An agile port is an interface that can function as a 10G port or can subsume a predefined set of 10G interfaces to form an interface with higher speed capabilities.

The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

- To view the set of available agile ports and the subsumable interfaces that comprise them, enter **`show platform fm6000 agileport map`**.
- To configure the primary port as a higher speed port, enter **`speed`** **40gfull** or **`speed`** **auto 40gfull**.
- To revert the primary port and its subsumed ports to 10G interfaces, enter **no** **`speed`**.

11.1.6.14 Subinterface Configuration

For a subinterface to be operational on an Ethernet or port channel interface, the parent interface must be configured as a routed port and be administratively up, and a VLAN must be configured on the subinterface. If the parent interface goes down, all subinterfaces automatically go down as well, but will come back up with the same configuration once the parent interface is up.

Note that a port channel should not contain Ethernet interfaces with subinterfaces configured on them, and that subinterfaces cannot be members of a port channel.

Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface. Note that the subinterface number has no relation to the ID of the VLAN corresponding to the subinterface.

Subinterfaces are available on the following platforms:

- DCS-7050X
- DCS-7060X
- DCS-7250X
- DCS-7260X
- DCS-7280E
- DCS-7300X
- DCS-7320X

- DCS-7500E

11.1.6.14.1 Creating a Subinterface

To create a subinterface on an Ethernet or port channel interface:

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#no switchport
switch(config-if-Et1/1)#no shutdown
```

2. Configure a VLAN on the subinterface. The **encapsulation dot1q vlan** command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)#interface Ethernet1/1.1
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100
```

3. Configure an IP address on the subinterface (optional) and ensure that it is up.

```
switch(config-if-Et1/1)#ip address 10.0.0.1/24
switch(config-if-Et1/1)#no shutdown
switch(config-if-Et1/1)#
```

11.1.6.14.2 Creating a Range of Subinterfaces

A range of subinterfaces can also be configured simultaneously. The following example configures subinterfaces ***1*** to ***100*** on ***Ethernet interface 1/1***, and assigns ***VLANs 501*** through ***600*** to them. Note that the range of interfaces must be the same size as the range of VLAN IDs.

Example

```
switch(config)#interface eth1/1.1-100
switch(config-if-Et1/1.1-100)#no shutdown
switch(config-if-Et1/1.1-100)#encapsulation dot1q vlan {501,600}
switch(config-if-Et1/1.1-100)#exit
switch(config)#
```

11.1.6.14.3 Parent Interface Configuration

For subinterfaces to function, the parent interface must be administratively up and configured as a routed port.

Some settings are inherited by subinterfaces from the parent interface. These include QoS (trust mode and default DSCP) and MTU.

Additionally, on the DCS-7050X, DCS-7250X, and DCS-7300X platforms, the parent interface may be configured with an IP address. In this case, untagged packets are treated as incoming traffic on the parent interface

11.1.6.14.4 Configuring Routing Features on a Subinterface

Once a subinterface is created, the following features can be configured on it:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- VRF
- VRRP

- SNMP
- Inheritance of QoS (trust mode and default DSCP) and MTU settings from the parent interface

Additionally, these features can be configured on subinterfaces on Arad (DCS-7500E and DCS-7280E) platforms:

- Subinterface counters on ingress
- VXLAN
- MPLS
- GRE
- PBR
- QoS

11.1.6.14.5 Displaying Subinterface Information

Subinterface information is displayed using the same show commands as for other interfaces.

Examples

- This command displays summary information for all IP interfaces on the switch, including subinterfaces.

```
switch#show ip interfaces brief
 Interface            IP Address     Status    Protocol     MTU
 Ethernet1/1        10.1.1.1/24up     up        1500
Ethernet1/1.1       10.0.0.1/24up     up        1500
 Ethernet1/2         unassigned       up         up       1500
```

- This command displays information for subinterface Ethernet ***1/1.1***.

```
switch#show interface ethernet 1/1.1
Ethernet1/1.1 is down, line protocol is lowerlayerdown (notconnect)
  Hardware is Subinterface, address is 001c.735d.65dc
  Internet address is 10.0.0.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes , BW 10000000 kbit
  Down 59 seconds
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch#show interfaces status sub-interfaces
Port       Name    Status       Vlan     Duplex       Speed       Type                Flags
Et1.1              connect     101        full       10G      dot1q-encapsulation
Et1.2              connect     102        full       10G      dot1q-encapsulation
Et1.3              connect     103        full       10G      dot1q-encapsulation
Et1.4              connect     103        full       10G      dot1q-encapsulation
```

11.1.6.15 Maximum Latency Tail-drop Thresholds

The maximum latency for Tail-drop thresholds can be configured in interface configuration mode or in the QoS profile. **QoS profile** configuration mode is a group change mode.

Example

These commands configure the maximum latency value for VOQ tail-drop threshold on ***transmit queue 3*** on ***interface Ethernet1***. The latency value can be specified to a maximum of ***50*** ms. Both milliseconds and microseconds may be used.

```
switch(config)#interface Ethernet1
```

```
switch(config-if-Et1)#tx-queue 3
switch(config-if-Et1-txq-3)#latency maximum <1-50000> microseconds
switch(config-if-Et1-txq-3)#latency maximum <1-50> milliseconds
switch(config)#
```

11.1.6.16 Autonegotiated Settings

In autonegotiation, the transmission speed, duplex setting, and flow control parameters used for Ethernet-based communication can be automatically negotiated between connected devices to establish optimized common settings.

11.1.6.16.1 Speed and Duplex

The **speed** command affects the transmission speed and duplex setting for the configuration mode interface. When a **speed** command is in effect on an interface, autonegotiation of speed and duplex settings is disabled for the interface; to enable autonegotiation, use the **speed auto** command.

The scope and effect of the **speed** command depends on the interface type; see **Ethernet Interfaces** and **Ethernet Configuration Procedures** for detailed information on the speed settings for different interfaces.

11.1.6.16.2 Flow Control

Flow control is a data transmission option that temporarily stops a device from sending data because of a peer data overflow condition. If a device sends data faster than the receiver can accept it, the receiver's buffer can overflow. The receiving device then sends a PAUSE frame, instructing the sending device to halt transmission for a specified period.

Flow control commands configure administrative settings for flow control packets.

- The **flowcontrol receive** command configures the port's ability to receive flow control pause frames.
  - **off**: port does not process pause frames that it receives.
  - **on**: port processes pause frames that it receives.
  - **desired**: port autonegotiates; processes pause frames if peer is set to **send** or desired.
- The flowcontrol send command configures the port's ability to transmit flow control pause frames.
  - **off**: port does not send pause frames.
  - **on**: port sends pause frames.
  - **desired**: port autonegotiates; sends pause frames if peer is set to **receive** or **desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. Compatible Settings for Flow Control Negotiation lists the compatible flow control settings.

Table 61: Compatible Settings for Flow Control Negotiation

local port	peer port
receive on	send on or send desired
receive off	send off or send desired
receive desired	send on , send off, or send desired
send on	receive on or receive desired

send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

Example

These commands set the flow control receive and send to **on** on ***Ethernet interface 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```

11.1.6.17 Displaying Ethernet Port Properties

Show commands are available to display various Ethernet configuration and operational status on each interface. Ethernet settings that are viewable include:

- Port Type
- PHY Status
- Negotiated Settings
- Flow Control
- Capabilities

Port Type

The port type is viewable from the output of **show interfaces status**, **show interfaces hardware**, and **show interfaces transceiver properties** commands.

Examples

- This **show interfaces status** command displays the status of Ethernet interfaces ***1-5***.

```
switch#show interfaces status
Port      Name             Status       Vlan        Duplex  Speed Type
Et1                        connected    1             full    10G 10GBASE-SRL
Et2                        connected    1             full    10G 10GBASE-SRL
Et3                        connected    1             full    10G 10GBASE-SRL
Et4                        connected    1             full    10G 10GBASE-SRL
Et5                        notconnect   1             full    10G Not Present
switch>
```

- This **show interfaces hardware** command displays the speed, duplex, and flow control capabilities of Ethernet interfaces ***2*** and ***18***.

```
switch#show interfaces ethernet 2,18 hardware
Ethernet2
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol:  rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch>
```

- This command displays the media type, speed, and duplex properties for Ethernet interfaces ***1***.

```
switch#show interfaces ethernet 1 transceiver properties
Name : Et1
Administrative Speed: 10G
```

```
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL
```

PHY

PHY information for each Ethernet interface is viewed by entering the **show interfaces phy** command.

Example

This command summarizes PHY information for Ethernet interfaces ***1-3***.

```
switch#show interfaces ethernet 1-3 phy
Key:
   U    = Link up
   D    = Link down
   R    = RX Fault
   T    = TX Fault
   B    = High BER
   L    = No Block Lock
   A    = No XAUI Lane Alignment
   0123 = No XAUI lane sync in lane N

                                 State    Reset
Port           PHY state        Changes    Count PMA/PMD PCS   XAUI
-------------- ---------------- -------- -------- ------- ----- --------
Ethernet1      linkUp             14518     1750 U..     U.... U.......
Ethernet2      linkUp             13944     1704 U..     U.... U.......
Ethernet3detectingXcvr          3        1               D..A0123
switch>
```

Negotiated Settings

Speed, duplex, and flow control settings are displayed through the show interfaces hardware, PHY information for each Ethernet interface is viewed by entering the **show interfaces hardware**, **show interfaces flow-control**, and **show interfaces status** commands.

Examples

- This command displays speed/duplex and flow control settings for Ethernet interface ***1***.

```
switch#show interfaces ethernet 1 hardware
Ethernet1
  Model:        DCS-7150S-64-CL
  Type:         10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch>
```

- This command shows the flow control settings for Ethernet interfaces ***1-2***.

```
switch#show flow-control interface ethernet 1-2
Port       Send FlowControl  Receive FlowControl  RxPause       TxPause
           admin    oper     admin    oper
---------  -------- -------- -------- --------    ------------- -------------
Et1        off      off      off      off         0             0
Et2        off      off      off      off         0             0
switch>
```

- This command displays the speed type and duplex settings for management interfaces ***1-2***.

```
switch#show interfaces management 1-2 status
Port      Name              Status       Vlan        Duplex  Speed Type
Ma1                         connected    routed      a-full a-100M 10/100/1000
Ma2                         connected    routed      a-full   a-1G 10/100/1000
switch>
```

11.1.6.18 Ingress Counters

The Ingress counters enables the switch to count the ingress traffic on the Layer 3 ports of the switch.

Any ingress traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision. The VLAN counters are supported on DCS- 7050x, DCS-7250x, and DCS-7300x series switches and not supported on any routed ports.

11.1.6.18.1 Configuring Ingress Counters

The hardware counter feature in command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

Examples

- This command configures the ingress traffic count on the sub-interfaces. The **no** form of the command disables the counter configuration from the switch ports.

```
switch#hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface. The **no** form of the command disables the counter configuration from the VLAN configured switch ports.

```
switch#hardware counter feature vlan-interface in
```

11.1.6.18.2 Displaying the Ingress Counter Information

The show interface counters command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface of the switch. The clear counters command resets the counters to ***0***.

Example

This command displays the ingress traffic count on a VLAN interface ***vl12***.

```
switch#show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
Vl12           3136          47           2
```

11.1.6.19 Configuring Ingress Traffic-Class Counters

Ingress traffic class counter support is enabled in order to display per traffic-class counters on ingress interfaces, and supported on routed-ports and subinterfaces. Both packet and octet counts are displayed.

Examples

- This command enables traffic-class counter support.

```
switch(config)#hardware counter feature traffic-class in
```

- This command enables TCAM profile tc-counters if this profile is configured.

```
switch(config)#hardware tcam profile tc-counters
```

11.1.6.20 Hardware Counter Support

Hardware counter support allows enabling counters for features using programmable hardware counter resources.

Hardware counter support can be used to count the following feature specific counters:

- Ingress VLAN-interface counters count the packets/octets ingressing through a VLAN interface.
- Egress VLAN-interface counters count the packets/octets egressing a VLAN interface.
- Ingress subinterface counters count the packets/octets ingressing through a subinterface.
- Egress subinterface counters count the packets/octets egressing a subinterface.
- VXLAN VNI counters count the packets/octets encapsulated/decapsulated per VNI.
- VXLAN VTEP counters count the packets/octets encapsulated/decapsulated per VTEP.
- Route counter for IPv4/IPv6 routes count the packets/octets routed using the route entry.
- Ingress GRE Tunnel Interface counters count the packets/octets ingressing through the GRE Tunnel Interface.
- Egress GRE Tunnel Interface counters count the packets/octets egressing through the GRE Tunnel Interface.

11.1.6.20.1 Hardware Counter Support Configuration

You can enable the Hardware Counter feature on a per-feature basis using the **`hardware counter feature`** command. The **`no hardware counter feature`** disables the feature. Multiple ingress and egress hardware counter features can work concurrently. Review MRU Enforcement Limitations for details.

Note: Enabling the hardware counter features may impact the transit traffic.

11.1.6.20.1.1 Ingress VLAN Interface Counters

The **`hardware counter feature vlan-interface in`** command enables the counting of ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.

Example

```
switch#[no]hardware counter feature vlan-interface in
```

11.1.6.20.1.2 Egress VLAN Interface Counters

The **`hardware counter feature vlan-interface out`** command enables the counting of egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the VLAN interface for every VLAN interface configured in the system.

Example

```
switch#[no]hardware counter feature vlan-interface out
```

11.1.6.20.1.3 Ingress SubInterface Counters

The **`hardware counter feature subinterface in`** command enables the counting of ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets ingressing through the subinterface for every L3 subinterface configured in the system.

Example

```
switch#[no]hardware counter feature subinterface in
```

11.1.6.20.1.4 Egress SubInterface Counters

The **hardware counter feature subinterface out** command enables the counting of egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets, and total octets egressing the subinterface for every L3 subinterface configured in the system.

Example

```
switch#[no]hardware counter feature subinterface out
```

11.1.6.20.1.5 VXLAN VNI Encapsulation Counters

The **hardware counter feature vni encap** command enables the counting of per VNI encap counters. When enabled, the switch counts the number of packets and bytes egressing a VNI through VTI, encap BUM packets, and the number of encap packets dropped due to any reason.

Example

```
switch(config)#[no]hardware counter feature vni encap
```

11.1.6.20.1.6 VXLAN VNI Decapsulation Counters

The **hardware counter feature vni decap** command enables the per VNI decap counters. When enabled, the switch counts the number of packets/octets received from VTEP and decapsulated for each VNI.

Example

```
switch(config)#[no]hardware counter feature vni decap
```

11.1.6.20.1.7 Route Counters

The **hardware counter feature route** command configures the route counters for the specified IP version and ip-address/ip-prefix. When enabled, the switch counts the number of packets/bytes hitting a route. The VRF name is optional and default VRF is assumed if no VRF is specified.

Example

```
switch(config)#[no]hardware counter feature route[ipv4|ipv6]vrf
 <name>][ip-address|ip-address-prefix]
```

11.1.6.20.1.6 GRE Tunnel Interface Encapsulation Counters

The **hardware counter feature gre tunnel interface out** command enables GRE Tunnel Interface encap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting encapsulated on the Tunnel Interface.

Example

```
switch(config)#[no]hardware counter feature gre tunnel interface
 out
```

11.1.6.20.1.6 GRE Tunnel Interface Decapsulation Counters

The **hardware counter feature gre tunnel interface in** command enables GRE Tunnel Interface decap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the Tunnel Interface.

Example

```
switch(config)#[no]hardware counter feature gre tunnel interface
 in
```

11.1.6.20.2 MRU Enforcement Show commands

The MRU on an interface is found in the show interface output.

```
switch(config)#show interface ethernet 1
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 444c.a8b7.1ed8 (bia 444c.a8b7.1ed8)
  Member of Port-Channel10
  Ethernet MTU 10178 bytes, Ethernet MRU 1500 bytes, BW 10000000 kbit
  Full-duplex, 10Gb/s, auto negotiation: off, uni-link: disabled.
```

Counter

MRU dropped packets are counted per-chip.

The Ethernet interfaces corresponding chip are found in the **show platform fap mapping** output.

```
switch(config)#show platform fap mapping interface Ethernet 1
Jericho0 (FapId: 0  BaseSystemCoreId: 0)
Port            SysPhyPort   Voq   Core  FapPort  OtmPort BaseQPair
 QPairs Xlge NifPort
-------------------------------------------------------------------------
-----------------
Ethernet1       100          2608  0     2       0        0         8
   8     33
```

Reassembly Errors use per-chip counters from the show hardware counter drop output.

```
switch(config)#show hardware counter drop
Type  Chip       CounterName       : Count    : First Occurrence    :
 Last Occurrence
```

```
------------------------------------------------------------------------
----------------------
A     Jericho0   ReassemblyErrors  : 12132989 : 2020-09-22 17:05:45 :
 2020-09-22 17:22:40
```

11.1.6.20.3 MRU Enforcement Limitations

- The number of features for which the hardware counters can be enabled simultaneously is limited by the availability of counter hardware resources in the system. When the configured hardware features exceed the available counter resources, not all counters for all features are available.
  - At lower scales of the feature key (for example, the number of interfaces in the case of subinterface/SVI counters), you can typically concurrently support up to six (6) ingress features and three (3) egress features. As scales grow beyond table sizes, single features use multiple tables.
- Route counters do not support the counting of host routes or ALPM routes.
- Packets sent from the CPU are not included in egress counters.

11.1.6.21 Configuring Power over Ethernet (PoE)

Power over Ethernet (PoE) is enabled by default on all Ethernet ports of PoE-capable switches, and the switch will detect IEEE-compliant powered devices (PDs) when they are plugged into a port and supply power appropriately.

Limitations

- Ethernet ports will not detect non IEEE-compliant devices by default, and may not be able to detect or power them even if configured to do so.
- If attached PDs overload the switch, it will power off. This can occur when an attached PD increases its power demand via LLDP, when too many PDs are connected to the switch, or when a power supply fails on a heavily loaded dual-supply switch.
- Power-cycling the switch will cause temporary loss of power to attached PDs.
- PoE is not available on management interfaces.

Disabling PoE on an Interface

On switches which support PoE, it is enabled by default on all Ethernet ports but can be disabled per-port with the **poe disabled** command.

Example

These commands disable PoE on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe disabled
switch(config-if-Et5)#
```

PoE Power Settings

When an IEEE-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its initial power needs are determined by hardware negotiation, after which further negotiation is managed through the Link Layer Discovery Protocol (LLDP). For details, see **Configuring LLDP for Power over Ethernet**.

PoE power output can be limited on a port using the **poe limit** command. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

Note: LLDP uses Power Via MDI type-length-value elements (TLVs) to allow the switch to dynamically negotiate power needs with PDs. LLDP will not include Power Via MDI TLVs for the interface if a power limit has been configured on it.

Examples

- These commands limit nominal PoE power output on Ethernet interface ***5*** to ***10*** W.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe limit 10 watts
switch(config-if-Et5)#
```

- These commands limit nominal PoE power output on Ethernet interface ***7*** to ***4*** W.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit class 1
switch(config-if-Et7)#
```

Detecting Legacy PDs

IEEE-compliant powered devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. By default, legacy PD detection is disabled, and legacy devices are not powered.

To configure an interface to use hardware detection for these non-compliant PoE devices and attempt to power them, use the **poe legacy detect** command.

Note: Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

Example

These commands configure ***Ethernet interface 5*** to attempt to detect and power non-compliant PDs.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe legacy detect
switch(config-if-Et5)#
```

Displaying PoE Information

To display PoE information for a specific interface range or for all Ethernet interfaces, use the **show poe** command.

Example

This command displays PoE information for ***Ethernet interface 46***.

```
switch(config)#show poe interface ethernet 46
show poe interface ethernet 46
PSELLDPPowerGrantedPort
Port Enabled Enabled Limit  Power   State   Class  Power Current Voltage Temperature
---- ------- ------- ------ ------- ------- ------ ----- ------- ------- -----------
46      True    True 15.40W 15.40W  powered class0  1.40W 27.00mA 55.04V  41.25C
switch(config-if-Et7)#
```

11.1.6.22 Configuring Link Fault Signaling

As part of the Link Fault Signaling (LFS) configuration, a new configuration mode called the Ethernet Operations Administration and Management (EOAM) mode is introduced. The EOAM profile has a link-error sub-mode wherein the threshold, action, and the period is configured for both FCS and Symbol errors. The period can be in seconds or in number of frames. The default values are threshold ***0***, action

syslog, and period ***0*** seconds. If the errors exceed the threshold within the given period, the configured action is executed. The recovery time configures the recovery timeout value for link fault signaling. Only one EOAM profile is associated with a port.

The following steps enable configuring the LFS parameters:

1. Enable the EOAM mode.

```
switch(config)#monitor ethernet oam
```

2. Create an EOAM profile named as ***profile1***.

```
switch(config-eoam)#profile profile1
```

3. Enter the EOAM ***link-error sub-mode***.

```
switch(config-eoam-profile-profile1)#link-error
```

4. Enter the commands in the profile ***link-error submode*** to configure a specific LFS parameter.

```
switch(config-eoam-profile-profile1-link-error)#symbol action
 errdisable
switch(config-eoam-profile-profile1-link-error)#symbol period 300
 frames
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
switch(config-eoam-profile-profile1-link-error)#recovery-time 40
```

5. Apply the EOAM profile ***profile1*** to the Ethernet interface ***1/1***.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```

11.1.6.23 Configuring Hardware TCAM

Ternary Content-Addressable Memory (TCAM) is a specialized type of high-speed memory that increase the speed of route look-up, packet classification, packet forwarding and access control list-based commands. The **`hardware tcam`** command is used to configure and place the switch in the TCAM mode. In this mode the user can configure few TCAM related commands such as feature, profile and system.

In the TCAM mode, use the feature command to configure the reservation of TCAM banks for the features like ACL, IPsec, flow-spec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy. The profile command configures a new TCAM profile, or just copy the TCAM profile which is already created using the hardware tcam profile command such as default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing. Similarly, the system command configures the system-wide TCAM profiles.

Example

This command places the switch in Hardware TCAM configuration mode.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#
```

These are the commands allowed to configure in Hardware TCAM mode.

Examples

- This command allow the switch to configure the TCAM feature.

```
switch(config)#hardware tcam
```

```
switch(config-hw-tcam)#feature
```

- This command allow the switch to configure TCAM profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile
```

- This command allow the switch to configure TCAM system profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system
```

11.1.6.24 CPU Traffic Policy

Create a TCAM profile to enable actions such as permit, deny, and police in hardware before the traffic gets to the kernel for processing. The action is taken based on IP packet header information such as DSCP, L4 port values, fragmentation bits, etc.

TCAM Profile Example

The following file extract displays an example of a TCAM profile, **cpu-traffic-policy**, with features configured to enable CPU traffic policy.

```
hardware tcam
   profile cpu-traffic-policy
      feature acl port ip
         sequence 45
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-
src-port src-ip tcp-control ttl
         action count drop
         packet ipv4 forwarding bridged
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet ipv4 non-vxlan forwarding routed decap
         packet ipv4 vxlan eth ipv4 forwarding routed decap
         packet ipv4 vxlan forwarding bridged decap
      feature acl port ipv6
         sequence 25
         key field dst-ipv6 ipv6-next-header ipv6-traffic-class l4-dst-
port l4-ops-3b l4-src-port src-ipv6-high src-ipv6-low tcp-control
         action count drop mirror
         packet ipv6 forwarding bridged
         packet ipv6 forwarding routed
         packet ipv6 forwarding routed multicast
         packet ipv6 ipv6 forwarding routed decap
      feature acl subintf ip
         sequence 40
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops-18b
 l4-src-port src-ip tcp-control ttl
         action count drop mirror
         packet ipv4 forwarding routed
      feature acl subintf ipv6
         sequence 15
         key field dst-ipv6 ipv6-next-header l4-dst-port l4-src-port src-
ipv6-high src-ipv6-low tcp-control
         action count drop mirror redirect
         packet ipv6 forwarding routed
      feature counter lfib
```

```
         sequence 85
      feature mpls
         sequence 5
         key size limit 160
         action drop redirect set-ecn
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding mpls
         packet mpls non-ip forwarding mpls
      feature mpls pop ingress
         sequence 90
      feature pbr mpls
         sequence 65
         key size limit 160
         key field mpls-inner-ip-tos
         action count drop redirect
         packet mpls ipv4 forwarding mpls
         packet mpls ipv6 forwarding mpls
         packet mpls non-ip forwarding mpls
      feature qos ip
         sequence 75
         key size limit 160
         key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-
src-port src-ip
         action set-dscp set-policer set-tc
         packet ipv4 forwarding routed
         packet ipv4 forwarding routed multicast
         packet ipv4 mpls ipv4 forwarding mpls decap
         packet ipv4 mpls ipv6 forwarding mpls decap
         packet ipv4 non-vxlan forwarding routed decap
      feature qos ipv6
         sequence 70
         key field dst-ipv6 ipv6-next-header ipv6-traffic-class l4-dst-
port l4-src-port src-ipv6-high src-ipv6-low
         action set-dscp set-policer set-tct
         packet ipv6 forwarding routed
      feature traffic-policy cpu ipv4
         sequence 1
         key size limit 160
         key field dst-ip ip-frag ip-protocol l4-dst-port l4-src-port
 src-ip
         action count set-drop-precedence set-policer
      feature traffic-policy cpu ipv6
         sequence 2
         key field dst-ipv6 ipv6-next-header l4-dst-port l4-src-port src-
ipv6-high src-ipv6-low
         action count set-drop-precedence set-policer
   system profile cpu-traffic-policy
```

Configuring the Policy

The following configures **cpu-traffic-policy** under the traffic-policies global configuration mode.

```
traffic-policies
  cpu traffic-policy <name> vrf <vrf-list>
  traffic-policy <name>
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      source prefix       A.B.C.D/E [ A.B.C.D/E ]
      destination prefix  A.B.C.D/E [ A.B.C.D/E ]
      protocol <protocol-list> | {tcp,udp}
                          [ source port <port-list> |
```

```
                                        field-set <port-set-name> ] |
                          [ destination port <port-list> |
                                        field-set <port-set-name> ]
      actions
         drop
         police rate <rate> <unit>
         count
```

The following applies the policies to the VRFs. The policy is applied to all interfaces belonging to the VRF.

```
traffic-policies
  cpu traffic-policy <name> vrf all
```

Default Rules

The **ipv4-all-default** and **ipv6-all-default** are programmed by default and cannot be reordered, or removed. Only the associated action can be changed. The **permit** rule is never installed and is the default action for packet processing.

Examples

L3 Protocol Match Criteria (protocol neighbors bgp)

The following displays the configuration of a profile to match on a set of configured protocol peers which allows only TCP traffic from those BGP peers.

```
traffic-policies
  cpu traffic-policy <name> vrf <vrf-list>
  traffic-policy <name>
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      source prefix       A.B.C.D/E [ A.B.C.D/E ]
      destination prefix  A.B.C.D/E [ A.B.C.D/E ]
      protocol <protocol-list> | {tcp,udp}
                          [ source port <port-list> |
                                        field-set <port-set-name> ] |
                          [ destination port <port-list> |
                                        field-set <port-set-name> ]
      actions
         drop
         police rate <rate> <unit>
         count

traffic-policies
  cpu traffic-policy <traffic-policy-name> vrf all
    match <rule-name> <ipv4 | ipv6> [ <after | before> <rule-name> ]

      protocol neighbors bgp
      actions
         drop

traffic-policies
   cpu traffic-policy foo vrf all
      traffic-policy foo
         match BGP ipv4
            protocol neighbors bgp
```

The following policy permits dynamic peers from the listen-range ***2.0.0.0/24*** and all IPv6 BGP LL peers.

```
traffic-policies
```

```
   traffic-policy cpuPolicy
      match BGP ipv4
         protocol neighbors bgp
      match BGP-DYN ipv4
         source prefix 2.0.0.0/24
      match BGP-LL ipv6
         source prefix fe80::/64
```

Note: Configuring any match criteria will result in a CLI error when combined with the **`protocol neighbor bgp`** match criteria as these conflict with the expanded BGP rules.

The following displays error messages with conflicting configurations.

```
traffic-policies
   traffic-policy cpuPolicy
      match BGP ipv4
         protocol neighbors bgp
         source prefix 1.0.0.1/32
! The 'source prefix' subcommand is not supported when the 'protocol
 neighbors' subcommand is configured.

traffic-policies
   traffic-policy cpuPolicy
      match BGP ipv4
         source prefix 1.0.0.1/32
         protocol neighbors bgp
! The 'protocol neighbors' subcommand is not supported when any other
 match subcommands are configured.
```

Deny other BGP Traffic

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is inadequate as attempts to create BGP sessions from ***1.0.0.0/24*** (for example) will pass through this policy unfiltered.

```
traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BFD ipv4
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is effective and easier to implement for administrators.

```
traffic-policies
   cpu traffic-policy CPU
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BGP-REST ipv4
         protocol tcp udp destination port 179
         actions
            drop
      match BFD ipv4
```

```
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

The following displays a policy to whitelist some BGP sessions and other management IPs or IP protocol. The policy is effective and easier to implement for administrators. The clause matches on any inbound traffic destined for the configured BGP port(s).

```
traffic-policies
   cpu traffic-policy CPU
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
      match BGP-REST ipv4
         protocol bgp
         actions
            drop
      match BFD ipv4
         source address 1.0.0.0/24 1.0.1.0/24 1.0.4.0/24
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Actions

Drop: packet is discarded on a match

Police: tracks the usage for each BGP neighbor, and holds it to a maximum rate.

The **`police rate <rate-value> [rate-unit]`** command sets the policing rate. The optional **rate-unit** are bps, kbps (default), mbps, and gbps. The following configures a policing rate of 15 kbps for each BGP neighbor.

```
traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
         actions
            police rate 15 kbps
```

Count

The following enables counters for the CPU traffic policy to count all packets matching the rule in which the **count** action is configured.

```
no hardware counter feature acl out <address-family>

hardware counter feature traffic-policy cpu

traffic-policies
   cpu traffic-policy CPU vrf all
   traffic-policy CPU
      match BGP ipv4
         protocol neighbors bgp
         actions
```

```
            count
```

Use-case Scenarios
Securing BGP Neighbors

The following implements a policy to secure BGP neighbors.

```
traffic-policies
   cpu traffic-policy CPU-DEFAULT vrf all
   traffic-policy CPU-DEFAULT
      match ICMPV6 ipv6
         protocol icmpv6
      match BGP ipv4
         protocol neighbors bgp
      match BGP-OTHER ipv4
         protocol bgp
         actions
            drop
      match BGP6 ipv6
         protocol neighbors bgp
      match BGP-OTHER6 ipv6
         protocol bgp
         actions
            drop
      match OSPF ipv4
         protocol ospf
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Whitelist BFD Neighbors (not neighbor-specific)

Add the following rule to Whitelist BFD Neighbors.

```
traffic-policies
   traffic-policy CPU-DEFAULT
      match BFD-DPORT ipv4
         protocol udp destination port 3784-3785
      match BFD-SPORT ipv4
         protocol udp source port 49152
      match BFD-DPORT6 ipv6
         protocol udp destination port 3784-3785
      match BFD-SPORT6 ipv6
         protocol udp source port 49152
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

Whitelist a few Common Control-plane Protocols and Deny others

Add the following rule to Whitelist protocols such as ICMPv6 while denying others.

```
traffic-policies
   cpu traffic-policy CPU-DEFAULT vrf all
   traffic-policy CPU-DEFAULT
      match ICMPV6 ipv6
         protocol icmpv6
```

```
      match BGP ipv4
         protocol neighbors bgp
      match BGP-OTHER ipv4
         protocol bgp
         actions
            drop
      match BGP6 ipv6
         protocol neighbors bgp
      match BGP-OTHER6 ipv6
         protocol bgp
         actions
            drop
      match OSPF ipv4
         protocol ospf
      match PIM4 ipv4
         protocol pim
      match PIM6 ipv6
         protocol pim
      match ipv4-all-default ipv4
         actions
            drop
      match ipv6-all-default ipv6
         actions
            drop
```

11.1.6.25 TCAM Profile for Configurable Port Qualifier Sizing

A TCAM profile can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

Modifying a Default TCAM Profile to allow Dynamic Sizing for ACL Labels

The following commands create a copy of the default TCAM profile, name it **port-qualifier-size**, and configure it to support a 6-bit dynamic sizing for ACL labels for IPKGV. Once the profile has been created, it can be applied to the system.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile port-qualifier-size copy default
switch(config-hw-tcam-profile-port-qualifier-size)#feature port-qualifie
r-size ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-
size)#port-qualifier-size 6
switch(config-hw-tcam-profile-port-qualifier-size-feature-port-qualifier-
size)#exit
switch(config-hw-tcam-profile-port-qualifier-size)#feature acl port ip
switch(config-hw-tcam-profile-port-qualifier-size)#exit
switch(config-hw-tcam)#exit
switch(config)#
```

Verifying the Configuration of Dynamic Qualifier Size

The following command verifies the configuration.

```
switch#show running-config
hardware tcam
   profile port-qualifier-size
      feature acl port ip
         port qualifier size 6 bits
```

Verifying the Configuration of System Profile

The following command verifies the system profile was configured and applied successfully. The profile name appears in both the Configuration and Status columns.

```
switch#show harware tcam profile
                  Configuration                    Status
Linecard1         port-qualifier-size              port-qualifier-
size
Linecard2         port-qualifier-size              port-qualifier-
size
Linecard3         port-qualifier-size              port-qualifier-
size
```

When the profile does not get applied correctly, the Status column shows Error.

```
switch#show harware tcam profile
                  Configuration                    Status
Linecard1         port-qualifier-size              ERROR
Linecard2         port-qualifier-size              ERROR
Linecard3         port-qualifier-size              ERROR
```

Note: The packet type, the key field must be set. The dynamic qualifier size can be set for ACL. Not all hardware platforms support this feature. Modular systems require all linecards to support this feature for the profile to be applicable.

