraded.

The upgrade process typically takes about 20 to 30 minutes per FSVM.

Calm, Objects, and Other Nutanix Software Installed on Prism Central or Prism Element

You update these software products as part of the LCM inventory and update process. *See Life Cycle Manager - Inventory and Update LCM Process*.

AHV OVERVIEW

As the default option for Nutanix HCI, the native Nutanix hypervisor, AHV, represents a unique approach to virtualization that offers the powerful virtualization capabilities needed to deploy and manage enterprise applications. AHV compliments the HCI value by integrating native virtualization along with networking, infrastructure, and operations management with a single intuitive interface - Nutanix Prism.

Virtualization teams find AHV easy to learn and transition to from legacy virtualization solutions with familiar workflows for VM operations, live migration, VM high availability, and virtual network management. AHV includes resiliency features, including high availability and dynamic scheduling without the need for additional licensing, and security is integral to every aspect of the system from the ground up. AHV also incorporates the optional Flow Security and Networking, allowing easy access to hypervisor-based network microsegmentation and advanced software-defined networking.

See the *Field Installation Guide* for information about how to deploy and create a cluster. Once you create the cluster by using Foundation, you can use this guide to perform day-to-day management tasks.

AOS and AHV Compatibility

For information about the AOS and AHV compatibility with this release, see *Software Bundled in This Release Family* in the *Acropolis Family Release Notes*.

Limitations

For information about AHV configuration limitations, see Nutanix Configuration Maximums webpage.

Nested Virtualization

Nutanix does not support nested virtualization (nested VMs) in an AHV cluster.

Storage Overview

AHV uses a Distributed Storage Fabric to deliver data services such as storage provisioning, snapshots, clones, and data protection to VMs directly.

In AHV clusters, AOS passes all disks to the VMs as raw SCSI block devices. By that means, the I/O path is lightweight and optimized. Each AHV host runs an iSCSI redirector, which establishes a highly resilient storage path from each VM to storage across the Nutanix cluster.

QEMU is configured with the iSCSI redirector as the iSCSI target portal. Upon a login request, the redirector performs an iSCSI login redirect to a healthy Stargate (preferably the local one).

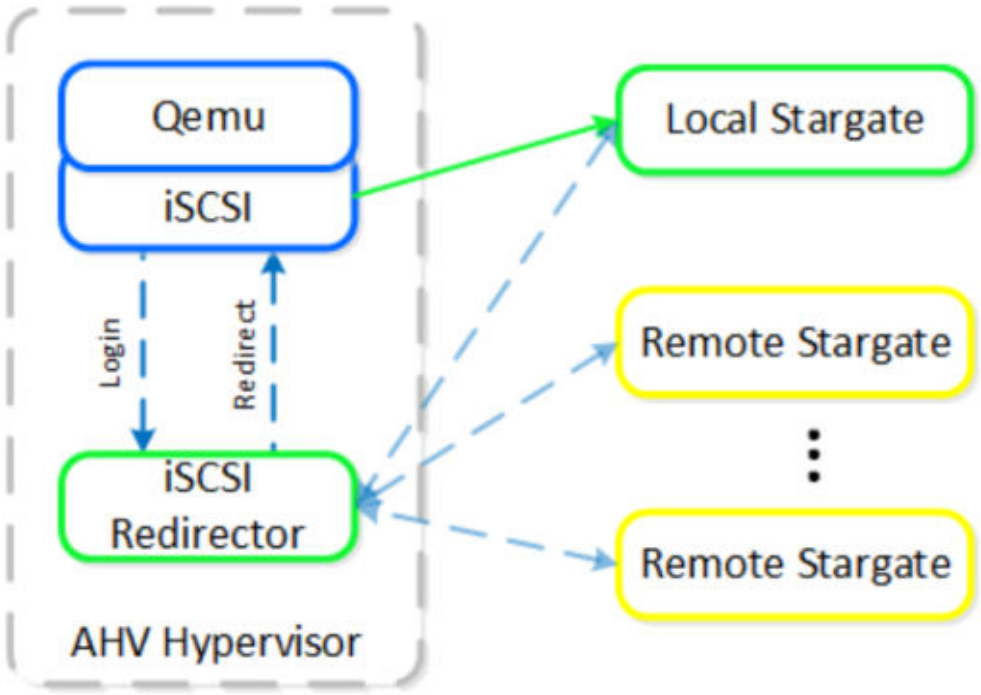

Figure 1: AHV Storage

AHV Turbo

AHV Turbo represents significant advances to the data path in AHV. AHV Turbo provides an I/O path that bypasses QEMU and services storage I/O requests, which lowers CPU usage and increases the amount of storage I/O available to VMs.

AHV Turbo is enabled by default on VMs running in AHV clusters.

When using QEMU, all I/O travels through a single queue, which can impact performance. The AHV Turbo design introduces a multi-queue approach to allow data to flow from a VM to the storage, resulting in a much higher I/O capacity. The storage queues scale out automatically to match the number of vCPUs configured for a given VM, making even higher performance possible as the workload scales up.

The AHV Turbo technology is transparent to the VMs, but you can achieve even greater performance if:

- The VM has multi-queue enabled and an optimum number of queues. See Enabling RSS Virtio-Net Multi-Queue by Increasing the Number of VNIC Queues on page 80 for instructions about how to enable multi-queue and set an optimum number of queues. Consult your Linux distribution documentation to make sure that the guest operating system fully supports multi-queue before you enable it.
- You have installed the latest Nutanix VirtIO package for Windows VMs. Download the VirtIO package from the Downloads section of Nutanix Support Portal. No additional configuration is required.
- The VM has more than one vCPU.
- The workloads are multi-threaded.

Acropolis Dynamic Scheduling in AHV

Acropolis Dynamic Scheduling (ADS) proactively monitors your cluster for any compute and storage I/O contentions or hotspots over a period of time. If ADS detects a problem, ADS creates a migration plan that eliminates hotspots in the cluster by migrating VMs from one host to another.

You can monitor VM migration tasks from the **Task** dashboard of the Prism Element web console.

Following are the advantages of ADS:

- ADS improves the initial placement of the VMs depending on the VM configuration.
- Nutanix Volumes uses ADS for balancing sessions of the externally available iSCSI targets.

> Note: ADS honors all the configured host affinities, VM-host affinities, VM-VM antiaffinity policies, and HA policies.

By default, ADS is enabled and Nutanix recommends you keep this feature enabled. However, see Disabling Acropolis Dynamic Scheduling on page 8 for information about how to disable the ADS feature. See Enabling Acropolis Dynamic Scheduling on page 8 for information about how to enable the ADS feature if you previously disabled the feature.

ADS monitors the following resources:

- VM CPU Utilization: Total CPU usage of each guest VM.
- Storage CPU Utilization: Storage controller (Stargate) CPU usage per VM or iSCSI target

ADS does not monitor memory and networking usage.

How Acropolis Dynamic Scheduling Works

Lazan is the ADS service in an AHV cluster. AOS selects a Lazan manager and Lazan solver among the hosts in the cluster to effectively manage ADS operations.

ADS performs the following tasks to resolve compute and storage I/O contentions or hotspots:

- The Lazan manager gathers statistics from the components it monitors.
- The Lazan solver (runner) checks the statistics for potential anomalies and determines how to resolve them, if possible.
- The Lazan manager invokes the tasks (for example, VM migrations) to resolve the situation.

> Note:
>
> - During migration, a VM consumes resources on both the source and destination hosts as the High Availability (HA) reservation algorithm must protect the VM on both hosts. If a migration fails due to lack of free resources, turn off some VMs so that migration is possible.
> - If a problem is detected and ADS cannot solve the issue (for example, because of limited CPU or storage resources), the migration plan might fail. In these cases, an alert is generated. Monitor these alerts from the **Alerts** dashboard of the Prism Element web console and take necessary remedial actions.
> - If the host, firmware, or AOS upgrade is in progress and if any resource contention occurs during the upgrade period, ADS does not perform any resource contention rebalancing.

When Is a Hotspot Detected?

Lazan runs every 15 minutes and analyzes the resource usage for at least that period of time. If the resource utilization of an AHV host remains >85% for the span of 15 minutes, Lazan triggers migration tasks to remove the hotspot.

> Note: For a storage hotspot, ADS looks at the last 40 minutes of data and uses a smoothing algorithm to use the most recent data. For a CPU hotspot, ADS looks at the last 10 minutes of data only, that is, the average CPU usage over the last 10 minutes.

Following are the possible reasons if there is an obvious hotspot, but the VMs did not migrate:

- Lazan cannot resolve a hotspot. For example:
  - If there is a huge VM (16 vCPUs) at 100% usage, and accounts for 75% of the AHV host usage (which is also at 100% usage).
  - The other hosts are loaded at ~ 40% usage.

  In these situations, the other hosts cannot accommodate the large VM without causing contention there as well. Lazan does not prioritize one host or VM over others for contention, so it leaves the VM where it is hosted.
- Number of all-flash nodes in the cluster is less than the replication factor.

  If the cluster has an RF2 configuration, the cluster must have a minimum of two all-flash nodes for successful migration of VMs on all the all-flash nodes.

Migrations Audit

Prism Central displays the list of all the VM migration operations generated by ADS. In Prism Central, go to **Menu** -> **Activity** -> **Audits** to display the VM migrations list. You can filter the migrations by clicking **Filters** and selecting **Migrate** in the **Operation Type** tab. The list displays all the VM migration tasks created by ADS with details such as the source and target host, VM name, and time of migration.

Disabling Acropolis Dynamic Scheduling

Perform the procedure described in this topic to disable ADS. Nutanix recommends you keep ADS enabled.

Procedure

1. Log onto a Controller VM in your cluster with SSH.
2. Disable ADS.

   ```
   nutanix@cvm$ acli ads.update enable=false
   ```

   Even after you disable the feature, the checks for the contentions or hotspots run in the background and if any anomalies are detected, an alert is raised in the **Alerts** dashboard. However, no action is taken by ADS to solve the contentions. You need to manually take the remedial actions or you can enable the feature.

Enabling Acropolis Dynamic Scheduling

If you have disabled the ADS feature and want to enable the feature, perform the following procedure.

Procedure

1. Log onto a Controller VM in your cluster with SSH.

2. Enable ADS.

```
nutanix@cvm$ acli ads.update enable=true
```

Virtualization Management Web Console Interface

You can manage the virtualization management features by using the Prism GUI (Prism Element and Prism Central web consoles).

You can do the following by using the Prism web consoles:

- Configure network connections
- Create virtual machines
- Manage virtual machines (launch console, start/shut down, take snapshots, migrate, clone, update, and delete)
- Monitor virtual machines
- Enable VM high availability

See *Prism Web Console Guide* and *Prism Central Guide* for more information.

Finding the AHV Version on Prism Element

You can see the installed AHV version in the Prism Element web console.

About this task

To view the AHV version installed on the host, do the following.

Procedure

1. Log on to Prism Web Console
2. The **Hypervisor Summary widget** widget on the top left side of the Home page displays the AHV version.

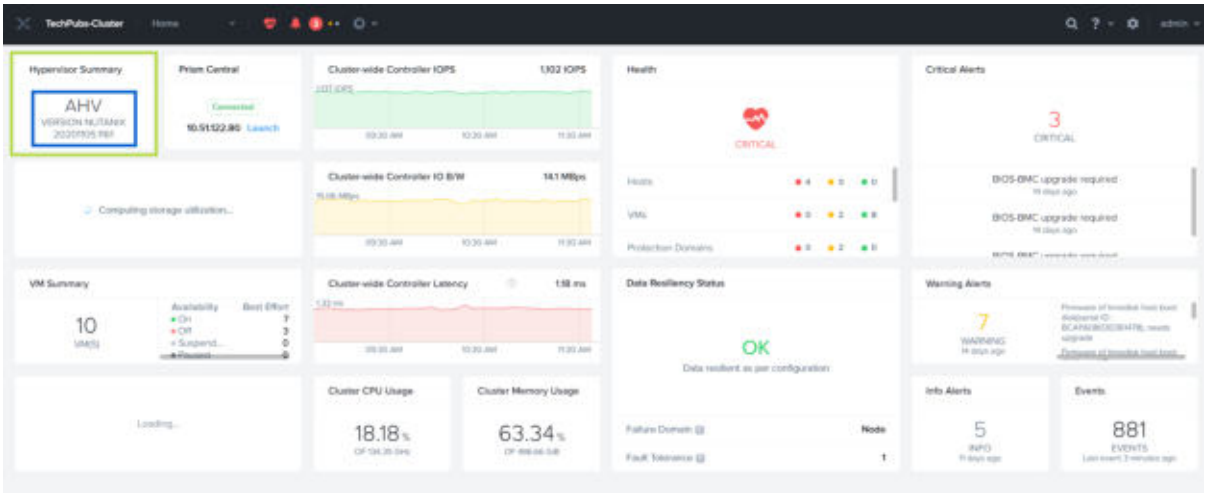

Figure 2: LCM Page Displays AHV Version

Finding the AHV Version on Prism Central

You can see the installed AHV version in the Prism Central console.

About this task

To view the AHV version installed on any host in the clusters managed by the Prism Central, do the following.

Figure 3: Finding the AHV Version on Prism Central

A video on this topic is available https://players.brightcove.net/5850956868001/xJM5EiUJJ_default/index.html?videoId=6275777446001 on Brightcove.

Procedure

1. Log on to Prism Central.
2. In side bar, select **Hardware** > **Hosts** > **Summary** tab.
3. Click the host you want to see the hypervisor version for.
4. The Host detail view page displays the **Properties** widget that lists the `Hypervisor Version`.

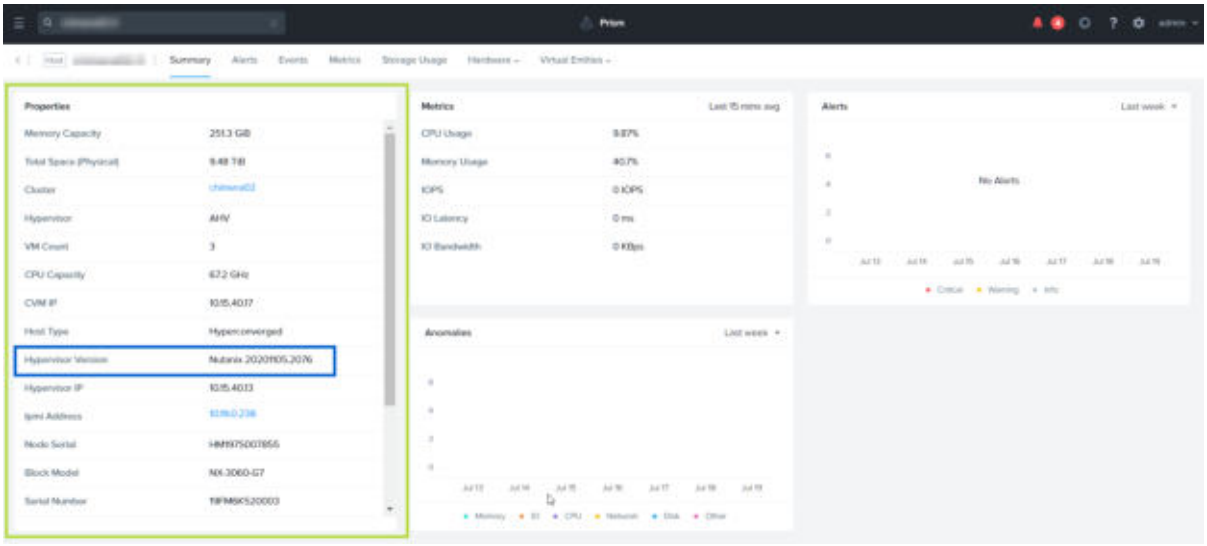

Figure 4: Hypervisor Version in Host Detail View

2

NODE MANAGEMENT

Nonconfigurable AHV Components

The components listed here are configured by the Nutanix manufacturing and installation processes. Do not modify any of these components except under the direction of Nutanix Support.