11.1.7 Ethernet Configuration Commands

Global Configuration Commands

- clear counters
- clear vxlan counters
- hardware port-group
- hardware counter feature
- hardware counter feature in (DCS-7050x, 7350x, 7300x)
- hardware tcam
- interface ethernet
- interface ethernet create
- interface management
- monitor ethernet oam
- transceiver qsfp default-mode
- transceiver channel

Hardware TCAM Commands

- feature
- system

Interface Configuration Commands Ethernet and Management Interfaces

- flowcontrol receive
- flowcontrol send
- link-debounce
- mac-address
- poe disabled
- poe legacy detect
- poe limit
- power budget
- power budget exceed action (warning | hold-down)
- speed

EOAM Configuration Commands

- link-error
- monitor ethernet oam profile
- profile

Link-error Configuration Commands

- action
- period
- phy link detection aggressive
- recovery-time
- threshold

Interface Display Commands

- show hardware counter
- show hardware port-group

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates
- show interfaces flow-control
- show interfaces hardware
- show interfaces hardware default
- show interfaces interactions
- show interfaces negotiation
- show interfaces phy
- show interfaces status
- show interfaces status errdisabled
- show interfaces transceiver
- show interfaces transceiver channels
- show interfaces transceiver hardware
- show interfaces transceiver properties
- show monitor ethernet oam profile
- show platform fm6000 agileport map
- show platform trident flexcounters
- show platform trident flexcounters l3intf
- show poe
- show route counters
- show vxlan counters vni

400GBASE-ZR Transceivers Display Commands

- show interface transceiver dom
- show interface transceiver eeprom
- show transceiver status interface

Shared Support across Multiple Subinterfaces Commands

- qos scheduling
- show qos scheduling

11.1.7.1 action

The **action** command configures the link monitoring action that is specified for the link fault signaling event.

The **no action** command removes the action type specified for the chosen link fault signaling. The **default action** command configures the link monitoring action as system log type.

Command Mode

Link-error Configuration

Command Syntax

{fcs | symbol} **action** [linkfault | errdisable | log]

no {fcs | symbol} **action** [linkfault | errdisable | log]

default {fcs | symbol} **action** [linkfault | errdisable | log]

Parameters

- **fcs** Inbound packets with frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **linkfault** The link fault action type.
- **errdisable** The errdisable action type.
- **log** The system log action type.

Related Commands

- period
- threshold

Example

These commands set the errdisable action type for the profile ***profile1*** in the Link-error configuration mode for symbol error.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol action errdisable
```

11.1.7.2 clear counters

The **`clear counters`** command in ***privileged EXEC*** mode resets the counters to zero for the specified interfaces including VLAN interfaces, Sub-Interfaces, and GRE Tunnel Interfaces.

Command Mode

Privileged EXEC

Command Syntax

`clear counters` [vlan *vlanId* | Tunnel *tunnelID*][[route][ipv4 | ipv6][vrf]]

Parameters

- **vlan *vlanId*** Clears the VLAN Interface and subinterface Ingress and Egress counters.
- **Tunnel *tunnelID*** Allows the command to be used for clearing counters only for the specified VLAN interface.
- **route** Clears the route counters.
  - **ipv4** Allows targeting the clearing of IPv4 route counters.
  - **ipv6** Allows targeting the clearing of IPv6 route counters.
- **vrf** Allows specifying the VRF to only clear the route counters for the VRF.

Examples

- Clears the VLAN Interface and subinterface ingress and egress counters.

```
switch#clear counters[vlan vlanId]
```

- Clears the GRE Tunnel Interface Ingress and Egress counters.

```
switch#clear counters[tunnel TunnelId]
```

11.1.7.3 clear vxlan counters

Use the **clear vxlan counters** command to clear the VXLAN encap and decap counters.

Command Mode

EXEC

Command Syntax

clear vxlan counters [[vni | [vtep [vtep-ip-address | unlearnt]]]

Parameters

- **vni** Clears the VXLAN counters.
- **vtep** Clears the VTEP counters.
  - **vtep-ip-address** Clears the counters for the specified VTEP.
  - **unlearnt** Clears the counters for unlearned VTEPs. Unlearned VTEPs track the counts of packets received by the switch before the VTEP is learned.

11.1.7.4 feature

The **feature** command allows the user to reserve the number of TCAM banks for the following features such as ACL, flow-spec, IPsec, l2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy.

The **exit** command returns the switch to global configuration mode.

Command Mode

Hardware TCAM

Command Syntax

feature

Example

This commands allows the switch to configure the TCAM flow-spec feature for IPv4 ports.

```
switch(config-hw-tcam)#feature flow-spec port ipv4 bank maximum count 12
```

11.1.7.5 flowcontrol receive

The **flowcontrol receive** command configures administrative settings for inbound flowcontrol packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The flowcontrol receive command configures the configuration mode port's ability to receive flowcontrol pause frames.

- ***off***: port does not process pause frames that it receives.
- ***on***: port processes pause frames that it receives.
- ***desired***: port autonegotiates flow control; processes pause frames if the peer is set to send **desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to desired. Management ports are set to desired by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. The table below lists the compatible flow control settings.

Table 62: Compatible Settings for Flow Control Negotiation – Local Port Receiving

local port	peer port
receive on	send on or send desired
receive off	send off or send desired
receive desired	send on , send off, or send desired

The **no flowcontrol receive** and **default flowcontrol receive** commands restore the default flowcontrol setting for the configuration mode interface by removing the corresponding **flowcontrol receive** command from **running-config**. The default setting is **off** for Ethernet data ports and desired for Management ports.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

flowcontrol receive STATE

no flowcontrol receive

default flowcontrol receive

Parameters

STATE flow control pause frame processing setting. Options include:

- **On**
- **Off**

Example

These commands set the flow control received on Ethernet interface ***5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#
```

11.1.7.6 flowcontrol send

The **flowcontrol send** command configures administrative settings for outbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The **flowcontrol send** command configures the configuration mode port's ability to transmit flow control pause frames.

- **off**: port does not send pause frames.
- **on**: port sends pause frames.
- **desired**: port autonegotiates flow control; sends pause frames if the peer is set to **receive desired**.

Desired is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **no flowcontrol send** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. **Compatible Settings for Flow Control Negotiation Local Port Transmitting** lists the compatible flow control settings.

Table 63: Compatible Settings for Flow Control Negotiation Local Port Transmitting

local port	peer port
send on	receive on or receive desired
send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

The **no flowcontrol send** and **default flowcontrol send** commands restore the default flow control setting for the configuration mode interface by removing the corresponding **flowcontrol send** command from ***running-config***. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

flowcontrol send **STATE**

no flowcontrol send

default flowcontrol send

Parameters

STATE Flow control send setting. Options include:

- **on**
- **off**

Example

These commands set the flow control sent on ***Ethernet interface 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```

11.1.7.7 hardware counter feature

You can enable on a per feature basis the **`hardware counter feature`** command from the global configuration mode. The **`no hardware counter feature`** disables the feature. Multiple ingress and egress hardware counter features can work concurrently.

Command Mode

Global configuration mode

Command Syntax

`hardware counter feature` [[vlan-interface | subinterface] [in | out]][vni [encap | decap]][[route [ipv4 | ipv6][vrf *name*][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]

`no hardware counter feature` [[vlan-interface | subinterface] [in | out]][vni [encap | decap]] [[route [ipv4 | ipv6][vrf *name*][ip-address | ip-address-prefix]][[gre tunnel interface][in | out]]

Parameters

- **vlan-interface** Enables VLAN interface counters
  - **in** Enables the counting of ingress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets ingressing through the VLAN interface for every VLAN interface configured in the system.
  - **out** Enables the counting of egress VLAN interface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets egressing the vlan interface for every vlan interface configured in the system.
- **subinterface** Enables the counting subinterface counters.
  - **in** Enables the counting of ingress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets ingressing through the subinterface for every L3 subinterface configured in the system.
  - **out** Enables the counting of egress subinterface counters. When configured, the switch counts the number of unicast packets, multicast packets and total octets egressing the subinterface for every L3 subinterface configured in the system.
- **vni** Enables the counting of per VNI counters.
  - **encap** Enables the per encap counters. When enabled, the switch counts the number of packets/octets coming from the edge, encapsulated on the device and directed towards the core.
  - **decap** Enables the per VTEP decap counters. When enabled, the switch counts the number of packets/octets coming from the core, decapsulated on the device and heading towards the edge per each VTEP.
- **route** Configures the route counters for the specified ip version and ip-address/ip-prefix. When enabled, the switch counts the number of packets/bytes hitting a route.
  - **ipv4** Identifies the IPv4 route.
  - **ipv6** Identifies the IPv6 route.
- **vrf *name*** The VRF name is optional and default VRF is assumed if no VRF is specified.
- **ip-address** Specifies the target IP address.
- **ip-address-prefix** Specifies the target IP address prefix.
- **gre tunnel interface** Enables GRE tunnel interface counters.
  - **in** Enables GRE tunnel interface decap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting decapsulated on the tunnel interface.
  - **out** Enables GRE Tunnel Interface encap counters. When enabled, the switch counts the number of unicast GRE packets and total octets getting encapsulated on the Tunnel Interface.

Examples

```
switch#hardware counters feature vlan-interface in
```

```
switch#hardware counter feature vlan-interface out
```

```
switch#hardware counter feature subinterface in
```

```
switch#hardware counter feature subinterface out
```

```
switch(config)#hardware counter feature vni encap
```

```
switch(config)#hardware counter feature vni decap
```

```
switch(config)#hardware counter feature vtep encap
```

```
switch(config)#hardware counter feature vtep decap
```

```
switch(config)#hardware counter feature gre tunnel interface in
```

```
switch(config)#hardware counter feature gre tunnel interface out
```

11.1.7.8 hardware counter feature in (DCS-7050x, 7350x, 7300x)

The **hardware counter feature** command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

The **no hardware counter feature in** command disable the counter configuration from the switch ports. By default the ingress counter is disabled on the switch.

Command Mode

Global Configuration

Command Syntax

hardware counter feature [**INTERFACE**]in

no hardware counter feature [**INTERFACE**]in

Parameters

INTERFACE Layer 3 interface on the switch.

- **subinterface** Displays the subinterface traffic count.
- **vlan-interface** Displays the VLAN-interface traffic count.

Examples

- This command configures the ingress traffic count on the sub-interfaces.

```
switch#hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface.

```
switch#hardware counter feature vlan-interface in
```

- These commands enable the QSFP+ interface in port *group 1* and SFP+ interfaces in port ***group 2*** on a DCS-7050Q-16 switch, display the port group status, and display interface status.

```
switch(config)#hardware port-group 1 select Et15/1-4
switch(config)#hardware port-group 2 select Et21-24
switch(config)#show hardware port-group

Et24                        connected    in Po998      full    10G 10GBASE-SLR
switch(config)#
```

11.1.7.9 hardware port-group

The **hardware port-group** command configures a port group to activate a 40GBASE (QSFP+) interface or four 10GBASE (SFP+) interfaces, affecting QSFP+ and SFP+ availability.

The **no hardware port-group** and **default hardware port-group** commands restore a port groups default setting by removing the corresponding **hardware port-group** command from ***running-config***. The QSFP+ interface is active by default in each port group.

The **hardware port-group** command is available on DCS-7050Q-16 and DCS-7050QX-32S switches, and has different parameters on each platform.

Command Mode

Global Configuration

Command Syntax

hardware port-group *group_number* **select** **PORT_LIST**

no hardware port-group *group_number* **select** **PORT_LIST**

default hardware port-group *group_number* **select** **PORT_LIST**

Parameters

- ***group_number*** Label of the port group. Valid options are ***1*** and ***2*** on the 7050Q-16; only ***1*** is available on the 7050QX-32S.
- **PORT_LIST** Ports activated by command. Options vary by platform and depend on ***group_number*** value.
  - DCS-7050Q-16
    - ***Et15/1-4*** activates QSFP+ port on port ***group 1***. Available when ***group_number*** is ***1***.
    - ***Et16/1-4*** activates QSFP+ port on port ***group 2***. Available when ***group_number*** is ***2***.
    - ***Et17-20*** activates SFP+ ports on port ***group 1***. Available when ***group_number*** is ***1***.
    - ***Et21-23*** activates SFP+ ports on port ***group 2***. Available when ***group_number*** is ***2***.
  - DCS-7050QX-32S
    - ***Et1-4*** activates SFP+ ports on port ***group 1***. Available when *group_number* is ***1***.
    - ***Et5/1-4*** activates QSFP+ port on port ***group 1***. Available when ***group_number*** is ***1***.

11.1.7.10 hardware tcam

The **hardware tcam** command places the switch in Hardware TCAM configuration mode.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

hardware tcam

Related Commands

- profile
- interface ethernet

Example

This command places the switch in Hardware TCAM configuration mode.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#
```

11.1.7.11 interface ethernet create

The **`interface ethernet create`** command is used to configure a range of Ethernet subinterfaces. The command places the switch in Ethernet-interface configuration mode for the specified range of subinterfaces.

Command Mode

Global Configuration

Command Syntax

`interface ethernet create` *sub_range*

Parameters

sub_range Range of subinterfaces to be configured. Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface.

Example

This command enters interface configuration mode for Ethernet subinterfaces ***1/1.1-100***:

```
switch(config)#interface ethernet create 1/1.100
switch(config-if-Et1/1.1-100)#
```

11.1.7.12 interface ethernet

The **interface ethernet** command places the switch in Ethernet-interface configuration mode for the specified interfaces. The command can specify a single interface or multiple interfaces.

Ethernet interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from Ethernet interface configuration mode.

Command Mode

Global Configuration

Command Syntax

interface ethernet *e_range*

Parameters

e_range Ethernet interfaces (number, range, or comma-delimited list of numbers and ranges). Valid Ethernet numbers depend on the switchs available Ethernet interfaces.

Examples

- This command enters interface configuration mode for Ethernet interfaces ***1*** and ***2***:

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#
```

- This command enters interface configuration mode for Ethernet interface 1:

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#
```

11.1.7.13 interface management

The **`interface management`** command places the switch in management-interface configuration mode for the specified interfaces. The list can specify a single interface or multiple interfaces if the switch contains more than one management interface.

Management interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- **description**
- **exit**
- **load-interval**
- **mtu**
- **shutdown** (Interfaces)

Ethernet management commands include:

- **flowcontrol**
- **mac-address**
- **speed**

Chapters describing supported protocols and other features list additional configuration commands available from ***management-interface*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`interface management` *m_range*

Parameter

m_range Management interfaces (number, range, or comma-delimited list of numbers and ranges).

Valid management numbers depend on the switchs available management interfaces. A value of ***0***, where available, configures the virtual management interface on a dual-supervisor modular switch. Management interface ***0*** accesses management port ***1*** on the active supervisor of a dual-supervisor modular switch.

Examples

- This command enters the ***interface configuration*** mode for management interfaces ***1*** and ***2***.

```
switch(config)#interface management 1-2
switch(config-if-Ma1-2)#
```

- This command enters the ***interface configuration*** mode for management interface ***1***:

```
switch(config)#interface management 1
switch(config-if-Ma1)#
```

11.1.7.14 link-debounce

The **link-debounce** command configures the link debounce time for the configuration mode interface. Link debounce time is the time that advertisements for new link states are delayed after the link state is established. By default, debounce time is set to zero, disabling link debounce.

Debounce times for link-up and link-down transitions can be independently configured.

- **Link-up debounce time:** the delay before an interface advertises link down to link up transitions.
- **Link-down debounce time:** the delay before an interface advertises link up to link down transitions.

The **no link-debounce** and **default link-debounce** commands restore the default debounce setting for the configuration mode interface by removing the corresponding **link-debounce** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

link-debounce time **WAIT_TIME**

no link-debounce time **WAIT_TIME**

default link-debounce time **WAIT_TIME**

Parameters

WAIT_TIME Link debounce period (milliseconds). All debounce values range from 0 (disabled) to 30000 (30 seconds). Options include:

- ***0*** - ***30000*** One debounce value assigned as both link up and link down.
- ***0*** - ***30000 0*** - ***30000*** Two debounce values: link up is first, link down is second.

Examples

- These commands set the link-up and link-down debounce period to ***10*** seconds on Ethernet interface ***5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 10000
switch(config-if-Et5)#
```

- These commands set the link-up debounce to ***10*** seconds and the link-down debounce period to zero on Ethernet interface ***5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 10000 0
switch(config-if-Et5)#
```

- These commands set the link-up debounce to ***0*** and the link-down debounce period to ***12.5*** seconds on Ethernet interface ***5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 0 12500
switch(config-if-Et5)#
```

11.1.7.15 link-error

The **link-error** command places the Ethernet Operations, Administration, and Management (EOAM) profile in the EOAM link-error sub-mode.

The **no link-error** and **default link-error** commands exit from the EOAM link-error sub-mode.

Command Mode

EOAM Configuration

Command Syntax

link-error

no link-error

default link-error

Related Commands

- monitor ethernet oam profile
- show monitor ethernet oam profile

Example

These commands place the EOAM profile ***profile1*** in the ***link-error*** sub-mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#
```

11.1.7.16 mac-address

The **mac-address** command assigns a MAC address to the configuration mode interface. An interfaces default MAC address is its burn-in address.

The **no mac-address** and **default mac-address** commands revert the interface to its default MAC address by removing the corresponding **mac-address** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

mac-address ***address***

no mac-address

default mac-address

Parameter

address MAC address assigned to the interface. Format is dotted hex notation (H.H.H). Disallowed addresses are 0.0.0 and FFFF.FFFF.FFFF.

Example

This command assigns the MAC address of ***001c.2804.17e1*** to Ethernet interface ***7***, then displays interface parameters, including the assigned address.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#mac-address 001c.2804.17e1
switch(config-if-Et7)#show interface ethernet 7
Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
  Description: b.e45
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 7.84 kbps (0.0% with framing), 10 packets/sec
  5 seconds output rate 270 kbps (0.0% with framing), 24 packets/sec
     1363799 packets input, 222736140 bytes
     Received 0 broadcasts, 290904 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     2264927 packets output, 2348747214 bytes
     Sent 0 broadcasts, 28573 multicast

     0 PAUSE output
switch(config-if-Et7)#
```

11.1.7.17 monitor ethernet oam profile

The **monitor ethernet oam profile** command applies the EOAM profile to the specific interface in interface configuration mode.

The **no monitor ethernet oam profile** and **default monitor ethernet oam profile** commands remove the EOAM profile from the interface.

Command Mode

Interface Configuration

Command Syntax

monitor ethernet oam profile ***name***

no monitor ethernet oam profile

default monitor ethernet oam profile

Parameters

name The EOAM profile name. An EOAM profile cannot be named as summary.

Related Commands

- link-error
- show monitor ethernet oam profile

Example

These commands apply the EOAM profile ***profile1*** to the Ethernet interface ***1/1***.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```

11.1.7.18 monitor ethernet oam

The **monitor ethernet oam** command places the switch in the Ethernet Operations, Administration, and Management (EOAM) configuration mode.

The **no monitor ethernet oam** and **default monitor ethernet oam** commands exit from the EOAM configuration mode.

Command Mode

Global Configuration

Command Syntax

monitor ethernet oam

no monitor ethernet oam

default monitor ethernet oam

Example

This command places the switch in the ***EOAM*** configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#
```

11.1.7.19 period

The **period** command configures the link monitoring period that is specified for a link error in terms of number of frames or seconds.

The **no period** command removes the period type specified on the chosen link error. The **default period** command configures the link monitoring period as zero seconds.

Command Mode

Link-error Configuration

Command Syntax

{fcs | symbol} **period** num {*seconds* | *frames*}

no {fcs | symbol} **period** num {*seconds* | *frames*}

default {fcs | symbol} **period** num {*seconds* | *frames*}

Parameters

- **fcs** Inbound packets with Frame Check Sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **num** The link monitoring period in frames or seconds. The frames value ranges from ***1*** to ***4000000000***. The seconds value ranges from ***2*** to ***200*** seconds. The default value is ***2*** seconds.
  - ***seconds*** The monitor errors per num seconds.
  - ***frames*** The monitor errors per num frames.

Related Commands

- action
- threshold

Example

These commands set the frames period type for the profile ***profile1*** in the Link-error configuration mode for ***300*** frames.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol period 300 frames
```

11.1.7.20 phy link detection aggressive

The **phy link detection aggressive** command allows configuration of interfaces for aggressive link-up declaration (~***50*** ms) on those interfaces. **no/default phy link detection aggressive** configuration reverts to a more reliable link-up with at least a two-second delay. When the aggressive mode is not supported, the system generates an advisory message.

Command Mode

Global Configuration

Command Syntax

phy link detection aggressive

no phy link detection aggressive

default phy link detection aggressive

Examples

- This command configures aggressive link detection.

```
switch(config-if-Et1)#phy link detection aggressive
switch(config-if-Et1)#
```

- This command configures aggressive link detection but fails on a platform that does not support the feature.

```
switch(config-if-Et1)#phy link detection aggressive
detection     detection not supported on this hardware platform
switch(config-if-Et1)#
```

11.1.7.21 poe disabled

Power over Ethernet (PoE) is enabled on all Ethernet ports by default on switches that support PoE. The **poe disabled** command disables PoE on the configuration-mode interface.

The **no poe disabled** and **default poe disabled** commands restore PoE on the interface by removing the corresponding **poe disabled** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

poe disabled

no poe disabled

default poe disabled

Example

These commands disable PoE on ***Ethernet interface 7***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe disabled
switch(config-if-Et7)#
```

11.1.7.22 poe legacy detect

IEEE-compliant Powered Devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. The **poe legacy detect** command causes the configuration-mode interface to attempt to use hardware detection for these non-compliant PoE devices and power them. By default, legacy PD detection is disabled, and legacy devices are not powered.

Note: Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

The **no poe legacy detect** and **default poe legacy detect** commands restore the default behavior by removing the corresponding **poe legacy detect** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

poe legacy detect

no poe legacy detect

default poe legacy detect

Example

These commands configure ***Ethernet interface 7*** to attempt to detect and power capacitive PDs.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe legacy detect
switch(config-if-Et7)#
```

11.1.7.23 poe limit

Power over Ethernet (PoE) power output is limited by the hardware-negotiated power level and by the total power capacity of the switch. The **`poe limit`** command sets an additional maximum power output for the configuration-mode interface. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

Note: If a power limit is set by this command, Power Via MDI TLVs will not be sent from the interface. See Configuring LLDP for Power over Ethernet for details.

The **`no poe limit`** and **`default poe limit`** commands restore the default power limitation by removing the corresponding **`poe limit`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`poe limit` {***class class_num*** | ***watt_num watts***}

`no poe limit`

`default poe limit`

Parameters

- ***class_num*** Specifies the power output limit by power class. Values range from 0-6 as follows:
  - Class 0 = 15.4 W
  - Class 1 = 4 W
  - Class 2 = 7 W
  - Class 3 = 15.4 W
  - Class 4 = 30 W
  - Class 5 = 45 W
  - Class 6 = 60 W
- ***watt_num*** Specifies the power output limit in watts. Values range from ***0-60***. A value of ***0*** watts prevents the port from providing PoE power.

Examples

- These commands limit nominal PoE power output on ***Ethernet interface 7*** to ***10 W***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit 10 watts
switch(config-if-Et7)#
```

- These commands limit nominal PoE power output on ***Ethernet interface 7*** to ***4 W***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit class 1
switch(config-if-Et7)#
```

11.1.7.24 power budget

Power over Ethernet (PoE) budget is not set on all Ethernet ports by default on switches that support PoE. The **power budget [n] watts** command sets a limit of 'n' watts available for use by the ports on the switch. Otherwise, available power for PoE is limited to the sum of all power provided by the PSUs minus the power reserved for the chassis.

The **no power budget** restores the default state.

Command Mode

Interface-Ethernet Configuration

Command Syntax

power budget [n] watts

no power budget

Example

The following command sets the PoE power budget to ***600W***.

```
switch(config)#power budget 600 watts
```

11.1.7.25 power budget exceed action (warning | hold-down)

When the Power over Ethernet (PoE) ports exceeds the budgeted amount, the switch issues a warning and continues to provide additional power above the budgeted limit. The **power budget exceed action hold-down** command causes the switch to issue a warning and limit the power to the configured limit.

The **no power budget** restores the default state.

Command Mode

Interface-Ethernet Configuration

Command Syntax

power budget exceed action hold-down

no power budget

Example

The following commands set the PoE power budget to ***600W*** and configure the switch to not exceed the limit.

```
switch(config)#power budget 600 watts
switch(config)#power budget exceed action hold-down
```

11.1.7.26 profile

The **profile** command creates an Ethernet operations, administration, and management (EOAM) profile in the EOAM configuration mode.

The **no profile** and **default profile** commands exit from the EOAM configuration mode.

Command Mode

EOAM Configuration

Command Syntax

profile ***profile_name***

no profile ***profile_name***

default profile ***profile_name***

Parameter

profile_name The profile name that is specified.

Related Commands

- monitor ethernet oam profile
- show monitor ethernet oam profile

Guidelines

Run the **shutdown** or **no shutdown** command to bring the port back to the normal state.

Example

These commands create an EOAM profile ***profile1*** in the ***EOAM*** configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#
```

11.1.7.27 qos scheduling

The **qos scheduling** command places the switch in the QoS scheduling mode under which the scheduling groups and scheduling policies are configured for shared shaper across multiple subinterfaces.

The **no qos scheduling** command removes the QoS scheduling configuration from the **running-config**.

Command Mode

QoS Scheduling Mode

Command Syntax

qos scheduling

no qos scheduling

Example

These commands create a scheduling policy with the desired shape rate and optional guaranteed bandwidth:

```
switch(config)#qos scheduling
switch(config-qos-scheduling)#scheduling policy P1
switch(config-qos-scheduling-policy-P1)#shape rate 75000000
switch(config-qos-scheduling-policy-P1)#bandwidth guaranteed 10000000
```

11.1.7.28 recovery-time

The **recovery-time** command configures the recovery timeout value for link fault signaling.

The **no recovery-time** command and the **default recovery-time** command removes the recovery timeout value specified for the chosen link error.

Command Mode

Link-error Configuration

Command Syntax

recovery-time ***value***

no recovery-time ***value***

default recovery-time ***value***

Parameters

value Specifies the recovery timeout value for LFS. The value ranges from ***20*** to ***200***.

Related Commands

- action
- period
- threshold

Example

These commands set the recovery time value of ***40*** for the ***profile profile1*** in the Link-error configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#recovery-time 40
```

11.1.7.29 show hardware counter

The **show hardware counter** command displays counter events across time intervals.

Command Mode

EXEC

Command Syntax

show hardware counter

Example

This command displays counter events across all time intervals, which are currently more than one standard deviation apart from a given time interval.

```
switch(config-handler-eventHandler1-counters)#show hardware counter events
-------------------------------------------------------------------------------------------
Interval | Event Name  | Chip | First  | Last  | Count | Z-Score
 |  | Name | Occurrence  | Occurrence  |  |
-------------------------------------------------------------------------------------------
5 Min  | MacCounters |  All | 2017-01-31 09:31:35 | 2017-01-31 09:44:32 |  5 | -6.9430
10 Min | MacCounters |  All | 2017-01-31 09:39:43 | 2017-01-31 09:44:32 |  3 | -4.8123
-------------------------------------------------------------------------------------------
switch(config-handler-eventHandler1-counters)#
```

11.1.7.30 show hardware port-group

The **show hardware port-group** command displays the status of DCS-7050Q-16 port-groups. Port groups contain one QSFP+ interface and a set of four SFP+ interfaces. In each port group, either the QSFP+ interface or the SFP+ interface set is enabled. The port groups are configured independent of each other.

- ***Port group 1*** contains ***interface 15*** (QSFP+) and ***interfaces 17-20*** (SFP+).
- ***Port group 2*** contains ***interface 16*** (QSFP+) and ***interfaces 21-24*** (SFP+).

Command Mode

EXEC

Command Syntax

show hardware port-group

Guidelines

The **hardware port-group** command is available on on DCS-7050Q-16 switches.

Example

This command displays the status of ports in the two port groups on a DCS-7050Q-16 switch.

```
switch#show hardware port-group

Portgroup: 1    Active Ports: Et15/1-4
Port            State
-----------------------------------------
Ethernet17      ErrDisabled
Ethernet18      ErrDisabled
Ethernet19      ErrDisabled
Ethernet20      ErrDisabled
Ethernet15/1    Active
Ethernet15/2    Active
Ethernet15/3    Active
Ethernet15/4    Active

Portgroup: 2    Active Ports: Et16/1-4
Port            State
-----------------------------------------
Ethernet16/1    Active
Ethernet16/2    Active
Ethernet16/3    Active
Ethernet16/4    Active
Ethernet21      ErrDisabled
Ethernet22      ErrDisabled
Ethernet23      ErrDisabled
Ethernet24      ErrDisabled
switch>
```

11.1.7.31 show interfaces counters bins

The **`show interfaces counters bins`** command displays packet counters, categorized by packet length, for the specified interfaces. Packet length counters that the command displays include:

- 64 bytes
- 65-127 bytes
- 128-255 bytes
- 256-511 bytes
- 512-1023 bytes
- 1024-1522 bytes
- larger than 1522 bytes

Command Mode

EXEC

Command Syntax

`show interfaces` **[INTERFACE]** **`counters bins`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates

Example

This command displays packet counter results for ***Ethernet interfaces 1*** and ***Ethernet interfaces 2***.

```
switch#show interfaces ethernet 1-2 counters bins
Input
Port                64 Byte      65-127 Byte     128-255 Byte     256-511 Byte
-------------------------------------------------------------------------------
Et1                    2503         56681135          1045154          1029152
Et2                       8         50216275          1518179          1086297

Port          512-1023 Byte   1024-1522 Byte    1523-MAX Byte
-------------------------------------------------------------
Et1                  625825         17157823          8246822
Et2                  631173         27059077          5755101
switch>
```

11.1.7.32 show interfaces counters errors

The **`show interfaces counters errors`** command displays the error counters for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` **[INTERFACE]** **`counters errors`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Display Values

The table displays the following counters for each listed interface:

- **`FCS`**: Inbound packets with CRC error and proper size.
- **`Align`**: Inbound packets with improper size (undersized or oversized).
- **`Symbol`**: Inbound packets with symbol error and proper size.
- **`Rx`**: Total inbound error packets.
- **`Runts`**: Outbound packets that terminated early or dropped because of underflow.
- **`Giants`**: Outbound packets that overflowed the receiver and were dropped.
- **`Tx`**: Total outbound error packets.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters queue
- show interfaces counters rates

Examples

This command displays the error packet counters on ***Ethernet interface 1*** and ***Ethernet interface 2***.

```
switch#show interfaces ethernet 1-2 counters errors
Port               FCS    Align    Symbol       Rx    Runts   Giants
 Tx
Et1                  0        0        0        0        0        0
  0
Et2                  0        0        0        0        0        0
  0
switch>
```

11.1.7.33 show interfaces counters queue

The **show interfaces counters queue** command displays the queue drop counters for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] counters queue

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters rates

Example

This command displays the queue drop counters for ***Ethernet interfaces 1*** and ***Ethernet interfaces 2***.

```
switch#show interfaces ethernet 1-2 counters queue
Port                  InDrops
Et1                       180
Et2                       169
switch>
```

11.1.7.34 show interfaces counters rates

The **show interfaces counters rates** command displays the received and transmitted packet rate counters for the specified interfaces. Counter rates provided include megabits per second (Mbps), kilopackets per second (Kpps) and utilization percentage.

All port rates are approximately calculated. Note that, when displaying the rate information of a port channel, the rate value of the port channel differs from the sum of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports except for port channels with single ports. The rate values of individual member ports are less inaccurate than the rate values of the port channel as a whole.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] counters rates

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

Related Commands

- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue

Example

This command displays rate counters for ***Ethernet interfaces 1*** and ***Ethernet interfaces 2***.