Nutanix Software

Modifying any of the following Nutanix software settings may inadvertently constrain performance of your Nutanix cluster or render the Nutanix cluster inoperable.

- Local datastore name.
- Configuration and contents of any CVM (except memory configuration to enable certain features).

Important: Note the following important considerations about CVMs.

- Do not delete the Nutanix CVM.
- Do not take a snapshot of the CVM for backup.
- Do not rename, modify, or delete the **admin** and **nutanix** user accounts of the CVM.
- Do not create additional CVM user accounts.

  Use the default accounts (**admin** or **nutanix**), or use `sudo` to elevate to the **root** account.
- Do not decrease CVM memory below recommended minimum amounts required for cluster and add-in features.

  Nutanix Cluster Checks (NCC), preupgrade cluster checks, and the AOS upgrade process detect and monitor CVM memory.
- Nutanix does not support the usage of third-party storage on the host part of Nutanix clusters.

  Normal cluster operations might be affected if there are connectivity issues with the third-party storage you attach to the hosts in a Nutanix cluster.
- Do not run any commands on a CVM that are not in the Nutanix documentation.

AHV Settings

Nutanix AHV is a cluster-optimized hypervisor appliance.

Alteration of the hypervisor appliance (unless advised by Nutanix Technical Support) is unsupported and may result in the hypervisor or VMs functioning incorrectly.

Unsupported alterations include (but are not limited to):

- Hypervisor configuration, including installed packages
- Controller VM virtual hardware configuration file (.xml file). Each AOS version and upgrade includes a specific Controller VM virtual hardware configuration. Therefore, do not edit or otherwise modify the Controller VM virtual hardware configuration file.
- iSCSI settings
- Open vSwitch settings
- Installation of third-party software not approved by Nutanix
- Installation or upgrade of software packages from non-Nutanix sources (using yum, rpm, or similar)
- Taking snapshots of the Controller VM
- Creating user accounts on AHV hosts
- Changing the timezone of the AHV hosts. By default, the timezone of an AHV host is set to UTC.
- Joining AHV hosts to Active Directory or OpenLDAP domains

Controller VM Access

Although each host in a Nutanix cluster runs a hypervisor independent of other hosts in the cluster, some operations affect the entire cluster.

Most administrative functions of a Nutanix cluster can be performed through the web console (Prism), however, there are some management tasks that require access to the Controller VM (CVM) over SSH. Nutanix recommends restricting CVM SSH access with password or key authentication.

This topic provides information about how to access the Controller VM as an `admin` user and `nutanix` user.

You can perform most administrative functions of a Nutanix cluster through the Prism web consoles or REST API. Nutanix recommends using these interfaces whenever possible and disabling Controller VM SSH access with password or key authentication. Some functions, however, require logging on to a Controller VM with SSH. Exercise caution whenever connecting directly to a Controller VM as it increases the risk of causing cluster issues.

> Warning: When you connect to a Controller VM with SSH, ensure that the SSH client does not import or change any locale settings. The Nutanix software is not localized, and running the commands with any locale other than en_US.UTF-8 can cause severe cluster issues.
>
> To check the locale used in an SSH session, run `/usr/bin/locale`. If any environment variables are set to anything other than en_US.UTF-8, reconnect with an SSH configuration that does not import or change any locale settings.

Admin User Access to Controller VM

You can access the Controller VM as the admin user (**admin** user name and password) with SSH. For security reasons, the password of the admin user must meet Controller VM Password Complexity Requirements. When you log on to the Controller VM as the admin user for the first time, you are prompted to change the default password.

See Controller VM Password Complexity Requirements to set a secure password.

After you have successfully changed the password, the new password is synchronized across all Controller VMs and interfaces (Prism web console, nCLI, and SSH).

Note:

- As an `admin` user, you cannot access nCLI by using the default credentials. If you are logging in as the `admin` user for the first time, you must log on through the Prism web console or SSH to the Controller VM. Also, you cannot change the default password of the `admin` user through nCLI. To change the default password of the `admin` user, you must log on through the Prism web console or SSH to the Controller VM.
- When you make an attempt to log in to the Prism web console for the first time after you upgrade to AOS 5.1 from an earlier AOS version, you can use your existing `admin` user password to log in and then change the existing password (you are prompted) to adhere to the password complexity requirements. However, if you are logging in to the Controller VM with SSH for the first time after the upgrade as the `admin` user, you must use the default `admin` user password (Nutanix/4u) and then change the default password (you are prompted) to adhere to the Controller VM Password Complexity Requirements.
- You cannot delete the `admin` user account.
- The default password expiration age for the `admin` user is 60 days. You can configure the minimum and maximum password expiration days based on your security requirement.
  - `nutanix@cvm$ sudo chage -M MAX-DAYS admin`
  - `nutanix@cvm$ sudo chage -m MIN-DAYS admin`

When you change the `admin` user password, you must update any applications and scripts using the `admin` user credentials for authentication. Nutanix recommends that you create a user assigned with the admin role instead of using the `admin` user for authentication. The *Prism Web Console Guide* describes authentication and roles.

Following are the default credentials to access a Controller VM.

Table 1: Controller VM Credentials

Interface	Target	User Name	Password
SSH client	Nutanix Controller VM	`admin`	Nutanix/4u
		`nutanix`	nutanix/4u
Prism web console	Nutanix Controller VM	`admin`	Nutanix/4u

Accessing the Controller VM Using the Admin User Account

About this task

Perform the following procedure to log on to the Controller VM by using the admin user with SSH for the first time.

Procedure

1. Log on to the Controller VM with SSH by using the management IP address of the Controller VM and the following credentials.

   - User name: `admin`
   - Password: `Nutanix/4u`

   You are now prompted to change the default password.

2. Respond to the prompts, providing the current and new `admin` user password.

   ```
   Changing password for admin.
   Old Password:
   New password:
   Retype new password:
   Password changed.
   ```

   See the requirements listed in Controller VM Password Complexity Requirements to set a secure password.

   For information about logging on to a Controller VM by using the `admin` user account through the Prism web console, see *Logging Into The Web Console* in the *Prism Web Console Guide*.

Nutanix User Access to Controller VM

You can access the Controller VM as the `nutanix` user (**`nutanix`** user name and password) with SSH. For security reasons, the password of the `nutanix` user must meet the Controller VM Password Complexity Requirements on page 16. When you log on to the Controller VM as the `nutanix` user for the first time, you are prompted to change the default password.

See Controller VM Password Complexity Requirements on page 16to set a secure password.

After you have successfully changed the password, the new password is synchronized across all Controller VMs and interfaces (Prism web console, nCLI, and SSH).

Note:

- As a **`nutanix`** user, you cannot access nCLI by using the default credentials. If you are logging in as the **`nutanix`** user for the first time, you must log on through the Prism web console or SSH to the Controller VM. Also, you cannot change the default password of the **`nutanix`** user through nCLI. To change the default password of the **`nutanix`** user, you must log on through the Prism web console or SSH to the Controller VM.
- When you make an attempt to log in to the Prism web console for the first time after you upgrade the AOS from an earlier AOS version, you can use your existing **nutanix** user password to log in and then change the existing password (you are prompted) to adhere to the password complexity requirements. However, if you are logging in to the Controller VM with SSH for the first time after the upgrade as the **nutanix** user, you must use the default **`nutanix`** user password (nutanix/4u) and then change the default password (you are prompted) to adhere to the Controller VM Password Complexity Requirements on page 16.
- You cannot delete the **`nutanix`** user account.

- You can configure the minimum and maximum password expiration days based on your security requirement.
  - `nutanix@cvm$ sudo chage -M MAX-DAYS admin`
  - `nutanix@cvm$ sudo chage -m MIN-DAYS admin`

When you change the `nutanix` user password, you must update any applications and scripts using the `nutanix` user credentials for authentication. Nutanix recommends that you create a user assigned with the nutanix role instead of using the `nutanix` user for authentication. The *Prism Web Console Guide* describes authentication and roles.

Following are the default credentials to access a Controller VM.

Table 2: Controller VM Credentials

Interface	Target	User Name	Password
SSH client	Nutanix Controller VM	`admin`	Nutanix/4u
		`nutanix`	nutanix/4u
Prism web console	Nutanix Controller VM	`admin`	Nutanix/4u

Accessing the Controller VM Using the Nutanix User Account

About this task

Perform the following procedure to log on to the Controller VM by using the nutanix user with SSH for the first time.

Procedure

1. Log on to the Controller VM with SSH by using the management IP address of the Controller VM and the following credentials.
   - User name: `nutanix`
   - Password: `nutanix/4u`

   You are now prompted to change the default password.
2. Respond to the prompts, providing the current and new `nutanix` user password.

   ```
   Changing password for nutanix.
   Old Password:
   New password:
   Retype new password:
   Password changed.
   ```

   See Controller VM Password Complexity Requirements on page 16to set a secure password.

   For information about logging on to a Controller VM by using the nutanix user account through the Prism web console, see *Logging Into The Web Console* in the *Prism Web Console Guide*.

Controller VM Password Complexity Requirements

The password must meet the following complexity requirements:

- At least eight characters long.
- At least one lowercase letter.
- At least one uppercase letter.
- At least one number.
- At least one special character.
- At least four characters difference from the old password.
- Must not be among the last 5 passwords.
- Must not have more than 2 consecutive occurrences of a character.
- Must not be longer than 199 characters.

AHV Host Access

You can perform most of the administrative functions of a Nutanix cluster using the Prism web consoles or REST API. Nutanix recommends using these interfaces whenever possible. Some functions, however, require logging on to an AHV host with SSH.

> Note: From AOS 5.15.5, AHV has two new user accounts—**admin** and **nutanix**.

Nutanix provides the following users to access the AHV host:

- `root`—It is used internally by the AOS. The root user is used for the initial access and configuration of the AHV host.
- `admin`—It is used to log on to an AHV host. The admin user is recommended for accessing the AHV host.
- `nutanix`—It is used internally by the AOS and must not be used for interactive logon.

Exercise caution whenever connecting directly to a AHV host as it increases the risk of causing cluster issues.

Following are the default credentials to access an AHV host:

Table 3: AHV Host Credentials

Interface	Target	User Name	Password
SSH client	AHV Host	root	nutanix/4u
		admin	There is no default password for admin. You must set it during the initial configuration.
		nutanix	nutanix/4u

Initial Configuration

About this task

The AHV host is shipped with the default password for the `root` and `nutanix` users, which must be changed using SSH when you log on to the AHV host for the first time. After changing the default passwords and the `admin` password, all subsequent logins to the AHV host must be with the `admin` user.

Perform the following procedure to change `admin` user account password for the first time:

> Note: Perform this initial configuration on all the AHV hosts.

Procedure

1. Use SSH and log on to the AHV host using the `root` account.

```
$ ssh root@<AHV Host IP Address>
Nutanix AHV
root@<AHV Host IP Address> password: # default password nutanix/4u
```

2. Change the default `root` user password.

```
root@ahv# passwd root
Changing password for user root.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

3. Change the default `nutanix` user password.

```
root@ahv# passwd nutanix
Changing password for user nutanix.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

4. Change the `admin` user password.

```
root@ahv# passwd admin
Changing password for user admin.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

Accessing the AHV Host Using the Admin Account

About this task

After setting the `admin` password in the Initial Configuration on page 17, use the `admin` user for all subsequent logins.

Perform the following procedure to log on to the Controller VM by using the `admin` user with SSH for the first time.

Procedure

1. Log on to the AHV host with SSH using the `admin` account.

```
$ ssh admin@ <AHV Host IP Address>
```

```
Nutanix AHV
```

2. Enter the `admin` user password configured in the Initial Configuration on page 17.

```
admin@<AHV Host IP Address> password:
```

3. Append sudo to the commands if privileged access is required.

```
$ sudo ls /var/log
```

Changing Admin User Password

About this task

Perform these steps to change the `admin` password on every AHV host in the cluster:

Procedure

1. Log on to the AHV host using the `admin` account with SSH.
2. Enter the `admin` user password configured in the Initial Configuration on page 17.
3. Run the sudo command to change to `admin` user password.

```
$ sudo passwd admin
```

4. Respond to the prompts and provide the new password.

```
[sudo] password for admin:
Changing password for user admin.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

> Note: Repeat this step for each AHV host.

See AHV Host Password Complexity Requirements on page 19 to set a secure password.

Changing Admin User Password Expiration Period

About this task

The default password expiration age for the `admin` user is 60 days. You can configure the maximum and minimum password expiration days based on your security requirements.

Perform these steps on every AHV host in the cluster to set the minimum and maximum expiration date for the admin user:

Procedure

1. Log on to the AHV host using the `admin` account with SSH.
2. Run the following commands to set the maximum and minimum password expiration duration:

   - sudo chage -M MAX-DAYS admin
   - sudo chage -m MIN-DAYS admin

Changing the Root User Password

About this task

Perform these steps to change the `root` password on every AHV host in the cluster:

Procedure

1. Log on to the AHV host using the `admin` account with SSH.
2. Run the sudo command to change to `root` user.
3. Change the `root` password.

```
root@ahv# passwd root
```

4. Respond to the prompts and provide the current and new root password.

```
Changing password for root.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

> Note: Repeat this step for each AHV host.

See AHV Host Password Complexity Requirements on page 19 to set a secure password.

Changing Nutanix User Password

About this task

Perform these steps to change the `nutanix` password on every AHV host in the cluster:

Procedure

1. Log on to the AHV host using the `admin` account with SSH.
2. Run the sudo command to change to `root` user.
3. Change the `nutanix` password.

```
root@ahv# passwd nutanix
```

4. Respond to the prompts and provide the current and new root password.