```
switch#show interfaces ethernet 1-2 counters rates
Port         Intvl   In Mbps      %  In Kpps  Out Mbps      % Out Kpps
Et1           0:05      53.3   0.5%        5      31.2   0.3%         2
Et2           0:05      43.3   0.4%        4       0.1   0.0%         0
switch#
```

11.1.7.35 show interfaces counters

The **`show interface counters`** command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface. The clear counters command resets the counters to zero. Counters displayed by the command include:

- inbound bytes
- inbound unicast packets
- inbound multicast packets
- inbound broadcast packets
- outbound bytes
- outbound unicast packets
- outbound multicast packets
- outbound broadcast packets

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`counters`** [*incoming*]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** All interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **subinterface** Displays the subinterface traffic counts.
  - **vlan-interface** Displays the VLAN-interface traffic counts.
- ***incoming*** Displays the traffic count for the ingress port.

Note: When no interface is specified, the output starts with ingress and egress counters section for regular interfaces, followed by section for the ingress L3 Interface counters.

Related Commands

- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates

Examples

- This command displays byte and packet counters for ***Ethernet interfaces 1*** and ***Ethernet interfaces 2***

```
switch#show interfaces ethernet 1-2 counters
Port                InOctets     InUcastPkts     InMcastPkts     InBcastPkts
Et1               99002845169        79116358           75557            2275

Et2                4512762190         5791718          110498              15
switch>
```

- This command displays the ingress traffic count on a ***VLAN interface vl12***.

```
switch#show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
```

Vl12	3136	47	2

11.1.7.36 show interfaces flow-control

The **`show interfaces flow-control`** command displays administrative and operational flow control data for the specified interfaces. Administrative data is the parameter settings stored in ***running-config*** for the specified interface; the switch uses these settings to negotiate flow control with the peer switch. Operational data is the resolved flow control setting that controls the ports behavior.

Command Mode

EXEC

Command Syntax

`show` **[INTERFACE]** **`flow-control`**

Parameters

INTERFACE Interface type and number for which flow control data is displayed.

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interfaces in the specified range.
- **management *m_range*** Management interfaces in the specified range.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command shows the settings for Ethernet interfaces ***1-10***.

```
switch#show flow-control interface ethernet 1-10
Port       Send FlowControl  Receive FlowControl  RxPause       TxPause
           admin    oper     admin    oper
---------  -------- -------- -------- --------    -------------
 -------------
Et1        off      off      off      off         0             0
Et2        off      off      off      off         0             0
Et3        off      off      off      off         0             0
Et4        off      off      off      off         0             0
Et5        off      off      off      off         0             0
Et6        off      off      off      off         0             0
Et7        off      off      off      off         0             0
Et8        off      off      off      off         0             0
Et9        off      off      off      off         0             0
Et10       off      off      off      off         0             0
switch#
```

11.1.7.37 show interfaces hardware default

The **show interfaces hardware default** command displays the static interface capability information of the specified interfaces. This command displays information related to the speed, auto-negotiation, error correction, and modulation capabilities (when applicable) of a system's ports. The command also provides information displayed by the show interfaces hardware command, such as model number, interface type, duplex mode, and flow control settings of the specific interface. Compared to the show interfaces hardware command, this command accounts for the capabilities of the system architecture only, and does not consider the capabilities of a transceiver.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **hardware default**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet** ***e_range*** Ethernet interface range specified by ***e_range***.
- **management** ***m_range*** Management interface range specified by ***m_range***.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays the static interface capability information at the default level.

```
switch>show interfaces hardware default
Ethernet1
  Model:     DCS-7020TR-48
  Type:      1000BASE-T
  Speed/Duplex: 100M/full,1G/full
  Flowcontrol:  rx-(off,on,desired),tx-(off)
  Autoneg CL28: 100M/full,1G/full
  Autoneg CL37: 1G/full
switch>
```

- This command displays the static interface capability information for ***Ethernet interface 4/1/1***

```
switch>show interfaces ethernet 4/1/1 hardware default
Ethernet4/1/1
  Model:     7500R2AK-36CQ-LC
  Type:      40GBASE-CR4
  Speed/Duplex: 1G/full,10G/full,25G/full,40G/full,50G/full,100G/full
  Flowcontrol:  rx-(off,on,desired),tx-(off)
  Autoneg CL28: 1G/full,10G/full
  Autoneg CL73:
IEEE:           25G/full,40G/full,100G/full
Consortium: 25G/full,50G/full
  Error Correction:
Reed-Solomon: 25G,50G,100G
Fire-code:   25G,50G
```

11.1.7.38 show interfaces hardware

The **show interfaces hardware** command displays the model number, interface type, duplex mode, and flow control settings of the specified interfaces. The capabilities command is available on Ethernet and management interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] hardware

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the model number, interface type, duplex mode, and flow control settings for ***Ethernet interface 2*** and ***Ethernet interface 18***.

```
switch#show interfaces ethernet 2,18 hardware
Ethernet2
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-CR
  Speed/Duplex: 10G/full,40G/full,auto
  Flowcontrol:  rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model:         DCS-7150S-64-CL
  Type:          10GBASE-SR
  Speed/Duplex: 10G/full
  Flowcontrol:  rx-(off,on),tx-(off,on)
switch#
```

11.1.7.39 show interfaces negotiation

The **show interfaces negotiation** command displays the speed, duplex, and flow control auto-negotiation status for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **negotiation** [**INFO_LEVEL**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays status and negotiated setting of local ports.
  - **detail** Displays status and negotiated settings of local ports and their peers.

Examples

- This command displays the negotiated status of ***management 1*** and **management 2** interfaces.

```
switch#show interface management 1-2 negotiation
Port       Autoneg            Negotiated Settings
           Status   Speed     Duplex    Rx Pause  Tx Pause
---------  -------  --------  --------  --------  --------
Ma1        success  100M      full      off       off
Ma2        success  auto      auto      off       off
switch>
```

- This command displays the negotiated status of ***management 1*** interface and its peer interface.

```
switch#show interface management 1 negotiation detail
Management1 :

Auto-Negotiation Mode     10/100/1000 BASE-T (IEEE Clause 28)
Auto-Negotiation Status   Success

  Advertisements       Speed           Duplex     Pause
                       --------------- ---------- --------------------
      Local            10M/100M/1G     half/full  Disabled
      Link Partner     None            None       None

  Resolution           100Mb/s         full       Rx=off,Tx=off
switch>
```

11.1.7.40 show interfaces phy

The **show interfaces phy** command displays physical layer characteristics for the specified interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] **phy** [**INFO_LEVEL**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- ***ethernet e_range*** Ethernet interfaces in specified range.

  Valid *e_range* formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Command displays table that summarizes PHY data.
  - **detail** Command displays data block for each specified interface.

Examples

- This command summarizes PHY information for Ethernet interfaces ***1-5***.

```
switch#show interfaces ethernet 1-5 phy
Key:
   U    = Link up
   D    = Link down
   R    = RX Fault
   T    = TX Fault
   B    = High BER
   L    = No Block Lock
   A    = No XAUI Lane Alignment
   0123 = No XAUI lane sync in lane N

                                 State    Reset
Port           PHY state        Changes    Count PMA/PMD PCS   XAUI
-------------- --------------- -------- -------- ------- ----- --------

11.1.7.41 show interfaces status errdisabled

The **show interfaces status errdisabled** command displays interfaces that are in errdisabled state, including their link status and errdisable cause.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] status errdisabled

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the error-disabled ports.

```
switch#show interfaces status errdisabled

Port    Name           Status        Reason
------- -------------- ------------- ------------------
Et49/2                 errdisabled   multi-lane-intf
Et49/3                 errdisabled   multi-lane-intf
Et49/4                 errdisabled   multi-lane-intf
switch>
```

11.1.7.42 show interfaces status

The **show interfaces status** command displays the interface name, link status, vlan, duplex, speed, and type of the specified interfaces. When the command includes a link status, the results are filtered to display only interfaces whose link status match the specified type.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**]**status** [**STATUS_TYPE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All existing interfaces.
- **ethernet *e_range*** Ethernet interfaces in the specified range.
- **management *m_range*** Management interfaces in the specified range.
- **port-channel *p_range*** All existing port-channel interfaces in the specified range.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **STATUS_TYP** Einterface status upon which the command filters output. Options include:
  - ***no parameter*** Command does not filter on interface status.
  - **connected** Interfaces connected to another port.
  - **notconnect** Unconnected interfaces that are capable of connecting to another port.
  - **disabled** Interfaces that have been powered down or disabled.
  - **sub-interfaces** L3 subinterfaces configured on the switch.

    Command may include multiple status types (**connected, notconnect, disabled**), which can be placed in any order.

Examples

- This command displays the status of Ethernet interfaces ***1-5***.

```
switch#show interfaces ethernet 1-5 status
Port      Name               Status       Vlan         Duplex  Speed Type
Et1                          connected    1              full    10G
 10GBASE-SRL
Et2                          connected    1              full    10G
 10GBASE-SRL
Et3                          connected    1              full    10G
 10GBASE-SRL
Et4                          connected    1              full    10G
 10GBASE-SRL
Et5                          notconnect   1              full    10G Not
 Present
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch#show interfaces status sub-interfaces
Port       Name    Status       Vlan     Duplex Speed  Type
    Flags
Et1.1              connect       101      full   10G   dot1q-encapsu
lation
Et1.2              connect       102      full   10G   dot1q-encapsu
lation
```

```
Et1.3               connect       103      full   10G   dot1q-encapsu
lation
Et1.4               connect       103      full   10G   dot1q-encapsu
lation
switch>
```

11.1.7.43 show interface transceiver dom

The **show interface [<intf>] transceiver dom** command displays the most important current performance data on the media (line) side.

Example

```
switch#show interface Ethernet11/1 transceiver dom
Ch: Channel, N/A: not applicable, TX: transmit, RX: receive
mA: milliamperes, dBm: decibels (milliwatts), C: Celsius, V: Volts

Port 11
Last update: 0:00:05 ago
                                          Value
                                        ----------------
   Case temperature                        66.59 C
   Voltage                                  3.26 V

  Number of VDM groups supported (2Fh:128): 2
```

11.1.7.45 show interfaces transceiver channels

The **show interfaces transceiver channels** command displays current wavelength/frequency settings for the specified channels.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE e_range**] **transceiver channels**

Parameters

INTERFACE Interface type and port numbers.

- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.

Related Commands

- transceiver channel
- show interfaces transceiver hardware

Example

This command displays the supported wave lengths/frequencies and their corresponding channel numbers on ***Ethernet interface 4*** to ***slot 3*** through ***4***.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4/3/4 transceiver
channels
Name: Et4/3/4
100GHz- 50GHz-
Wavelength Frequency spacing spacing
(nm) (GHz) Channel Channel
---------- --------- ------- -------
1567.95 191,200 1 1
1567.54 191,250 2
1567.13 191,300 2 3
1566.72 191,350 4
....
1529.16 196,050 98
1528.77 196,100 50 99
1528.38 196,150 100
switch(config-as-if-Et4/1/3)#
```

11.1.7.46 show interfaces transceiver hardware

The **show interfaces transceiver hardware** command displays current wavelength/frequency settings for the specified transceiver interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] ethernet *e_range* **transceiver hardware**

Parameters

INTERFACE Interface type and port numbers.

- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.

Related Commands

- transceiver channel
- show interfaces transceiver channels

Example

This command displays the current wavelength/frequency settings on ***Ethernet interface 4*** to ***slot 3*** through ***4***.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4 / 3 / 4
 transceiver hardware
Name: Et4/3/4
Media Type: 10GBASE-DWDM
Configured Channel : 39
Configured Grid (GHz) : 50
Computed Frequency (GHz) : 193,100
Computed Wavelength (nm) : 1552.52
Operational Channel : 39 (Default)
Operational Grid (GHz) : 50 (Default)
Operational Frequency (GHz): 193,100
Operational Wavelength (nm): 1552.52
switch(config-as-if-Et4/1/3)#
```

11.1.7.47 show interfaces transceiver properties

The **`show interfaces transceiver properties`** command displays configuration information for the specified interfaces. Information provided by the command includes the media type, interface speed-duplex settings, speed-duplex operating state.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`transceiver properties`**

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Related Commands

show interfaces transceiver

Example

This command displays the media type, speed, and duplex properties for Ethernet interfaces ***1-3***.

```
switch#show interfaces ethernet 1-3 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et2
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et3
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

switch>
```

11.1.7.48 show interfaces transceiver

The **`show interfaces transceiver`** command displays operational transceiver data for the specified interfaces.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] **`transceiver`** [**DATA_FORMAT**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** All interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range***, and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **DATA_FORMAT** format used to display the data. Options include:
  - ***no parameter*** table entries separated by tabs.
  - **csv** table entries separated by commas.

Related Commands

show interfaces transceiver properties

Example

This command displays transceiver data on ***Ethernet interfaces 1*** through ***Ethernet interfaces 4***.

```
switch#show interfaces ethernet 1-4 transceiver
If device is externally calibrated, only calibrated values are printed.

switch#
```

11.1.7.49 show monitor ethernet oam profile

The **show monitor ethernet oam profile** command displays configuration information for the specified ethernet OAM profile name or the summary information of all configured profile names.

Command Mode

EXEC

Command Syntax

show monitor ethernet oam profile [*name* | summary]

Parameters

- ***name*** The EOAM profile name.
- **summary** The EOAM summary of all profiles that are configured.

Related Commands

- link-error
- monitor ethernet oam profile

Examples

- This command displays the OAM profile configuration information for the specific profile name.

```
switch#show monitor ethernet oam profile[name]

         Ethernet OAM Profile : p

         Error Type : symbol

                          Threshold  :    20  frames
                          Action     :          log
                          Period     :    20 seconds

         Error Type : fcs
                          Threshold  :    10  frames
                          Action     :     linkfault
                          Period     :   100  frame

         Recovery Timeout : 20
```

- This command displays the OAM profile configuration summary for all profiles configured.

```
switch#show monitor ethernet oam profile [name] summary

         Eoam Profile : p
            Configured on:  Et3/1-4,5
```

11.1.7.50 show platform fm6000 agileport map

The **show platform fm6000 agileport map** command displays the list of Ethernet interfaces that are combinable to form a higher speed port.

Command Mode

Privileged EXEC

Command Syntax

show platform fm6000 agileport map

Example

These commands displays the agile port map for the switch, then configures Ethernet interface ***13*** as a 40G port, subsuming Ethernet interfaces ***15***, ***17*** and ***19***.

```
switch#show platform fm6000 agileport map

-----------------------------------------------------------------
Agile Ports       |        Interfaces subsumed in 40G link
-----------------------------------------------------------------
Ethernet1         |  Ethernet3      Ethernet5      Ethernet7
Ethernet2         |  Ethernet4      Ethernet6      Ethernet8
Ethernet13        |  Ethernet15     Ethernet17     Ethernet19
Ethernet14        |  Ethernet16     Ethernet18     Ethernet20

switch#config
switch(config)#interface ethernet 13
switch(config-if-Et13)#speed 40gfull

  WARNING!  Executing this command will cause the forwarding agent
            to be restarted. All interfaces will briefly drop links
            and forwarding on all interfaces will momentarily stop.

            Do you wish to proceed with this command? [y/N]

Ethernet13 configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now subsumed.
switch(config-if-Et13)#
```

11.1.7.51 show platform trident flexcounters

Use the **show platform trident flexcounters** command to display the L3 interfaces when the corresponding hardware counter feature is enabled.

Command Mode

Privileged EXEC

Command Syntax

show platform trident flexcounters [vni [egress summary | ingress summary]]|[[vtep [decap summary | encap summary]]

Parameters

- **vni** Displays the VNI feature state.
  - **egress summary** Displays the egress direction flexcounters summary.
  - **ingress summary** Displays the ingress direction flexcounters summary.
- **vtep** Displays the VTEP feature state
  - **decap summary** Displays the decap direction flexcounter summary.
  - **encap summary** Displays the encap direction flexcounter summary.

Examples

- The following example displays the headings for the **show platform tridant flexcounters vni egress summary** show command.

```
switch#show platform tridant flexcounters vni egress summary
VNI      EgrVfiIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vni ingress summary** show command.

```
switch#show platform trident flexcounters vni ingress summary
VNI      VfiIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vtep decap summary** show command.

```
switch#show platform trident flexcounters vtep decap summary
VTEP      SvpIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

- The following example displays the headings for the **show platform trident flexcounters vtep encap summary** show command.

```
switch#show platform trident flexcounters vtep encap summary
VTEP      DvpIndex    PoolId    OffsetMode    BaseCounterIndex
-----------------------------------------------------------
```

11.1.7.52 show platform trident flexcounters l3intf

Use the **show platform trident flexcounters l3intf** command to display the subinterface, SVI, and GRE tunnel interface features.

Command Mode

EXEC

Command Syntax

show platform trident flexcounters l3intf [[in | out] [summary | values]]

Parameters

- **in summary** Displays the details of the hardware resources allocated to the ingress subinterface, SVI, and GRE Tunnel Interface features.
- **out summary** Displays the details of the hardware resources allocated to the egress subinterface, SVI, and GRE Tunnel Interface features.
- **in values** Displays the counters in the counter and snapshot table for the ingress subinterface, SVI, and GRE Tunnel Inteface features.
- **out values** Displays the counters in the counter and snapshot table for the egress subinterface, SVI, and GRE Tunnel Interface features.

Note: The counter values in this show command output are not reset by the **clear counters** command.

Examples

- Use the **show platform trident flexcounters l3intf in summary** command to display the details of the hardware resources allocated to the ingress subinterface, SVI, and GRE Tunnel Interface features.

```
switch#show platform trident flexcounters l3intf in summary
L3intf     CounterIndex    PoolId    OffsetMode   BaseCounterIndex
-----------------------------------------------------------------
```

- Use the **show platform trident flexcounters l3intf out summary** command to display the details of the hardware resources allocated to the egress subinterface, SVI, and GRE Tunnel Interface features.

```
switch#show platform trident flexcounters l3intf out summary
L3intf     CounterIndex    PoolId    OffsetMode   BaseCounterIndex
-----------------------------------------------------------------
```

- Use the **show platform trident flexcounters l3intf in values** command to display the counters in the counter and snapshot table for the ingress subinterface, SVI, and GRE Tunnel Interface features.

```
switch#show platform trident flexcounters l3intf in values
L3intf   Offser Bytes(cntTbl)    Bytes(snapTbl)    Pkts(cntTbl)
 Pkts(snapTbl)
-----------------------------------------------------------------
-----------------
```

- Use the **show platform trident flexcounters l3intf out values** command to display the counters in the counter and snapshot table for the egress subinterface, SVI, and GRE Tunnel Interface features.

```
switch#show platform trident flexcounters l3intf out values

L3intf   Offser Bytes(cntTbl)    Bytes(snapTbl)    Pkts(cntTbl)
 Pkts(snapTbl)
```

```
------------------------------------------------------------------------
----------------
```

11.1.7.53 show poe

The **show poe** command displays PoE information for a specified port range or for all ports.

Command Mode

Privileged EXEC

Command Syntax

show poe [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet** ***e_range*** Ethernet interface range specified by ***e_range***.

Example

This command displays PoE information for ***Ethernet interface 46***.

```
switch(config)#show poe interface ethernet 46

Port Enabled Enabled Limit  Power   State   Class  Power Current Voltage Temperature
---- ------- ------- ------ ------- ------- ------ ----- ------- ------- -----------
46      True    True 15.40W  15.40W powered class0 1.40W 27.00mA  55.04V      41.25C
switch(config-if-Et7)#
```

11.1.7.54 show qos scheduling

The **`show qos scheduling`** command displays the QoS configuration on one or more scheduling groups. Both group name and parent interface name are optional, in which case all groups will be displayed.

Command Mode

Privileged EXEC

Command Syntax

`show qos scheduling` **Options**

Parameter

Options include the Group, Interface or the Hierarchy.

Example

This command displays the QoS configuration for scheduling group G1 of interface Ethernet1.

```
switch#show qos scheduling group G1 Ethernet1
Interface: Et1
Scheduling Group Name: G1
Bandwidth: 10.1 / 10.0 (Gbps)
Shape Rate: 75.2 / 75.0 (Gbps)

Member          Bandwidth         Shape Rate
                  (units)           (units)
------        -------------  ------------------
Et1.1            - /  - (-)  50.1 / 50.0 (Gbps)
Et1.2            - /  - (-)  30.1 / 30.0 (Gbps)
```

11.1.7.55 show route counters

Use the **show route [ipv4 | ipv6] counters** to display the IPv4 or IPv6 pack and byte counts.

Command Mode

EXEC

Command Syntax

show route [ipv4 | ipv6]

Parameters

- **ipv4** Displays IPv4 route counters.
- **ipv6** Displays IPv6 route counters.

Example

The following example displays the IPv4 packet and byte count.

```
switch#show route ipv4 counters
Vrf Name         Prefix       Packet Count    Byte Count
-------- ---------------- ------------------ ----------
 default    22.0.0.0/8                    0          0
 default    32.0.0.0/8                    0          0
```

11.1.7.56 show transceiver status interface

The **`show transceiver status interface [<intf>]`** command displays the most important alarms, faults and interface status.

Example

For 400GBASE-ZR modules, media and host side coherent alarms, host-side pre-FEC BER, defined in the Coherent CMIS and post-FEC BER have been added to the command's output:

```
switch#show transceiver status interface Ethernet14/1
                              Current State        Changes       Last
 Change
                              -------------        -------
 -----------

  TX adaptive input EQ fault
    Host lane 1                 ok                          0       never
    Host lane 2                 ok                          0       never
    Host lane 3                 ok                          0       never
    Host lane 4                 ok                          0       never
    Host lane 5                 ok                          0       never
    Host lane 6                 ok                          0       never
    Host lane 7                 ok                          0       never
    Host lane 8                 ok                          0       never
```

Note: In the operational state, module state is ‘Ready’ and datapath state for all 8 lanes is activated.

11.1.7.57 show vxlan counters vni

Use the **show vxlan counters vni** command to display the encapsulation and decapsulation counters at the VNI.

Command Mode

Privledged EXEC

Command Syntax

show vxlan counters vni [encap | decap]

Parameters

- **encap** Displays the encapsulation related counters at the VNI.
- **decap** Displays the decapsulation related counters at the VNI.

Examples

- The following **show vxlan counters vni encap** command displays the encapsulation related commands at the VNI.

```
switch#show vxlan counters vni encap
                                          Encap BUM   Encap Drop
VNI       Encap Bytes  Encap Packets  Packets     Packets
--------- ------------ -------------- ----------- -----------
2824963             0              0           0           0
7023745             0              0           0           0
```

  Encap Packets displays the total count of L2 packets that have been successfully encapsulated by the VNI towards the VTEP.

  Encap Drop Or Exception Packets display the total count of L2 packets that have been encapsulated and dropped for any reason.
- The following **show vxlan counters vni decap** command displays the decapsulation related counters at the VNI.

```
switch#show vxlan counters vni decap
                                                          Decap Drop Or

                             Decap Known   Decap BUM       Exception
VNI       Decap Bytes   Unicast Packets      Packets        Packets
-------   -----------   ---------------   ----------   -------------
2824963             0                 0           0               0
7023745             0                 0           0               0
```

  Decap Known UnicastPkts displays the total count of L2 known unicast packets coming into the VTI hitting the VTEP and getting decapsulated.

  Decap BUM Packets displays the total count of L2 BUM packets coming into the VTI hitting the VTEP and getting decapsulated.

  Decap Drop or Exception Packets displays the count of L2 packets coming into the VTI and getting dropped for any reason.

11.1.7.58 speed

The **speed** command configures the transmission speed and duplex setting for the configuration mode interface. The scope and effect of this command depends on the interface type. Interface types include:

- **40GBASE (QSFP+)**: Default is 4x10G-full. **Speed forced 40gfull** and **Speed auto 40gfull** configure interface as a 40G port.
- **10GBASE-T**: Default is 10G-full. **Speed** command affects interface.
- **10GBASE (SFP+)**: Default is 10G-full. **Speed** command does not affect interface.
- **1000BASE (copper)**: Default is 1G-full. **speed auto 100full** affects interface.
- **1000BASE (fiber)**: Default is 1G-full. **Speed** command does not affect interface.
- **10/100/1000**: Default is auto-negotiation. **Speed** command (10/100/1000 options) affects interface.

The **speed 40gfull** and **auto 40gfull** commands configure a QSFP+ Ethernet interface as a 40G port. The **no speed** and **no auto 40gfull** commands configure a QSFP+ Ethernet interface as four 10G ports. These commands must be applied to the /1 port. These commands are hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, these commands restart the forwarding agent, which will result in traffic disruption.

The **no speed** and **default speed** commands restore the default setting for the configuration mode interface by removing the corresponding **speed** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

speed **MODE**

no speed

default speed

Parameters

MODE Transmission speed and duplex setting. Options include:

- **speed auto** auto negotiation mode. (For SFP-1G-T, auto-negotiates 1Gbps, this is because no speed is specified, and we are defaulting to advertise 1G).
- **speed auto 40gfull** auto negotiation mode with clause 73 auto negotiation.
- **speed auto 1G full**/ **speed 1G** auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated).
- **speed auto 100full** auto-negotiated 100Mbps.
- **speed 100full** non-negotiated and true-forced 100Mbps.

  Note: Interfaces using clause 73 auto negotiation must connect to a device that runs clause 73 auto negotiation.
- **sfp-1000baset auto** auto-negotiation mode (fu).
- **10000full** 10G full duplex.
- **1000full** 1G full duplex.
- **1000half** 1G half duplex.
- **100full** 100M full duplex.
- **100gfull** 100G full duplex.
- **100half** 100M half duplex.
- **10full** 10M full duplex.
- **10half** 10M half duplex.
- **40gfull** 40G full duplex.

On 40GBASE and 100GBASE interfaces, options that change the SFP+ and MXP interfaces (the **auto 40gfull**, the ***40gfull***, and the **no speed** options) may restart the forwarding agent on some switch platforms, disrupting traffic on all ports for more than a minute.

Guidelines

Note: The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the **speed auto, speed auto 1G full**/ **speed 1G, speed auto 100full,** and **speed 100full** commands.

Examples

- This command configures a 40GBASE interface as a 40G port.

```
switch(config)#interface ethernet 49/1
switch(config-if-Et49/1)#speed 40gfull
switch(config-if-Et49/1)#show interface ethernet 49/1 - 49/4 status
Port      Name          Status       Vlan        Duplex  Speed Type
Et49/1                  connected    in Po999      full    40G 40GBASE-
CR4
Et49/2                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
Et49/3                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
Et49/4                  errdisabled  inactive    unconf unconf 40GBASE-
CR4
switch(config-if-Et49/1)#
```

- This command configures a 40GBASE interface as four 10G ports (default configuration).

```
switch(config-if-Et49/1)#no speed
switch(config-if-Et49/1)#show interface ethernet 49/1 - 49/4 status
Port      Name          Status       Vlan        Duplex  Speed Type
Et49/1                  connected    routed        full    10G 40GBASE-
SR4
Et49/2                  connected    routed        full    10G 40GBASE-
SR4
Et49/3                  connected    routed        full    10G 40GBASE-
SR4
Et49/4                  notconnect   inactive      full    10G 40GBASE-
SR4
switch(config-if-Et49/1)#
```

11.1.7.59 system

The **system** command allows the user to configure the system-wide TCAM profiles such as default, mirroring-acl, mpls-evpn, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, and vxlan-routing.

The **exit** command returns the switch to global configuration mode.

Command Mode

Hardware TCAM

Command Syntax

system profile *name*

Parameter

name TCAM profile name.

Reference

hardware tcam

Example

This commands allow the switch to configure the TCAM profile qos.

```
switch(config-hw-tcam)#system profile qos
```

11.1.7.60 threshold

The **threshold** command configures the link monitoring threshold value that is specified for a link error.

The **no threshold** and the **default threshold** commands remove the threshold value specified for the chosen link error.

Command Mode

Link-error Configuration

Command Syntax

[**fcs** | **symbol**] **threshold** *threshold_value*

no [**fcs** | **symbol**] **threshold** *threshold_value*

default [**fcs** | **symbol**] **threshold** *threshold_value*

Parameters

- **fcs** Inbound packets with Frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- ***threshold_value*** Specifies the threshold value in number of errors. The value ranges from ***1*** to ***100***.

Related Commands

- action
- period

Example

These commands set the threshold value of ***20*** for the ***profile profile1*** in the ***link-error*** configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
```

11.1.7.61 transceiver channel

The **`transceiver channel`** command displays transceiver wavelength/frequency by channel number. The channel numbering depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing.

- If the startup configuration does not specify the channel number for the interface, the transceiver will automatically tune to the default channel (i.e. channel-39 of 50GHz-spacing grid) when it is inserted.
- If the configured wavelength/frequency is not supported by the transceiver, the transceiver is tuned to the default channel (i.e. channel-39 of 50GHz-spacing grid).

The interface is shutdown before the channel number is configured.

Command Mode

Global Configuration

Command Syntax

`transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** *SPACING_GRID*

`no transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** *SPACING_GRID*

`default transceiver channel` **CHANNEL_NUMBER** **`grid-spacing`** *SPACING_GRID*

Parameters

- **CHANNEL-NUMBER** The default channel is ***39*** (50GHz-spacing grid) which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
- **GRID_SPACING** Grid-spacing mode (optional) depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing. For example, channel ***39*** of 50GHz-spacing grid is equivalent to channel ***20*** of 100GHz-spacing grid, which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
  - ***SPACING_GRID*** default grid-spacing mode in GHz.

Related Commands

- show interfaces transceiver channels
- show interfaces transceiver hardware

Example

This command tunes the transceiver on slot number ***4*** to slot ***1*** through ***3*** of 50GHz-spacing grid.

```
switch(config-as)#interface ethernet 4/1/3
switch(config-if-Et4/1/3)#transceiver channel 1 grid-spacing 50
switch(config-if-Et4/1/3)#
```

11.1.7.62 transceiver qsfp default-mode

The **transceiver qsfp default-mode** command specifies the transmission mode of all QSFP transceiver modules that are not explicitly configured.

Each QSFP+ module Ethernet interface is configurable as a single 40G port or as four 10G ports. The switch displays four ports for each interface. Each ports status depends on the interface configuration:

- The */1* port is active (**connected** or not connected), regardless of the interface configuration.
- The */2*, */3*, and */4* ports are **error-disabled** when the interface is configured as a single 40G port.
- All ports are active (**connected** or not connected), when the interface is configured as four 10G ports.

QSFP modules that are not configured through a **speed** command are operated as four 10G ports.

The **no transceiver qsfp default-mode** and **default transceiver qsfp default-mode** commands restore the default-mode transceiver setting from 40G to 4x10G.

Command Mode

Global Configuration

Command Syntax

transceiver qsfp default-mode 4x10G

no transceiver qsfp default-mode

default transceiver qsfp default-mode

Note: QSFP100 ports with external PHY always have 40G as the default QSFP mode.

Guidelines

The **transceiver qsfp default-mode 4x10g** statement is always in ***running-config*** and cannot be modified or removed in the current release.

Example

- When default QSFP mode is configured as 4x10G, the **show running-config** contains **transceiver qsfp default-mode 4x10G**. **show interfaces hardware** shows 10G as the default speed.

```
switch(config)#transceiver qsfp default-mode 4x10G
switch(config)#show running-config | grep 4x10G
transceiver qsfp default-mode 4x10G
switch(config)#show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
  Speed/Duplex:   10G/full(default),40G/full,auto
  Flowcontrol:    rx-(off,on,desired),tx-(off)
```

- When QSFP mode configuration is reverted to the default, **show running-config**does not contain **transceiver qsfp default-mode 4x10G**. **show interfaces hardware** shows 40G as the default speed.

```
switch(config)#no transceiver qsfp default-mode
switch(config)#show running-config | grep 4x10G
switch(config)#show interfaces ethernet 35/1 hardware
*  = Requires speed group setting change
Ethernet35/1
  Model:          DCS-7280CR3-32P4
  Type:           40GBASE-CR4
```

```
  Speed/Duplex:    10G/full,40G/full(default),auto
  Flowcontrol:     rx-(off,on,desired),tx-(off)
```

11.2 Port Channels and LACP

This chapter describes channel groups, port channels, port channel interfaces, and the Link Aggregation Control Protocol (LACP). This chapter contains the following sections:

- Port Channel Introduction
- Port Channel Conceptual Overview
- Port Channel Configuration Procedures
- Load Balancing Hash Algorithms
- Port Channel and LACP Configuration Commands

11.2.1 Port Channel Introduction

Arista's switching platforms support industry-standard link aggregation protocols. Arista switches optimize traffic throughput by using MAC addressing, IP addressing, and services fields to effectively load share traffic across aggregated links. Managers can configure multiple ports into a logical port channel, either statically or dynamically through the IEEE Link Aggregation Control Protocol (LACP). Various negotiation modes are supported to accommodate different configurations and peripheral requirements, including LACP fallback to support devices that need simple network connectivity to retrieve images or configurations prior to engaging port channel aggregation modes.

Arista's Multi-chassis Link Aggregation protocol (MLAG) supports LAGs across paired Arista switches to provide both link aggregation and active/active redundancy.

11.2.2 Port Channel Conceptual Overview

11.2.2.1 Channel Groups and Port Channels

A port channel is a communication link between two switches supported by matching channel group interfaces on each switch. A port channel is also referred to as a Link Aggregation Group (LAG). Port channels combine the bandwidth of multiple Ethernet ports into a single logical link.

A channel group is a collection of Ethernet interfaces on a single switch. A port channel interface is a virtual interface that serves a corresponding channel group and connects to a compatible interface on another switch to form a port channel. Port channel interfaces can be configured and used in a manner similar to Ethernet interfaces. Port channel interfaces are configurable as Layer 2 interfaces, Layer 3 (routable) interfaces, and VLAN members. Most Ethernet interface configuration options are also available to port channel interfaces.