```
Changing password for nutanix.
New password:
Retype new password:
passwd: all authentication tokens updated successfully.
```

> Note: Repeat this step for each AHV host.

See AHV Host Password Complexity Requirements on page 19 to set a secure password.

AHV Host Password Complexity Requirements

The password you choose must meet the following complexity requirements:

- In configurations with high-security requirements, the password must contain:
  - At least 15 characters.
  - At least one upper case letter (A–Z).
  - At least one lower case letter (a–z).
  - At least one digit (0–9).
  - At least one printable ASCII special (non-alphanumeric) character. For example, a tilde (~), exclamation point (!), at sign (@), number sign (#), or dollar sign ($).
  - At least eight characters different from the previous password.
  - At most three consecutive occurrences of any given character.
  - At most four consecutive occurrences of any given class.

  The password cannot be the same as the last 24 passwords.
- In configurations without high-security requirements, the password must contain:
  - At least eight characters.
  - At least one upper case letter (A–Z).
  - At least one lower case letter (a–z).
  - At least one digit (0–9).
  - At least one printable ASCII special (non-alphanumeric) character. For example, a tilde (~), exclamation point (!), at sign (@), number sign (#), or dollar sign ($).
  - At least three characters different from the previous password.
  - At most three consecutive occurrences of any given character.

  The password cannot be the same as the last 10 passwords.

  In both types of configuration, if a password for an account is entered three times unsuccessfully within a 15-minute period, the account is locked for 15 minutes.

Verifying the Cluster Health

Before you perform operations such as restarting a CVM or AHV host and putting an AHV host into maintenance mode, check if the cluster can tolerate a single-node failure.

Before you begin

Ensure that you are running the most recent version of NCC.

About this task

> Note: If you see any critical alerts, resolve the issues by referring to the indicated KB articles. If you are unable to resolve any issues, contact Nutanix Support.

Perform the following steps to avoid unexpected downtime or performance issues.

Procedure

1. Review and resolve any critical alerts. Do one of the following:

   » In the Prism Element web console, go to the **Alerts** page.

   » Log on to a Controller VM (CVM) with SSH and display the alerts.

   ```
   nutanix@cvm$ ncli alert ls
   ```

   > Note: If you receive alerts indicating expired encryption certificates or a key manager is not reachable, resolve these issues before you shut down the cluster. If you do not resolve these issues, data loss of the cluster might occur.

2. Verify if the cluster can tolerate a single-node failure. Do one of the following:

   » In the Prism Element web console, in the **Home** page, check the status of the **Data Resiliency Status** dashboard.

   Verify that the status is **OK**. If the status is anything other than **OK**, resolve the indicated issues before you perform any maintenance activity.

   » Log on to a Controller VM (CVM) with SSH and check the fault tolerance status of the cluster.

   ```
   nutanix@cvm$ ncli cluster get-domain-fault-tolerance-status type=node
   ```

   An output similar to the following is displayed:

   > Important:

   ```
   Domain Type               : NODE
       Component Type            : STATIC_CONFIGURATION
       Current Fault Tolerance   : 1

    Fault Tolerance Details   :
    Last Update Time          : Wed Nov 18 14:20:57 GMT+05:00 2015
```

The value of the **Current Fault Tolerance** column must be at least 1 for all the nodes in the cluster.

Node Maintenance

You are required to gracefully place a node into the maintenance mode or non-operational state for reasons such as making changes to the network configuration of a node, performing manual firmware upgrades or replacements, performing CVM maintenance or any other maintenance operations.

Entering and Exiting Maintenance Mode

You can only place one node at a time in maintenance mode for each cluster. When a host is in maintenance mode, the CVM is placed in maintenance mode as part of the node maintenance operation and any associated RF1 VMs are powered-off. The cluster marks the host as unschedulable so that no new VM instances are created on it. When a node is placed in the maintenance mode from the Prism web console, an attempt is made to evacuate VMs from the host. If the evacuation attempt fails, the host remains in the "entering maintenance mode" state, where it is marked unschedulable, waiting for user remediation.

When a host is placed in the maintenance mode, the CVM is placed in the maintenance mode as part of the node maintenance operation. The non-migratable VMs (for example, pinned or RF1 VMs which have affinity towards a specific node) are powered-off while live migratable or high availability (HA) VMs are moved from the original host to other hosts in the cluster. After exiting the maintenance mode, all non-migratable guest VMs are powered on again and the live migrated VMs are automatically restored on the original host.

> Note: VMs with CPU passthrough or PCI passthrough, pinned VMs (with host affinity policies), and RF1 VMs are not migrated to other hosts in the cluster when a node undergoes maintenance. Click **View these VMs** link to view the list of VMs that cannot be live-migrated.

See Putting a Node into Maintenance Mode (AHV) on page 23 to place a node under maintenance.

You can also enter or exit a AHV host under maintenance through the CLI.

- To use the CLI method to place a AHV host in maintenance mode, see the *Putting a Node into Maintenance Mode using CLI* section in the *AHV Administration Guide*.

  > Note: Using the CLI method to place a AHV host under maintenance only places the hypervisor under maintenance mode. The CVM is up running in this method. To place the entire node under maintenance, Nutanix recommends using <UI>.

- To use the CLI method to exit a node from the maintenance mode, see the *Exiting a Node from the Maintenance Mode using CLI* section in the *AHV Administration Guide*.

Exiting a Node from Maintenance Mode

See Exiting a Node from the Maintenance Mode (AHV) on page 29 to remove a node from the maintenance mode.

Viewing a Node under Maintenance Mode

See Viewing a Node under the Maintenance Mode on page 27 to view the node under maintenance mode.

UVM Status when Node under Maintenance Mode

See UVM Status when Node under Maintenance Mode on page 31 to view the status of UVMs when a node is undergoing maintenance operations.

Best Practices and Recommendations

Nutanix strongly recommends using the **Enter Maintenance Mode** option on the Prism web console to place a node under maintenance.

Known Issues and Limitations

- The Prism web console enabled maintenance operations (enter and exit node maintenance) are currently supported only on AHV.
- Entering or exiting a node under maintenance from the CLI is not equivalent to entering or exiting the node under maintenance from the Prism Element web console. For example, placing a node under maintenance from the CLI only places the AHV host under maintenance while the CVM continues to remain powered on.
- You cannot exit the node from maintenance mode from Prism Element web console if the node is placed under maintenance mode from CLI. However, you can enter the node maintenance through the Prism Element web console and exit the node maintenance through the CLI.

Putting a Node into Maintenance Mode (AHV)

Before you begin

Check the cluster status and resiliency before putting a node under maintenance. You can also verify the status of the UVMs. See UVM Status when Node under Maintenance Mode on page 31 for more information.

About this task

Perform the following steps to put the node into maintenance mode.

Procedure

1. Login to the Prism Element web console.
2. On the home page, select **Hardware** from the drop-down menu.
3. Go to the **Table** > **Host** view.
4. Select the node which you intend to put under maintenance.

5. Click the **Enter Maintenance Mode** option.

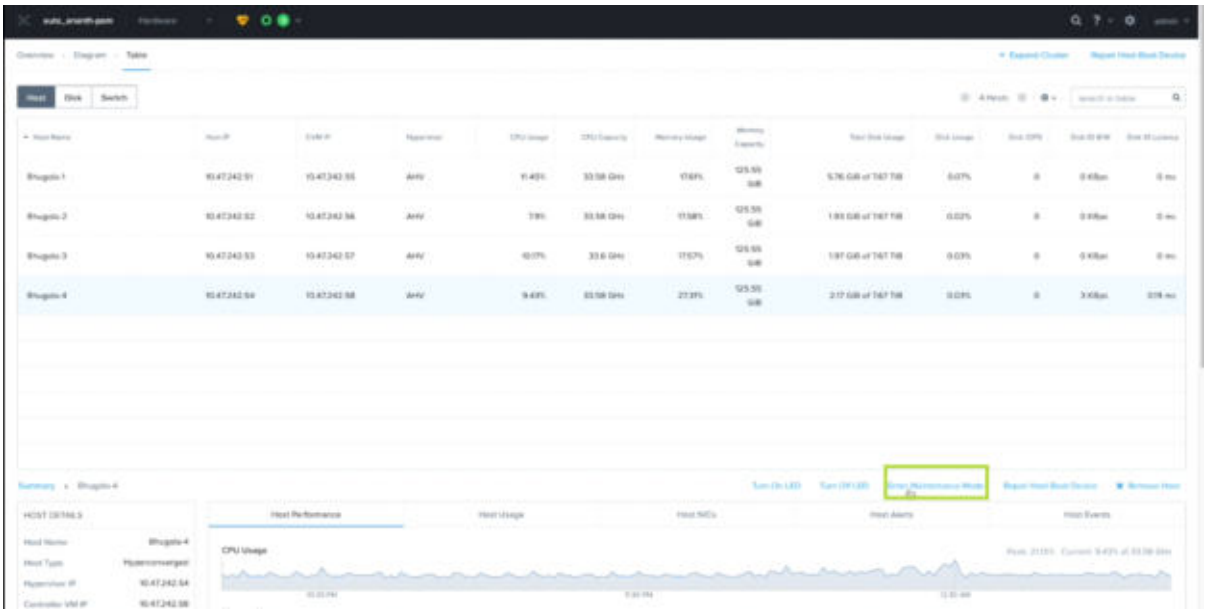

Figure 5: Enter Maintenance Mode Option

The Host Maintenance window appears with a prompt to power-off all VMs that cannot be live migrated,.

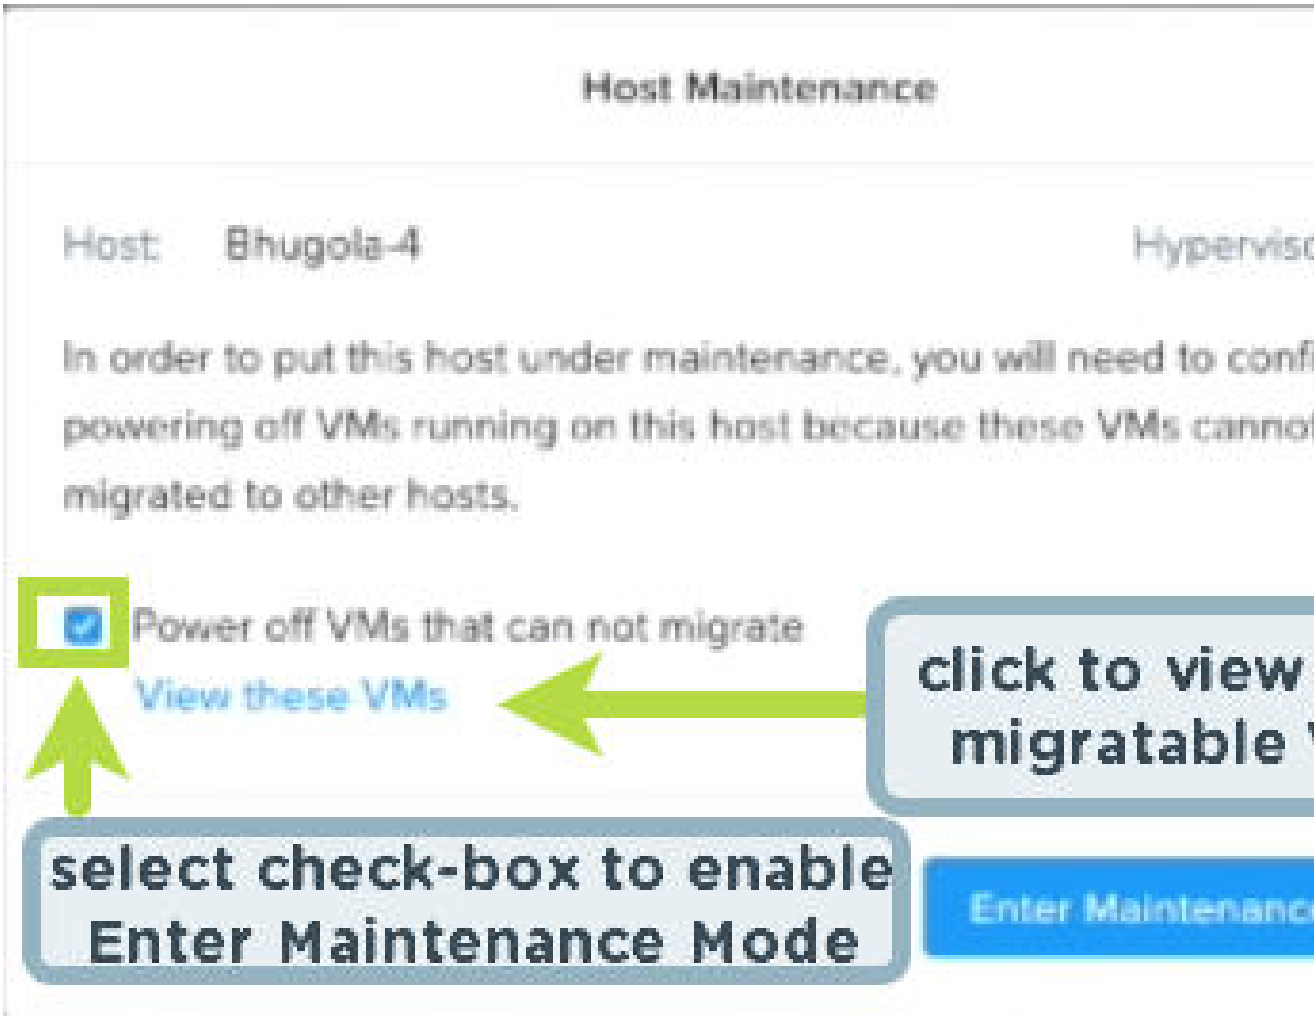

Figure 6: Host Maintenance Window (Enter Maintenance Mode Enabled)

Note: VMs with CPU passthrough, PCI passthrough, pinned VMs (with host affinity policies), and RF1 are not migrated to other hosts in the cluster when a node undergoes maintenance. Click **View these VMs** link to view the list of VMs that cannot be live-migrated.

6. Check the **Power-off VMs that can not migrate** check-box to enable the **Enter Maintenance Mode** button.

7. Click the **Enter Maintenance Mode** button.

   - A revolving icon appears as a tool tip beside the selected node and also in the Host Details view. This indicates that the host is entering the maintenance mode.
   - The revolving icon disappears and the **Exit Maintenance Mode** option is enabled after the node completely enters the maintenance mode.

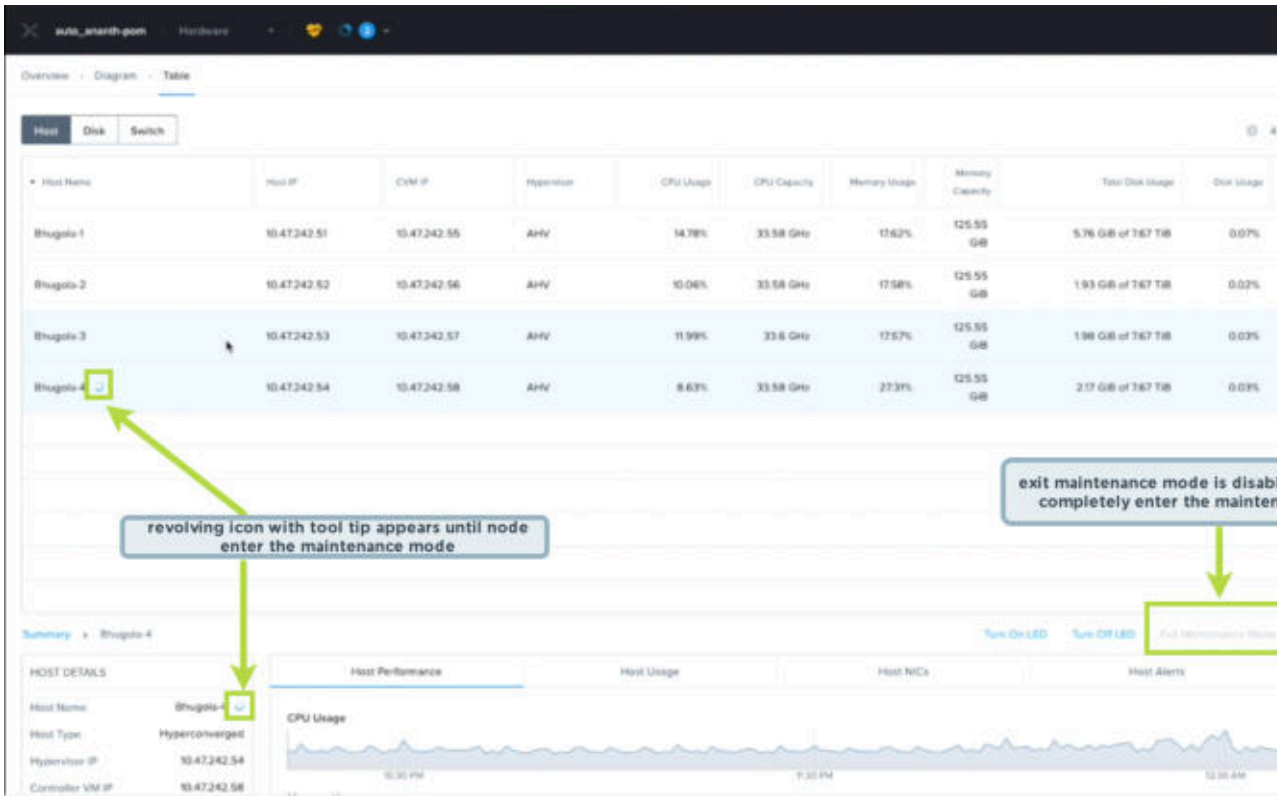

Figure 7: Enter Node Maintenance (On-going)

- You can also monitor the progress of the node maintenance operation through the newly created Host enter maintenance and Enter maintenance mode tasks which appear in the task tray.
- As the node enter the maintenance mode, the following high-level tasks are performed internally.

  1. The AHV host initiates entering the maintenance mode.
  2. The HA VMs are live migrated.
  3. The pinned and RF1 VMs are powered-off.
  4. The AHV host completes entering the maintenance mode.
  5. The CVM enters the maintenance mode.
  6. The CVM is shutdown.

  For more information, see UVM Status when Node under Maintenance Mode on page 31 to view the status of the UVMs.

  Note: In case of a node maintenance failure, certain rolled-back operations are performed. For example, the CVM is rebooted. But the live migrated are not restored to the original host.

What to do next

Once the maintenance activity is complete, you can perform any of the following.

- View the nodes under maintenance, see Viewing a Node under the Maintenance Mode on page 27
- View the status of the UVMs, see UVM Status when Node under Maintenance Mode on page 31
- Remove the node from the maintenance mode Exiting a Node from the Maintenance Mode (AHV) on page 29)

Viewing a Node under the Maintenance Mode

After you perform any maintenance activity, exit the node from the maintenance mode.

About this task

Perform the following steps to view a node under maintenance.

Procedure

1. Login to the Prism Element web console.
2. On the home page, select **Hardware** from the drop-down menu.
3. Go to the **Table** > **Host** view.

4. Observe the icon along with a tool tip that appears beside the node which is under maintenance. You can also view this icon in the host details view.

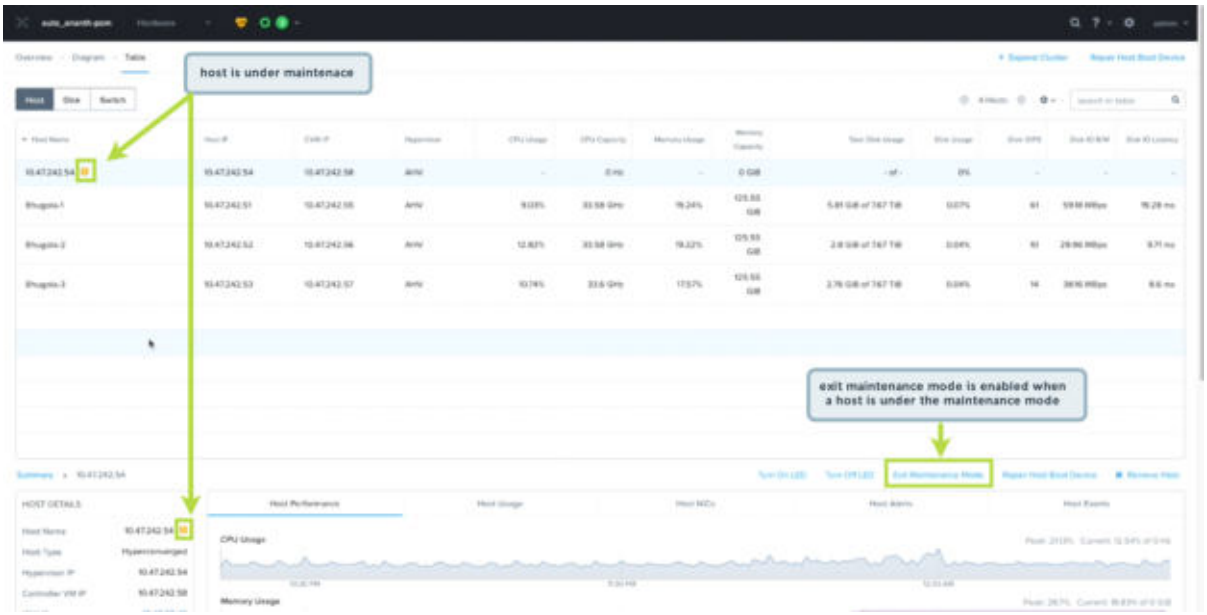

Figure 8: Node under Maintenance (Table and Host Details View)

Alternatively, you can view the node under maintenance from the **Hardware** > **Diagram** view.

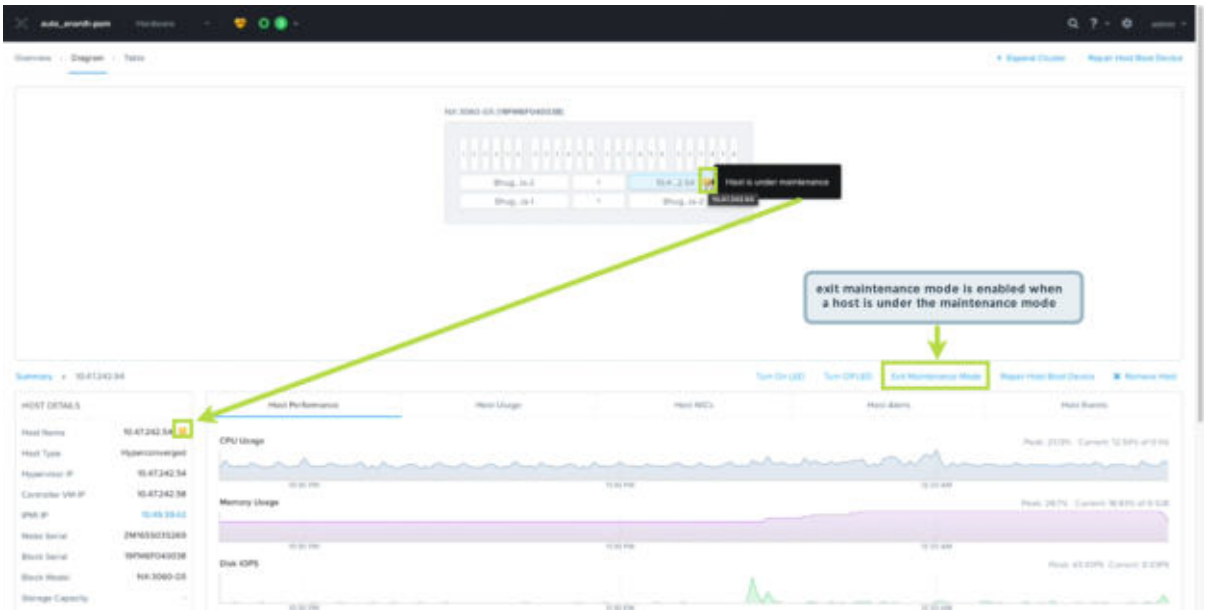

Figure 9: Node under Maintenance (Diagram and Host Details View)

What to do next

When a node is under maintenance, you can perform any of the following.

- View the status of the UVMs, see UVM Status when Node under Maintenance Mode on page 31.

- Remove the node from the maintenance mode Exiting a Node from the Maintenance Mode (AHV) on page 29)

Exiting a Node from the Maintenance Mode (AHV)

After you perform any maintenance activity, exit the node from the maintenance mode.

About this task

Procedure

1. On the Prism web console home page, select **Hardware** from the drop-down menu.
2. Go to the **Table** > **Host** view.
3. Select the node which you intend to remove from the maintenance mode.
4. Click the **Exit Maintenance Mode** option.

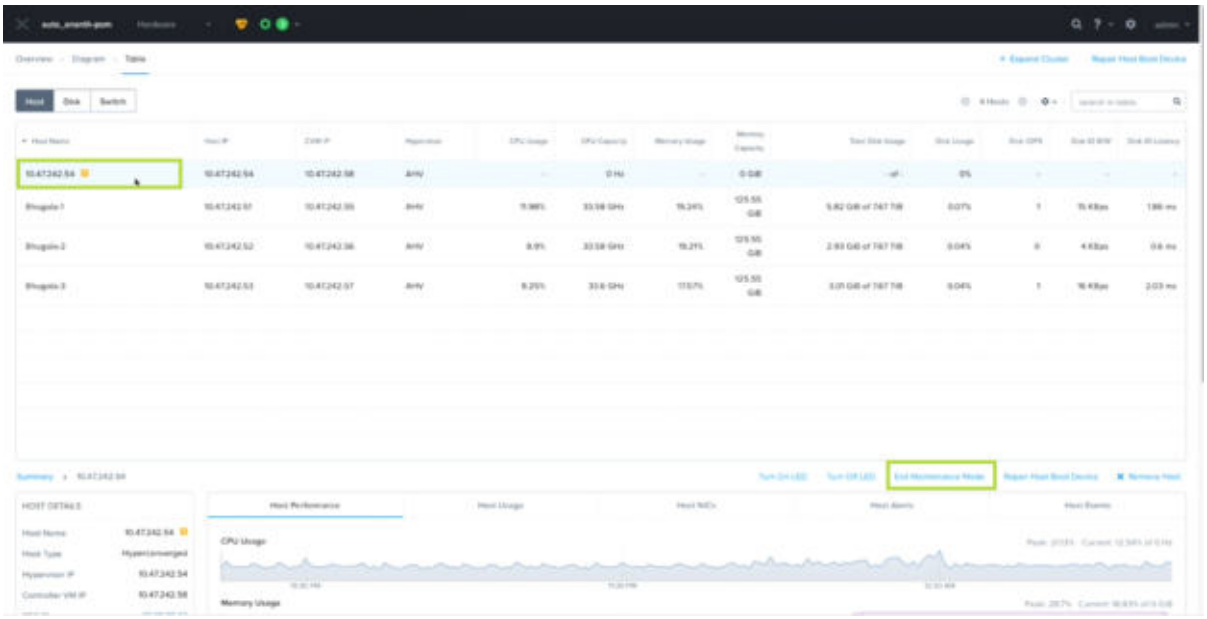

Figure 10: Exit Maintenance Mode Option

The Host Maintenance window appears.

5. Click the **Exit Maintenance Mode** button.

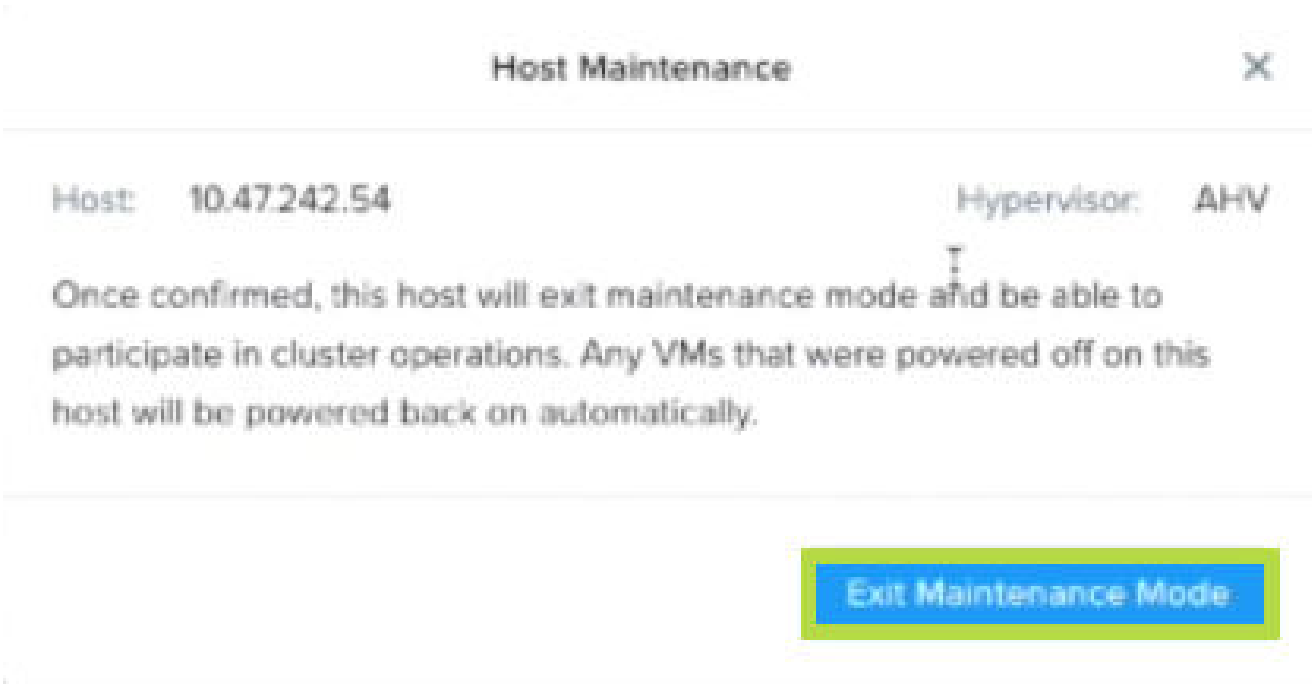

Figure 11: Host Maintenance Window (Exit Maintenance Mode)

- A revolving icon appears as a tool tip beside the selected node and also in the Host Details view. This indicates that the host is exiting the maintenance mode.
- The revolving icon disappears and the **Enter Maintenance Mode** option is enabled after the node completely exits the maintenance mode.

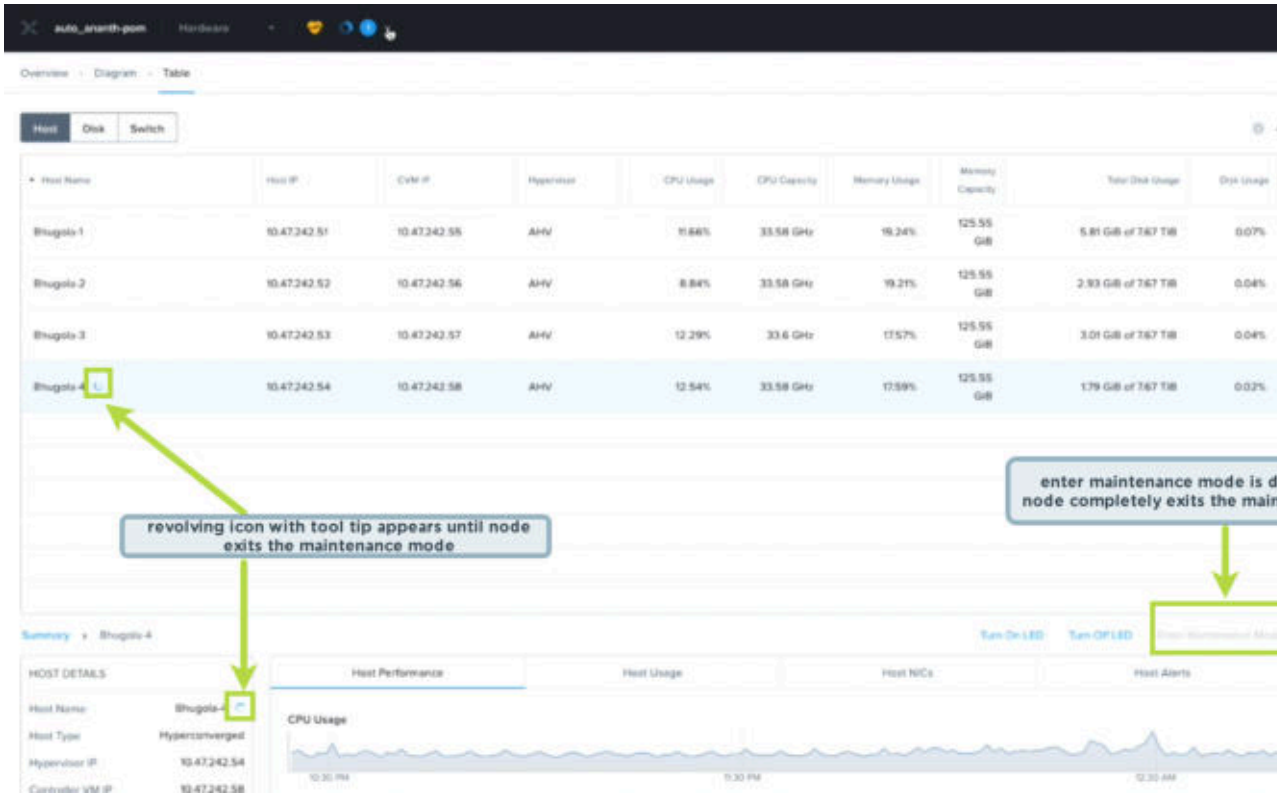

Figure 12: Exit Node Maintenance (On-going)

- You can also monitor the progress of the exit node maintenance operation through the newly created Host exit maintenance and Exit maintenance mode tasks which appear in the task tray.
- As the node exits the maintenance mode, the following high-level tasks are performed internally.

  1. The CVM is powered on.
  2. The CVM is taken out of maintenance.
  3. The host is taken out of maintenance.

  After the host exits the maintenance mode, the RF1 VMs continue to be powered on and the VMs migrate to restore host locality.

  For more information, see UVM Status when Node under Maintenance Mode on page 31 to view the status of the UVMs.

What to do next

Once a node exits the maintenance mode, you can perform any of the following.

- View the status of node under maintenance, see Viewing a Node under the Maintenance Mode on page 27.
- View the status of the UVMs, see UVM Status when Node under Maintenance Mode on page 31.

UVM Status when Node under Maintenance Mode

The following scenarios demonstrate the behavior of the UVMs when a node enters and exits a maintenance operation. The examples showcase the behavior of three VM types. high

availability (HA) VMs, pinned VMs, and RF1 VMs. The HA VMs are live migratable and can migrate across nodes if the host server goes down or reboots. The pinned VMs have the affinity towards a specific AHV node and the RF1 VMs have affinity towards a specific node or a CVM. To view the status of the UVMs, go to **VM** > **Table** > **view.**.

Scenario 1: UVMs before Node Entering Maintenance Mode

In this example, you can observe the status of the UVMs on the node prior to the node entering the maintenance mode. All the UVMs are powered-on and reside on the same host.

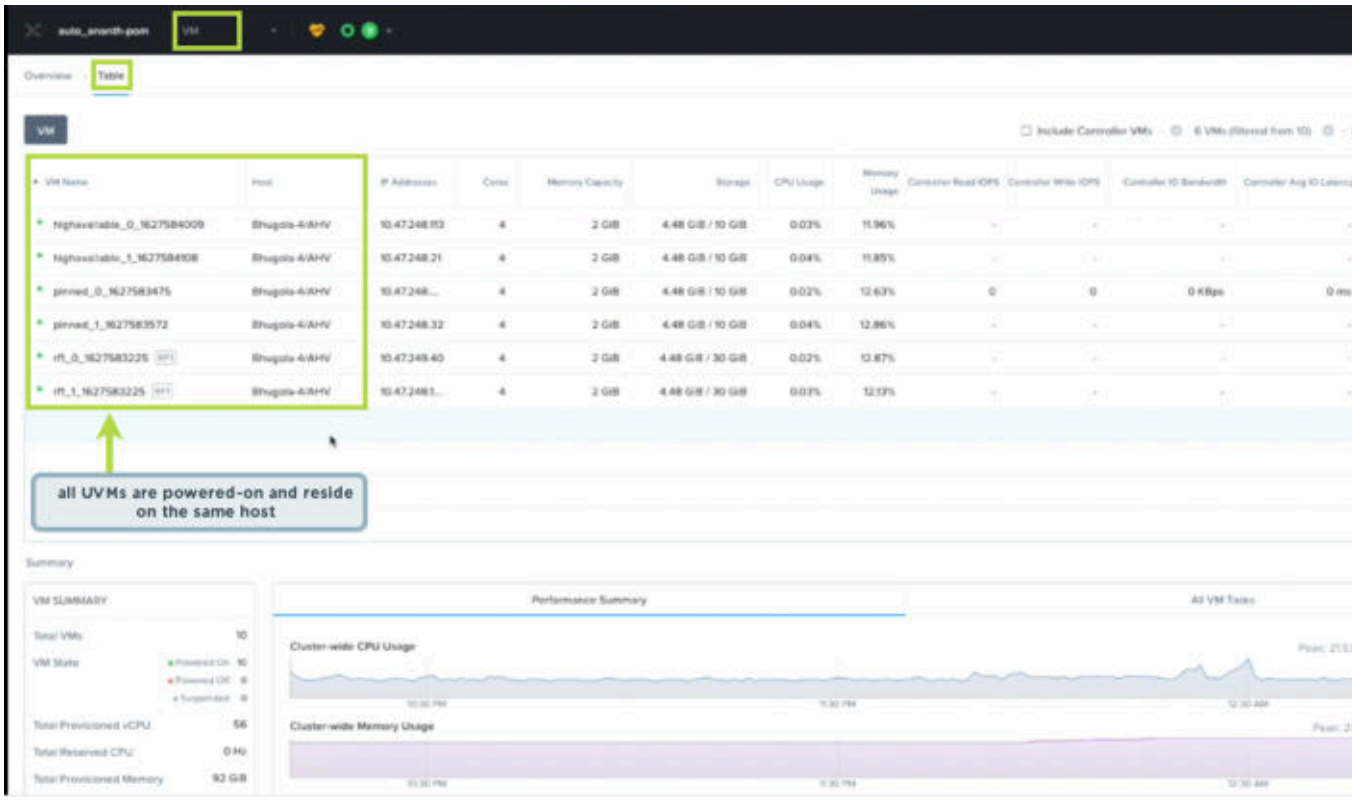

Figure 13: Example: Original State of VM and Hosts

Scenario 2: UVMs during Node Maintenance Mode

- As the node enter the maintenance mode, the following high-level tasks are performed internally.
  1. The AHV host initiates entering the maintenance mode.
  2. The HA VMs are live migrated.
  3. The pinned and RF1 VMs are powered-off.
  4. The AHV host completes entering the maintenance mode.
  5. The CVM enters the maintenance mode.
  6. The CVM is shutdown.

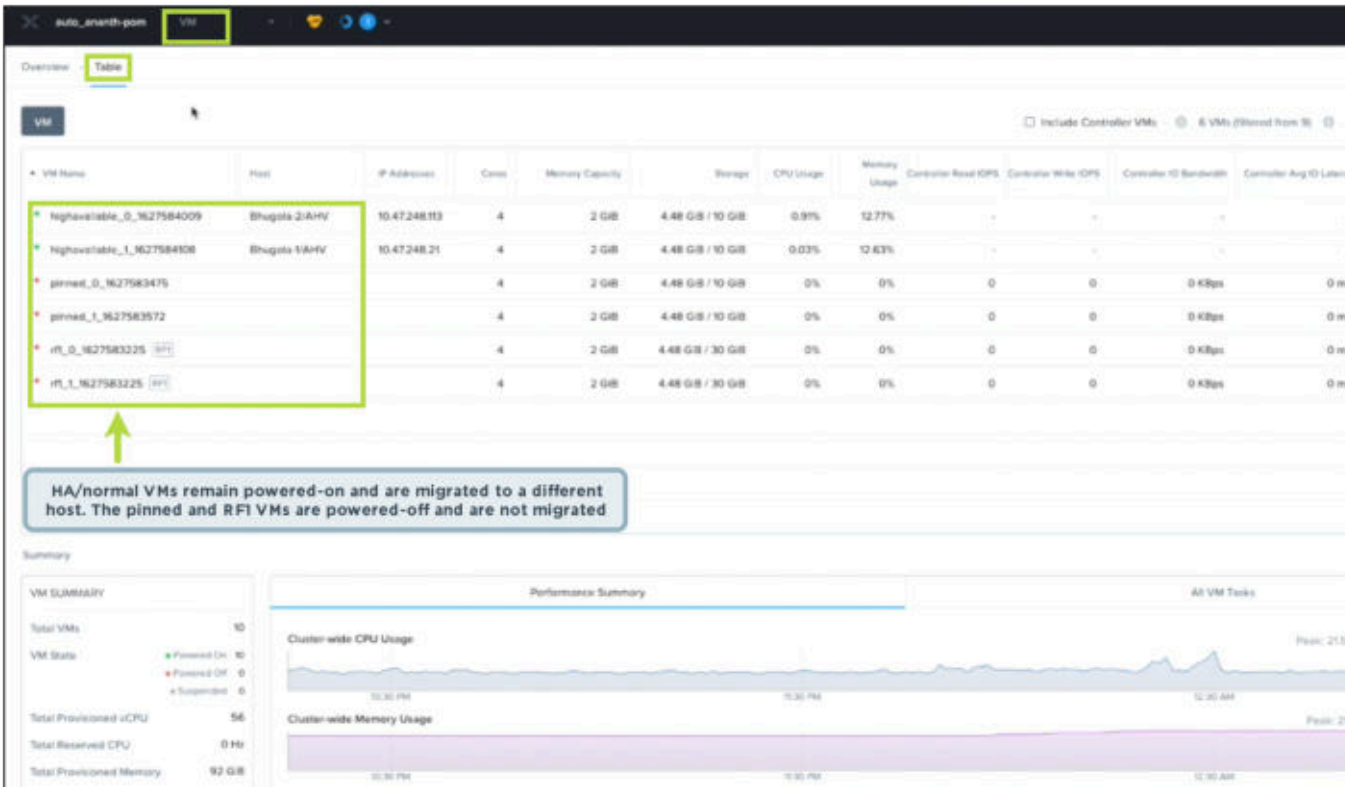

Figure 14: Example: VM and Hosts before Entering Maintenance Mode

Scenario 3: UVMs after Node Exiting Maintenance Mode

- As the node exits the maintenance mode, the following high-level tasks are performed internally.

  1. The CVM is powered on.
  2. The CVM is taken out of maintenance.
  3. The host is taken out of maintenance.

  After the host exits the maintenance mode, the RF1 VMs continue to be powered on and the VMs migrate to restore host locality.

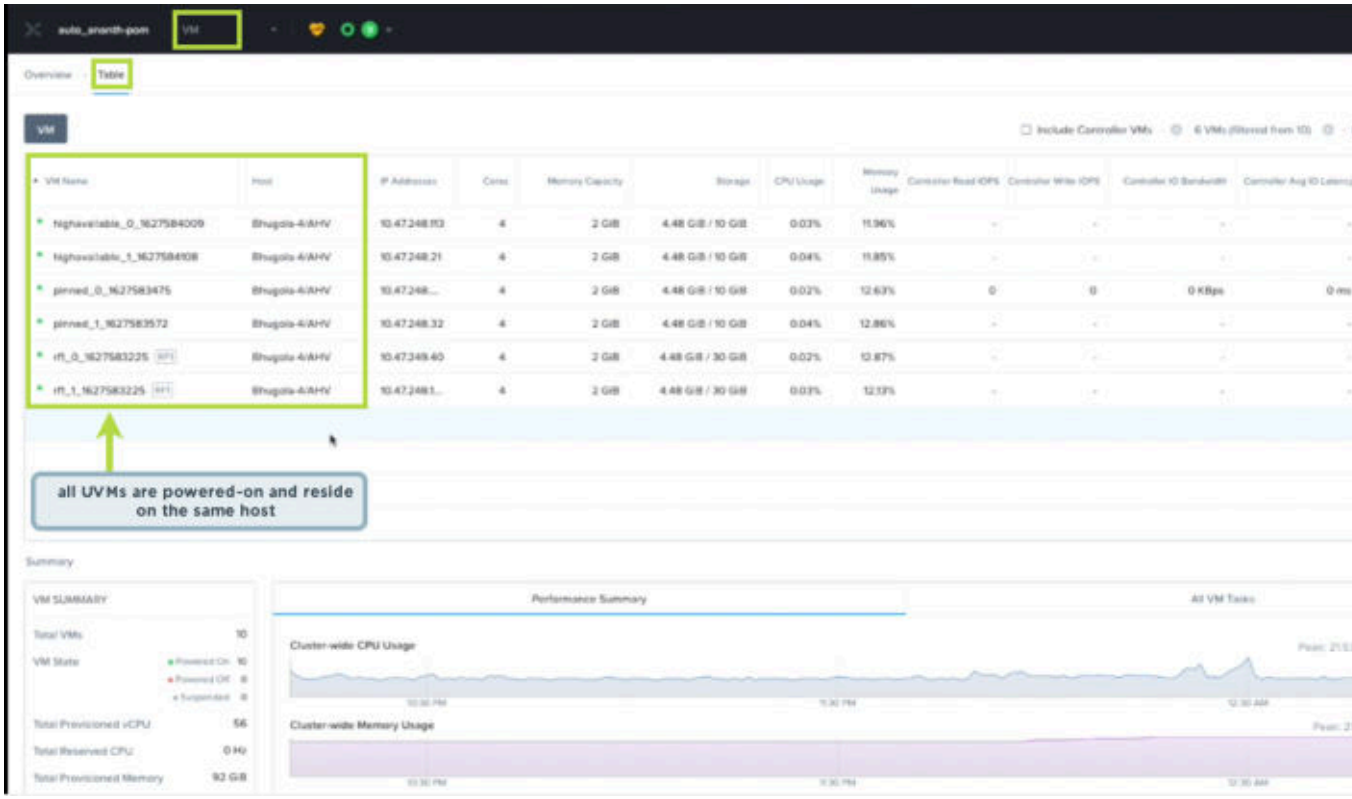

Figure 15: Example: Original State of VM and Hosts

Putting a Node into Maintenance Mode using CLI

You are required to put a node into maintenance mode for reasons such as making changes to the network configuration of a node, performing manual firmware upgrades, or any other.

Before you begin

CAUTION: Verify the data resiliency status of your cluster. If the cluster only has replication factor 2 (RF2), you can only shut down one node for each cluster. If an RF2 cluster would have more than one node shut down, shut down the entire cluster.

About this task

When a host is in maintenance mode, AOS marks the host as unschedulable so that no new VM instances are created on it. Next, an attempt is made to evacuate VMs from the host.

If the evacuation attempt fails, the host remains in the "entering maintenance mode" state, where it is marked unschedulable, waiting for user remediation. You can shut down VMs on the host or move them to other nodes. Once the host has no more running VMs, it is in maintenance mode.

When a host is in maintenance mode, VMs are moved from that host to other hosts in the cluster. After exiting maintenance mode, those VMs are automatically returned to the original host, eliminating the need to manually move them.

VMs with GPU, CPU passthrough, PCI passthrough, and host affinity policies are not migrated to other hosts in the cluster. You can choose to shut down such VMs while putting the node into maintenance mode.

Agent VMs are always shut down if you put a node in maintenance mode and are powered on again after exiting maintenance mode.

Perform the following steps to put the node into maintenance mode.

Procedure

1. Use SSH to log on to a Controller VM in the cluster.
2. Determine the IP address of the node you want to put into maintenance mode.

   ```
   nutanix@cvm$ acli host.list
   ```

   Note the value of **Hypervisor IP** for the node you want to put in maintenance mode.
3. Put the node into maintenance mode.

   ```
   nutanix@cvm$ acli host.enter_maintenance_mode hypervisor-IP-address [wait="{ true |
    false }" ] [non_migratable_vm_action="{ acpi_shutdown | block }" ]
   ```

   > Note: Never put Controller VM and AHV hosts into maintenance mode on single-node clusters. It is recommended to shutdown user VMs before proceeding with disruptive changes.

   Replace *host-IP-address* with either the IP address or host name of the AHV host you want to shut down.

   The following are optional parameters for running the `acli host.enter_maintenance_mode` command:

   - **wait**: Set the **wait** parameter to **true** to wait for the host evacuation attempt to finish.
   - **non_migratable_vm_action**: By default the **non_migratable_vm_action** parameter is set to **block**, which means VMs with GPU, CPU passthrough, PCI passthrough, and host affinity policies are not migrated or shut down when you put a node into maintenance mode.

     If you want to automatically shut down such VMs, set the **non_migratable_vm_action** parameter to **acpi_shutdown**.
4. Verify if the host is in the maintenance mode.

   ```
   nutanix@cvm$ acli host.get host-ip
   ```

   In the output that is displayed, ensure that **node_state** equals to **EnteredMaintenanceMode** and **schedulable** equals to **False**.

   Do not continue if the host has failed to enter the maintenance mode.
5. See Verifying the Cluster Health on page 20 to once again check if the cluster can tolerate a single-node failure.
6. Put the CVM into the maintenance mode.

   ```
   nutanix@cvm$ ncli host edit id=host-ID enable-maintenance-mode=true
   ```

   Replace *host-ID* with the ID of the host.

   This step prevents the CVM services from being affected by any connectivity issues.
7. Determine the ID of the host.

   ```
   nutanix@cvm$ ncli host list
   ```

   An output similar to the following is displayed:

   ```
   Id                        : aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee::1234
   Uuid                      : ffffffff-gggg-hhhh-iiii-jjjjjjjjjjj
   Name                      : XXXXXXXXXX-X
   ```