11.2.2.2 Port Channel Subinterfaces

Port channel subinterfaces divide a single port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

For further details about subinterfaces, see Subinterfaces.

11.2.2.3 Link Aggregation Control Protocol (LACP)

The Link Aggregation Control Protocol (LACP), described by IEEE 802.3ad, defines a method for two switches to automatically establish and maintain link aggregation groups (LAGs, also called channel groups or port channels). Using LACP, a switch can configure LACP-compatible ports into a dynamic LAG. The ports try to complete LACP negotiation automatically with the linked ports (also configured as a dynamic LAG) on the partner switch. The maximum number of ports per LAG varies by platform;

numbers for each platform in the latest EOS release are available here: https://www.arista.com/en/support/product-documentation/supported-features.

Static LAGs

In static mode (with the channel-group mode configured as **on** on the member interfaces), the switch aggregates links without an awareness of LAGs on the partner switch and without LACP negotiation. The member ports do not send LACP packets or process inbound LACP packets on static LAGs. Packets may drop when static LAG configurations differ between switches.

Dynamic LAGs

Dynamic LAGs are aware of their partners' port-channel states. Interfaces configured as dynamic LAGs are designated as **active** or **passive**.

- **Active interfaces** send LACP Protocol Data Units (LACP PDUs) at a rate of one per second when forming a channel with an interface on the peer switch. An aggregate forms if the peer runs LACP in active or passive mode.
- **Passive interfaces** only send LACP PDUs in response to PDUs received from the partner. The partner switch must be in active mode and initiates negotiation by sending a LACP packet. The passive mode switch receives and responds to the packet to form a LAG.

An active interface can form port channels with passive or active partner interfaces, but port channels are not formed when the interface on each switch is passive.

Table 64: LACP Mode Combinations summarizes the effect of different LACP mode combinations:

Table 64: LACP Mode Combinations

Switch 1	Switch 2	Comments
active	active	Links aggregate when LACP negotiation is successful.
active	passive	Links aggregate when LACP negotiation is successful.
passive	passive	Links do not aggregate because LACP negotiation is not initiated.
on (static)	on (static)	Links aggregate without LACP.
on (static)	active or passive	Links aggregate on the static switch without LACP; links do not aggregate on the other switch, and no port-channel connection is established with the partner.

During synchronization, interfaces in dynamic LAGs transmit one LACP PDU per second. After synchronization is complete, interfaces exchange one PDU every thirty seconds, facilitated by a default timeout of 30 seconds and a failure tolerance of three. Under these parameters, when the switch does not receive a LACP PDU for an interface during a ninety-second period, it records the partner interface as **failed** and removes the interface from the port channel.

Fallback Mode

An active interface that is not in fallback mode does not form a LAG until it receives PDUs from, and negotiates with its peer. Fallback mode allows an active LACP interface to maintain a LAG without receiving PDUs from its peer. The fallback timer specifies the period the LAG waits to receive a peer PDU. Upon timer expiry, the port channel reverts to its configured fallback mode if one is configured.

Static fallback: the port channel maintains one active port while in fallback mode; all its other member ports are in standby mode until a LACP PDU is received by the port channel. All member ports send (and can receive) LACP PDUs, but only the active port sends or receives data.

Individual fallback: all member ports act as individual switch ports while in fallback mode. Individual port configuration (rather than port channel configuration) is active while the port channel is in fallback mode, with the exception of ACLs. This includes VLAN membership. All member ports send and receive data, and continue to send LACP PDUs. As soon as a LACP PDU is received by a member of the port channel, all ports revert to normal port-channel operation.

The switch uses a link aggregation hash algorithm to determine the forwarding path within a link aggregation group. The IP and MAC header fields can be selected as components of the hash algorithm.

11.2.3 Port Channel Configuration Procedures

These sections describe channel group and port channel configuration procedures:

- Configuring a Channel Group
- Configuring a Port Channel Interface
- Maximum port channel ID increase
- Configuring Port Channel Subinterfaces
- Configuring LACP
- Displaying Port Channel Information

11.2.3.1 Configuring a Channel Group

Creating a Channel Group

The channel-group command assigns the configuration-mode Ethernet interfaces to a channel group, creates the channel group if it does not already exist, and specifies LACP attributes for the channel.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in port-channel configuration mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group.

LACP is enabled on the member interfaces by setting the channel-group mode to **active** or **passive**. Setting the mode to **on** disabled LACP on the member interfaces and creates a static channel group.

Example:

These commands assign Ethernet interfaces ***1*** and ***2*** to channel group ***10*** (creating the channel group if it does not already exist), enable LACP on those interfaces, and place the channel group in a negotiating state.

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#channel-group 10 mode active
switch(config-if-Et1-2)#
```

Adding an Interface to a Channel Group

The channel-group command is also used to add the configuration mode interface to an existing channel group. When adding channels to a previously created channel group, the channel-group mode for the new channel must match the mode for the existing group.

Example

These commands add Ethernet interfaces ***7*** through ***10*** to previously created channel group ***10***, using the channel-group mode (**active**) under which it was created.

```
switch(config)#interface ethernet 7-10
switch(config-if-Et7-10)#channel-group 10 mode active
switch(config-if-Et7-10)#
```

Removing an Interface from a Channel Group

The **`no channel-group`** command removes the configuration mode interface from the specified channel group. Deleting all members of a channel group does not remove the associated port channel interface from ***running-config***.

Example

These commands removes ***Ethernet interface 8*** from previously created channel group ***10***.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no channel-group
switch(config-if-Et8)#
```

Configuring a Port-Channel as Mixed-Speed

By default, only configured members of the same speed become active. The port-channel speed mixed command configures a port channel with the ability to have active members of multiple speeds.

Note: Available on the 7020, 7280, 7500, and 7800 platforms. Minimum links is not available on mixed-speed port channels.

Example

```
switch(config)#interface port-channel 1
switch(config-if-Po1)#port-channel speed mixed
```

Configuring Minimum Links

Note: Minimum links is not available on Mixed-Speed Port-Channels. If a minimum requirement is desired for a Mixed-Speed Port-Channel, consider Minimum Speed instead. On Port-Channels that are not mixed-speed, if both Minimum Links and Minimum Speed are configured, then Minimum Speed will take precedence.

Configuring Minimum Speed

The port-channel speed minimum command specifies the cumulative minimum speed of all active members in order for a port channel to become active. If there is less than the specified by this command, the port channel interface does not become active.

Note: If both minimum speed and minimum links are configured, minimum speed will take precedence.

Example

These command sets 100 Gbps as the minimum speed needed for port channel 1 to become active.

```
switch(config)#interface port-channel 1
switch(config-if-Po1)#port-channel speed minimum 100 gbps
```

Deleting a Channel Group

A channel group is deleted by removing all Ethernet interfaces from the channel group. A channel group's LACP mode can be changed only by deleting the channel group and then creating an

equivalent group with a different LACP mode. Deleting a channel group by removing all Ethernet interfaces from the group preserves the port channel interface and its configuration settings.

View ***running-config*** to verify the deletion of all Ethernet interfaces from a channel group.

11.2.3.2 Configuring a Port Channel Interface

Creating a Port Channel Interface

The switch provides two methods for creating port channel interfaces:

- creating a channel group simultaneously creates an associated port channel.
- the **`interface port-channel`** command creates a port channel without assigning Ethernet channels to the new interface.

The interface port-channel command places the switch in ***interface-port channel configuration mode***.

Example

This command creates ***port channel interface 8*** and places the switch in ***port channel interface configuration mode***.

```
switch(config)#interface port-channel 8
switch(config-if-Po8)#
```

Deleting a Port Channel Interface

The **`no interface port-channel`** command deletes the configuration mode port channel interface and removes the channel group assignment for each Ethernet interface assigned to the group associated with the port channel interface. Removing all Ethernet interfaces from a channel group does not remove the associated port channel interface from ***running-config***.

11.2.3.3 Maximum port channel ID increase

Previously, the maximum valid port channel ID was equal to the maximum number of port channels configurable on the system, *2000*, and this feature increases the maximum ID to *999,999* while maintaining the same limit of *2000* port channels on the system.

11.2.3.3.1 Configuration

This feature does not involve any specific configuration procedure, but it does include visible changes to port channel configuration commands. In the following examples, suppose port channels *1-2000* have already been configured, so creating Port-Channel *2001* would exceed the configuration limit.

```
switch(config)#interface create port-channel 2001
Port channel config limit 2000 reached. No interfaces were created.
```

```
switch(config-ifEtX)#channel-group 2001 mode
Port channel config limit 2000 reached. No interfaces were created.
```

11.2.3.3.2 Show Commands

Changes to existing show commands simply involve displaying when a port channel is inactive. In the following examples, suppose port channels *2001-4001* are configured, Port-Channel *4001* is inactive, and Ethernet1 is a member of Port-Channel *4001*.

```
switch(config)#show lacp 1-$ aggregates
Port channel 4001 is inactive. The number of configured port channels
 exceeds the config limit 2000.

11.2.3.3.3 Limitations

- The number of configured port channels can exceed the configurable limit if two configuration sessions simultaneously create two different port channels. In this scenario, port channels that exceed the limit are inactive. This is uncommon and does not impact traffic in any way. If an inactive port channel exists and an active port channel is deleted, then the inactive port channel is activated.
- Only port channels with ID from *1 to 2000* are configured as MLAG port channels.

11.2.3.4 Configuring Port Channel Subinterfaces

When configuring subinterfaces on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

An L3 interface with subinterfaces configured on it should not be made a member of a port channel.

- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Port channel subinterfaces are otherwise configured similarly to Ethernet subinterfaces. For additional information, see Subinterfaces.

11.2.3.5 Configuring LACP

Configuring the Channel-group Mode

The channel-group mode is configured when a channel group is created using the channel-group command. A channel group's mode cannot be modified without deleting the entire channel group, but it can be modified without deleting the port channel interface associated with the channel group. The mode setting defines whether the port channel is static or dynamic, and whether a dynamic port channel is active or passive.

Examples

- These commands create a dynamic channel group and place it in LACP **active** mode.

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#channel-group 10 mode active
switch(config-if-Et1-2)#
```

- These commands create a static channel group.

```
switch(config)#interface ethernet 4-5
switch(config-if-Et4-5)#channel-group 11 mode on
switch(config-if-Et4-5)#
```

Configuring the System Priority

Each switch is assigned a globally unique system identifier by concatenating the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). The system identifier is used by peer devices when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities in response to LACP information; the system with the numerically lower system identifier is permitted to dynamically change advertised aggregation capabilities.

The lacp system-priority command configures the switch's LACP system priority.

Example

This command assigns the system priority of ***8192*** to the switch.

```
switch(config)#lacp system-priority 8192
switch(config)#
```

Configuring Port Priority

LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority. Port priority is supported on port channels that are enabled with LACP physical interfaces.

The lacp port-priority command sets the aggregating port priority for the configuration mode interface.

Example

This command assigns the port priority of ***4096*** to ***Ethernet interface 1***.

```
switch(config-if-Et1)#lacp port-priority 4096
switch(config-if-Et1)#
```

Configuring the LACP Packet Reception Rate

The lacp timer command sets the reception rate of LACP packets on the local device for the interface being configured. This command supports the following reception rates:

- **normal:** LACP packets are received at the following rates:
  - 30 seconds for synchronized interfaces.
  - One second for interfaces that are being synchronized.
- **fast:** LACP packets are received every second.

•

Example

This command sets the LACP reception rate to one second on the ***Ethernet interface 4***.

```
switch(config-if-Et4)#lacp timer fast
switch(config-if-Et4)#
```

Configuring LACP Fallback

Fallback mode (static or individual) is configured on a port channel interface with the port-channel lacp fallback command. The fallback timeout interval is configured with the port-channel lacp fallback timeout command. Fallback timeout settings persist in ***running-config*** without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is ***90*** seconds.

Examples

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of ***100*** seconds on ***port channel interface 13***. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback static
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
   port-channel lacp fallback static
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of ***50*** seconds on ***port channel interface 17***. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 17
switch(config-if-Po17)#port-channel lacp fallback individual
switch(config-if-Po17)#port-channel lacp fallback timeout 50
switch(config-if-Po17)#show active
interface Port-Channel17
   port-channel lacp fallback individual
   port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```

Configuring Minimum Links

The port-channel min-links command specifies the minimum number of interfaces that the configuration mode LAG requires to be active. If there are fewer ports than specified by this command, the port channel interface does not become active.

Note: In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol

must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK_INTF_INSUFFICIENT message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK_INTF_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK_INTF_INSUFFICIENT is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Example

This command sets four as the minimum number of ports required for ***port channel 5*** to become active.

```
switch(config-if-Po5)#port-channel min-links 4
switch(config-if-Po5)#
```

Configuring Minimum Links Review Interval

The port-channel min-links review interval command enables or disables timer based min-links review feature for all port-channels. The timer based min-links feature is enabled when all of the following conditions are true. It is disabled otherwise:

- The min-links configured is greater than ***1***.
- LACP fallback is disabled.
- The number of interfaces configured in the port-channel is more than min-links.
- The number of active member interfaces in the port-channel is less than min-links.
- The default timer values are:
  - min-links-review-timeout = min-links-timeout-base + f (configured min-links)
  - min-links-timeout-base = ***180*** seconds
  - min-links-retry-timeout = ***360*** seconds

11.2.3.6 Displaying Port Channel Information

Port channel information is accessed using some of the **show** commands listed under Interface Display Commands. Ensure that while using the show interfaces counters rates command to view the rate information of a port channel, rate values for the individual member ports are less inaccurate than rate values of the port channel.

Both the port channel rate and the individual port rates are calculated approximations; the rate value of a port channel might vary from the total of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports, and will be most obvious in single-port port channels.

11.2.4 Load Balancing Hash Algorithms

The switch balances packet load across multiple links in a port channel by calculating a hash value based on packet header fields. The hash value determines the active member link through which the packet is transmitted. This method, in addition to balancing the load in the LAG, ensures that all packets in a data stream follow the same network path.

In network topologies that include MLAGs or Multiple Paths with Equal Cost (ECMP), programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links. This uneven distribution is avoided by performing different hash calculations on each switch routing the paths.

The port-channel load-balance command specifies the seed for hashing algorithms that balance the load across ports comprising a port channel. Available seed values vary by switch platform.

Example

This command configures the hash seed of ***10*** on 7150 Series (FM6000 platform) switches.

```
switch(config)#port-channel load-balance fm6000 10
switch(config)#
```

Hashing algorithm inputs varies by switch platform. These sections describe hashing algorithm inputs for each platform.

- Load Balance Hash Algorithms on 7048 and 7500 Series Switches
- Load Balance Hash Algorithms on 7500E Series Switches
- Load Balance Hash Algorithms on 7050 Series Switches
- Load Balance Hash Algorithms on 7150 Series Switches

11.2.4.1 Load Balance Hash Algorithms on 7048 and 7500 Series Switches

One command configures the load balance hash algorithm on 7048 and 7500 Series switches:

- port-channel load-balance petraA fields ip: controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Example

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)#port-channel load-balance petraA fields ip mac-
header
switch(config)#
```

11.2.4.2 Load Balance Hash Algorithms on 7500E Series Switches

One command configures the load balance hash algorithm on 7500E Series switches:

port-channel load-balance arad fields ip: controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Example

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)#port-channel load-balance arad fields ip mac-
header
switch(config)#
```

11.2.4.2.1 Dynamic and Symmetric LAG Hashing

Dynamic LAG hashing enables high link utilization and highly even distribution among LAG members by employing a randomized hashing algorithm. Symmetric LAG hashing allows the two flows of a bidirectional communication link, even when the two flows enter the switch on different ingress ports, to be hashed to the same member of a LAG on egress.

Dynamic and symmetric LAG hashing policies are enabled via named port-channel load-balancing profiles. LAG load-balancing policies can be provisioned on per line-card basis using these profiles. Load-balancing profiles can be used to provision all LAG load-balance attributes, including hash polynomials, hash seeds, and hash fields.

When no specific LAG hashing profile is assigned to a line card, then a global LAG hashing profile can be defined and applied to all the line cards with no LAG hashing defined on them.

Note, if no profile is selected as global profile then the default profile takes the precedence and set as a global profile. The default profile is reserved and if it is set as a global profile it cannot be deleted, if the profile is deleted then the following warning message is displayed.

Note: When a global profile is already set and if some other profile is tried to configured as a default profile the following warning message is displayed "! A global load balancing profile myProfile is currently active. This setting will not take effect."

Examples

- These commands configure a load balance profile for symmetric hashing.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance arad profile
switch(config-sand-load-balance-profile-symmetric-p
rofile-1)#hash symmetric
switch(config-sand-load-balance-profile-symmetric-p
rofile-1)#show active
load-balance policies
   load-balance arad profile symmetric-profile-1
      hash symmetric
```

- These commands configure a load balance profile for dynamic hashing.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance arad profile
switch(config-sand-load-balance-profile-dynamic-hash-
profile-1)#distribution
```

```
clock
switch(config-sand-load-balance-profile-dynamic-hash-
profile-1)#show active
load-balance policies
   load-balance arad profile dynamic-hash-profile-1
      distribution clock
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command configures a global profile on all line cards on which LAG hashing is not defined.

```
switch(config)#port-channel load-balance sand profile
 myGlobalProfile
```

- These commands designates a default profile as a global profile, if no other profile is set as a global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
 default
```

- These commands configure a hash seed in a profile and assigns it as a global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
 myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)#hash
 seed 20
switch(config)#port-channel load-balance sand profile
 myGlobalProfile
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

11.2.4.3 Load Balance Hash Algorithms on 7050 Series Switches

Three commands configure the load balance hash algorithm on 7050 Series switches:

- port-channel load-balance trident fields ip controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include

source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the **port-channel load-balance trident fields mac** command.

- port-channel load-balance trident fields ipv6 controls the hash algorithm for IPv6 packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the **port-channel load-balance trident fields mac** command.
- port-channel load-balance trident fields mac controls the hash algorithm for non-IP packets b specifying the algorithm's use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type fields.

Example

These commands configure the switch's port channel load balance for non IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields mac dst-
mac eth-type
switch(config)#
```

11.2.4.4 Load Balance Hash Algorithms on 7150 Series Switches

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports ***16*** load balance profiles, including the default profile. The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

11.2.4.4.1 Load Balance Profiles

Load balance profiles are managed in ***load-balance-policies configuration*** mode. ***load-balance-policies configuration*** mode provides commands that display the contents of all configured profiles and place the switch in **load-balance-profile** command. Load balance profiles are created by entering the ***load-balance-profile*** mode and edited while in that mode.

The load-balance policies command places the switch in ***load-balance-policies configuration*** mode. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

Examples

- This command places the switch in ***load-balance-policies configuration*** mode.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the four load balance profiles configured on the switch.

```
switch(config-load-balance-policies)#show active

load-balance policies
   load-balance fm6000 profile F-01
      port-channel hash-seed 22
      fields ip dscp
      distribution random port-channel
   !
```

```
   load-balance fm6000 profile F-02
      fields ip protocol dst-ip
      distribution random port-channel
   !
   load-balance fm6000 profile F-03
      fields ip protocol dst-ip
      fields mac dst-mac eth-type
      distribution random ecmp port-channel
   !
   load-balance fm6000 profile F-04

switch(config-load-balance-policies)#
```

Creating a Load Balance Profile

The load-balance fm6000 profile command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Example

These commands enter ***load-balance-profile configuration*** mode, creates the ***LB-5*** profile, and lists the default settings for the profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-5
switch(config-load-balance-profile-LB-5)#show active all

load-balance policies
   load-balance fm6000 profile LB-5
      port-channel hash-seed 0
      fields mac dst-mac src-mac eth-type vlan-priority vlan-id
      fields ip protocol dst-ip dst-port src-ip src-port dscp
      no distribution symmetric-hash
      no distribution random

switch(config-load-balance-profile-LB-5)#
```

Configuring a Load Balance Profile

These commands are available in load-balance-profile configuration mode to specify the parameters that comprise a profile.

- The fields ip command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The fields mac command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The distribution symmetric-hash command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.
- The distribution random command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile.

Example

These commands configure the following components of the hash algorithm defined by the LB-7 load balance profile:

- L2 header fields: MAC destination address, VLAN priority.
- L3/L4 header fields: Source IP address, protocol field.
- Symmetric hash distribution of IP and non-IP packets.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000
 profile LB-7
switch(config-load-balance-profile-LB-7)#fields ip src-ip
 protocol
switch(config-load-balance-profile-LB-7)#fields mac dst-mac
 vlan-priority
switch(config-load-balance-profile-LB-7)#distribution
 symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#show active
load-balance policies
   load-balance fm6000 profile LB-7
      fields mac dst-mac vlan-priority
      fields ip protocol src-ip
      distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#exit
switch(config-load-balance-policies)#exit
switch(config)#exit
```

Assigning a Load Balance Profile to an Interface

The ingress load-balance profile command applies a specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Example

This command applies the ***LB-1*** load balance profile to ***port channel interface 100***.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ingress load-balance profile LB-1
switch(config-if-Po100)#show active
interface Port-Channel100
   ingress load-balance profile LB-1
switch(config-if-Po100)#
```

11.2.4.4.2 Default Load Balance Profile

Two commands configure the load balance default profile on 7150 Series switches:

- port-channel load-balance fm6000 fields ip controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets).
- port-channel load-balance fm6000 fields mac controls the hash algorithm for non-IP packets by specifying the algorithm's use of MAC header fields. Fields that the command can specify include include the MAC source address, MAC destination address, and Ethernet type, VLAN-ID, and VLAN-priority fields.

Examples

- These commands configure the load balance default profile for IP packets by using source and destination IP address fields, along with source and destination port fields for TCP, and UDP packets.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-
tcp-udp-header
switch(config)#
```

- This command applies the default load balance profile to ***port channel interface 100.***

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#no ingress load-balance profile
switch(config-if-Po100)#show active
interface Port-Channel100
switch(config-if-Po100)#
```

11.2.5 Port Channel and LACP Configuration Commands

Global Port Channel and LACP Configuration Commands

- interface port-channel
- lacp system-priority

Interface Configuration Commands – Ethernet Interface

- channel-group
- lacp port-priority
- lacp timer
- port-channel lacp fallback
- port-channel lacp fallback timeout
- port-channel min-links
- port-channel min-links review interval
- port-channel speed minimum
- port-channel speed mixed

Load Balance (Default) Commands

- port-channel load-balance
- port-channel load-balance arad fields ip
- port-channel load-balance fm6000 fields ip
- port-channel load-balance fm6000 fields mac
- port-channel load-balance module
- port-channel load-balance petraA fields ip
- port-channel load-balance sand profile (7500E/7500R)
- port-channel load-balance trident fields ip
- port-channel load-balance trident fields ipv6
- port-channel load-balance trident fields mac

Load Balance Policies Commands

- distribution random
- distribution symmetric-hash
- fields ip
- fields mac
- hash-seed
- ingress load-balance profile
- load-balance fm6000 profile
- load-balance policies
- load-balance sand profile (7500E/7500R)
- port-channel hash-seed

EXEC Commands

- show lacp aggregates
- show lacp counters
- show lacp interface
- show lacp internal
- show lacp peer

- show lacp sys-id
- show load-balance profile
- show port-channel
- show port-channel dense
- show port-channel limits
- show port-channel load-balance
- show port-channel load-balance fields

11.2.5.1 channel-group

The **`channel-group`** command assigns the configuration mode Ethernet interfaces to a channel group, creates the group if it does not already exist, and sets the port-channel mode for the group. When adding interfaces to a previously created channel group, the port-channel mode for the newly added interfaces must match the mode for the existing group.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in Port-channel Configuration Mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group. The interface port-channel command places the switch in the ***interface-port-channel*** configuration Mmde.

The **`no channel-group`** and **`default channel group`** commands remove the configuration-mode interface from the specified channel group.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`channel-group` *number* mode *group_mode*

`no channel-group`

`default channel-group`

Parameters

- ***number*** Specifies a channel group ID. Values range from 1 through 2000.
- ***group_mode*** Specifies the channel-group mode for the channel group. Values include:
  - **on** Port channel is static and LACP is disabled on member interfaces. Port neither verifies nor negotiates port channel membership.
    - **active** Port channel is dynamic and member interfaces are active LACP ports that transmit and receive LACP negotiation packets.
    - **passive** Port channel is dynamic and member interfaces are passive LACP ports that respond to LACP negotiation packets but do not generate them.

Guidelines: Port Channels

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform-specific. For example, compatibility may require identical operating parameters such as speed and Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Guidelines: MLAG Configurations

Static LAG is not recommended in MLAG configurations. However, these considerations apply when the channel group mode is **on** while configuring static MLAG:

- When configuring multiple interfaces on the same static port channel:
  - all interfaces must physically connect to the same neighboring switch.
  - the neighboring switch must configure all interfaces into the same port channel.

The switches are misconfigured when these conditions are not met.

Disable the static port channel membership before moving any cables connected to these interfaces or changing a static port channel membership on the remote switch.

Examples

- These commands assign Ethernet interfaces ***8*** and ***9*** to channel group ***10***, and enable LACP in negotiating mode.

```
switch(config)#interface ethernet 8-9
switch(config-if-Et8-9)#channel-group 10 mode active
switch(config-if-Et8-9)#show active
interface Ethernet8
   channel-group 10 mode active
interface Ethernet9
   channel-group 10 mode active
switch(config-if-Et8-9)#
```

- These commands assign Ethernet interfaces ***12*** and ***13*** to static channel group ***11***. LACP is disabled on these interfaces.

```
switch(config)#interface ethernet 12-13
switch(config-if-Et12-13)#channel-group 11 mode on
switch(config-if-Et12-13)#show active
interface Ethernet12
   channel-group 11 mode on
interface Ethernet13
   channel-group 11 mode on
switch(config-if-Et12-13)#
```

11.2.5.2 distribution random

The **`distribution random`** command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile. All data fields and hash seeds that are configured for the profile are used as seeds for the random number generator that defines the distribution of individual packets.

Command options allow for the random distribution of traffic across port channel links and ECMP routes. Random distribution can be enabled for either, both, or neither.

The **`no distribution random`** and **`default distribution random`** commands remove random distribution on the configuration mode load balance profile by deleting the corresponding **`distribution random`** command from the configuration.

Command Mode

Load-balance-profile Configuration

Command Syntax

`distribution random` **BALANCE_TYPE**

`no distribution random`

`default distribution random`

Parameters

SCOPE Specifies use of random distribution for port channels and ECMP routes. Options include:

- ***no parameter*** Random distribution is enabled for ECMP routes and port channel links.
- **ecmp** Random distribution is enabled for ECMP routes.
- **port-channel** Random distribution is enabled for port channel links.
- **port-channel ecmp** Random distribution is enabled for ECMP routes and port channel links.
- **ecmp port-channel** Random distribution is enabled for ECMP routes and port channel links.

Guidelines

The **`distribution random`** command takes precedence over the distribution symmetric-hash command when both methods are simultaneously enabled.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#distribution random ecmp
 port-channel
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
   load-balance fm6000 profile LB-1
      distribution random ecmp port-channel
switch(config-load-balance-profile-LB-1)#
```

11.2.5.3 distribution symmetric-hash

The **distribution symmetric-hash** command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.

Two symmetric-hash options specify the traffic upon which symmetry is enforced:

- **distribution symmetric-hash mac** specifies that only non-IP traffic is hashed symmetrically. IP traffic is hashed normally without regard to symmetry.
- **distribution symmetric-hash mac-ip** specifies that all traffic is hashed symmetrically.

The **no distribution symmetric-hash** and **default distribution symmetric-hash** commands remove the specified hashing symmetry restriction on the configuration mode load balance profile by deleting the corresponding **distribution symmetric-hash** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

distribution symmetric-hash FIELD_TYPE

no distribution symmetric-hash

default distribution symmetric-hash

Parameters

FIELD_TYPE Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **mac** Non-IP traffic is hashed symmetrically.
- **mac-ip** All traffic is hashed symmetrically.

Guidelines

The distribution random command takes precedence over the **distribution symmetric-hash** command when both methods are simultaneously enabled.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#distribution symmetric-
hash mac-ip
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
   load-balance fm6000 profile LB-1
      distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-1)#
```

11.2.5.4 fields ip

The **fields ip** command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value by using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields ip** configures the algorithm not to use L3/L4 data fields. The **default fields ip** command restores the default data L3/L4 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields ip** or **no fields ip** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

fields ip IP_FIELD

no fields ip

default fields ip

Parameters

IP_FIELD Specifies the L3/L4 fields the hashing algorithm uses. Options include:

- **dscp** Algorithm uses dscp field.
- **dst-ip** Algorithm uses destination IP address field.
- **dst-port** Algorithm uses destination TCP/UDP port field.
- **protocol** Algorithm uses protocol field.
- **src-ip** Algorithm uses source IP address field.
- **src-port** Algorithm uses source TCP/UDP port field.

Command may include from one to six fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands specify the IP source and protocol fields as components of the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#fields ip src-ip
 protocol
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
```

```
   load-balance fm6000 profile LB-1
      fields ip protocol src-ip
switch(config-load-balance-profile-LB-1)#
```

11.2.5.5 fields mac

The **fields mac** command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields mac** configures the algorithm not to use L2 data fields. The **default fields mac** command restores the default data L2 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields mac** or **no fields mac** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

fields mac MAC_FIELD

no fields mac

default fields mac

Parameters

MAC_FIELD Specifies the L2 fields the hashing algorithm uses. Options include:

- **dst-mac** Algorithm uses MAC destination field.
- **eth-type** Algorithm uses MAC destination field.
- **src-mac** Algorithm uses MAC source field.
- **vlan-id** Algorithm uses VLAN ID field.
- **vlan-priority** Algorithm uses VLAN priority field.

Related Commands

load-balance fm6000 profile places the switch in the ***load-balance-profile*** configuration mode.

Example

These commands specify the MAC destination and VLAN priority fields as components of the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#fields mac dst-mac vlan-
priority
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
   load-balance fm6000 profile LB-1
      fields mac dst-mac vlan-priority
```

```
switch(config-load-balance-profile-LB-1)#
```

11.2.5.6 hash-seed

The **hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile. Profile algorithms can load balance packets across port channel links or ECMP routes.

The **no hash-seed** and **default hash-seed** commands restore the default hash seed value of 0 to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **hash-seed** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

hash-seed *number*

no hash-seed *number*

default hash-seed *number*

Parameters

number Specifies the value of the hash seed. Value ranges from ***0*** to ***39***.

Example

These commands configure the ***hash seed 20*** in a profile and assign it as the global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
 myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)#hash-
seed 20
switch(config)#port-channel load-balance sand profile
 myGlobalProfile
```

11.2.5.7 ingress load-balance profile

The **`ingress load-balance profile`** command applies the specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Load balance profiles can be assigned to Ethernet and port channel interfaces. Profiles define the distribution method of traffic that ingresses the interface among the ports comprising a port channel or routes comprising an ECMP.

The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

The **`no ingress load-balance profile`** and **`default ingress load-balance profile`** commands restore the default load balance profile for the configuration mode interface by removing the corresponding **`ingress load-balance profile`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`ingress load-balance profile` *profile_name*

`no ingress load-balance profile`

`default ingress load-balance profile`

Parameters

profile_name Name of profile assigned to interface.

Example

This command applies the ***LB-1*** load balance profile to port channel interface ***100***.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#show active
interface Port-Channel100

switch(config-if-Po100)#ingress load-balance profile LB-1
switch(config-if-Po100)#
interface Port-Channel100
   ingress load-balance profile LB-1

switch(config-if-Po100)#
```

11.2.5.8 interface port-channel

The **`interface port-channel`** command places the switch in port-channel interface configuration mode for modifying parameters of specified link aggregation (LAG) interfaces. When entering configuration mode to modify existing port channel interfaces, the command can specify multiple interfaces.

The command creates a port channel interface if the specified interface does not exist prior to issuing the command. When creating an interface, the command can only specify a single interface.

The **`no interface port-channel`** and **`default interface port-channel`** commands delete the specified LAG interfaces from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`interface port-channel` *p_range*

`no interface port-channel` *p_range*

`default interface port-channel` *p_range*

Parameter

p_range Port channel interfaces (number, range, or comma-delimited list of numbers and ranges).

Port channel numbers range from ***1*** to ***2000***.

Guidelines

When configuring a port channel, you do not need to issue the **`interface port-channel`** command before assigning a port to the port channel (see the channel-group command). The port channel number is implicitly created when a port is added to the specified port channel with the **`channel-group number`** command.

To display ports that are members of a port channel, enter show port-channel. To view information about hardware limitations for a port channel, enter show port-channel limits.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

You can configure a port channel with a set of ports such that more than one subset of the member ports are mutually compatible. Port channels in EOS are designed to activate the compatible subset of ports with the largest aggregate capacity. A subset with two 40 Gbps ports (aggregate capacity 80 Gbps) has preference to a subset with five active 10 Gbps ports (aggregate capacity 50 Gbps).

Example

This example creates ***port channel interface 3***:

```
switch(config)#interface port-channel 3
switch(config-if-Po3)#
```

11.2.5.9 lacp port-priority

The **lacp port-priority** command sets the aggregating port priority for the configuration mode interface. Priority is supported on port channels with LACP-enabled physical interfaces. LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority.