```
IPMI Address              : X.X.Z.3
Controller VM Address     : X.X.X.1
Hypervisor Address        : X.X.Y.2
```

In this example, the host ID is 1234.

Wait for a few minutes until the CVM is put into the maintenance mode.

8. Verify if the CVM is in the maintenance mode.

   Run the following command on the CVM that you put in the maintenance mode.

   ```
   nutanix@cvm$ genesis status | grep -v "\[\]"
   ```

   An output similar to the following is displayed:

   ```
   nutanix@cvm$ genesis status | grep -v "\[\]"
   2021-09-24 05:28:03.827628: Services running on this node:
     genesis: [11189, 11390, 11414, 11415, 15671, 15672, 15673, 15676]
     scavenger: [27241, 27525, 27526, 27527]
     xmount: [25915, 26055, 26056, 26074]
     zookeeper: [13053, 13101, 13102, 13103, 13113, 13130]
   nutanix@cvm$
   ```

   Only the Genesis, Scavenger, Xmount, and Zookeeper processes must be running (process ID is displayed next to the process name).

   Do not continue if the CVM has failed to enter the maintenance mode, because it can cause a service interruption.

What to do next

Perform the maintenance activity. Once the maintenance activity is complete, remove the node from the maintenance mode. See Exiting a Node from the Maintenance Mode Using CLI on page 36 for more information.

Exiting a Node from the Maintenance Mode Using CLI

After you perform any maintenance activity, exit the node from the maintenance mode.

About this task

Perform the following to exit the host from the maintenance mode.

Procedure

1. Remove the CVM from the maintenance mode.

   a. Determine the ID of the host.

   ```
   nutanix@cvm$ ncli host list
   ```

   An output similar to the following is displayed:

   ```
   Id                        : aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee::1234
   Uuid                      : ffffffff-gggg-hhhh-iiii-jjjjjjjjjjjj
   Name                      : XXXXXXXXXX-X
   IPMI Address              : X.X.Z.3
   Controller VM Address     : X.X.X.1
   ```

```
Hypervisor Address        : X.X.Y.2
```

In this example, the host ID is 1234.

a. From any other CVM in the cluster, run the following command to exit the CVM from the maintenance mode.

```
nutanix@cvm$ ncli host edit id=host-ID enable-maintenance-mode=false
```

Replace *host-ID* with the ID of the host.

> Note: The command fails if you run the command from the CVM that is in the maintenance mode.

b. Verify if all the processes on all the CVMs are in the UP state.

```
nutanix@cvm$ cluster status | grep -v UP
```

Do not continue if the CVM has failed to exit the maintenance mode.

2. Remove the AHV host from the maintenance mode.

a. From any CVM in the cluster, run the following command to exit the AHV host from the maintenance mode.

```
nutanix@cvm$ acli host.exit_maintenance_mode host-ip
```

Replace *host-ip* with the new IP address of the host.

This command migrates (live migration) all the VMs that were previously running on the host back to the host.

b. Verify if the host has exited the maintenance mode.

```
nutanix@cvm$ acli host.get host-ip
```

In the output that is displayed, ensure that **node_state** equals to **kAcropolisNormal** or **AcropolisNormal** and **schedulable** equals to **True**.

Contact Nutanix Support if any of the steps described in this document produce unexpected results.

Shutting Down a Node in a Cluster (AHV)

Before you begin

- > CAUTION: Verify the data resiliency status of your cluster. If the cluster only has replication factor 2 (RF2), you can only shut down one node for each cluster. If an RF2 cluster would have more than one node shut down, shut down the entire cluster.

  See Verifying the Cluster Health on page 20 to check if the cluster can tolerate a single-node failure. Do not proceed if the cluster cannot tolerate a single-node failure.

- Put the node you want to shut down into maintenance mode.

  See Putting a Node into Maintenance Mode using CLI on page 34 for instructions about how to put a node into maintenance mode.

  You can list all the hosts in the cluster by running `nutanix@cvm$ acli host.list` command, and note the value of **Hypervisor IP** for the node you want to shut down.

About this task

Perform the following procedure to shut down a node.

Procedure

1. Using SSH, log on to the Controller VM on the host you want to shut down.
2. Shut down the Controller VM.

```
nutanix@cvm$ cvm_shutdown -P now
```

> Note: Once the CVM is put into maintenance mode, it might take a couple of minutes before you can shut down the CVM. It is recommended to wait for one to two minutes before running the command to shut down the CVM.

3. Log on to the AHV host with SSH.
4. Shut down the host.

```
root@ahv# shutdown -h now
```

What to do next

See Starting a Node in a Cluster (AHV) on page 38 for instructions about how to start a node, including how to start a CVM and how to exit a node from maintenance mode.

Starting a Node in a Cluster (AHV)

About this task

Procedure

1. On the hardware appliance, power on the node. The CVM starts automatically when your reboot the node.
2. If the node is in maintenance mode, log on (SSH) to the Controller VM and remove the node from maintenance mode.

   See Exiting a Node from the Maintenance Mode Using CLI on page 36 for more information.
3. Log on to another CVM in the Nutanix cluster with SSH.
4. Verify that the status of all services on all the CVMs are Up.

```
nutanix@cvm$ cluster status
```

If the Nutanix cluster is running properly, output similar to the following is displayed for each node in the Nutanix cluster.

```
CVM:host IP-Address Up
                                Zeus   UP       [9935, 9980, 9981, 9994, 10015, 10037]
                          Scavenger   UP       [25880, 26061, 26062]
                             Xmount   UP       [21170, 21208]
                     SysStatCollector   UP       [22272, 22330, 22331]
                            IkatProxy   UP       [23213, 23262]
                     IkatControlPlane   UP       [23487, 23565]
                        SSLTerminator   UP       [23490, 23620]
                      SecureFileSync   UP       [23496, 23645, 23646]
                               Medusa   UP       [23912, 23944, 23945, 23946, 24176]
                  DynamicRingChanger   UP       [24314, 24404, 24405, 24558]
                               Pithos   UP       [24317, 24555, 24556, 24593]
                           InsightsDB   UP       [24322, 24472, 24473, 24583]
                               Athena   UP       [24329, 24504, 24505]
                              Mercury   UP       [24338, 24515, 24516, 24614]
```

```
                            Mantle   UP       [24344, 24572, 24573, 24634]
                         VipMonitor   UP       [18387, 18464, 18465, 18466, 18474]
                           Stargate   UP       [24993, 25032]
                InsightsDataTransfer   UP       [25258, 25348, 25349, 25388, 25391, 25393,
25396]
                              Ergon   UP       [25263, 25414, 25415]
                            Cerebro   UP       [25272, 25462, 25464, 25581]
                            Chronos   UP       [25281, 25488, 25489, 25547]
                            Curator   UP       [25294, 25528, 25529, 25585]
                              Prism   UP       [25718, 25801, 25802, 25899, 25901, 25906,
25941, 25942]
                                CIM   UP       [25721, 25829, 25830, 25856]
                       AlertManager   UP       [25727, 25862, 25863, 25990]
                           Arithmos   UP       [25737, 25896, 25897, 26040]
                            Catalog   UP       [25749, 25989, 25991]

```

Shutting Down an AHV Cluster

You might need to shut down an AHV cluster to perform a maintenance activity or tasks such as relocating the hardware.

Before you begin

Ensure the following before you shut down the cluster.

1. Upgrade to the most recent version of NCC.
2. Log on to a Controller VM (CVM) with SSH and run the complete NCC health check.

   ```
   nutanix@cvm$ ncc health_checks run_all
   ```

   If you receive any failure or error messages, resolve those issues by referring to the KB articles indicated in the output of the NCC check results. If you are unable to resolve these issues, contact Nutanix Support.

   > Warning: Warning: If you receive alerts indicating expired encryption certificates or a key manager is not reachable, resolve these issues before you shut down the cluster. If you do not resolve these issues, data loss of the cluster might occur.

About this task

Shut down an AHV cluster in the following sequence.

Procedure

1. Shut down the services or VMs associated with AOS features or Nutanix products. For example, shut down all the Nutanix file server VMs (FSVMs). See the documentation of those features or products for more information.
2. Shut down all the guest VMs in the cluster in one of the following ways.
   - » Shut down the guest VMs from within the guest OS.
   - » Shut down the guest VMs by using the Prism Element web console.
   - » If you are running many VMs, shut down the VMs by using aCLI:

   a. Log on to a CVM in the cluster with SSH.

   b. Shut down all the guest VMs in the cluster.

   ```
   nutanix@cvm$ for i in `acli vm.list power_state=on | awk '{print $1}' | grep -v NTNX` ; do
    acli vm.shutdown $i ; done
   ```

   c. Verify if all the guest VMs are shut down.

   ```
   nutanix@CVM$ acli vm.list power_state=on
   ```

   d. If any VMs are on, consider powering off the VMs from within the guest OS. To force shut down through AHV, run the following command:

   ```
   nutanix@cvm$ acli vm.off vm-name
   ```

   Replace *vm-name* with the name of the VM you want to shut down.
3. Stop the Nutanix cluster.

   a. Log on to any CVM in the cluster with SSH.

   b. Stop the cluster.

   ```
   nutanix@cvm$ cluster stop
   ```

   c. Verify if the cluster services have stopped.

   ```
   nutanix@CVM$ cluster status
   ```

   The output displays the message `The state of the cluster: stop`, which confirms that the cluster has stopped.

   > Note: Some system services continue to run even if the cluster has stopped.
4. Shut down all the CVMs in the cluster. Log on to each CVM in the cluster with SSH and shut down that CVM.

   ```
   nutanix@cvm$ sudo shutdown -P now
   ```
5. Shut down each node in the cluster. Perform the following steps for each node in the cluster.

   a. Log on to the IPMI web console of each node.

   b. Under **Remote Control** > **Power Control**, select **Power Off Server - Orderly Shutdown** to gracefully shut down the node.

   c. Ping each host to verify that all AHV hosts are shut down.
6. Complete the maintenance activity or any other tasks.

7. Start all the nodes in the cluster.
   a. Press the power button on the front of the block for each node.
   b. Log on to the IPMI web console of each node.
   c. On the **System** tab, check the **Power Control** status to verify if the node is powered on.
8. Start the cluster.
   a. Wait for approximately 5 minutes after you start the last node to allow the cluster services to start.
      All CVMs start automatically after you start all the nodes.
   b. Log on to any CVM in the cluster with SSH.
   c. Start the cluster.
      ```
      nutanix@cvm$ cluster start
      ```
   d. Verify that all the cluster services are in the UP state.
      ```
      nutanix@cvm$ cluster status
      ```
   e. Start the guest VMs from within the guest OS or use the Prism Element web console.
      If you are running many VMs, start the VMs by using aCLI:
      ```
      nutanix@cvm$ for i in `acli vm.list power_state=off | awk '{print $1}' | grep -v NTNX` ;
       do acli vm.on $i; done
      ```
   f. Start the services or VMs associated with AOS features or Nutanix products. For example, start all the FSVMs. See the documentation of those features or products for more information.
   g. Verify if all guest VMs are powered on by using the Prism Element web console.

Changing CVM Memory Configuration (AHV)

About this task

You can increase the memory reserved for each Controller VM in your cluster by using the 1-click Controller VM Memory Upgrade available from the Prism Element web console. Increase memory size depending on the workload type or to enable certain AOS features. See the *Increasing the Controller VM Memory Size* topic in the *Prism Web Console Guide* for CVM memory sizing recommendations and instructions about how to increase the CVM memory.

Changing the AHV Hostname

To change the name of an AHV host, log on to any Controller VM (CVM) in the cluster and run the `change_ahv_hostname` script.

About this task

Perform the following procedure to change the name of an AHV host:

Procedure

1. Log on to any CVM in the cluster with SSH.

2. Change the hostname of the AHV host.