Each port in an aggregation is assigned a 32-bit port identifier by prepending the port priority (16 bits) to the port number (16 bits). Port priority determines the ports that are placed in standby mode when hardware limitations prevent a single aggregation of all compatible ports.

Priority numbers range from ***0*** to ***65535***. The default is ***32768***. Interfaces with higher priority numbers are placed in standby mode before interfaces with lower priority numbers.

The **no lacp port-priority** and **default lacp port-priority** commands restore the default port-priority to the configuration mode interface by removing the corresponding **lacp port-priority** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

lacp port-priority *priority_value*

no lacp port-priority

default lacp port-priority

Parameters

priority_level Port priority. Values range from ***0*** to ***65535***. Default is ***32768***

Example

These commands assign the port priority of ***4096*** to ***Ethernet interface 8***.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#lacp port-priority 4096
switch(config-if-Et8)#show active
interface Ethernet8
   lacp port-priority 4096
switch(config-if-Et8)#
```

11.2.5.10 lacp system-priority

The **lacp system-priority** command configures the switch's LACP system priority. Values range between ***0*** and ***65535***. Default value is ***32768***.

Each switch is assigned a globally unique 64-bit system identifier by prepending the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). Peer devices use the system identifier when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities resulting from LACP data; the system with the numerically lower system identifier can dynamically change advertised aggregation parameters.

The **no lacp system-priority** and **default lacp system-priority** commands restore the default system priority by removing the **lacp system-priority** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

lacp system-priority *priority_value*

no lacp system-priority

default lacp system-priority

Parameters

priority_value System priority number. Values range from ***0*** to ***65535***. Default is *32768*.

Example

This command assigns the system priority of ***8192*** to the switch.

```
switch(config)#lacp system-priority 8192
switch(config)#
```

11.2.5.11 lacp timer

The **`lacp timer`** command configures the LACP reception interval on the configuration mode interface. The LACP timeout specifies the reception rate of LACP packets at interfaces supporting LACP. Supported rates include:

- **normal**: 30 seconds with synchronized interfaces; one second while interfaces are synchronizing.
- **fast**: one second.

This command is supported on LACP-enabled interfaces. The default value is **normal**.

The **`no lacp timer`** and **`default lacp timer`** commands restore the default value of **normal** on the configuration mode interface by deleting the corresponding **`lacp timer`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`lacp timer` **RATE_LEVEL**

`no lacp timer`

`default lacp timer`

Parameters

RATE_LEVEL LACP reception interval. Options include:

- **fast** One second.
- **normal** 30 seconds for synchronized interfaces; one second while interfaces synchronize.

Example

This command sets the LACP timer to ***1*** second on ***Ethernet interface 4***.

```
switch(config-if-Et4)#lacp timer fast
switch(config-if-Et4)#
```

11.2.5.12 load-balance fm6000 profile

The **load-balance fm6000 profile** command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through port-channel load-balance fm6000 fields ip and port-channel load-balance fm6000 fields mac commands.

The load balance profile name is referenced when it is applied to an interface. The default profile is not associated with a name and is applied to an interface in the absence of a named profile assignment.

The **no load-balance fm6000 profile** and **default load-balance fm6000 profile** commands delete the specified load balance profile from ***running-config***. Profiles that are assigned to an interface cannot be deleted. Attempts to delete an assigned profile generate a **profile in use** error messages.

The **load-balance fm6000 profile** command is accessible from ***load-balance-policies*** configuration mode. The ***load-balance-profile*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***load-balance-policies*** configuration mode does not affect the configuration. The **exit** command returns the switch to the ***load-balance-policies*** configuration mode.

Command Mode

Load-balance-policies Configuration

Command Syntax

load-balance fm6000 profile *profile_name*

no load-balance fm6000 profile *profile_name*

default load-balance fm6000 profile *profile_name*

Parameters

profile_name Name of the load-balance profile.

Commands Available in Load-balance-profile Configuration Mode

- fields ip
- fields mac
- distribution random
- distribution symmetric-hash
- port-channel hash-seed
- **show active** displays the contents of the configuration mode profile.

Related Commands

- load-balance policies places the switch in ***load-balance-policies*** configuration mode.
- ingress load-balance profile applies a load-balance profile to an Ethernet or port channel interface.
- show load-balance profile displays the contents of load balance profiles.

Example

These commands enters the ***load-balance-profile*** configuration mode, creates the **LB-1** profile, and lists the default settings for the profile.

```
switch(config)#load-balance policies
```

```
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#show active all
load-balance policies
   load-balance fm6000 profile LB-1
      port-channel hash-seed 0
      fields mac dst-mac src-mac eth-type vlan-priority vlan-id
      fields ip protocol dst-ip dst-port src-ip src-port dscp
      no distribution symmetric-hash
      no distribution random
switch(config-load-balance-profile-LB-1)#
```

11.2.5.13 load-balance policies

The **load-balance policies** command places the switch in load-balance-policies configuration mode. Load-balance-policies configuration mode provides commands for managing load-balance profiles. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

The **no load-balance policies** and **default load-balance policies** commands delete all load balance profiles from ***running-config***. The command generates an error message when at least one profile is assigned to an interface.

Load-balance-policies configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***load-balance-policies*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

load-balance policies

no load-balance policies

default load-balance policies

Commands Available in Load-balance-policies Configuration Mode

- load-balance fm6000 profile places the switch in ***load-balance-profile configuration mode***.
- **show active** displays contents of all load balance profiles.

Related Commands

- ingress load-balance profile applies a load-balance profile to an Ethernet or port channel interface.
- show load-balance profile displays the contents of load balance profiles.

Examples

- This command places the switch in the ***load-balance-policies*** configuration mode.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the three configured load balance profiles.

```
switch(config-load-balance-policies)#show active

load-balance policies
   load-balance fm6000 profile F-01
      port-channel hash-seed 22
      fields ip dscp
      distribution random port-channel
   !
   load-balance fm6000 profile F-02
      fields ip protocol dst-ip
      fields mac dst-mac eth-type
      distribution random ecmp port-channel
   !
   load-balance fm6000 profile F-03

switch(config-load-balance-policies)#
```

11.2.5.14 load-balance sand profile (7500E/7500R)

The **load-balance sand profile** command configures a load-balance profile on a sand module switch. A default profile is designated as a global profile when no other profile is set as global profile. Note, a warning message is displayed when a profile is entered or deleted.

If **no load-balance sand profile** command is executed when the profile set is default then the following warning message is displayed:

```
! profile default is a reserved profile and cannot be deleted
```

Command Mode

Global Configuration

Command Syntax

load-balance sand profile *profile_name*

no load-balance sand profile *profile_name*

Parameter

profile_name Name of the profile assigned to the selected module.

Examples

- These commands designate a default profile as a global profile on sand module platform switch. Note, a warning message is displayed when a profile is entered or deleted.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
 default
 ! profile default is a reserved profile
! profile default is the current global profile
```

- When no form of the command is executed it displays the following warning message.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#no load-balance sand
 profile default
! profile default is a reserved profile and cannot be deleted
```

11.2.5.15 port-channel hash-seed

The **port-channel hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile when distributing the load across ports comprising a port channel. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The hash seed that the algorithm uses to select port channel links or ECMP routes is configured by the ip load-sharing command.

The **no port-channel hash-seed** and **default port-channel hash-seed** commands restore the default hash seed value of ***0*** to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **port-channel hash-seed** command from ***running-config***.

Command Mode

Load-balance-profile Configuration

Command Syntax

port-channel hash-seed *number*

no port-channel hash-seed

default port-channel hash-seed

Parameters

number The hash seed. Value ranges from ***0*** to ***39***.

Related Commands

load-balance fm6000 profile places the switch in the *load-balance-profile* configuration mode.

Example

Thes commands configure the port-channel hash seed of ***22*** for the hash algorithm defined by the ***LB-1*** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
 LB-1
switch(config-load-balance-profile-LB-1)#port-channel hash-seed
 22
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
   load-balance fm6000 profile LB-1
      port-channel hash-seed 22
switch(config-load-balance-profile-LB-1)#
```

11.2.5.16 port-channel lacp fallback timeout

The **`port-channel lacp fallback timeout`** command specifies the fallback timeout period for the configuration mode interface.

Fallback timeout settings persist in ***running-config*** without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is ***90*** seconds.

The **`no port-channel lacp fallback timeout`** and **`default port-channel lacp fallback timeout`** commands restore the default fallback timeout of ***90*** seconds for the configuration mode interface by removing the corresponding **`port-channel lacp fallback timeout`** command from ***running-config***.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel lacp fallback timeout` *period*

`no port-channel lacp fallback timeout`

`default port-channel lacp fallback timeout`

Parameters

period Maximum interval between receipt of LACP PDU packets (seconds). Value ranges from ***1*** to ***300*** seconds. Default value is ***90***.

Related Commands

port-channel lacp fallback configures fallback mode for a port channel interface.

Guidelines

The fallback timeout period should not be shorter than the LACP reception interval (lacp timer). The default LACP reception interval is ***30*** seconds.

Example

This command enables LACP fallback mode, then configures an LACP fallback timeout of ***100*** seconds on ***port channel interface 13***.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
   port-channel lacp fallback
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

11.2.5.17 port-channel lacp fallback

The **port-channel lacp fallback** command enables the LACP fallback mode on the interface.

LACP fallback is unconfigured and disabled by default. An LACP interface without fallback enabled does not form a LAG until it receives PDUs from its peer.

LACP fallback can be configured on an interface in static or individual mode:

- **static mode** The port channel member with the lowest LACP port priority is active and maintains contact with the peer (sending and receiving data) while other port channel members remain in standby mode until a LACP PDU is received. All members continue to send (and can receive) LACP PDUs.
- **individual mode** All port channel members act as individual ports, reverting to their port-specific configuration while the channel is in fallback mode, and continue to send and receive data. All members continue to send LACP PDUs until a LACP PDU is received by one of the member ports.

The **no port-channel lacp fallback** and **default port-channel lacp fallback** commands disable LACP fallback mode on the configuration mode interface by removing the corresponding **port-channel lacp fallback** command from ***running-config***.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

port-channel lacp fallback [**MODE**]

no port-channel lacp fallback

default port-channel lacp fallback

Parameters

MODE LACP fallback mode. Options include:

- ***no parameter*** Enables static LACP fallback mode.
  - **static** Enables static LACP fallback mode.
  - **individual** Eenables individual LACP fallback mode.

Related Commands

- port-channel lacp fallback timeout configures the fallback timeout period for a port channel interface. The default LACP fallback timeout period is ***90*** seconds.
- lacp port-priority configures the port priority for an individual interface.

Examples

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of 100 seconds on ***port channel interface 13***. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback static
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
   port-channel lacp fallback static
   port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of ***50*** seconds on ***port channel interface 17***. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 17
switch(config-if-Po17)#port-channel lacp fallback individual
switch(config-if-Po17)#port-channel lacp fallback timeout 50
switch(config-if-Po17)#show active
interface Port-Channel17
   port-channel lacp fallback individual
   port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```

11.2.5.18 port-channel load-balance arad fields ip

The **port-channel load-balance arad fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Arad platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance arad fields ip** and **default port-channel load-balance arad fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance arad A fields ip** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance arad fields ip **IP_FIELD_NAME**

no port-channel load-balance arad fields ip

default port-channel load-balance arad fields ip

Parameters

IP_FIELD_NAME Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
  - **mac-header** Algorithm uses entire MAC header.

  A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Command

port-channel load-balance configures the hash seed for the algorithm.

Example

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-
udp-header
switch(config)#
```

11.2.5.19 port-channel load-balance fm6000 fields ip

The **port-channel load-balance fm6000 fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on FM6000 platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields ip** and **default port-channel load-balance fm6000 fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields ip** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance fm6000 fields ip **IP_FIELD_NAME**

no port-channel load-balance fm6000 fields ip

default port-channel load-balance fm6000 fields ip

Parameters

IP_FIELD_NAME Specifies fields the hashing algorithm uses for layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance fm6000 fields mac controls the hash algorithm for non-IP packets.

Example

These commands configure the switch's port channel load balance for IP packets by source and destination IP address and port fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-
udp-header
switch(config)#
```

11.2.5.20 port-channel load-balance fm6000 fields mac

The **port-channel load-balance fm6000 fields mac** command specifies data fields that configure the port channel load balance hash algorithm for non-IP packets on FM6000 platform switches. The hashing algorithm fields used for balancing non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields mac** and **default port-channel load-balance fm6000 fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields mac** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance fm6000 fields mac **MAC_FIELD_NAME**

no port-channel load-balance fm6000 fields mac

default port-channel load-balance fm6000 fields mac

Parameters

MAC_FIELD_NAME Fields the hashing algorithm uses for Layer 2 routing. Options include:

- **dst-mac** MAC destination field.
- **eth-type** EtherType field.
- **src-mac** MAC source field.
- **vlan-id** VLAN ID field.
- **vlan-priority** VLAN priority field.

Command may include from one to five fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance fm6000 fields ip controls the hash algorithm for IP packets.

Example

These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance fm6000 fields mac dst-
mac eth-type
switch(config)#
```

11.2.5.21 port-channel load-balance module

The **port-channel load-balance module** command assigns a named load-balancing profile to a linecard.

Note: Available on the 7500E platform.

The **no port-channel load-balance module** and **default port-channel load-balance module** commands unassigns the load balancing module, or restores the default data fields for the load balancing module.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

no port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

default port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

Parameters

- **LINECARD_RANGE** Linecard number range includes:
  - ***3-10*** Linecard number range.
- **PROFILE_NAME** Load-balance profile name.

Examples

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
 profile Linecard5
switch(config)#
```

11.2.5.22 port-channel load-balance petraA fields ip

The **port-channel load-balance petraA fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Petra platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance petraA fields ip** and **default port-channel load-balance petraA fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance petraA fields ip** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance petraA fields ip **IP_FIELD_NAME**

no port-channel load-balance petraA fields ip

default port-channel load-balance petraA fields ip

Parameters

IP_FIELD_NAME Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
- **mac-header** Algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Command

port-channel load-balance configures the hash seed for the algorithm.

Example

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-
udp-header
switch(config)#
```

11.2.5.23 port-channel load-balance sand profile (7500E/7500R)

The **`port-channel load-balance sand profile`** command configures a global LAG hashing profile on the port channel interface. A default profile is set as a global profile when no other profile is set as global.

The **`no port-channel load-balance sand profile`** command removes the active profile from the **`port-channel load-balance`** command from ***running-config***, restoring the default profile.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` sand profile *profile_name*

`no port-channel load-balance` sand profile *profile_name*

Parameter

profile_name Name of the profile assigned to the selected module.

Example

This command configures a global LAG hashing profile on 7500 series platform switch.

```
switch(config)#port-channel load-balance sand profile
 myGlobalProfile
switch(config)#
```

11.2.5.24 port-channel load-balance trident fields ip

The **`port-channel load-balance trident fields ip`** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Trident platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance trident fields ip`** and **`default port-channel load-balance trident fields ip`** commands restore the default data fields for the IP packet load balancing algorithm by removing the **`port-channel load-balance trident fields ip`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` trident fields ip **IP_FIELD_NAME**

`no port-channel load-balance` trident fields ip

`default port-channel load-balance` trident fields ip

`default port-channel load-balance` trident fields ip ingress-interface *disabled*

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Options include:
- Command may include from one to four of the following four options, in any combination and listed in any order.
  - **destination-ip** Algorithm uses destination IP address field.
  - **source-ip** Algorithm uses source IP address field.
  - **destination-port** aAgorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
    - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

      Note: This option can't be used in combination with any other option.
  - **mac-header** Algorithm uses fields specified by port-channel load-balance trident fields mac.

    Note: This option can't be used in combination with any other option.
  - **ingress-interface** Disable from LAG hashing.

Default setting is **ip-tcp-udp-header**

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance trident fields ipv6 controls the hash algorithm for IPv6 packets.
- port-channel load-balance trident fields mac controls the hash algorithm for non-IP/IPv6 packets.

Example

These commands configure the switch's port channel load balance for IP packets by using the IPv6 destination field in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields ip
 destination-ip
switch(config)#
```

This command disables the ingress interface for IPv4 traffic.

```
switch(config)#port-channel load-balance trident fields ip
 ingress-interface disabled
switch(config)#
```

11.2.5.25 port-channel load-balance trident fields ipv6

The **`port-channel load-balance trident fields ipv6`** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IPv6 packets on Trident platform switches. The hashing algorithm fields used for IPv6 packets differ from the fields used for non-IPv6 packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **`no port-channel load-balance trident fields ipv6`** and **`default port-channel load-balance trident fields ipv6`** commands restore the default data fields for the IPv6 packet load balancing algorithm by removing the **`port-channel load-balance trident fields ipv6`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` trident fields ipv6 **IP_FIELD_NAME**

`no port-channel load-balance` trident fields ipv6

`default port-channel load-balance` trident fields ipv6

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Options include:

  Command may include from one to four of the following four options, in any combination and listed in any order.

  - **destination-ip** Algorithm uses destination IPv6 address field.
  - **source-ip** Algorithm uses source IPv6 address field.
  - **destination-port** Algorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
    - **ip-tcp-udp-header** Algorithm uses source and destination IPv6 address fields. Source and destination port fields are included for TCP and UDP packets.

      Note: This option can't be used in combination with any other option.
    - **mac-header** Algorithm uses fields specified by port-channel load-balance trident fields mac.

      Note: This option can't be used in combination with any other option.
    - **ingress-interface** Disable from LAG hashing.

  Default setting is **ip-tcp-udp-header**

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance trident fields ipv6 controls the hash algorithm for non-IP packets.
- port-channel load-balance trident fields mac controls the hash algorithm for non-IP packets.

Examples

- These commands configure the switch's port channel load balance for IP packets by using the IPv6 source field in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields ipv6
 source-ip
switch(config)#
```

- This command disables the ingress interface for IPv6 traffic.

```
switch(config)#port-channel load-balance trident fields ipv6
 ingress-interface disabled
switch(config)#
```

11.2.5.26 port-channel load-balance trident fields mac

The **port-channel load-balance trident fields mac** command specifies data fields that the port channel load balance hash algorithm uses for distributing non-IP packets on Trident platform switches. The hashing algorithm fields used for non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance trident fields mac** and **default port-channel load-balance trident fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance trident fields mac** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance trident fields mac **MAC_FIELD_NAME**

no port-channel load-balance trident fields mac

default port-channel load-balance trident fields mac

default port-channel load-balance trident fields mac ingress-interface *disabled*

Parameters

- **MAC_FIELD_NAME** Fields the hashing algorithm uses for Layer 2 routing. Options include:
  - **dst-mac** MAC destination field.
  - **eth-type** EtherType field.
  - **src-mac** MAC source field.
  - **ingress-interface** Disable from LAG hashing.

  Command may include from one to three fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- port-channel load-balance configures the hash seed for the algorithm.
- port-channel load-balance trident fields ip controls the hash algorithm for IP packets.
- port-channel load-balance trident fields ipv6 controls the hash algorithm for IP packets.

Examples

- These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields mac
 dst-mac eth-type
switch(config)#
```

- This command disables the ingress interface for IPv4 traffic.

```
switch(config)#port-channel load-balance trident fields mac
 ingress-interface disabled
switch(config)#
```

11.2.5.27 port-channel load-balance

The **`port-channel load-balance`** command specifies the seed in the hashing algorithm that balances the load across ports comprising a port channel. Available seed values vary by switch platform.

The **`no port-channel load-balance`** and **`default port-channel load-balance`** commands remove the **`port-channel load-balance`** command from ***running-config***, restoring the default hash seed value of ***0***.

Command Mode

Global Configuration

Command Syntax

`port-channel load-balance` *platform* {*hash_seed* | fields ip *fields* | hash *hash_function* }

`no port-channel load-balance` *platform* [*hash_seed*]

`default port-channel load-balance` *platform* [*hash_seed*]

Parameters

Note: Parameter options vary by switch model. Verify available options with the **`?`** command.

- ***platform*** ASIC switching device. Value depends on the switch model.
- ***hash_seed*** The numerical seed for the hash function. Value range varies by switch platform:
  - **arad *0*** to ***65535***.
  - **fm6000 *0*** to ***39***.
  - **petraA** Uses field inputs only.
  - **trident *0*** to ***47***.

  For trident platform switches, algorithms using hash seeds between ***0*** and *15* typically result in more effective distribution of data streams across the port channels.
- ***fields*** Which fields will be used as inputs to the port channel hash.
  - **gre** Configure which GRE fields are inputs to the hash.
  - **ip** Configure which fields are inputs to the hash for IPv4 packets.
  - **ipv6** Configure which fields are inputs to the hash for IPv6 packets.
  - **mac** Configure which MAC fields are inputs to the hash.
  - **mac-in-mac** Configure which MAC-in-MAC fields are inputs to the hash.
  - **mpls** Configure which MPLS fields are inputs to the hash.
  - **destination-ip** Use the Layer 3 IP destination address in the hash.
  - **destination-port** Use the Layer 4 TCP/UDP destination port in the hash.
  - **dst-ip** Use the destination IP address in the hash.
  - **dst-mac** Use the destination Payload MAC in the hash (or the destination MAC address in the MAC hash).
  - **eth-type** Use the Ethernet type in the MAC hash.
  - **ip-in-ip** Use the outer IP header in the hash for IPv4 over IPv4 GRE tunnel.
  - **ip-in-ipv6** Use the outer IP header in the hash for IPv4 over IPv6 GRE tunnel.
  - **ipv6-in-ip** Use the outer IP header in the hash for IPv6 over IPv4 GRE tunnel.
  - **ipv6-in-ipv6** Use the outer IP header in the hash for IPv6 over IPv6 GRE tunnel.
  - **ip-tcp-udp-header** Use the Layer 3 and Layer 4 hashes.
  - **isid** Use the MAC-in-MAC ISID in the hash.
  - **label** Use the MPLS label in the hash.
  - **mac-header** Use the MAC hash.
  - **outer-mac** Use the outer MAC of source and destination in the hash.

- **source-ip** Use the Layer 3 IP source address in the hash.
- **src-ip** Use the source IP address in the hash.
- **source-port** Use I\Layer 4 TCP/UDP source port in the hash.
- **src-mac** Use the source payload MAC in the hash (or the source MAC address in the MAC hash).

- ***hash_function*** Specifies the hash polynomial function. Values range from ***0***-***2***.

Example

This command configures a hash seed of ***10*** on an FM6000 platform switch.

```
switch(config)#port-channel load-balance fm6000 10
switch(config)#
```

11.2.5.28 port-channel min-links review interval

The **`port-channel min-links review interval`** command enables or disables timer based min-links review feature for all port-channels.

The **`no port-channel min-links review interval`** and **`default port-channel min-links review interval`**commands restore the default min-links-timeout-base to 180 seconds by removing the corresponding **`port-channel min-links review interval`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`port-channel min-links review interval` *timeout(seconds)*

`no port-channel min-links review interval`

`default port-channel min-links review interval`

Guidelines

The min-links-timeout-base interval for port-channels can be set within the range of ***0*** to ***600*** seconds. When setting the review interval to zero, the command has the following effect:

- Disables the timer-based min-links review feature for all port-channels.
  - For LACP port-channels, it prevents the port-channel from bringing link up (even after one or more member ports were negotiated to collect or distribute (rx or tx)) until there are sufficient member interfaces ready to join the port-channel. Meanwhile, the partner can enable the port-channel link with fewer than required member interfaces. This configuration does not impact port-channels without min-links configuration.

Related Command

port-channel min-links

Example

This command sets the port-channel min-links interval to ***200*** seconds.

```
switch(config)#port-channel min-links review interval 200
```

11.2.5.29 port-channel min-links

The **port-channel min-links** command specifies the minimum number of interfaces that the configuration mode LAG requires to become active. If there are fewer ports than specified by this command, the port channel interface does not become active. The default min-links value is ***0***.

The **no port-channel min-links** and **default port-channel min-links** commands restore the default min-links setting for the configuration mode LAG by removing the corresponding **port-channel min-links** command from the configuration.

Note: In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK_INTF_INSUFFICIENT message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK_INTF_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK_INTF_INSUFFICIENT is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

port-channel min-links *quantity*

no port-channel min-links

default port-channel min-links

Parameters

quantity Minimum number of interfaces. Value range varies by platform. Default value is ***0***.

Example

These commands set ***4*** as the minimum number of ports required for ***port channel 13*** to become active.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel min-links 4
switch(config-if-Po13)#show active
interface Port-Channel13
   port-channel min-links 4
```

```
switch(config-if-Po13)#
```

11.2.5.30 port-channel speed mixed

The **`port-channel speed mixed`** command configures a port channel with the ability to have active members of multiple speeds.

Note: Available on the 7020, 7280, 7500, and 7800 platforms. Minimum links is not available on mixed-speed port channels.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel speed mixed`

Related Commands

interface port-channel places the switch in thr i***nterface-port-channel*** configuration mode.

Example

These commands places the switch in the ***interface port-channel*** mode and configures the mixed speed port-channel.

```
switch(config)#interface port-channel 1
switch(config-if-Po1)#port-channel speed mixed
```

11.2.5.31 port-channel speed minimum

The **`port-channel speed minimum`** command specifies the cumulative minimum speed of all active members in order for a port channel to become active. If there is less than the specified by this command, the port channel interface does not become active.

Note: If both minimum speed and minimum links are configured, minimum speed will take precedence.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

`port-channel speed minimum` *speed-value*

Parameter

speed-value Minimum speed value. The value ranges from ***1*** to ***65535***.

Related Command

interface port-channel places the switch in interface-port-channel configuration mode.

Example

These command sets 100 Gbps as the minimum speed needed for port channel ***1*** to become active.

```
switch(config)#interface port-channel 1
switch(config-if-Po1)#port-channel speed minimum 100 gbps
```

11.2.5.32 show lacp aggregates

The **`show lacp aggregates`** command displays aggregate IDs and the list of bundled ports for all specified port channels.

Command Mode

EXEC

Command Syntax

`show lacp` [**PORT_LIST**] aggregates [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: PORT_LEVEL and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Port channels for which aggregate information is displayed. Options include:
  - ***<no parameter>*** All configured port channels.
  - ***c_range*** Channel list (number, range, or comma-delimited list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Ports bundled by LACP into the port channel.
  - **all-ports** All channel group ports, including channel group members not bundled into the port channel interface.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Aggregate ID and bundled ports for each channel.
  - **brief** Aggregate ID and bundled ports for each channel.
  - **detailed** Aggregate ID and bundled ports for each channel.

Example

This command lists aggregate information for all configured port channels.

```
switch>show lacp aggregates

Port Channel Port-Channel1:
 Aggregate ID:
[(8000,00-1c-73-04-36-d7,0001,0000,0000),(8000,00-1c-73-09-a0-f3,0001,0000,0000)]
  Bundled Ports: Ethernet43 Ethernet44 Ethernet45 Ethernet46
Port Channel Port-Channel2:
 Aggregate ID:
[(8000,00-1c-73-01-02-1e,0002,0000,0000),(8000,00-1c-73-04-36-d7,0002,0000,0000)]
  Bundled Ports: Ethernet47 Ethernet48
Port Channel Port-Channel3:
 Aggregate ID:
[(8000,00-1c-73-04-36-d7,0003,0000,0000),(8000,00-1c-73-0c-02-7d,0001,0000,0000)]
  Bundled Ports: Ethernet3 Ethernet4
Port Channel Port-Channel4:

11.2.5.33 show lacp counters

The **`show lacp counters`** command displays LACP traffic statistics.

Command Mode

EXEC

Command Syntax

`show lacp` [**PORT_LIST**] counters [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Ports for which port information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Port on Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port on port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Only ports bundled by LACP into an aggregate.
  - **all-ports** All ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays packet transmission (TX and RX) statistics.
  - **brief** Displays packet transmission (TX and RX) statistics.
  - **detailed** Displays packet transmission (TX and RX) statistics and actor-partner statistics.

Example

This command displays transmission statistics for all configured port channels.

```
switch>show lacp counters brief

                      LACPDUs          Markers   Marker Response

```

11.2.5.34 show lacp interface

The **`show lacp interface`** command displays port status for all port channels that include the specified interfaces. Within the displays for each listed port channel, the output displays sys-id, partner port, state, actor port, and port priority for each interface in the channel.

Command Mode

EXEC

Command Syntax

`show lacp interface` [**INTERFACE_PORT**] [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: INTERFACE_PORT is listed first when present. Other parameters can be listed in any order.

Parameters

- **INTERFACE_PORT** Interfaces for which information is displayed. Options include:
  - ***no parameter*** All interfaces in channel groups.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into the aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays LACP configuration information for all ethernet interfaces.

```
switch>show lacp interface
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state

11.2.5.35 show lacp internal

The **`show lacp internal`** command displays the local LACP state for all specified channels. Local state data includes the state machines and LACP protocol information.

Command Mode

EXEC

Command Syntax

`show lacp` [**PORT_LIST**] internal [**PORT_LEVEL**] [**INFO_LEVEL**]

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Note: PORT_LEVEL and **INFO_LEVEL** parameters can be placed in any order.

Example

This command displays internal data for all configured port channels.

```
switch>show lacp internal

LACP System-identifier: 8000,00-1c-73-04-36-d7
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,

```

11.2.5.36 show lacp peer

The **show lacp peer** command displays the LACP protocol state of the remote neighbor for all specified port channels.

Command Mode

EXEC

Command Syntax

show lacp [**PORT_LIST**] peer [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: PORT_LEVEL and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
  - ***no parameter*** Displays information for all configured port channels.
  - ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays the LACP protocol state of the remote neighbor for all port channels.

```
switch>show lacp peer

State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state
               |                              Partner

* - Only local interfaces for MLAGs are displayed. Connect to the peer to
    see the state for peer interfaces.
```

```
switch>
```

11.2.5.37 show lacp sys-id

The **show lacp sys-id** command displays the System Identifier the switch uses when negotiating remote LACP implementations.

Command Mode

EXEC

Command Syntax

show lacp sys-id [**INFO_LEVEL**]

Parameters

INFO_LEVEL Amount of information that is displayed. Options include:

- ***no parameter*** Displays system identifier.
- **brief** Displays system identifier.
- **detailed** Displays system identifier and system priority, including the MAC address.

Examples

- This command displays the system identifier.

```
switch>show lacp sys-id brief
8000,00-1c-73-04-36-d7
```

- This command displays the system identifier and system priority.

```
switch>show lacp sys-id detailed
System Identifier used by LACP:
System priority: 32768  Switch MAC Address: 00:1c:73:04:36:d7
  802.11.43 representation: 8000,00-1c-73-04-36-d7
```

11.2.5.38 show load-balance profile

The **`show load-balance profile`** command displays the contents of the specified load balance profiles. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes.

Command Mode

EXEC

Command Syntax

`show load-balance profile` [**PROFILES**]

Parameters

PROFILES Load balance profiles for which command displays contents. Options include:

- ***no parameter*** Displays all load balance profiles.
- ***profile_name*** Displays specified profile.

Related Commands

- load-balance policies places the switch in ***load-balance-policies*** configuration mode.
- ingress load-balance profile applies a load-balance profile to an Ethernet or port channel interface.

Example

This command displays the contents of the ***LB-1*** load balance profile.

```
switch>show load-balance profile LB-1

---------- LB-1 ----------

Source MAC address hashing               ON
Destination MAC address hashing          ON
Ethernet type hashing                    ON
VLAN ID hashing                          ON
IP protocol field hashing                ON
DSCP field hashing is                    ON
Symmetric hashing for non-IP packets     OFF
Symmetric hashing for IP packets         OFF
Random distribution for port-channel     ON
Random distribution for ecmp             ON

Profile LB-1 is applied on the following
    Port-Channel100

---------- myGlobalProfile (global) ----------
L3 hashing is ON
Symmetric hashing is OFF
Hashing mode is flow-based
Hash polynomial is 3
Hash seed is 0
Profile myGlobalProfile (global) is applied on the following
Linecard3
Linecard4
Linecard5
Linecard6

switch>
```

11.2.5.39 show port-channel dense

The **show port-channel dense** command displays the port-channels on the switch and lists their component interfaces, LACP status, and set flags.

Command Mode

EXEC

Command Syntax

show port-channel dense

Example

This command displays **show port-channel dense** output:

```
switch>show port-channel dense

    Flags
--------------------------------------------------------------------
a - LACP Active        p - LACP Passive
U - In Use             D - Down
+ - In-Sync            - - Out-of-Sync      i - incompatible with agg
P - bundled in Po      s - suspended        G - Aggregable
I - Individual         S - ShortTimeout     w - wait for agg

Number of channels in use: 2
Number of aggregators:2

   Port-Channel       Protocol    Ports
------------------------------------------------------
   Po1(U)             LACP(a)      Et47(PG+) Et48(PG+)
   Po2(U)             LACP(a)      Et39(PG+) Et40(PG+)
```

11.2.5.40 show port-channel limits

The **show port-channel limits** command displays groups of ports that are compatible and may be joined into port channels. Each group of compatible ports is called a LAG group. For each LAG group, the command also displays **Max interfaces** and **Max ports per interface**.

- **Max interfaces** defines the maximum number of active port channels that may be formed out of these ports.
- **Max ports per interface** defines the maximum number of active ports allowed in a port channel from the compatibility group.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

Command Mode

EXEC

Command Syntax

show port-channel limits

Example

This command displays **show port-channel list** output:

```
switch>show port-channel limits

LAG Group: focalpoint
--------------------------------------------------------------------------------
  Max port-channels per group: 24, Max ports per port-channel: 16
  24 compatible ports: Ethernet1  Ethernet2  Ethernet3  Ethernet4
                       Ethernet5  Ethernet6  Ethernet7  Ethernet8
                       Ethernet9  Ethernet10 Ethernet11 Ethernet12
                       Ethernet13 Ethernet14 Ethernet15 Ethernet16
                       Ethernet17 Ethernet18 Ethernet19 Ethernet20
                       Ethernet21 Ethernet22 Ethernet23 Ethernet24
--------------------------------------------------------------------------------
```

11.2.5.41 show port-channel load-balance fields

The **show port-channel load-balance fields** command displays the fields that the hashing algorithm uses to distribute traffic across the interfaces that comprise the port channels.

Command Mode

EXEC

Command Syntax

show port-channel load-balance **HARDWARE** fields

Parameters

HARDWARE ASIC switching device. Selection options depend on the switch model and include:

- **arad**
- **fm6000**
- **petraA**
- **trident**

Example

This command displays the hashing fields used for balancing port channel traffic.

```
switch>show port-channel load-balance fm6000 fields

Source MAC address hashing for non-IP packets is ON
Destination MAC address hashing for non-IP packets is ON
Ethernet type hashing for non-IP packets is ON
VLAN ID hashing for non-IP packets is ON
VLAN priority hashing for non-IP packets is ON
Source MAC address hashing for IP packets is ON
Destination MAC address hashing for IP packets is ON
Ethernet type hashing for IP packets is ON
VLAN ID hashing for IP packets is ON
VLAN priority hashing for IP packets is ON
IP source address hashing is ON
IP destination address hashing is ON
IP protocol field hashing is ON
TCP/UDP source port hashing is ON
TCP/UDP destination port hashing is ON

switch>
```

11.2.5.42 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from ***0*** at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the clear counters command.

Command Mode

EXEC

Command Syntax

show port-channel load-balance [**MEMBERS**]

Parameters

MEMBERS list of port channels for which information is displayed. Options include:

- ***no parameter*** all configured port channels.
- ***c_range*** ports in specified channel list (number, number range, or list of numbers and ranges).

Example

This command displays traffic distribution for all configured port channels.

```
switch>show port-channel load-balance
ChanId      Port Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
------ --------- ------- ------- ------- ------- ------- -------
     8      Et10 100.00% 100.00% 100.00% 100.00%   0.00% 100.00%
------ --------- ------- ------- ------- ------- ------- -------
     1       Et1  13.97%  42.37%  47.71%  30.94%   0.43%  99.84%
     1       Et2  86.03%  57.63%  52.29%  69.06%  99.57%   0.16%
------ --------- ------- ------- ------- ------- ------- -------
     2      Et23  48.27%  50.71%  26.79%  73.22%   0.00% 100.00%
     2      Et24  51.73%  49.29%  73.21%  26.78%   0.00%   0.00%
------ --------- ------- ------- ------- ------- ------- -------
     4       Et3  55.97%  63.29%  51.32%  73.49%   0.00%   0.00%
     4       Et4  44.03%  36.71%  48.68%  26.51%   0.00%   0.00%
------ --------- ------- ------- ------- ------- ------- -------
     5      Et19  39.64%  37.71%  50.00%  90.71%   0.00%   0.00%
     5      Et20  60.36%  62.29%  50.00%   9.29%   0.00% 100.00%
------ --------- ------- ------- ------- ------- ------- -------

switch>
```

11.2.5.43 show port-channel

The **show port-channel** command displays information about members the specified port channels.

Command Mode

EXEC

Command Syntax

show port-channel [**MEMBERS**] [**PORT_LIST**] [**INFO_LEVEL**]

Parameters

- **MEMBERS** List of port channels for which information is displayed. Options include:
  - ***no parameter*** All configured port channels.
  - ***p_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - ***no parameter*** Displays information on ports that are active members of the LAG.
  - **active-ports** Displays information on ports that are active members of the LAG.
  - **all-ports** Displays information on all ports (active or inactive) configured for LAG.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
  - ***no parameter*** Displays information at the brief level.
  - **brief** Displays information at the brief level.
  - **detailed** Displays information at the detail level.

Display Values

- **Port Channel** Type and name of the port channel.
- **Time became active** Time when the port channel came up.
- **Protocol** Protocol operating on the port channel.
- **Mode** Status of the Ethernet interface on the port. The status value is Active or Inactive.
- **No active ports** Number of active ports on the port channel.
- **Configured but inactive ports** Ports configured but that are not actively up.
- **Reason unconfigured** Reason why the port is not part of the LAG.

Guidelines

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform specific. For example, compatibility may require identical operating parameters such as speed and maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Examples

- This command displays output from the **show port-channel** command.

```
switch>show port-channel 3
Port Channel Port-Channel3:
  Active Ports:
       Port                Time became active       Protocol    Mode
     ---------------------------------------------------------------------
       Ethernet3           15:33:41                 LACP        Active
       PeerEthernet3       15:33:41                 LACP        Active
```

- This command displays output from the **show port-channel active-ports** command.

```
switch>show port-channel active-ports
```

```
Port Channel Port-Channel3:
  No Active Ports
Port Channel Port-Channel11:
  No Active Ports
switch>
```

- This command displays output from the **show port-channel all-ports** command.

```
switch>show port-channel all-ports
Port Channel Port-Channel3:
  No Active Ports
  Configured, but inactive ports:
      Port            Time became inactive    Reason unconfigured
    ------------------------------------------------------------------
-----------
      Ethernet3       Always                  not compatible with aggregate

Port Channel Port-Channel11:
  No Active Ports
  Configured, but inactive ports:
      Port            Time became inactive    Reason unconfigured
    ------------------------------------------------------------------
-----------
      Ethernet25      Always                  not compatible with aggregate
      Ethernet26      Always                  not compatible with aggregate
```

11.3 Multi-Chassis Link Aggregation

Arista switches support Multi-Chassis Link Aggregation (MLAG) to logically aggregate ports across two switches. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that appears as a single 20-gigabit port. MLAG-configured ports provide Layer 2 multipathing, increased bandwidth, higher availability, and other improvements on traditional active-passive or Spanning Tree governed infrastructures.

The Multi-Chassis Link Aggregation section contains these topics:

- MLAG Introduction
- MLAG Conceptual Overview
- MLAG Maintenance
- MLAG Dual Primary Detection and Release
- Configuring MLAG
- EVPN - MLAG Single-homed Hosts
- MLAG Implementation Example
- MLAG Commands

11.3.1 MLAG Introduction

High availability data center topologies typically provide redundancy protection at the expense of over-subscription by connecting top-of-rack (TOR) switches and servers to dual aggregation switches. In these topologies, Spanning Tree Protocol prevents network loops by blocking half of the links to the aggregation switches. This reduces the available bandwidth by 50%.

Deploying MLAG removes over-subscription by configuring an MLAG link between two aggregation switches to create a single logical switching instance that utilizes all connections to the switches. Interfaces on both devices participate in a distributed port channel, enabling all active paths to carry data traffic while maintaining the integrity of the Spanning Tree topology.

MLAG provides these benefits:

- Aggregates multiple Ethernet ports across two switches.
- Provides higher bandwidth links as network traffic increases.
- Utilizes bandwidth more efficiently with fewer links blocked by STP.
- Connects to other switches and servers by static LAG or LACP without other proprietary protocols.
- Supports normal STP operation to prevent loops.
- Supports active-active Layer-2 redundancy.

Note: PTP (precision timing protocol) is not supported with MLAG.

Note: The global STP configuration is derived from the primary peer device while the secondary device parameters are ignored. When STP is disabled on the primary device, the secondary device will not contain any STP configuration information from the primary device. As a result, the secondary device will not be able to decide on the port roles or states, and will remain in the default state which is the discarding state. This is an expected behavior.

Note: It is highly recommended that both MLAG peer switches are identical platforms and run identical EOS images. Running different images/platform may result in a failure to form an association with the MLAG peer or see discrepancy in behavior.

11.3.2 MLAG Conceptual Overview

11.3.2.1 MLAG Operation Process

A Multi-chassis Link Aggregation Group (MLAG) is a pair of links that terminate on two cooperating switches and appear as an ordinary Link Aggregation Group (LAG). The cooperating switches are MLAG peer switches and communicate through an interface called a peer link. While the peer link's primary purpose is exchanging MLAG control information between peer switches, it also carries data traffic from devices that are attached to only one MLAG peer and have no alternative path. An MLAG domain consists of the peer switches and the control links that connect the switches.

In the figure below, Switch A and Switch B are peer switches in the MLAG domain and connect to each other through the peer link. Each peer switch uses the peer address to form and maintain the peer link.

The MLAG domain ID is a text string configured in each peer switch. MLAG switches use this string to identify their peers. The MLAG System ID (MSI) is the MLAG domain's MAC address. The MSI is automatically derived when the MLAG forms and does not match the bridge MAC address of either peer. Each peer uses the MSI in STP and LACP PDUs.

The topology shown below contains four MLAGs: one MLAG connects each device to the MLAG domain. Each peer switch connects to the four servers through MLAG link interfaces.

In a conventional topology, with dually-attaching devices to multiple switches for redundancy, Spanning Tree Protocol (STP) blocks half of the switch-device links. In the MLAG topology, STP does not block any portion because it views the MLAG Domain as a single switch and each MLAG as a single port. The MLAG protocol facilitates the balancing of device traffic between the peer switches.

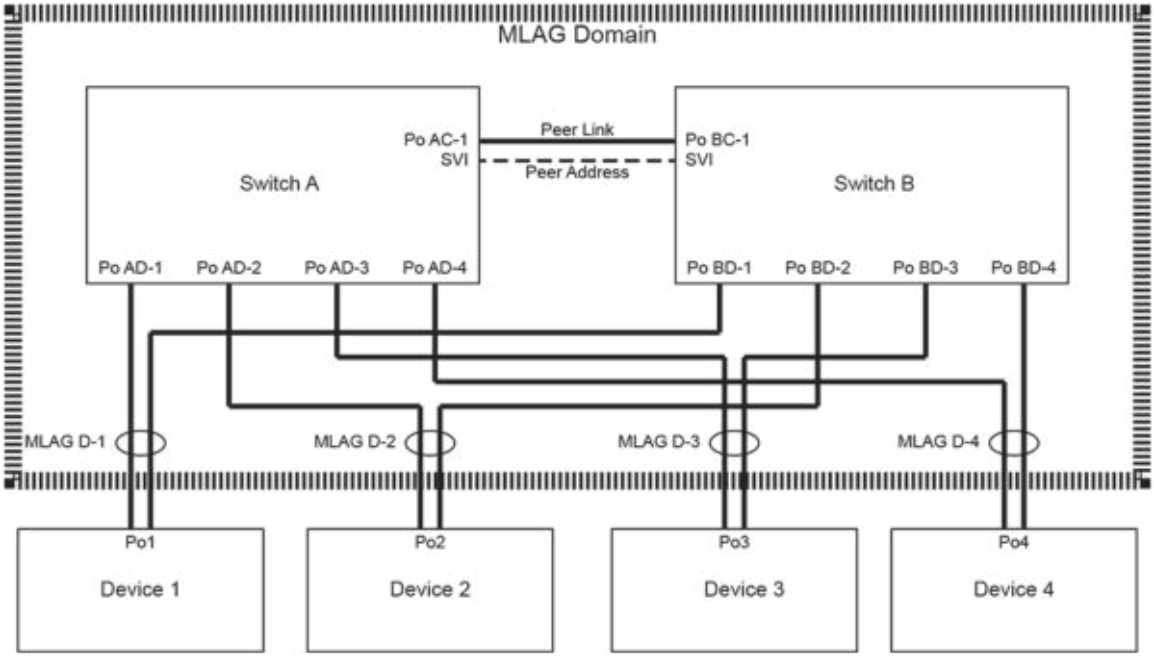

Figure 21: MLAG Domain Topology

When MLAG is disabled, peer switches revert to their independent state. MLAG is disabled by any of the following:

- MLAG configuration changes.
- The TCP connection breaks.
- The peer-link or local-interface goes down.
- A switch does not receive a response to a keep alive message from its peer within a specified period.

11.3.2.2 MLAG Interoperability with Other Features

The following sections describe MLAG interaction with other switch features.

11.3.2.2.1 VLANs

VLAN parameters must be configured identically on each peer for the LAGs comprising the peer link and MLAGs. These parameters include the switchport access VLAN, switchport mode, trunk-allowed VLANs, the trunk native VLAN, and switchport trunk groups.

Configuration discrepancies may result in traffic loss in certain failure scenarios. Port-specific bridging configuration originates on the switch where the port is physically located.

11.3.2.2.2 LACP

Link Aggregation Control Protocol (LACP) should be used on all MLAG interfaces, including the peer-link. LACP control packets reference the MLAG system ID.

11.3.2.2.3 Static MAC Addresses

A static MAC address configured on an MLAG interface is automatically configured on the peer's corresponding interface. Configuring static MAC addresses on both peers prevents undesired flooding if an MLAG peer relationship fails.

If the MLAG peering relationship is disabled, the static MAC previously learned from peer is removed.

11.3.2.2.4 STP

When implementing MLAG in a spanning tree network, spanning tree must be configured globally and on port-channels configured with an MLAG ID. Port specific spanning tree configuration comes from the switch where the port physically resides. This includes spanning-tree PortFast BPDU Guard and BPDU filter.

11.3.2.2.5 Port Mirroring

A port channel which is a member of an MLAG *must not* be used as the destination port for a port mirroring (port monitoring) session.

11.3.2.3 IPv6 Flow Label Hashing

Arista switches use the hashing algorithm to load-balance traffic among LAG members and Layer 3 ECMP (equal cost multipath) paths. For IP and IPv6 traffic, the hashing algorithm includes (if so configured for LAG) the IP packet fields such as source and destination IP addresses as well as source and destination ports for UDP and TCP traffic.

To improve traffic distribution for IPv6 traffic, IPv6 Flow Label field has been added to the hashing algorithm for both LAG and ECMP.

Note: IPv6 Flow Label is included in the LAG hashing algorithm only when the MAC header hashing is not enabled for IPv6 traffic.

11.3.3 MLAG Maintenance

These sections describe tasks required for MLAG to operate on the switch:

- Ensuring Control Plane ACL Compatibility
- MLAG Availability through a Single Functional Peer
- Upgrading MLAG Peers

11.3.3.1 Ensuring Control Plane ACL Compatibility

The control plane Access Control List (ACL) on any interface participating in the MLAG must be configured to allow only the peer link neighbor to generate MLAG control traffic. The required rules are included in the default control plane ACL for Ethernet ports.

Any custom control plane ACL applied to a participating port must include these three rules:

```
permit tcp any any eq mlag ttl eq 255
permit udp any any eq mlag ttl eq 255
permit tcp any eq mlag any ttl eq 255
```

MLAG peers that function as routers must each have routing enabled.

11.3.3.2 MLAG Availability through a Single Functional Peer

MLAG high availability advantages are fully realized when all devices that connect to one MLAG switch also connect to the peer switch. A switch can continue supporting MLAG when its peer is offline if the STP agent is restartable. When one peer is offline, data traffic flows from the devices through the MLAG component link that connects to the functioning switch. When a switch is offline, its interfaces and ports do not appear in show mlag and **`show spanning tree protocol`** commands of the functioning peer.

To view the restartability status of the STP agent, use the **detail** option of the **`show spanning-tree instance`** command:

```
switch-1#show spanning-tree instance detail | grep agent
Stp agent restartable                    :            True
```

STP agent restartability requires consistent configuration between the peers of STP, LACP, MLAG, and switchport parameters. Events triggering an STP state machine change may also briefly prevent the STP agent from being restartable.

11.3.3.2.1 Reload Delay

If an MLAG peer reboots, all ports except those in the peer-link port-channel remain in ***errdisabled*** state for a specified time, called the reload-delay period. This period allows all topology states to stabilize before the switch begins forwarding traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: 300 seconds
- **Trident II modular switches**: 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: 600 seconds
  - 7280 series
- **Sand platform modular switches**: 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the **reload-delay mlag** command.

Severing the physical connection (cable) that establishes the peer-link between MLAG peers may result in a ***split brain*** state where each peer independently enters spanning tree state to prevent topology loops. Sessions established through one interface of a dual attached device may fail if its path is disrupted by the STP reconvergence, possibly resulting in temporarily lost connectivity. Sessions can be reestablished if permitted by the resulting topology.

11.3.3.3 Upgrading MLAG Peers

MLAG ISSU (In-Service Software Upgrade) upgrades EOS software on one MLAG peer with minimal traffic disruptions on active MLAG interfaces and without changing the network topology.

11.3.3.3.1 Verifying Configuration Compatibility

A seamless EOS upgrade on an MLAG peer requires that the following features are configured consistently on each switch:

- VLANs.
- Switchport configuration on port channel interfaces that are configured with an MLAG ID.
- STP configuration (global).

11.3.3.3.2 Version Compatibility

A switch running MLAG can be upgraded without disrupting MLAG traffic when the upgrade EOS version is compatible with the version on the peer switch. Refer to the Release Notes for a list of compatible EOS versions.

11.3.3.3.3 Reload Warning Conditions

Entering an EOS reload command while MLAG is active generates warning messages if conditions that can result in packet loss during the upgrade are present. All warnings should be resolved before confirming the reload request. The following table displays the reload conditions and a common resolution method for each condition.

Table 65: Reload Warning Resolutions

Reload Condition	Resolution Method
Compatibility check	Refer to the Release Notes to verify that the new version is compatible with the currently installed version.
Active-partial MLAG warning	Bring up the remote port-channel. If the MLAG is not actively used, then this warning can be ignored.
STP is not restartable	Wait for STP to be restartable: typically 30 seconds, up to 120 seconds for a newly started STP agent. Refer to MLAG Availability through a Single Functional Peer for information on checking restartability.
Reload delay too low	Configure a reload delay value greater than or equal to the default. Recommend delay is 300 seconds for TOR switches, 900 seconds for modular switches, and 600 seconds for Sand platform fixed configuration switches (7280 series).
Peer has error-disabled interfaces	Wait for reload-delay to expire on the peer.

Example

The following **reload** command generates MLAG warning conditions that should be addressed before confirming the ***proceed with reload*** prompt.

```
switch(config)#reload
If you are performing an upgrade, and the Release Notes for the
new version of EOS indicate that MLAG is not backwards-compatible
with the currently installed version (4.9.2), the upgrade will
result in packet loss.

The following MLAGs are not in Active mode. Traffic to or from these ports will
be lost during the upgrade process.
                                                                  local/remote
  mlag      desc               state      local      remote          status
--------- --------- ------------------- ---------- ----------- ------------
    14                active-partial       Po14        Po14         up/down
    15                active-partial       Po15        Po15         up/down

Stp is not restartable. Topology changes will occur during the upgrade process.

The configured reload delay of 100 seconds is below the default
value of 300 seconds. A longer reload delay allows more time to
rollback an unsuccessful upgrade due to incompatibility.

The other MLAG peer has errdisabled interfaces. Traffic loss will occur during
the upgrade process.

Proceed with reload? [confirm]
```

11.3.3.3.4 Performing an MLAG ISSU Upgrade

The following procedure performs an MLAG ISSU upgrade:

1. Verify configuration consistency on each peer (Verifying Configuration Compatibility).
2. Verify version compatibility between the new and existing images (Version Compatibility).
3. Configure reload-delay mlag (MLAG Availability through a Single Functional Peer) if needed. Recommended delay period varies by switch type, and each switch defaults to its recommended delay period.
4. Install the new image onto one of the peers:
   a. Upload the new image to the switch.
   b. Set the boot path to the new image.
   c. Enter the **reload** command.
5. Resolve all reload warnings.
6. Confirm the reload.
7. Wait for MLAG peers to renegotiate to the active state and reload-delay expiry on rebooted peer; until reload-delay period has expired, ports on the rebooted peer (except the peer-link) will be in ***errdisabled*** state with err-disabled reason being ***mlag-issu***.

   Avoid configuration changes on both peers until after this step.
8. Repeat the upgrade process for the other peer.

   When upgrading modular switches with dual supervisors, upgrade the standby supervisors first, then upgrade the active supervisors.

11.3.4 MLAG Dual Primary Detection and Release

When the MLAG peer-link goes down, the secondary peer assumes the primary peer is down or dead, and takes over the primary role. It is possible that when peer-link is down, the primary is not actually down or dead, and both MLAG peers think they are the primary. This is called **dual-primary** condition or state. In this state, each peer runs Layer-2 protocols such as Spanning Tree Protocol independently. Depending on the topology, this can cause loops in the network. This can also impact the IGMP snooping feature.

The Dual Primary Detection feature uses the management interface as an out-of-band connection between the two peers along with the peer-link. Once configured, the MLAG peers sends UDP heartbeat packets on the management interface. When the peer-link goes down and the heartbeat is still active on out-of-band connection, both MLAG peers detects **dual-primary** condition. The switch can take optional action to shutdown all links except the peer-link on the original secondary MLAG peer.

Beginning with the ***EOS Release 4.23.1F***, there is support for dual primary recovery delay.

Recovery delay is an improvement to the current dual-primary detection feature. Use only when MLAG pairs recover from dual-primary detection with configured errdisable all-interfaces. When recovery delay is configured, the old secondary MLAG peer expects to un-errdisable MLAG interfaces later than non-MLAG to allow more time for L3 interfaces to converge.

Beginning with the ***EOS Release 4.25.0F***, when dual-primary-detection is enabled, there will be heartbeats transferred on both the peer-link and the management link at the same time. This improves dual-primary-detection because both the management link and the peer-link need to fail before the detection fails.

11.3.4.1 Supported EOS Versions

MLAG dual primary detection is supported beginning with ***EOS Release 4.20.0F*** and onwards.

11.3.4.2 Limitations

The following limitaions apply to the MLAG Dual Primary Detection feature.

1. UDP port 4432 is used to exchange control information between the peers, and must not be blocked on the management interfaces on both of the MLAG peers.
2. At least one MLAG port-channel must be configured on the MLAG peers to perform dual primary detection and the corresponding errdisable action.
3. Errdisable action brings down all physical Ethernet interfaces excluding the MLAG peer-link and management port. However, Layer-2 port-channels go down and VLAN SVIs may go down (i.e. autostate taking down VLAN SVIs).
4. When the errdisable action is configured with the non-MLAG interfaces recovery delay the errdisable action must always be less than the MLAG interfaces recovery delay. Otherwise, MLAG interfaces will come up sooner and cause northbound traffic loss.
5. Do not configure this feature if there can be consecutive peer-link flaps. There is an issue that if there are consecutive peer-link flaps during which MLAG peers also happen to switch roles, you can have unexpired recovery timers on the new primary and the secondary can not go dual primary detected until the MLAG recovery timer expires. This can open a small window for L3 traffic blackholing on the primary depending on the delta between recovery delay for MLAG and non-MLAG interfaces.
6. Changing the recovery delay configurations during active recovery delay may cause interfaces to stay errdisabled.

11.3.4.3 MLAG Dual Primary Detection and Release Configuration

To enable MLAG dual primary detection feature, you must configure the following commands on both MLAG peers in the ***MLAG*** configuration mode.

```
switch(config-mlag)#peer-address heartbeat Peer-IP [vrf VRF-NAME ]
```

Parameters:

- ***Peer-IP*** The Management IP address of the MLAG peer reachable in the targeted VRF.
- ***VRF-NAME*** The MLAG peer reachable in VRF (or default VRF if no VRF is configured).

The **peer-address heartbeat** command causes the MLAG agent to start using ***Peer-IP*** address in the given VRF for UDP-based heartbeat control messages.

The **dual-primary detection delay** command configures dual primary detection delay with an optional action to errdisable all interfaces on secondary MLAG peer after detecting the dual primary condition.

```
switch(config-mlag)#dual-primary detection delay SECONDS [action
 errdisable all-interfaces]
```

Parameters:

- **delay** Specifies the number of seconds to wait after MLAG failover to listen for MLAG heartbeats to determine dual primary condition.
- **action errdisable all-interfaces** Errdisables all local physical interfaces on the secondary MLAG peer after detecting the dual primary condition.

Note: This feature must be configured on both MLAG peers.

Use both the **peer-address heartbeat** command and the **dual-primary detection** command on each peer to disable the Dual Primary Detection feature.

The **peer-address heartbeat** command triggers MLAG to revert using the peer-link for heartbeat control messages instead of the management IP address of the MLAG peer.

```
switch(config-mlag)#(no|default) peer-address heartbeat
```

The **dual-primary detection** command removes the detection delay time as well as detection action.

Examples

- This example specifies the MLAG Peer's Management IP address ***172.30.118.190*** in default VRF for heartbeats.

  ```
  switch(config)#mlag
  switch(config-mlag)#peer-address heartbeat 172.30.118.190
  ```

- In this example, the command errdisables all physical interfaces on secondary MLAG peer when dual primary condition is detected.

  ```
  switch(config-mlag)#dual-primary detection delay 5 action errdisable
   all-interfaces
  ```

  Both MLAG peers must have equivalent configurations.

The following commands remove the Dual Primary Detection feature. You must unconfigure both MLAG peers.

```
switch(config-mlag)#no peer-address heartbeat
switch(config-mlag)#no dual-primary detection
```

The **dual-primary recovery delay** command configures the dual-primary detection recovery-delay for MOLG interfaces and non-MPLG interfaces. Negating the configurations or configuring default values makes both recovery delay values reset back to 0. The non-MLAG delay must always be less than the MLAG delay so that you have more time for L3 convergence before you enable the MLAG interfaces. A suggested value for MLAG is 60 seconds, and non-MLAG is 0 seconds. These values can be adjusted depending on the network scale.

```
switch(config-mlag)#dual-primary recovery delay mlag <0-1000> non-
mlag <0-1000>
```

```
switch(config-mlag)#[no|default] dual-primary recovery delay
```

11.3.4.3.1 ISSU Implications

When upgrading from an EOS release that does not support the Dual Primary Detection feature, you must configure this feature only after both MLAG peers are upgraded to the release that has support. When downgrading to a release without Dual Primary Detection support, the configuration must be removed from both the peers before the downgrade process is initiated on either peer. Otherwise, MLAG fails configuration sanity.

11.3.4.4 Viewing the MLAG Dual Primary Detection and Release Status

Use the **show running-config** command to display the MLAG dual primary detection configuration.

Example

```
switch#show running-config
...
mlag configuration
 domain-id test_domain_1
 local-interface Vlan4094
 peer-address 10.0.0.2
 peer-address heartbeat 172.30.118.190
 primary-priority 11
 peer-link Port-Channel1
 dual-primary detection delay 5 action errdisable all-interfaces
 ...
```

Use the **show mlag detail** command to display MLAG dual primary interface errdisabled status, recovery delay status, and the heartbeat counts sent and received. You can infer that the status of recovery delay is active if the dual-primary detection is Configured (dual primary resolved) and dual-primary interface errdisabled is True.

Example

```
switch(config-mlag)#show mlag detail
 MLAG Configuration:
 domain-id : test_domain_1
 local-interface : Vlan4094
 peer-address : 10.0.0.1
 peer-link : Port-Channel1
 hb-peer-address : 172.30.117.28
 peer-config : consistent

MLAG Status:
 state : Active
 negotiation status : Connecting
 peer-link status : Down
 local-int status : Up
 system-id : 46:4c:a8:c6:42:dd
 dual-primary detection : Detected

MLAG Ports:
 Disabled : 0
 Configured : 0
 Inactive : 0
 Active-partial : 0
 Active-full : 0

MLAG Detailed Status:
 State : primary
```

```
 State changes : 5
 Last state change time : 1:06:19 ago
 Hardware ready : True
 Failover : True
 Last failover change time : 1:06:19 ago
 Secondary from failover : False
 primary-priority : 12
 Peer primary-priority : 11
 Peer MAC address : 44:4c:a8:c6:42:dd
 Peer MAC routing supported : True
 Reload delay : 0 seconds
 Non-MLAG reload delay : 0 seconds
 Peer ports errdisabled : False
 Lacp standby : False
 Configured heartbeat interval : 4000 ms
 Effective heartbeat interval : 4000 ms
 Heartbeat timeout : 60000 ms
 Last heartbeat timeout : never
 Heartbeat timeouts since reboot : 0
 UDP heartbeat alive : True
 Heartbeats sent/received : 3189/3189
 Peer monotonic clock offset : unknown
 Agent should be running : True
 P2p mount state changes : 4
 Fast MAC redirection enabled : False
 Dual-primary detection delay : 5
 Dual-primary action : errdisable-all
```

When the dual-primary action is errdisable and detects the **dual-primary** condition, all the ethernet interfaces on the secondary MLAG peer are errdisabled with a **mlagdualprimary** reason.

Example

```
switch#show interfaces status errdisabled
 Port Name Status Reason
 ------------ ---------------- ----------------- --------------------
 Et1 errdisabled mlagdualprimary
 Et2 errdisabled mlagdualprimary
 Et14 errdisabled mlagdualprimary
...
```

11.3.5 Configuring MLAG

These sections describe the basic MLAG configuration steps:

- Configuring the MLAG Peers
- Configuring MLAG Services

11.3.5.1 Configuring the MLAG Peers

Connecting two switches as MLAG peers requires the establishment of the peer link and an SVI that defines local and peer IP addresses on each switch.

The peer link is composed of a LAG between the switches. When all devices that connect to the MLAG domain are dually connected to the switches through an MLAG, a peer link of two Ethernet interfaces is sufficient to handle MLAG control data and provide N+1 redundancy. When the domain connects to devices through only one MLAG peer, the peer link may require additional Ethernet interfaces to manage data traffic.

Disruptions to peer link connectivity due to forwarding agent restarts may cause an extended MLAG outage. Forwarding agent restart event include some configuration changes, such as port speed

change or UFT mode change). The following precautions can reduce the risk of losing peer-link connectivity:

- all switches: constructing peer-links from port-channels in preference to a single Ethernet interface.
- modular systems: peer-link port-channel members should span multiple line cards.
- multi-chip systems: peer-link port-channel member should span multiple chips.

Managing Switch Configuration Settings describes modular systems.

The steps that configure two switches as MLAG peers include:

- Configuring the Port Channels, VLAN Interfaces, and IP addresses
- Configuring Peer Parameters
- Configuring MLAG Peer Gateway

11.3.5.1.1 Configuring the Port Channels, VLAN Interfaces, and IP addresses

The peer link is a normal port channel. The local address is the SVI that maps to the peer link port channel. The port channel and SVI must be configured on each peer switch. The port channel should be an active LACP port. The local and peer addresses must be located on the same IP address subnet. Autostate should be disabled on the SVI configured as the local interface.

Examples

- These commands create an active mode LACP port channel interface from two Ethernet interfaces and configure it as part of a trunk group on each switch.

  The **`switchport mode trunk`** command permits all VLANs on the interface by default, so all VLANs are permitted on port channel 10 in the following example. The configuration of a trunk group for a VLAN restricts only that specific VLAN to the associated ports: VLAN 4094 is only permitted on port channel 10, and not on any other ports on the switch. It is important to remember that all VLANs must be permitted between the peers on the peer link for correct operation.

  Switch 1

```
switch1#config
switch1(config)#vlan 4094
switch1(config-vlan-4094)#trunk group m1peer
switch1#config
switch1(config)#interface ethernet 1-2
switch1(config-if-et1-2)#channel-group 10 mode active
switch1(config-if-et1-2)#interface port-channel 10
switch1(config-if-po10)#switchport mode trunk
switch1(config-if-po10)#switchport trunk group m1peer
switch1(config-if-po10)#exit
switch1(config)#
```

  Switch 2

```
switch2#config
switch2(config)#vlan 4094
switch2(config-vlan-4094)#trunk group m1peer
switch2(config-vlan-4094)#exit
switch2(config)#interface ethernet 1-2
switch2(config-if-et1-2)#channel-group 10 mode active
switch2(config-if-et1-2)#interface port-channel 10
switch2(config-if-po10)#switchport mode trunk
switch2(config-if-po10)#switchport trunk group m1peer
switch2(config-if-po10)#exit
switch2(config)#
```

- These commands create an SVI for the local interface and associate it to the trunk group assigned to the peer link port channel.

  The SVI creates a Layer 3 endpoint in the switch and enables MLAG processes to communicate via TCP. The IP address can be any unicast address that does not conflict with other SVIs. STP is disabled for the peer link ***VLAN 4094*** to prevent any potential STP disruption of inter peer communications. Recall that the VLAN has been restricted to port-channel 10 by the earlier trunk group configuration thus preventing potential Layer 2 loop conditions within ***VLAN 4094***.

  Switch 1

```
switch1#config
switch1(config)#interface vlan 4094
switch1(config-if-vl4094)#ip address 10.0.0.1/30
switch1(config-if-vl4094)#no autostate
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#
```

  Switch 2

```
switch2#config
switch2(config)#interface vlan 4094
switch2(config-if-vl4094)#ip address 10.0.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.5.1.2 Configuring Peer Parameters

Peer connection parameters configure the connection between the MLAG peer switches. This section describes the following peer configuration parameters.