```
nutanix@cvm$ change_ahv_hostname --host_ip=host-IP-address --host_name=new-host-name
```

Replace *host-IP-address* with the IP address of the host whose name you want to change and *new-host-name* with the new hostname for the AHV host.

> Note: This entity must fulfill the following naming conventions:
>
> - The maximum length is 63 characters.
> - Allowed characters are uppercase and lowercase letters (A-Z and a-z), decimal digits (0-9), dots (.), and hyphens (-).
> - The entity name must start and end with a number or letter.

If you want to update the hostname of multiple hosts in the cluster, run the script for one host at a time (sequentially).

> Note: The Prism Element web console displays the new hostname after a few minutes.

Changing the Name of the CVM Displayed in the Prism Web Console

You can change the CVM name that is displayed in the Prism web console. The procedure described in this document does not change the CVM name that is displayed in the terminal or console of an SSH session.

About this task

You can change the CVM name by using the `change_cvm_display_name` script. Run this script from a CVM other than the CVM whose name you want to change. When you run the `change_cvm_display_name` script, AOS performs the following steps:

- 1. Checks if the new name starts with **NTNX-** and ends with **-CVM**. The CVM name must have only letters, numbers, and dashes (-).
  2. Checks if the CVM has received a shutdown token.
  3. Powers off the CVM. The script does not put the CVM or host into maintenance mode. Therefore, the VMs are not migrated from the host and continue to run with the I/O operations redirected to another CVM while the current CVM is in a powered off state.
  4. Changes the CVM name, enables autostart, and powers on the CVM.

Perform the following to change the CVM name displayed in the Prism web console.

Procedure

1. Use SSH to log on to a CVM other than the CVM whose name you want to change.

2. Change the name of the CVM.

```
nutanix@cvm$ change_cvm_display_name --cvm_ip=CVM-IP --cvm_name=new-name
```

Replace *CVM-IP* with the IP address of the CVM whose name you want to change and *new-name* with the new name for the CVM.

The CVM name must have only letters, numbers, and dashes (-), and must start with **NTNX-** and end with **-CVM**.

> Note: Do not run this command from the CVM whose name you want to change, because the script powers off the CVM. In this case, when the CVM is powered off, you lose connectivity to the CVM from the SSH console and the script abruptly ends.

Adding a Never-Schedulable Node (AHV Only)

Add a never-schedulable node if you want to add a node to increase data storage on your Nutanix cluster, but do not want any AHV VMs to run on that node.

About this task

AOS never schedules any VMs on a never-schedulable node. Therefore, a never-schedulable node configuration ensures that no additional compute resources such as CPUs are consumed from the Nutanix cluster. In this way, you can meet the compliance and licensing requirements of your virtual applications.

Note the following points about a never-schedulable node configuration.

> Note:
>
> - Ensure that at any given time, the cluster has a minimum of three nodes (never-schedulable or otherwise) in function. To add your first never-schedulable node to your Nutanix cluster, the cluster must comprise of at least three schedulable nodes.
> - You can add any number of never-schedulable nodes to your Nutanix cluster.
> - If you want a node that is already a part of the cluster to work as a never-schedulable node, remove that node from the cluster and then add that node as a never-schedulable node.
> - If you no longer need a node to work as a never-schedulable node, remove the node from the cluster.

Procedure

You can add a never-schedulable node (storage-only node) to a cluster using the **Expand Cluster** operation from Prism Web Console.

For information about how to add a never-schedulable node to a cluster, see the *Expanding a Cluster* topic in *Prism Web Console Guide*.

Compute-Only Node Configuration (AHV Only)

A compute-only (CO) node allows you to seamlessly and efficiently expand the computing capacity (CPU and memory) of your AHV cluster. The Nutanix cluster uses the resources (CPUs and memory) of a CO node exclusively for computing purposes.

You can use a supported server or an existing hyperconverged (HC) node as a CO node. To use a node as CO, image the node as CO by using Foundation and then add that node to the cluster by using the Prism Element web console. See *Field Installation Guide* for information about how to image a node as a CO node.

Note: If you want an existing HC node that is already a part of the cluster to work as a CO node, remove that node from the cluster, image that node as CO by using Foundation, and add that node back to the cluster. See the *Modifying a Cluster* topic in *Prism Web Console Guide* for information about how to remove a node.

Key Features of Compute-Only Node

Following are the key features of CO nodes.

- CO nodes do not have a Controller VM (CVM) and local storage.
- AOS sources the storage for vDisks associated with VMs running on CO nodes from the hyperconverged (HC) nodes in the cluster.
- You can seamlessly manage your VMs (CRUD operations, ADS, and HA) by using the Prism Element web console.
- AHV runs on the local storage media of the CO node.
- To update AHV on a cluster that contains a compute-only node, use the Life Cycle Manager. See *Life Cycle Manager Guide: LCM Updates* for more information.

Use Case of Compute-Only Node

CO nodes enable you to achieve more control and value from restrictive licenses such as Oracle. A CO node is part of a Nutanix HC cluster, and there is no CVM running on the CO node (VMs use CVMs running on the HC nodes to access disks). As a result, licensed cores on the CO node are used only for the application VMs.

Applications or databases that are licensed on a per CPU core basis require the entire node to be licensed and that also includes the cores on which the CVM runs. With CO nodes, you get a much higher ROI on the purchase of your database licenses (such as Oracle and Microsoft SQL Server) since the CVM does not consume any compute resources.

Minimum Cluster Requirements

Following are the minimum cluster requirements for compute-only nodes.

- The Nutanix cluster must be at least a three-node cluster before you add a compute-only node.

  However, Nutanix recommends that the cluster has four nodes before you add a compute-only node.
- The ratio of compute-only to hyperconverged nodes in a cluster must not exceed the following:

  1 compute-only : 2 hyperconverged
- All the hyperconverged nodes in the cluster must be all-flash nodes.
- The number of vCPUs assigned to CVMs on the hyperconverged nodes must be greater than or equal to the total number of available cores on all the compute-only nodes in the cluster. The CVM requires a minimum of 12 vCPUs. See the *CVM vCPU and vRAM Allocation* topic in *Field Installation Guide* for information about how Foundation allocates memory and vCPUs to your platform model.

- The total amount of NIC bandwidth allocated to all the hyperconverged nodes must be twice the amount of the total NIC bandwidth allocated to all the compute-only nodes in the cluster.

  Nutanix recommends you use dual 25 GbE on CO nodes and quad 25 GbE on an HC node serving storage to a CO node.

- The AHV version of the compute-only node must be the same as the other nodes in the cluster.

  When you are adding a CO node to the cluster, AOS checks if the AHV version of the node matches with the AHV version of the existing nodes in the cluster. If there is a mismatch, the add node operation fails.

See the *Expanding a Cluster* topic in the *Prism Web Console Guide* for general requirements about adding a node to a Nutanix cluster.

Restrictions

Nutanix does not support the following features or tasks on a CO node in this release:

1. Host boot disk replacement
2. Network segmentation

Supported AOS Versions

Nutanix supports compute-only nodes on AOS releases 5.11 or later.

Supported Hardware Platforms

Compute-only nodes are supported on the following hardware platforms.

- All the NX series hardware
- Dell XC Core
- Cisco UCS

Networking Configuration

To perform network tasks on a compute-only node such as creating or modifying bridges or uplink bonds or uplink load balancing, you must use the **manage_ovs** commands and add the **--host** flag to the **manage_ovs** commands as shown in the following example:

> Note: If you have storage-only AHV nodes in clusters with compute-only nodes being ESXI or Hyper-V, deployment of default virtual switch vs0 fails. In such cases, the Prism Element, Prism Central or CLI workflows for virtual switch management are unavailable to manage the bridges and bonds. Use the **manage_ovs** command options to manage the bridges and bonds.