- MLAG Configuration Mode
- Local VLAN Interface
- Peer Address
- Peer Link
- Domain ID
- Heartbeat Interval and Timeout
- Reload Delay Period
- Shutdown

11.3.5.1.2.1MLAG Configuration Mode

Peer connection parameters are configured in MLAG-configuration mode. The **mlag configuration (global configuration)** command places the switch in MLAG configuration mode.

Example

This command places the switch in MLAG configuration mode.

```
switch(config)#mlag configuration
switch(config-mlag)#
```

11.3.5.1.2.2Local VLAN Interface

The local interface specifies the SVI upon which the switch sends MLAG control traffic. The local IP address is specified within the definition of the VLAN associated with the local interface. The Peer Address configures the control traffic destination on the peer switch.

The **local-interface** command specifies a VLAN interface as the peer link SVI.

Example

This command configures ***VLAN 4094*** as the local interface.

```
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#
```

11.3.5.1.2.3Peer Address

The peer address is the destination address on the peer switch for MLAG control traffic. If the peer IP address is unreachable, MLAG peering fails and both peer switches revert to their independent state.

The **peer-address** command specifies the peer address.

Example

This command configures a peer address of ***10.0.0.2***.

```
switch(config-mlag)#peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.5.1.2.4Peer Link

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries MLAG advertisements, keepalive messages, and data traffic between the switches. This information keeps the two switches working together as one. While interfaces comprising the peer links on each switch must be compatible, they need not use the same interface number. Ethernet and Port-channel interfaces can be configured as peer links.

The **peer-link** command specifies the interface the switch uses to communicates MLAG control traffic.

Example

This command configures ***port-channel 10*** as the peer link.

```
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)#
```

11.3.5.1.2.5Domain ID

The MLAG domain ID is a unique identifier for an MLAG domain. The MLAG domain ID must be the identical on each switch to facilitate MLAG communication.

The **domain-id** command configures the MLAG domain ID.

Example

This command configures ***mlagDomain*** as the domain ID:

```
switch(config-mlag)#domain-id mlagDomain
switch(config-mlag)#
```

11.3.5.1.2.6Heartbeat Interval and Timeout

The heartbeat interval specifies the period between the transmission of successive keepalive messages. Each MLAG switch transmits keepalive messages and monitors message reception from its peer. The heartbeat timeout is reset when the switch receives a keepalive message. If the heartbeat timeout expires, the switch disables MLAG under the premise that the peer switch is not functioning.

The **heartbeat-interval (MLAG)** command configures the heartbeat interval between ***1*** **and** ***30*** **seconds, with a default value of** ***2*** seconds. The heartbeat timeout expiry is ***30*** seconds.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to ***10*** seconds.

Example

This command configures the heartbeat interval as ***2.5*** seconds (***2500*** ms).

```
switch(config-mlag)#heartbeat-interval 2500
switch(config-mlag)#
```

11.3.5.1.2.7Reload Delay Period

The reload delay period specifies the interval that non-peer links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states and synchronize ARP caches before the ports start handling traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform.

- Fixed configuration switches: ***300*** seconds (five minutes).
- Trident II platform modular switches: ***1200*** seconds (twenty minutes).
- Sand platform fixed configuration switches (7280 series): ***600*** seconds (ten minutes).
- Sand platform modular switches: ***1800*** seconds (thirty minutes).

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the **reload-delay mlag** command.

Example

This command configures the reload delay interval as ***2.5*** minutes (***150*** seconds).

```
switch(config-mlag)#reload-delay 150
switch(config-mlag)#
```

11.3.5.1.2.8Shutdown

The **shutdown (MLAG)** command disables MLAG operations without disrupting the MLAG configuration. The **`no mlag configuration`** command (global configuration mode) disables MLAG and removes the MLAG configuration. The **`no shutdown`** command resumes MLAG activity.

Examples

- This command disables MLAG activity on the switch.

```
switch(config-mlag)#shutdown
switch(config-mlag)#
```

- This command resumes MLAG activity on the switch.

```
switch(config-mlag)#no shutdown
switch(config-mlag)#
```

11.3.5.1.3 Configuring MLAG Peer Gateway

In an MLAG setup, routing on a MLAG peer switch is possible using its own bridge system MAC, VARP MAC, or VRRP MAC. On a peer receiving an IP packet with destination MAC set to one of these MACs, a packet gets routed if its hardware has enough information to route the packet. Configuring sending traffic to a cached MAC involves routing the session table and MLAG peer traffic if packets are received with the MAC peer.

Examples

- This command enables the MLAG peer gateway.

```
switch(config)#ip virtual-router mac-address mlag-peer
switch1(config)#
```

- This command disables the MLAG peer gateway.

```
switch(config)#no ip virtual-router mac-address mlag-peer
switch1(config)#
```

11.3.5.1.4 Configuring Ingress Replication to LAGs

Hardware support for ingress replication to LAGs is enabled by default when the user configures ingress replication. When multicast traffic is sent over the LAG, the hardware uses its built-in algorithm, based on the L2/L3/L4 headers, to load balance traffic over ports in the LAG. When a port goes down in a LAG, the hardware quickly hashes the multicast traffic over the remaining ports in the LAG, resulting in fewer drops than software based LAG support.

Examples

- This command enables ingress replication.

```
switch(config)#platform sand multicast replication default ingress
switch(config)#
```

- This command configures the maximum members (within a range of ***1*** through ***64***) for ingress only replication in a multicast group.

```
switch(config)#platform sand multicast replication ingress maximum 32
switch(config)#
```

11.3.5.2 Configuring MLAG Services

An MLAG is a pair of links that originate on a network attached device and terminate on the two MLAG peer switches. The MLAG switches coordinate traffic to the device through a common **mlag (port-channel interface configuration)** command on the interfaces that connect to the device.

The MLAG ID differs from the MLAG domain ID. The MLAG domain ID is assigned globally per switch in MLAG configuration mode, and the same MLAG domain ID must be on both switches.

It is not recommended that MLAGs are used with static LAGs. Configure the downstream switch or router connected to the MLAG peers to negotiate a LAG with LACP. For Arista Networks switches, this is in respect to a configuration such as **`channel-group`** ***group-number*** **`mode on`**.

Port channels configured as an MLAG must have identical port channel numbers. Although the MLAG ID is a distinct parameter from the port channel number, best practices recommend assigning the MLAG ID to match the port channel number.

The following example does not follow this convention to emphasize the parameters that are distinct. The example in **MLAG Implementation Example** follows the best practices convention.

Examples

- These ***Switch1*** commands bundle Ethernet interfaces ***3*** and ***4*** in ***port channel 20***, then associate that port channel with ***MLAG 12***.

```
switch1(config)#interface ethernet 3-4
switch1(config-if-et3-4)#channel-group 20 mode active
switch1(config-if-et3-4)#interface port-channel 20
switch1(config-if-po20)#mlag 12
switch1(config-if-po20)#exit
switch1(config)#
```

- These ***Switch2*** commands bundle Ethernet interfaces ***9*** and ***10*** in ***port channel 20***, then associate that port channel with ***MLAG 12***.

```
switch2(config)#interface ethernet 9-10
switch2(config-if-et9-10)#channel-group 20 mode active
switch2(config-if-et9-10)#interface port-channel 20
switch2(config-if-po20)#mlag 12
switch2(config-if-po20)#exit
switch2(config)#
```

- These commands configure the port channels that attach to the MLAG on network attached device:

```
NAD(config)#interface ethernet 1-4
NAD(config-if-Et1-4)#channel-group 1 mode active
NAD(config-if-Et1-4)#exit
NAD(config)#
```

The following figure displays the result of the interface MLAG configuration.

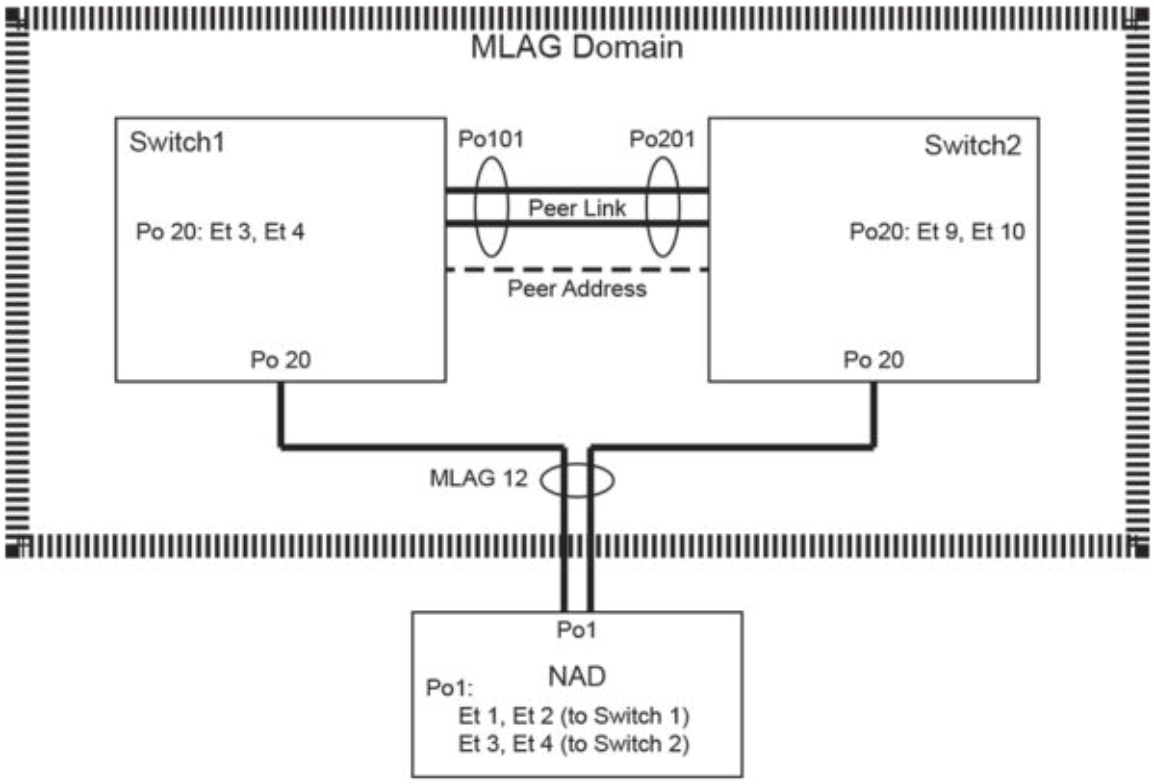

Figure 22: MLAG Interface Configuration

11.3.6 EVPN - MLAG Single-homed Hosts

Add a local VTEP to each MLAG peer for the control plane to advertise singly connected hosts as being directly behind a specific local VTEP-MLAG peer. Outgoing EVPN route advertisements contain nexthop and router MAC extended community when multi-VTEP MLAG mode is enabled. The following table summarizes the information. For symmetric IRB support, MLAG shared router MAC must be enabled.

Table 66: Route Advertisement

Routes	Single-homed host	Multi-homed host
MAC/IP routes (Type-2)	Local VTEP IP / Bridge MAC	MLAG VTEP IP / Shared MLAG Router MAC
IMET routes (Type-3)	MLAG VTEP IP	
IP Prefix routes (Type-5)	Local VTEP IP / Bridge MAC	

In multi-VTEP MLAG mode, IP prefix routes are advertised independently by each MLAG peer with its own local VTEP IP as nexthop, even when both peers are connected to that route. Additionally, egress VXLAN packets use the appropriate source IP to match what is advertised by the EVPN control plane.

Show commands

The following displays the nexthop of locally generated EVPN Type-2 and Type-3 routes. The real IP address helps identify the VTEP being used. The nexthop of locally generated EVPN Type-5 routes are displayed as "-". The shared MLAG VTEP IP is ***1.1.1.1*** and the local VTEP IPs of the two MLAG peers are ***1.0.1.1*** and ***1.0.2.2***.

```
switch#show bgp evpn
```

                1.0.2.2   -  100         0  i
```

Limitations

- BUM traffic is advertised on the MLAG VTEP IP. VXLAN flooded packets may be seen on the peer-link.
- The singly connected interfaces or non-MLAG interfaces have to be placed in an exclusive vlan that does not have any MLAG interface as a member.
- MLAG shared router MAC needs to be enabled to support symmetric IRB.
- For EVPN Type-5 setup, the VRF to VNI mapping must be configured on both VTEPs of the MLAG pair.
- For EVPN Type-5 setup as well as EVPN symmetric IRB setup, the VRF to VNI mapping must be configured to be the same across all the VTEPs in the network. That is, the same VRF must be mapped to the same value of VNI on all the VTEPs which participate in the EVPN network.

11.3.7 MLAG Implementation Example

This example creates an MLAG Domain, then configures MLAG connections between the peer switches and four Network Attached Devices (NADs). The MLAG switches connect through a LAG and communicate with the NADs through MLAGs. Although the NADs can be any device that supports LACP LAGs, the devices in this example are Arista switches.

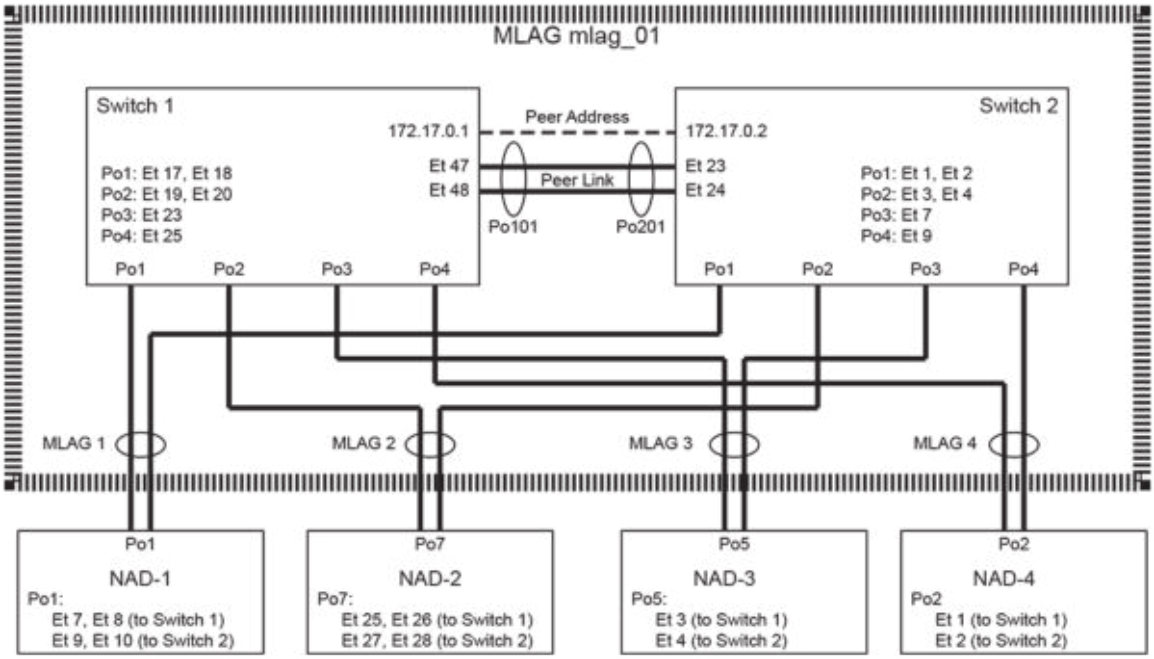

Figure 23: MLAG Implementation Example

11.3.7.1 Topology

Figure 23: MLAG Implementation Example displays the MLAG topology. Switch 1 and Switch 2 are MLAG peers that logically represent a single Layer 2 switch. The peer link between the switches contains the following interfaces:

- ***Switch 1: Ethernet 47***, ***Ethernet 48***
- ***Switch 2: Ethernet 23***, ***Ethernet 24***

The example configures MLAGs from the MLAG Domain to four network attached devices (NAD-1, NAD-2, NAD-3, NAD-4).

11.3.7.2 Configuring the Peer Switch Connections

To configure the switches in the described topology, perform the tasks in these sections:

- Configuring the Peer Switch Port Channels
- Configuring the Peer Switch SVIs
- Configuring the Peer Links

11.3.7.2.1 Configuring the Peer Switch Port Channels

These commands create the port channels the switches use to establish the peer link.

These commands create port channels on Switch1

```
switch1(config)#interface ethernet 47-48
switch1(config-if-et47-48)#channel-group 101 mode active
switch1(config-if-et47-48)#interface port-channel 101
switch1(config-if-po101)#switchport mode trunk
switch1(config-if-po101)#switchport trunk group peertrunk
switch1(config-if-po101)#exit
switch1(config)#
```

These commands create port channels on Switch2

```
switch2(config)#interface ethernet 23-24
switch2(config-if-et23-24)#channel-group 201 mode active
switch2(config-if-et23-24)#interface port-channel 201
switch2(config-if-po201)#switchport mode trunk
switch2(config-if-po201)#switchport trunk group trunkpeer
switch2(config-if-po201)#exit
switch2(config)#
```

11.3.7.2.2 Configuring the Peer Switch SVIs

For each peer switch, these commands create an SVI and associate it to the trunk group assigned to the peer link port channel. STP is disabled on the VLAN.

These commands configure the SVI on Switch1

```
switch1(config)#vlan 4094
switch1(config-vlan-4094)#trunk group peertrunk
switch1(config-vlan-4094)#interface vlan 4094
switch1(config-if-vl4094)#ip address 172.17.0.1/30
switch1(config-if-vl4094)#no autostate
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#
```

These commands configure the SVI on Switch2

```
switch2(config)#vlan 4094
switch2(config-vlan-4094)#trunk group trunkpeer
switch2(config-vlan-4094)#interface vlan 4094
switch2(config-if-vl4094)#ip address 172.17.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.7.2.3 Configuring the Peer Links

These commands create the peer links on each MLAG switch.

These commands create peer links on Switch1

```
switch1(config)#mlag configuration
switch1(config-mlag)#local-interface vlan 4094
switch1(config-mlag)#peer-address 172.17.0.2
switch1(config-mlag)#peer-link port-channel 101
switch1(config-mlag)#domain-id mlag_01
switch1(config-mlag)#heartbeat-interval 2500
switch1(config-mlag)#reload-delay 150
switch1(config-mlag)#exit
switch2(config)#
```

These commands create peer links on Switch2

```
switch2(config)#mlag configuration
```

```
switch2(config-mlag)#local-interface vlan 4094
switch2(config-mlag)#peer-address 172.17.0.1
switch2(config-mlag)#peer-link port-channel 201
switch2(config-mlag)#domain-id mlag_01
switch2(config-mlag)#heartbeat-interval 2500
switch2(config-mlag)#reload-delay 150
switch2(config-mlag)#exit
switch2(config)#
```

11.3.7.3 Configuring the Network Attached Devices

These commands create the LAGs on the Network Attached Devices that connect to the MLAG domain.

These commands configure the port channels on NAD-1

```
NAD-1(config)#interface ethernet 7-10
NAD-1(config-if-Et7-10)#channel-group 1 mode active
NAD-1(config-if-Et7-10)#exit
NAD-1(config)#
```

These commands configure the port channels on NAD-2

```
NAD-2(config)#interface ethernet 25-28
NAD-2(config-if-Et25-28)#channel-group 7 mode active
NAD-2(config-if-Et25-28)#exit
NAD-2(config)#
```

These commands configure the port channels on NAD-3

```
NAD-3(config)#interface ethernet 3-4
NAD-3(config-if-Et3-4)#channel-group 5 mode active
NAD-3(config-if-Et3-4)#exit
NAD-3(config)#
```

These commands configure the port channels on NAD-4

```
NAD-4(config)#interface ethernet 1-2
NAD-4(config-if-Et1-2)#channel-group 2 mode active
NAD-4(config-if-Et1-2)#exit
NAD-4(config)#
```

11.3.7.4 Verification

The following tasks verify the MLAG peer and connection configuration:

- Verify the Peer Switch Connection
- Verify the MLAGs
- Verify Spanning Tree Protocol (STP)
- Verify the MLAG Port Channel
- Verify the VLAN Membership

11.3.7.4.1 Verify the Peer Switch Connection

To display the MLAG configuration and the MLAG status on Switch 1, use the **show mlag** command:

```
Switch1#show mlag
MLAG Configuration:
domain-id          :            mlag_01
local-interface    :          Vlan4094
peer-address       :       172.17.0.2
peer-link          :    Port-Channel101

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:FF:00:15:38

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
Active-partial     :   0
Active-full        :   4
```

To display the MLAG configuration and the MLAG status on ***Switch 2***, use the **show mlag** command:

```
Switch2#show mlag
MLAG Configuration:
domain-id          :            mlag_01
local-interface    :          Vlan4094
peer-address       :       172.17.0.1
peer-link          :    Port-Channel102

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:FF:00:15:41

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
Active-partial     :   0
Active-full        :   4
```

11.3.7.4.2 Verify the MLAGs

The **show mlag interfaces** command displays MLAG connections between the MLAG switches and the Network Attached Devices.

- This **show mlag interfaces** command displays MLAG connections between the MLAG peer ***switch 1*** and the network attached devices:

```
switch1#show mlag interfaces
                                                                local/remote
  mlag     desc                    state     local     remote         status
-------------------------------------------------------------------------------
     1     sw1.po1          active-full       Po1       Po1          up/up
     2     sw1.po2          active-full       Po2       Po2          up/up
     3     sw1.po3          active-full       Po3       Po3          up/up
     4     sw1.po4          active-full       Po4       Po4          up/up
```

- The following **show mlag interfaces** command, with the **detail** option, displays MLAG connections between the MLAG peer ***switch 1*** and the network attached devices.

```
switch2#show mlag interfaces detail
                                  local/remote
mlag       state local remote   oper   config          last change  changes
--------------------------------------------------------------------------------
   1 active-full   Po1    Po1  up/up  ena/ena  6 days, 2:08:28 ago        5
   2 active-full   Po2    Po2  up/up  ena/ena  6 days, 2:08:30 ago        5
   3 active-full   Po3    Po3  up/up  ena/ena  6 days, 2:08:33 ago        5
   4 active-full   Po4    Po4  up/up  ena/ena  6 days, 2:08:41 ago        5
Switch2#
```

11.3.7.4.3 Verify Spanning Tree Protocol (STP)

STP functions can be displayed from each peer switch. MLAG interfaces are displayed as a single entry. Configured interfaces on each switch that are not included in an MLAG are displayed. Local interfaces have the normal notation; remote interfaces are preceded by ***P*** or ***Peer***.

VLAN Output 1: Assume VLAN 3903 includes MLAG 1

```
switch1#show spanning-tree vlan-id 3903
Spanning tree instance for vlan 3903
VL3903
  Spanning tree enabled protocol rapid-pvst
  Root ID    Priority    36671
             Address     001c.730c.3009
             Cost        1999 (Ext) 0 (Int)
             Port        105 (Port-Channel5)
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Bridge ID  Priority    36671  (priority 32768 sys-id-ext 3903)
             Address     021c.7300.1319
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- --------------------
Po1              root       forwarding 1999      128.105  P2p
switch1#
```

The output displays ***MLAG 1*** under its local interface name (***Po1***). A peer interface is not displayed because spanning tree considers the local and remote Port Channels as a single MLAG interface.

VLAN Output 2: Assume VLAN 3908 does not include any MLAGs

```
switch1#show spanning-tree vlan-id 3908
Spanning tree instance for vlan 3908
VL3908
  Spanning tree enabled protocol rapid-pvst
  Root ID    Priority    36676
             Address     021c.7300.1319
             This bridge is the root

  Bridge ID  Priority    36676  (priority 32768 sys-id-ext 3908)
             Address     021c.7300.1319
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- ---------------
Et17             designated forwarding 2000      128.217  P2p
Et18             designated forwarding 2000      128.218  P2p
PEt17            designated forwarding 2000      128.17   P2p
PEt18            designated forwarding 2000      128.18   P2p
```

The output displays all interfaces from both switches. Each interface is explicitly displayed because they are individual units that STP must consider when selecting ports to block.

- ***Et17*** and ***Et18*** are located on the switch where the **`show spanning-tree`** command is issued.
- ***PEt17*** and ***PEt18*** are located on the remote switch from where the command was issued

An identical command issued on the peer switch displays similar information.

Verify the MLAG does not create topology loops (show spanning-tree blocked)

```
switch1#show spanning-tree blocked
Name       Blocked Interfaces List
-------------------------------------------------------

Number of blocked ports (segments) in the system : 0
switch1#
```

11.3.7.4.4 Verify the MLAG Port Channel

Issue the command **`show port-channel`** for channels ***1-4*** from ***Switch 1***:

```
Switch#show port-channel 1-4
Port Channel Port-Channel1:
  Active Ports: Ethernet17     Ethernet18     PeerEthernet1 PeerEthernet2
Port Channel Port-Channel2:
  Active Ports: Ethernet19     Ethernet20     Ethernet21     Ethernet22
                PeerEthernet3 PeerEthernet4 PeerEthernet5 PeerEthernet6
Port Channel Port-Channel3:
  Active Ports: Ethernet23     Ethernet24     PeerEthernet7 PeerEthernet8
Port Channel Port-Channel4:
  Active Ports: Ethernet25     Ethernet26     PeerEthernet9 PeerEthernet1
0
```

Issue the command **`show port-channel load-balance fields detailed`** command for ***channel 1*** from ***Switch 2***:

```
Switch#show port-channel 1 detailed
Port Channel Port-Channel1:
  Active Ports:
       Port                Time became active       Protocol    Mode
    ------------------------------------------------------------------
------
       Ethernet17          7/7/11 15:27:36          LACP        Active
       Ethernet18          7/7/11 15:27:36          LACP        Active
       PeerEthernet1       7/7/11 15:27:36          LACP        Active
       PeerEthernet2       7/7/11 15:27:36          LACP        Active
```

11.3.7.4.5 Verify the VLAN Membership

The **`show vlan`** command displays VLAN member ports, including MLAG ports and ports on each peer not bundled in an MLAG.

```
Switch1#show vlan 3903, 3908
VLAN  Name                             Status    Ports
----- -------------------------------- --------- -------------------------------
3903  ar.mg.rn.172.17.254.16/29        active    Cpu, Po1
3908  po.ra.ar.mg.172.17.254.64/29     active    Cpu, Et17, Et18, PEt17, PEt18
```

11.3.8 MLAG Commands

MLAG and Port Channel Commands – Global Configuration Mode

- mlag configuration (global configuration)

Interface Configuration Commands – Interface Configuration Mode

- mlag (port-channel interface configuration)

MLAG Configuration Commands

- domain-id
- dual-primary detection delay
- dual-primary recovery delay
- heartbeat-interval (MLAG)
- local-interface
- peer-address
- peer-address heartbeat
- peer-link
- reload-delay mlag
- reload-delay mode
- reload-delay non-mlag
- shutdown (MLAG)

Display Commands

- show mlag
- show mlag interfaces
- show mlag interfaces members
- show mlag interfaces states
- show mlag issu warnings

11.3.8.1 domain-id

The **domain-id** command specifies a name for the multi-chassis link aggregation (MLAG) domain.

The **no domain-id** and **default domain-id** commands remove the MLAG domain name by deleting the **domain-id** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

domain-id *identifier*

no domain-id

default domain-id

Parameters

identifier alphanumeric string that names the MLAG domain.

Example

This command names the MLAG domain ***mlag1***.

```
switch(config)#mlag
switch(config-mlag)#domain-id mlag1
switch(config-mlag)#
```

11.3.8.2 dual-primary detection delay

Use the **dual-primary detection delay** command to configure a dual primary detection delay with an optional action to errdisable all interfaces on secondary MLAG peer after a dual primary condition is detected.

Command Mode

MLAG configuration mode

Command Syntax

dual-primary detection delay *seconds* [action erridisable all-interfaces]

no dual-primary detection delay *seconds* [action erridisable all-interfaces]

default dual-primary detection delay *seconds* [action erridisable all-interfaces]

Parameters

- ***seconds*** Dual primary detection delay in seconds.
- **action** Specifies the action when dual-primary is detected.
- **erridisable** Errdisable interfaces.
- **all-interfaces** Disables all Ethernet interfaces except the peer-link.

Examples

- In this example, the command errdisables all physical interfaces on secondary MLAG peer when dual primary condition is detected.

```
switch(config-mlag)#dual-primary detection delay 5 action errdisable
 all-interfaces
```

  Both MLAG peers must have equivalent configurations.
- The following command removes the Dual Primary Detection feature. You must unconfigure both MLAG peers.

```
switch(config-mlag)#no dual-primary detection
```

11.3.8.3 dual-primary recovery delay

Use the **dual-primary recovery delay** command to configure dual-primary detection recovery-delay for MLAG interfaces and non-MLAG interfaces. Negating the configurations or configuring default values makes both recovery delay values reset back to 0. The non-MLAG delay must always be less than the MLAG delay so you have more time for L3 convergence before enabling MLAG interfaces.

Command Mode

MLAG configuration mode

Command Syntax

dual-primary recovery delay mlag *seconds* non-mlag *seconds*

no dual-primary recovery delay mlag *seconds* non-mlag *seconds*

default dual-primary recovery delay mlag *seconds* non-mlag *seconds*

Parameters

- **mlag *seconds*** Delay in seconds after dual-primary detection resolves until non peer-link ports that are part of an MLAG are enabled. Range 0 - 1000 seconds. A suggested value for MLAG is 60 seconds. These values can be adjusted depending on the network scale.
- **non-mlag *seconds*** Delay in seconds after dual-primary detection resolves until ports that are not part of an MLAG are enabled. Range 0 - 1000 seconds. A suggested value for non-MLAG is 0 seconds. These values can be adjusted depending on the network scale.

Example

```
switch(config)#mlag
switch(config-mlag)#dual-primary recovery delay mlag 60 non-mlag 0
```

11.3.8.4 heartbeat-interval (MLAG)

The **heartbeat-interval** command configures the interval at which heartbeat messages are issued in a Multi-chassis Link Aggregation (MLAG) configuration.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

heartbeat-interval *period*

no heartbeat-interval

default heartbeat-interval

Parameters

period Interval duration (ms). Value ranges from ***1000*** through ***30000*** milliseconds. Default interval is ***2000*** milliseconds.

Guidelines

Heartbeat messages flow independently in both directions between the MLAG peers. If a peer stops receiving heartbeat messages within the expected time frame (***30*** seconds), the other peer can assume it no longer functions and without intervention or repair, the MLAG becomes disabled. Both switches revert to their independent state.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to ***10*** seconds.

Example

This command configures the heartbeat interval to ***15000*** milliseconds:

```
switch(config)#mlag
switch(config-mlag)#heartbeat-interval 15000
switch(config-mlag)#
```

11.3.8.5 local-interface

The **`local-interface`** command assigns a VLAN interface for use in Multi-chassis Link Aggregation (MLAG) configurations. The VLAN interface is used for both directions of communication between the MLAG peers.

The **`no local-interface`** and **`default local-interface`** commands delete the VLAN interface assignment by removing the **`local-interface`** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

`local-interface vlan` *vlan_number*

`no local-interface`

`default local-interface`

Parameters

vlan_number VLAN number, in the range from ***1*** through ***4094***.

Guidelines

When configuring the local interface, the VLAN interface must exist already. To configure a VLAN interface, issue the command **`interface vlan`**.

Example

This command assigns ***VLAN 4094*** as the local interface.

```
switch(config)#mlag
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#
```

11.3.8.6 mlag (port-channel interface configuration)

The **mlag** command assigns an MLAG ID to a port-channel. MLAG peer switches form an MLAG when each switch configures the same MLAG ID to a port-channel interface. Only one MLAG ID can be assigned to an interface. An individual MLAG number cannot be assigned to more than one interface.

The **no mlag** and **default mlag** commands remove the MLAG ID assignment from the configuration mode interface by deleting the corresponding **mlag** command from ***running-config***.

Command Mode

Interface-Port Channel Configuration

Command Syntax

mlag *number*

no mlag

default mlag

Parameters

number Number used as MLAG ID. Value ranges from ***1*** to ***2000***.

Example

These commands configures a port channel and assigns it ***MLAG 4***.

```
switch(config)#interface ethernet 5-10
switch(config-if-Et5-10)#channel-group 1 mode active
switch(config-if-Et5-10)#interface port-channel 4
switch(config-if-Po4)#switchport trunk group group4
switch(config-if-Po4)#mlag 4
switch(config-if-Po4)#exit
switch(config)#
```

11.3.8.7 peer-address

The **peer-address** command specifies the peer IPv4 address for a multi-chassis link aggregation (MLAG) domain. MLAG control traffic, including keepalive messages, is sent to the peer IPv4 address. If the peer IPv4 address is unreachable, then MLAG peering fails and both peer switches revert to their independent state.

The **no peer-address** and **default peer-address** commands remove the MLAG peer's IPv4 address assignment by deleting the peer-address command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

peer-address *ipv4_addr*

no peer-address

default peer-address

Parameters

ipv4_addr MLAG peer IPv4 address.

Example

These commands configure the MLAG peer address.