```
nutanix@cvm$ manage_ovs --host IP_address_of_co_node --bridge_name bridge_name
 create_single_bridge
```

Replace *IP_address_of_co_node* with the IP address of the CO node and *bridge_name* with the name of bridge you want to create.

> Note: Run the **manage_ovs** commands for a CO from any CVM running on a hyperconverged node.

Perform the networking tasks for each CO node in the cluster individually.

See the *Host Network Management* section in the *AHV Administration Guide* for more information about networking configuration of the AHV hosts.

Adding a Compute-Only Node to an AHV Cluster

About this task

Perform the following procedure to add a compute-only node to a Nutanix cluster.

Procedure

1. Log on to the Prism Element web console.
2. Do one of the following:
   - » Click the gear icon in the main menu and select **Expand Cluster** in the **Settings** page.
   - » Go to the hardware dashboard (see the *Hardware Dashboard* topic in *Prism Web Console Guide*) and click **Expand Cluster**.
3. In the **Select Host** screen, scroll down and, under **Manual Host Discovery**, click **Discover Hosts Manually**.

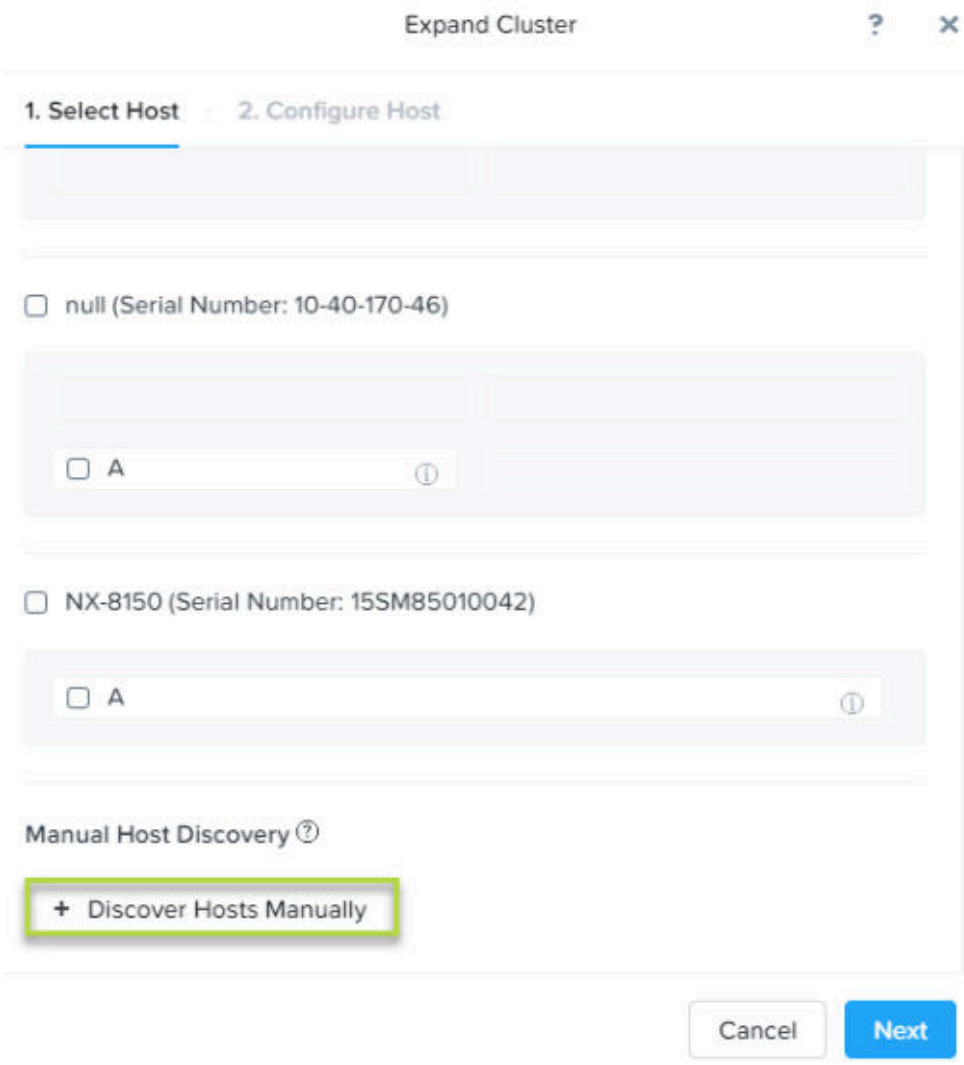

Figure 16: Discover Hosts Manually

4. Click **Add Host**.

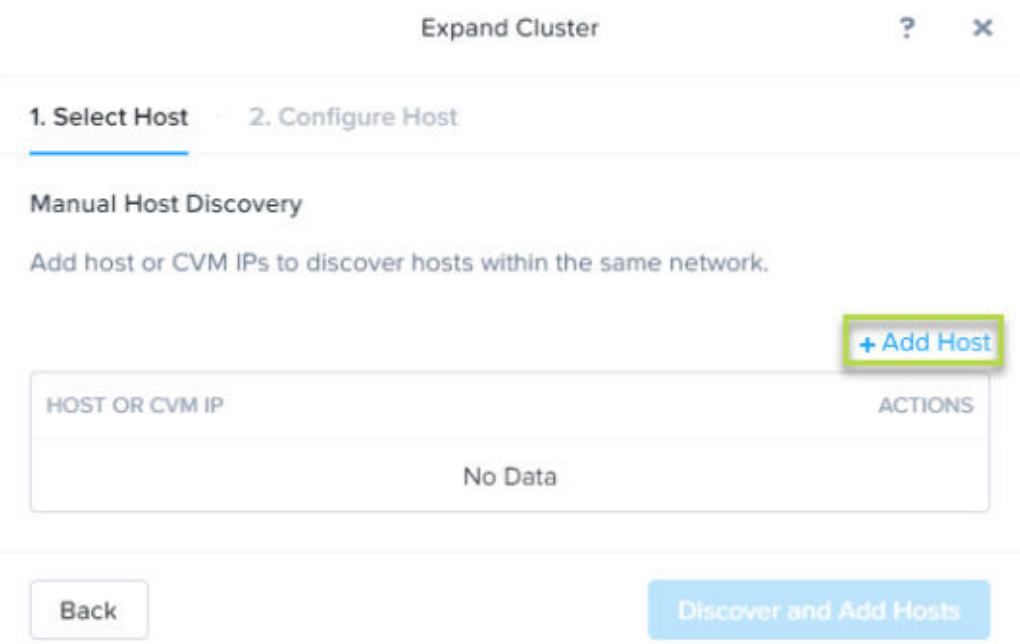

Figure 17: Add Host

5. Under **Host or CVM IP**, type the IP address of the AHV host and click **Save**.
   This node does not have a Controller VM and you must therefore provide the IP address of the AHV host.
6. Click **Discover and Add Hosts**.
   Prism Element discovers this node and the node appears in the list of nodes in the Select Host screen.
7. Select the node to display the details of the compute-only node.
8. Click **Next**.
9. In the **Configure Host** screen, click **Expand Cluster**.
   The add node process begins and Prism Element performs a set of checks before the node is added to the cluster.
   Check the progress of the operation in the **Tasks** menu of the Prism Element web console. The operation takes approximately five to seven minutes to complete.
10. Check the **Hardware Diagram** view to verify if the node is added to the cluster.
    You can identity a node as a CO node if the Prism Element web console does not display the IP address for the CVM.

3

HOST NETWORK MANAGEMENT

Network management in an AHV cluster consists of the following tasks:

- Configuring Layer 2 switching through virtual switch and Open vSwitch bridges. When configuring virtual switch vSwitch, you configure bridges, bonds, and VLANs.
- Optionally changing the IP address, netmask, and default gateway that were specified for the hosts during the imaging process.

Virtual Networks (Layer 2)

Each VM network interface is bound to a virtual network. Each virtual network is bound to a single VLAN; trunking VLANs to a virtual network is not supported. Networks are designated by the Layer 2 type (`vlan`) and the VLAN number.

By default, each virtual network maps to virtual switch such as the default virtual switch `vs0`. However, you can change this setting to map a virtual network to a custom virtual switch. The user is responsible for ensuring that the specified virtual switch exists on all hosts, and that the physical switch ports for the virtual switch uplinks are properly configured to receive VLAN-tagged traffic.

For more information about virtual switches, see About Virtual Switch on page 58.

A VM NIC must be associated with a virtual network. You can change the virtual network of a vNIC without deleting and recreating the vNIC.

Managed Networks (Layer 3)

A virtual network can have an IPv4 configuration, but it is not required. A virtual network with an IPv4 configuration is a managed network; one without an IPv4 configuration is an unmanaged network. A VLAN can have at most one managed network defined. If a virtual network is managed, every NIC is assigned an IPv4 address at creation time.

A managed network can optionally have one or more non-overlapping DHCP pools. Each pool must be entirely contained within the network's managed subnet.

If the managed network has a DHCP pool, the NIC automatically gets assigned an IPv4 address from one of the pools at creation time, provided at least one address is available. Addresses in the DHCP pool are not reserved. That is, you can manually specify an address belonging to the pool when creating a virtual adapter. If the network has no DHCP pool, you must specify the IPv4 address manually.

All DHCP traffic on the network is rerouted to an internal DHCP server, which allocates IPv4 addresses. DHCP traffic on the virtual network (that is, between the guest VMs and the Controller VM) does not reach the physical network, and vice versa.

A network must be configured as managed or unmanaged when it is created. It is not possible to convert one to the other.

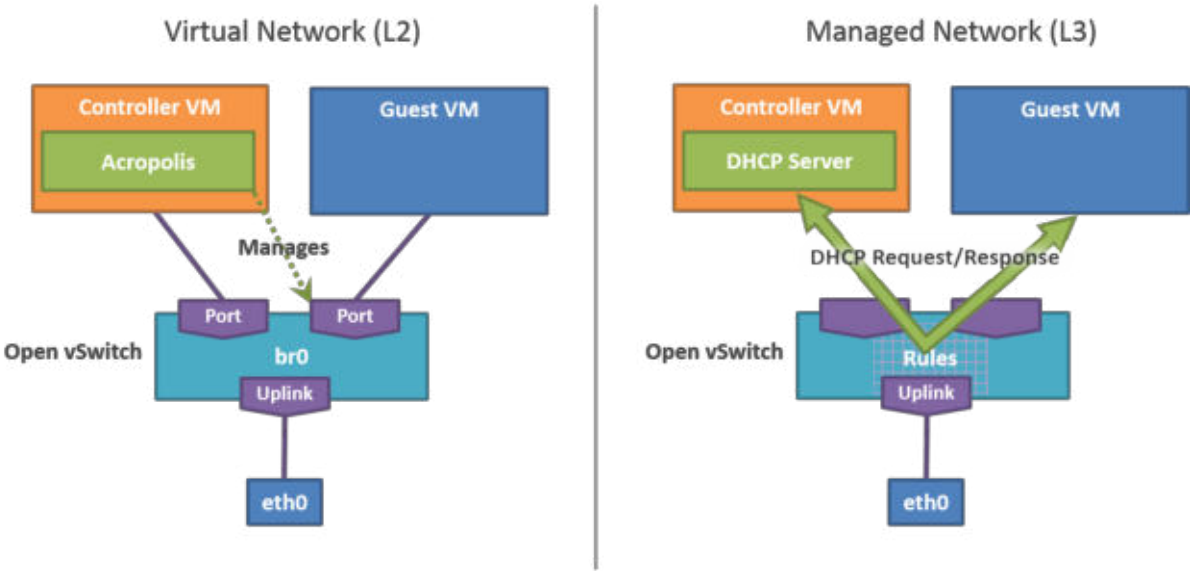

Figure 18: AHV Networking Architecture

Prerequisites for Configuring Networking

Change the configuration from the factory default to the recommended configuration. See AHV Networking Recommendations on page 49.

AHV Networking Recommendations

Nutanix recommends that you perform the following OVS configuration tasks from the Controller VM, as described in this documentation:

- Viewing the network configuration
- Configuring uplink bonds with desired interfaces using the Virtual Switch (VS) configurations.
- Assigning the Controller VM to a VLAN

For performing other network configuration tasks such as adding an interface to a bridge and configuring LACP for the interfaces in a bond, follow the procedures described in the *AHV Networking* best practices documentation under *Solutions Documentation* on the Nutanix Support portal.

Nutanix recommends that you configure the network as follows:

Table 4: Recommended Network Configuration

Network Component	Best Practice
Virtual Switch	Do not modify the OpenFlow tables of any bridges configured in any VS configurations in the AHV hosts. Do not rename default virtual switch vs0. You cannot delete the default virtual switch vs0. Do not delete or rename OVS bridge br0. Do not modify the native Linux bridge virbr0.
Switch Hops	Nutanix nodes send storage replication traffic to each other in a distributed fashion over the top-of-rack network. One Nutanix node can, therefore, send replication traffic to any other Nutanix node in the cluster. The network should provide low and predictable latency for this traffic. Ensure that there are no more than three switches between any two Nutanix nodes in the same cluster.
Switch Fabric	A switch fabric is a single leaf-spine topology or all switches connected to the same switch aggregation layer. The Nutanix VLAN shares a common broadcast domain within the fabric. Connect all Nutanix nodes that form a cluster to the same switch fabric. Do not stretch a single Nutanix cluster across multiple, disconnected switch fabrics. Every Nutanix node in a cluster should therefore be in the same L2 broadcast domain and share the same IP subnet.
WAN Links	A WAN (wide area network) or metro link connects different physical sites over a distance. As an extension of the switch fabric requirement, do not place Nutanix nodes in the same cluster if they are separated by a WAN.

Network Component	Best Practice
VLANs	Add the Controller VM and the AHV host to the same VLAN. Place all CVMs and AHV hosts in a cluster in the same VLAN. By default the CVM and AHV host are untagged, shown as VLAN 0, which effectively places them on the native VLAN configured on the upstream physical switch. Note: Do not add any other device (including guest VMs) to the VLAN to which the CVM and hypervisor host are assigned. Isolate guest VMs on one or more separate VLANs. Nutanix recommends configuring the CVM and hypervisor host VLAN as the native, or untagged, VLAN on the connected switch ports. This native VLAN configuration allows for easy node addition and cluster expansion. By default, new Nutanix nodes send and receive untagged traffic. If you use a tagged VLAN for the CVM and hypervisor hosts instead, you must configure that VLAN while provisioning the new node, before adding that node to the Nutanix cluster. Use tagged VLANs for all guest VM traffic and add the required guest VM VLANs to all connected switch ports for hosts in the Nutanix cluster. Limit guest VLANs for guest VM traffic to the smallest number of physical switches and switch ports possible to reduce broadcast network traffic load. If a VLAN is no longer needed, remove it.
Default VS bonded port (br0-up)	Aggregate the fastest links of the same speed on the physical host to a VS bond on the default vs0 and provision VLAN trunking for these interfaces on the physical switch. By default, interfaces in the bond in the virtual switch operate in the recommended active-backup mode. Note: The mixing of bond modes across AHV hosts in the same cluster is not recommended and not supported.

Network Component	Best Practice
1 GbE and 10 GbE interfaces (physical host)	If 10 GbE or faster uplinks are available, Nutanix recommends that you use them instead of 1 GbE uplinks. Recommendations for 1 GbE uplinks are as follows: • If you plan to use 1 GbE uplinks, do not include them in the same bond as the 10 GbE interfaces. Nutanix recommends that you do not use uplinks of different speeds in the same bond. • If you choose to configure only 1 GbE uplinks, when migration of memory-intensive VMs becomes necessary, power off and power on in a new host instead of using live migration. In this context, memory-intensive VMs are VMs whose memory changes at a rate that exceeds the bandwidth offered by the 1 GbE uplinks. Nutanix recommends the manual procedure for memory-intensive VMs because live migration, which you initiate either manually or by placing the host in maintenance mode, might appear prolonged or unresponsive and might eventually fail. Use the aCLI on any CVM in the cluster to start the VMs on another AHV host: `nutanix@cvm$ acli vm.on vm_list host=host` Replace `vm_list` with a comma-delimited list of VM names and replace `host` with the IP address or UUID of the target host. • If you must use only 1GbE uplinks, add them into a bond to increase bandwidth and use the balance-TCP (LACP) or balance-SLB bond mode.
IPMI port on the hypervisor host	Do not use VLAN trunking on switch ports that connect to the IPMI interface. Configure the switch ports as access ports for management simplicity.
Upstream physical switch	Nutanix does not recommend the use of Fabric Extenders (FEX) or similar technologies for production use cases. While initial, low-load implementations might run smoothly with such technologies, poor performance, VM lockups, and other issues might occur as implementations scale upward (see Knowledge Base article KB1612). Nutanix recommends the use of 10Gbps, line-rate, non-blocking switches with larger buffers for production workloads. Cut-through versus store-and-forward selection depends on network design. In designs with no oversubscription and no speed mismatches you can use low-latency cut-through switches. If you have any oversubscription or any speed mismatch in the network design, then use a switch with larger buffers. Port-to-port latency should be no higher than 2 microseconds. Use fast-convergence technologies (such as Cisco PortFast) on switch ports that are connected to the hypervisor host.

Network Component	Best Practice
Physical Network Layout	Use redundant top-of-rack switches in a traditional leaf-spine architecture. This simple, flat network design is well suited for a highly distributed, shared-nothing compute and storage architecture. Add all the nodes that belong to a given cluster to the same Layer-2 network segment. Other network layouts are supported as long as all other Nutanix recommendations are followed.
Jumbo Frames	The Nutanix CVM uses the standard Ethernet MTU (maximum transmission unit) of 1,500 bytes for all the network interfaces by default. The standard 1,500 byte MTU delivers excellent performance and stability. Nutanix does not support configuring the MTU on network interfaces of a CVM to higher values. You can enable jumbo frames (MTU of 9,000 bytes) on the physical network interfaces of AHV hosts and guest VMs if the applications on your guest VMs require them. If you choose to use jumbo frames on hypervisor hosts, be sure to enable them end to end in the desired network and consider both the physical and virtual network infrastructure impacted by the change.
Controller VM	Do not remove the Controller VM from either the OVS bridge br0 or the native Linux bridge virbr0.
Rack Awareness and Block Awareness	Block awareness and rack awareness provide smart placement of Nutanix cluster services, metadata, and VM data to help maintain data availability, even when you lose an entire block or rack. The same network requirements for low latency and high throughput between servers in the same cluster still apply when using block and rack awareness. Note: Do not use features like block or rack awareness to stretch a Nutanix cluster between different physical sites.

Network Component	Best Practice
Oversubscription	Oversubscription occurs when an intermediate network device or link does not have enough capacity to allow line rate communication between the systems connected to it. For example, if a 10 Gbps link connects two switches and four hosts connect to each switch at 10 Gbps, the connecting link is oversubscribed. Oversubscription is often expressed as a ratio—in this case 4:1, as the environment could potentially attempt to transmit 40 Gbps between the switches with only 10 Gbps available. Achieving a ratio of 1:1 is not always feasible. However, you should keep the ratio as small as possible based on budget and available capacity. If there is any oversubscription, choose a switch with larger buffers. In a typical deployment where Nutanix nodes connect to redundant top-of-rack switches, storage replication traffic between CVMs traverses multiple devices. To avoid packet loss due to link oversubscription, ensure that the switch uplinks consist of multiple interfaces operating at a faster speed than the Nutanix host interfaces. For example, for nodes connected at 10 Gbps, the inter-switch connection should consist of multiple 10 Gbps or 40 Gbps links.

This diagram shows the recommended network configuration for an AHV cluster. The interfaces in the diagram are connected with colored lines to indicate membership to different VLANs:

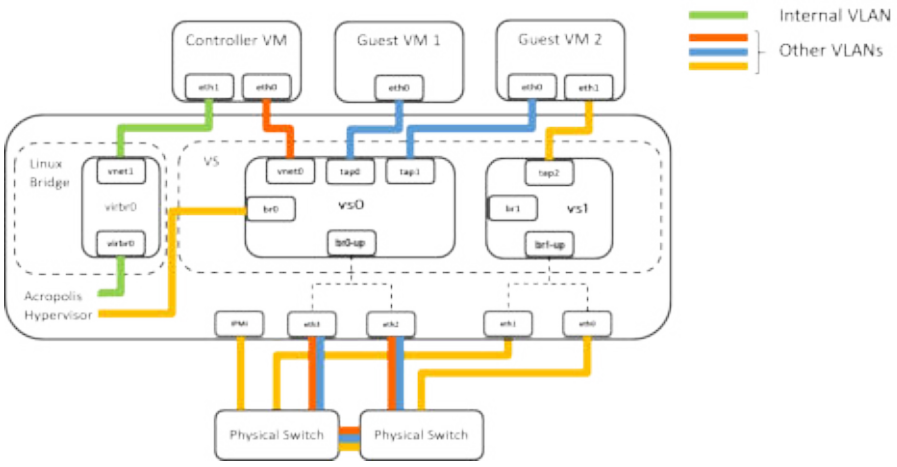

Figure 19:

IP Address Management

IP Address Management (IPAM) is a feature of AHV that allows it to assign IP addresses automatically to VMs by using DHCP. You can configure each virtual network with a specific IP address subnet, associated domain settings, and IP address pools available for assignment to VMs.

An AHV network is defined as a managed network or an unmanaged network based on the IPAM setting.