```
switch(config)#mlag
switch(config-mlag)#peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.8.8 peer-address heartbeat

The peer-address heartbeat command causes the MLAG agent to start using ***Peer-IP*** address in the given VRF for UDP-based heartbeat control messages.

To enable MLAG dual primary detection feature, the command must be configured on both MLAG peers in the MLAG config mode.

Command Mode

MLAG configuration mode

Command Syntex

`peer-address heartbeat` *Peer-IP* [vrf *vrf_name*]

`no peer-address heartbeat` *Peer-IP* [vrf *vrf_name*]

`default peer-address heartbeat` *Peer-IP* [vrf *vrf_name*]

Parameters

- ***Peer-IP*** The Management IP address of the MLAG peer reachable in the VRF **VRF-NAME** (or default VRF if there is no VRF configured).
- **vrf *vrf_name*** Named VRF.

Examples

- ```
  switch(config)#mlag
  switch(config-mlag)#peer-address heartbeat 172.30.118.190
  ```
- This example removes the feature.

  ```
  switch(config-mlag)#no peer-address heartbeat
  ```
  ```

11.3.8.9 peer-link

The **peer-link** command specifies the interface that connects multi-chassis link aggregation (MLAG) peers. To form an MLAG, two switches are connected through an interface called a peer link. The peer link carries control and data traffic between the two switches. Control traffic includes MLAG-related advertisements and keepalive messages. This information keeps the two switches working as one.

The **no peer-link** and **default peer-link** command remove the peer link by deleting the **peer-link** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

peer-link INT_NAME

no peer-link

default peer-link

Parameters

INT_NAME denotes the interface type and number of the interface. Values include:

- **ethernet *e_num*** Ethernet interface range specified by ***e_num***.
- **port-channel *p_num*** Channel group interface range specified by ***p_num***.

Example

These commands creates a peer link.

```
switch(config)#mlag configuration
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)
```

11.3.8.10 mlag configuration (global configuration)

The **mlag configuration** command enters MLAG configuration mode to configure multi-chassis link aggregation (MLAG) features. MLAG configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no mlag configuration** and **default mlag configuration** commands remove all MLAG configuration commands from ***running-config***.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

mlag configuration

no mlag configuration

default mlag configuration

mlag and **mlag configuration** are identical commands.

Guidelines

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries control and data traffic between the switches, including advertisements and keepalive messages. This information coordinates the switches. Functioning peers are in the **active** state.

Each peer switch uses IP-level connectivity between their local addresses and the MLAG peer IP address to form and maintain the peer link.

Commands Available in MLAG Configuration Mode

- domain-id
- heartbeat-interval (MLAG)
- local-interface
- peer-address
- peer-link
- reload-delay mlag
- shutdown (MLAG)

Example

These commands enter MLAG configuration mode and configure MLAG parameters:

```
switch(config)#mlag
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#peer-address 10.0.0.2
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)#domain-id mlagDomain
switch(config-mlag)#heartbeat-interval 2500
switch(config-mlag)#reload-delay 2000
switch(config-mlag)#exit
switch(config)#
```

11.3.8.11 reload-delay mlag

The **reload-delay mlag** command configures the reload delay period for MLAG links. The command also specifies the reload delay period for non-MLAG links when the **reload-delay non-mlag** command is not configured.

Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches**: 300 seconds
- **Trident II modular switches**: 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches**: 600 seconds
  - 7280 series
- **Sand platform modular switches**: 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S

The **no reload-delay mlag** and **default reload-delay mlag** commands restore the default value by deleting the **reload-delay mlag** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

reload-delay [mlag] **PERIOD**

no reload-delay [mlag]

default reload-delay [mlag]

Parameters

- **PERIOD** Period that non-peer links are disabled after an MLAG peer reboots. Options include:
  - **infinity** link is not enabled after reboot.
  - ***0*** to ***86400*** disabled link interval (seconds). Default varies by switch platform as described above.

Guidelines

The **reload-delay** and **reload-delay mlag** commands are equivalent.

Example

These commands configure the reload-delay interval to ***15*** minutes.

```
switch(config)#mlag configuration
switch(config-mlag)#reload-delay mlag 900
switch(config-mlag)#
```

11.3.8.12 reload-delay mode

The **reload-delay mode** command specifies the state of LACP LAG ports during the MLAG reload delay period. By default, MLAG ports remain in the errdisabled state during reload delay. This command configures MLAG ports to come up to standby mode before the expiration of the reload delay period.

The **no reload-delay mode** and **default reload-delay mode** commands restore the default behavior of MLAG ports by deleting the **reload-delay mode** statement from ***running-config***. The default behavior is for the MLAG ports to remain in the errdisabled state until the expiration of the reload delay period

Command Mode

MLAG Configuration

Command Syntax

reload-delay mode lacp standby

no reload-delay mode

default reload-delay mode

Related Commands

reload-delay mlag configures the MLAG reload delay period.

Example

These commands configure the MLAG port to come up to standby state before the end of the reload delay period.

```
switch(config)#mlag configuration
switch(config-mlag)#reload-delay mode lacp standby
switch(config-mlag)#
```

11.3.8.13 reload-delay non-mlag

The **reload-delay non-mlag** command specifies the period that non-MLAG links are disabled after an MLAG peer reboots. This interval allows non peer links to learn multicast and OSPF states before the ports start handling traffic. The recommended minimum value required to ensure the forwarding hardware is initialized with the topology state depends on the switch platform:

- Fixed configuration switches: ***300*** seconds (five minutes)
- Sand platform fixed configuration switches (7280 series): ***600*** seconds (ten minutes)
- Modular switches: ***1200*** seconds (twenty minutes)

When the **reload-delay non-mlag** command is not configured, the **reload-delay mlag** command specifies the reload delay time for non-MLAG and MLAG links.

The **no reload-delay non-mlag** and **default reload-delay non-mlag** command restores the default behavior by deleting the **reload-delay non-mlag** statement from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

reload-delay non-mlag PERIOD

no reload-delay non-mlag

default reload-delay non-mlag

Parameters

PERIOD Period that non-MLAG links are disabled after an MLAG peer reboots. Options include:

- **infinity** links are not enabled after reboot.
- ***0*** to ***86400*** disabled link interval (seconds). Values range from ***0*** to ***86400*** (24 hours).

Example

These commands configure the reload-delay interval of non-MLAG links to ***20*** minutes.

```
switch(config)#mlag configuration
switch(config-mlag)#reload-delay non-mlag 1200
switch(config-mlag)#
```

11.3.8.14 show mlag interfaces members

The **show mlag interfaces members** command displays information about the multi-chassis link aggregation (MLAG) members on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces members

Example

This command displays the MLAG interface members.

```
switch#show mlag interface members
Mlag4 is Port-Channel4
  Active Ports: Ethernet3 PeerEthernet3
Mlag5 is Port-Channel5
  Active Ports: Ethernet14
Mlag7 is Port-Channel7
  Active Ports: Ethernet5 PeerEthernet5
Mlag8 is Port-Channel8
  Active Ports: Ethernet10 PeerEthernet10
Mlag9 is Port-Channel9
  Active Ports: Ethernet15 Ethernet21 PeerEthernet19 PeerEthernet20
Mlag10 is Port-Channel10
  Active Ports: Ethernet19 Ethernet20 PeerEthernet21 PeerEthernet22
switch#
```

11.3.8.15 show mlag interfaces states

The **show mlag interfaces states** command displays information about the multi-chassis link aggregation (MLAG) states on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces [**MLAGS**] states [**STATE_NAMES**][**INFO_LEVEL**]

Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - ***no parameter*** command displays data for all MLAGs.
  - ***mlag_id*** specifies MLAG for which command displays data. Value ranges from ***1*** to ***2000***.
- **STATE_NAMES** MLAG channels for which command displays data. Parameter may specify more than one name, which can be listed in any order. Valid state names include:
  - **active-full** includes active-full interfaces.
  - **active-partial** includes active-partial interfaces.
  - **configured** includes configured interfaces.
  - **disabled** includes disabled interfaces.
  - **inactive** includes inactive interfaces.
- **INFO_LEVEL** specifies information displayed by command. Options include:
  - ***no parameter*** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface state parameters.

Example

This command displays the MLAG interface states that are active-full.

```
switch#show mlag interfaces states active-full
                                                                  local/remote
  mlag     desc                       state     local     remote         status
-------- -------------------- --------------- --------- ---------- ------------
     4     b.po1                active-full       Po4        Po4          up/up
     7     ar.mg.au.po1         active-full       Po7        Po7          up/up
     8     co.po1               active-full       Po8        Po8          up/up
     9     k.po5                active-full       Po9        Po9          up/up
    10     ar.mg.pt.ir.po10     active-full      Po10       Po10          up/up
switch#
```

11.3.8.16 show mlag interfaces

The **show mlag interfaces** command displays information about the Multi-chassis Link Aggregation (MLAG) configuration on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag interfaces [**MLAGS**][**INFO_LEVEL**]

Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - ***no parameter*** command displays data for all MLAGs.
  - ***mlag_id*** specifies MLAG for which command displays data. Value ranges from ***1*** to ***2000***.
- **INFO_LEVEL** specifies information displayed by command. Options include:
  - ***no parameter*** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface parameters.

Example

This command displays output from the **show mlag interfaces detail** command:

```
switch>show mlag interfaces detail
                                  local/remote
mlag       state local remote   oper   config          last change  changes
--------------------------------------------------------------------------------
   4 active-full   Po4    Po4  up/up  ena/ena  6 days, 1:19:26 ago        5
   5 active-full   Po5    Po5  up/up  ena/ena  6 days, 1:19:24 ago        5
   6 active-full   Po6    Po6  up/up  ena/ena  6 days, 1:19:23 ago        5
   7 active-full   Po7    Po7  up/up  ena/ena  6 days, 1:19:23 ago        5
```

11.3.8.17 show mlag issu warnings

The **show mlag issu warnings** command displays a warning message regarding the backward-compatibility of this feature before you upgrade.

Command Mode

EXEC

Command Syntax

show mlag issu warnings

Example

This command displays the MLAG backward-compatibility warning message. Refer to the latest version of the release notes for additional information before you upgrade.

```
switch##show mlag issu warnings
If you are performing an upgrade, and the Release Notes for the new
version of EOS indicate that MLAG is not backwards-compatible with the
currently installed version, the upgrade will result in packet loss.

Stp is not restartable. Topology changes will occur during the upgrade
process.

switch#
```

11.3.8.18 show mlag

The **show mlag** command displays information about the multi-chassis link aggregation (MLAG) configuration on bridged Ethernet interfaces.

Command Mode

EXEC

Command Syntax

show mlag [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies information displayed by command. Options include:

- ***no parameter*** command displays MLAG configuration, status, and ports.
- **detail** command displays MLAG configuration, status, ports, and detailed status.

Example

This command displays output from the **show mlag** command:

```
switch>show mlag
MLAG Configuration:
domain-id          :         ar.mg.mlag
local-interface    :           Vlan3901
peer-address       :       172.17.254.2
peer-link          :      Port-Channel1

MLAG Status:
state              :             Active
peer-link status   :                 Up
local-int status   :                 Up
system-id          :  02:1c:73:00:13:19

MLAG Ports:
Disabled           :   0
Configured         :   0
Inactive           :   0
Active-partial     :   0
Active-full        :   5
switch>
```

11.3.8.19 shutdown (MLAG)

The **shutdown** command disables MLAG on the switch without modifying the MLAG configuration.

The **no shutdown** and **default shutdown** commands re-enable MLAG by removing the **shutdown** command from ***running-config***.

Command Mode

MLAG Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

These commands disable MLAG on the switch.

```
switch(config)#mlag configuration
switch(config-mlag)#shutdown
switch(config-mlag)#
```

11.4 Data Transfer

Arista switches support the transfer of packets (network layer) and frames (data link layer). This chapter describes concepts and processes that are referenced by routing and switching protocols that Arista switches support.

Sections in this chapter include:

- Data Transfer Introduction
- Data Transfer Methods
- MAC Address Table
- Configuring Ports
- Monitoring Links
- PHY test pattern CLI
- Data Transfer Commands

11.4.1 Data Transfer Introduction

Arista switches transfer data through switching, routing, and Layer 3 switching. This chapter provides an introduction to these transfer methods.

Data structures and processes that support data transfer methods and referenced in specific protocol chapters are also described, including:

- routed ports
- switched ports
- MAC address table
- port mirroring
- storm control
- loopback interfaces
- route redistribution
- null0 interfaces
- MTUs

11.4.2 Data Transfer Methods

This section describes these data transfer methods:

- Switching and Bridging
- Routing
- Layer 3 Switching

11.4.2.1 Switching and Bridging

Switching and bridging operations transmit data link layer frames between devices within a single subnet. Each port is assigned a 48 bit Media Access Control (MAC) address. Frames arriving at a hub are bridged, or sent to all other ports on the subnet. Switches can associate ports with their MAC addresses, obviating the need to flood the subnet when sending a frame.

Subnets in the switch are defined by VLANs. A Virtual Local Area Network (VLAN) is a group of devices that are configured to communicate as if they are attached to the same network regardless of their physical location. **`VLANs`** describes VLANS.

Four MAC address types identify the scope of LAN interfaces that an address represents:

- **unicast:** represents a single interface.
- **broadcast:** represents all interfaces.

- **multicast:** represents a subset of all interfaces.
- **reserved:** assigned to nodes that have no configured MAC address.

The Individual/Group (I/G) bit distinguishes unicast MAC addresses from multicast addresses. As shown in Figure 24: MAC Address Format , the I/G bit is the least significant bit of the most significant byte in a MAC address.

11.4.2.1.1 MAC Address Format

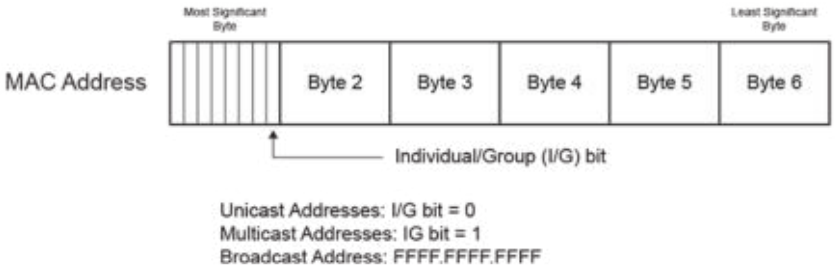

Figure 24: MAC Address Format

- Unicast address: the I/G bit is ***0***: ***1234.1111.1111*** is a unicast MAC address (the most significant byte is an even number).
  - Reserved address: all bits set to ***0 (0000.0000.0000)***.
- Multicast address: the I/G bit is ***1***: ***1134.1111.1111*** is a multicast MAC address (the most significant byte is an odd number).
- Broadcast address: all bits set to ***1 (FFFF.FFFF.FFFF)***.

Examples

- The following are unicast MAC addresses:

```
0200.0000.0000
1400.0000.0000
```

- The following are multicast MAC addresses:

```
0300.0000.0000
2500.0000.0000
```

The following sections describe MAC address functions and data structures:

- Assigning a MAC Address to an Interface
- MAC Address Table

11.4.2.2 Routing

Routing transmits network layer packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. Connected subnets have IP address ranges that do not overlap. A router connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are internet layer protocols that facilitate packet-switched networking, including transmissions across multiple networks.

These chapters describe available IP features:

- IPv4

- IPv6

11.4.2.2.1 Static Routing

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate.

Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as ***connected*** routes that are available for redistribution into routing domains defined by dynamic routing protocols.

These sections describe static route configuration commands:

- IPv4 Address Configuration
- Configuring Default and Static IPv6 Routes

11.4.2.2.2 Dynamic Routing

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic routing protocols:

- Open Shortest Path First – Version 2
- Open Shortest Path First – Version 3
- Border Gateway Protocol (BGP)
- Routing Information Protocol
- IS-IS

11.4.2.3 Layer 3 Switching

Layer 3 switches establish data paths through routing processes (Layer 3) and transfer data as a switch (Layer 2) through speed-optimized hardware. Layer 3 switches use a control plane (routing) and data plane (switching) to manage these processes.

11.4.2.3.1 Control plane

The control plane builds and maintains the IP routing table, which identifies IP packet routes in terms of destination addresses. The routing table defines a route by its next hop address and the egress interface that accesses the next hop.

The control plane derives routing information from three sources:

- Status of physical and virtual interfaces on the switch.
- Static routes entered through the CLI.
- Routes established through dynamic routing protocols.

Applying an ACL to the Control Plane

The control plane supports routing and management functions, handling packets that are addressed to the switch without regard to any switch interface.

To apply an IP ACL to the control plane, enter **ip access-group (Control Plane mode)** in control-plane mode. The **system control-plane** command places the switch in control-plane mode.

ACLs and Route Maps describes access control lists.

Example

These commands place the switch in control-plane mode and assigns ***CP-Test1*** to the control plane.

```
switch(config)#system control-plane
switch(config-system-cp)#ip access-group CP-Test1 in
switch(config-system-cp)#
```

11.4.2.3.2 Data plane

The data plane routes IP packets based on information derived by the control plane. Each packet's path includes Layer 2 addresses that reach its next hop destination. The data plane also performs other operations required by IP routing, such as recalculating IP header checksums and decrementing the Time-To-Live (TTL) field.

Arista data planes support these packet forwarding modes:

- **Store and forward:** the switch accumulates entire packets before forwarding them.
- **Cut through:** the switch begins forwarding frames before their reception is complete.

Cut through mode reduces switch latency at the risk of decreased reliability. Packet transmissions can begin immediately after the destination address is processed. Corrupted frames may be forwarded because packet transmissions begin before CRC bytes are received.

Packet forwarding mode availability varies by switch platform:

- **Arad**: store and forward mode only.
- **FM6000**: both modes are available.
- **Petra**: store and forward mode only.
- **Trident**: both modes are available.
- **Trident II**: both modes are available.

The data plane is also referred to as the forwarding plane.

Data Plane Forwarding Mode Configuration

The **switch forwarding-mode** command specifies the forwarding mode of the switch's data plane. This command is available on Trident, Trident II, and FM6000 platform switches. The forwarding mode is **store-and-forward** on Arad and Petra platform switches.

Examples

- This command changes the forwarding mode to **store-and-forward**.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#
```

- The **show switch forwarding-mode** command displays the switch's forwarding mode.

```
switch(config)#show switch forwarding-mode
Current switching mode:    store and forward
Available switching modes: cut through, store and forward
```

11.4.3 MAC Address Table

The switch maintains a MAC address table for switching frames efficiently between ports. The MAC address table contains static and dynamic MAC addresses.

- Static MAC addresses are entered into the table through a CLI command.

- Dynamic MAC addresses are entered into the table when the switch receives a frame whose source address is not listed in the MAC address table. The switch builds the table dynamically by referencing the source address of frames it receives.

11.4.3.1 MAC Address Table Configuration

These sections describe MAC address table configuration tasks.

- Static MAC Address Table Entries
- Dynamic MAC Address Table Entries

11.4.3.1.1 Static MAC Address Table Entries

The MAC address table accepts static MAC addresses, including multicast entries. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The **mac address-table static** command adds a static entry to the MAC address table.

Examples

- This command adds a static entry for unicast MAC address 0012.3694.03ec to the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3 interface
 Ethernet
7
switch(config)#show mac address-table static
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
   3    0012.3694.03ec    STATIC      Et7
Total Mac Addresses for this criterion: 1

          Multicast Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0

switch(config)#
```

- This command adds the static entry for the multicast MAC address ***0112.3057.8423*** to the MAC address table.

```
switch(config)#mac address-table static 0112.3057.8423 vlan 4
 interface
port-channel 10 port-channel 12
switch(config)#show mac address-table
          Mac Address Table
------------------------------------------------------------------
```

```
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
Total Mac Addresses for this criterion: 0

          Multicast Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
   4    0112.3057.8423    STATIC      Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#
```

11.4.3.1.2 Dynamic MAC Address Table Entries

Learning Mode

The switch maintains a MAC address table for switching frames efficiently between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The **switchport mac address learning** command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

Example

These commands disables MAC address learning for ***interface Ethernet 8***, then displays the active configuration for the interface.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
interface Ethernet8
no switchport mac address learning
switch(config-if-Et8)#
```

Aging Time

Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from ***10*** to ***1000000*** seconds with a default of ***300*** seconds (five minutes).

Example

This command sets the MAC address table aging time to two minutes (***120*** seconds).

```
switch(config)#mac address-table aging-time 120
switch(config)#
```

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Mac Moves

Secure MAC addresses is allowed to move when they appear on another interface, when configured. By default, secure MAC addresses does not move.

```
switch(config)# default switchport port-security mac address moveable
switch(config)#
```

Persistent Port Security

When the persistent PortSec-Protect is enabled, secure MAC addresses persist across device reboots and interface flaps. These MAC addresses can still be aged or moved when configured using the commands **mac address-table aging-time** and **default switchport port-security mac address moveable**. Persistent port security is enabled by default, and can be disabled.

```
switch(config)# default switchport port-security persistence disabled
```

Example

show port-security command displays the settings for the new global port security configurations, including MAC aging, MAC moves, and persistent port security.

```
switch(config)#show port-security
Secure address moves: disabled
Secure address aging: disabled
Secure address reboot persistence: enabled
Secure address link down persistence: enabled
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security
 Action
                (Count)       (Count)          (Count)
------------------------------------------------------------------------
------
------------------------------------------------------------------------
-----
Total Addresses in System: 0
```

Clearing Dynamic Addresses

The **clear mac address-table dynamic** command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

Example

This command clears all dynamic mac address table entries for ***port channel 5*** on ***VLAN 34***.

```
switch(config)#clear mac address-table dynamic vlan 34 interface port-
channel 5
switch(config)
```

11.4.3.2 Displaying the MAC Address Table

The **show mac address-table** command displays the specified MAC address table entries.

Example

This command displays the MAC address table.

```
switch#show mac address-table
```

```
          Mac Address Table
------------------------------------------------------------------
Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------

```

11.4.3.3 MAC Address Learning Per-VLAN

MAC address learning per-VLAN enables or disables MAC address learning per-VLAN instead of per-port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is disabled, the entry is not added to the table.

11.4.3.3.1 MAC Address Learning Configuration

The **mac address learning** command enables MAC address learning on a VLAN interface. By default, MAC address learning on a VLAN is enabled.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

To disable MAC learning on a particular VLAN, use **`no mac address learning`** command on a VLAN configuration.

Examples

- These commands enable MAC address learning on ***VLAN 10*** configuration.

```
switch(config)#vlan 10
```

```
switch(config-vlan-10)#mac address learning
```

- These commands disable MAC address learning on ***VLAN 10*** configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#no mac address learning
```

11.4.4 Configuring Ports

This section describes these port properties:

- Port Mirroring
- Storm Control
- Switched and Routed Ports
- Loopback Ports
- MAC Security
- Null0 Interface
- Maximum Transmission Units (MTU)

11.4.4.1 Port Mirroring

Port mirroring, also known as port monitoring, is the duplication of traffic from a collection of source ports to a destination port. A mirror session correlates a set of source ports to a destination port.

Valid mirror sources are Ethernet or port channel interfaces, including port channels which are part of an MLAG. Mirror destination ports are usually Ethernet interfaces; port channel destination ports are also supported on some platforms.

Note: On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

Layer 2 control protocols do not run on destination ports. An interface cannot be in more than one mirror session and cannot simultaneously be a source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

- **Ingress Mirroring**: Packets received by a source port are duplicated, including all valid data frames and L2 control PDUs. Ports mirror data before forwarding logic is applied. Packets subsequently dropped because of forwarding decisions are mirrored.
- **Egress Mirroring**: Packets transmitted by a source port are duplicated, with these exceptions:
  - **Flooded/Multicast Packets**: Packets sent to multiple mirror ports generate one copy, except in multi-chip devices when the mirror source and destination ports are on different chips; in this case, an extra copy is generated.
  - **Dropped Packets**: Packets dropped by forwarding decisions (such as output STP state checks) on egress sources are not duplicated. Packets dropped because of congestion may be duplicated.
- **Filtered Mirroring**: Specific packets are selected for mirroring based on PERMIT and DENY configurations.
- **Mirroring to GRE Tunnel**: Mirrored packets are encapsulated with GRE protocols for transiting Layer 3 network.

VLAN tags on duplicate packets from an egress source are identical to tags on inbound source packets.

When a packet's path through the switch includes multiple mirror source ports in different mirror sessions, the traffic is duplicated once and sent to the destination of the highest numbered session.

11.4.4.1.1 Port Mirroring Capacity

Port mirroring capacity varies by platform. This section describes session limits for each platform.

FM6000 Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (any number), Port channel interfaces (any number), CPU.
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting the number of available sessions.

Enabling each of the following features reduces the number of available sessions by one: ACL Logging, MLAG Peer Link, sFlow, VTEP Learning (VXLAN), LANZ Sampling

Arad Platform Switches

- **Maximum Number of Sessions:** 14.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Although the number of configured source interfaces is unlimited, the number of interfaces that can be effectively mirrored is restricted by the destination port speed.

Petra Platform Switches

- **Maximum Number of Sessions:** 16.
- **Session Sources:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Session Destinations:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- Egress IP ACL on destination port is not supported.

  Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Trident Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is supported.

  Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

Trident II Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on Destination Port is supported.

  Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

11.4.4.1.2 Configuring Mirror Ports

Mirror sessions associate a set of source ports to a destination port using the monitor session source and **monitor session destination** commands. An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction. On Trident and Trident II platform switches (DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series), all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device cannot process VLAN tags properly, mirroring should be configured exclusively for ingress traffic by specifying **rx** in the monitor session source command.

Filtering on TX traffic in a mirror session is not supported.

Example

These commands configure ***Ethernet interface 7*** as the source port and ***Ethernet interface 8*** as the destination port for the ***redirect_1*** mirroring session. The session mirrors ingress and egress traffic.

```
switch(config)#monitor session redirect_1 source ethernet 7
switch(config)#monitor session redirect_1 destination ethernet 8
```

The **show monitor session** command displays the configuration of the specified port mirroring session.

Example

This command shows the configuration of the ***redirect_1*** mirroring session.

```
switch(config)#show monitor session

Session redirect_1
------------------------

Source Ports

  Both:        Et7

Destination Port: Et8

switch(config)#
```

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port.

Example

These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session ***redirect_1***.

```
switch(config)#ip access-list allow-host
switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host)#20 deny ip any any
switch(config-acl-allow-host)#exit
switch(config)#monitor session redirect_1 ip access-group allow-host
switch(config)#
```

11.4.4.1.3 Configuring Filtered Mirroring

Filtered mirroring allows for configuring IPv4, IPv6, and MAC access lists and then updating a monitor session with corresponding configuration changes. EOS mirrors the packets that match permit statements. EOS does not select those packets for mirroring that match deny statements.

Note: EOS supports all standard IPv4, IPv6, and MAC qualifiers.

On Strata series platforms, packets from a single monitor source can be mirrored in multiple sessions that use the same access-list. You can attach multiple monitor sources with various access-lists to a monitor session. Each monitor session should contain one access-list type only. Hence, IPv4, IPv6, and MAC access-lists from the same monitor source must appear in different monitor sessions.

When multiple IPv6 monitor sessions share the same monitor source, only one of the monitor sessions remains active and others are automatically inactivated. When the active monitor session is removed from the monitor source, the system automatically activates the inactive monitor sessions.

Packets matching both IP and MAC access lists behave differently on various platforms.

Platform Series	Behavior of Filtered Mirroring
DCS-7050/7050X, DCS-7250X, and DCS-7300X	When entry packets match both IPv4 and MAC access-lists, mirrored copies are created for both IPv4 and MAC access-lists; and forwarded to configured destinations.
DCS-7280SE and DCS-7500E	When entry packets match both IPv4 and MAC access-lists, a mirrored copy is created only for IPv4 access-list. The behavior of filtered mirroring varies in the following ways when a packet matches an entry in both access-list types: • Mirroring is permitted when a packet contradicts with permit and deny configurations. • Mirroring is denied when an entry packet matches deny configurations in both. • IP access-list is prioritized over MAC access-list when an entry packet matches permit configurations in both.

Note: User-Defined Field (UDF) qualifiers in filtered mirroring access-lists allow matching packets using arbitrary user-defined patterns.

Use the **system profile** command to enable the Mirroring ACL profile that supports matching on IPv6, MAC and UDFs.

The following table provides the matching types supported in default and Mirroring ACL profiles.

Profiles	IPv4	IPv6	MAC	UDF
Default	Yes	No	No	No
Mirroring ACL	Yes	Yes	Yes	Yes

Note: MAC mirroring-ACLs do not accept routed IPv4/IPv6 packets and bridged IPv6 packets.

Examples

- These commands create an IPv4 access-list and then attach the access-list to monitor sessions.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#10 permit tcp any any rst
switch(config-acl-acl1)#20 permit tcp any any syn
```

```
switch(config-acl-acl1)#30 permit tcp any any ack

switch(config)#monitor session 1 source Ethernet1 rx ip access-group
 acl1
switch(config)#monitor session 1 source Ethernet2 rx ip access-group
 acl1
switch(config)#monitor session 1 destination <destination>
```

- These commands create an IPv6 access-list and then attach the access-list to monitor sessions.

```
Arista(config)#ipv6 access-list acl2
Arista(config-ipv6-acl-acl2)#10 permit ipv6 any any

Arista(config)#monitor session 2 source Ethernet4 rx ipv6 access-group
 acl2
Arista(config)#monitor session 2 destination Ethernet5
```

- These commands configure the same monitor source in multiple monitor sessions.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group
 acl1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group
 acl2
switch(config)#monitor session 2 destination <destination 2>
```

- This command configures access-list priorities for dictating the matching order across multiple access-lists that are attached to the same monitor source.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group
 acl1
priority 1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group
 acl2
priority 2
switch(config)#monitor session 2 destination <destination 2>
```

- This command enables the Mirroring ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
                    Configuration        Status
FixedSystem         mirroring-acl        mirroring-acl
switch(config-hw-tcam)#
```

11.4.4.1.4 Filtered Mirroring to CPU

Filtered mirroring to CPU adds a special destination to port mirroring that allows mirrored traffic to be sent to the switch supervisor. The traffic can then be monitored and analyzed locally without the need of a remote port analyzer. Filtered mirroring to CPU can also be used for debugging and troubleshooting configured to mirror RX traffic, TX traffic or both, with up to 14 mirroring profiles used simultaneously. In addition, mirroring to CPU uses control plane protection to limit the rate of the traffic sent to the CPU.

Examples

- These commands configure the source for normal mirroring and the destination to CPU.

```
switch(config)#monitor session mySession source ethernet 3/1 both
switch(config)#monitor session mySession destination cpu
switch(config)#
```

- These commands configure reserved bandwidth and shape rate of mirrored traffic.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-control-plane-copp-system-policy)#class
copp-system-mirroring
switch(config-pmap-c-copp-system-policy-copp-system-
mirroring)#bandwidth kbps
2000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#shape
 kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)#show monitor session

                          Session mySession

                          ------------------------

                          Source Ports:

                            Both : Et3/1

                          Destination Ports:

                            Cpu : active (mirror0)
switch(config)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)#show policy-map type copp copp-system-policy class
cop-system-mirroring

                            Class-map: copp-system-mirroring (match-any)

                               shape : None

                               bandwidth : None
switch(config)#
```

11.4.4.1.5 Configuring Filtered Mirroring to GRE Tunnel

The **monitor session source** and **monitor session destination** commands configure source and destination ports to the specified port mirroring session in a GRE tunnel.

On DCS-7010T, DCS-7050/7050X, DCS-7060X, DCS-7250X, DCS-7260X, DCS-7300X, a special GRE tunnel destination is supported to mirror ingress packets that are dropped during ASIC forwarding. This GRE destination is referred as the “forwarding-drop” destination, and the corresponding session is called as the “forwarding-drop” session.

Note: Forwarding-drop sessions are the sessions corresponding to forwarding-drop destinations.

Note: From Release ***EOS 4.25.2F*** onwards platforms DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, CCS-720X started supporting the **tx** keyword, which specifies that outgoing packets should be mirrored.

Examples

- These commands configure ingress filtered mirroring to a GRE tunnel.

```
switch(config)#monitor session abc source Ethernet1 rx ip access-group
 acl1
switch(config)#monitor session abc destination tunnel mode gre source
 1.1.1.1
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- These commands configure egress filtered mirroring to a GRE tunnel.

```
switch(config)#monitor session abc source Ethernet1 tx ip access-group
 acl1
switch(config)#monitor session abc destination tunnel mode gre source
 2.2.2.2
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- This command configures forwarding-drop sessions.

```
switch(config)#monitor session 1 forwarding-drop destination tunnel
mode gre source 1.1.1.1 destination 2.2.2.2
```

- A forwarding-drop session is configured by using the **forwarding-drop** keyword when configuring the GRE destination:

```
switch(config)#monitor session 1 source <source>
switch(config)#monitor session 1 forwarding-drop destination tunnel
 mode gre
                                                    source <sourceIp>
                                                    destination <destIp>
                                                    [ ttl <value> ]
                                                    [ dscp <value> ]
                                                    [ protocol <value> ]
                                                    [ vrf <value> ]
```

- A mirroring to GRE destination can be configured as follows:

```
switch(config)#monitor session 1 source <source> rx | tx
switch(config)#monitor session 1 destination tunnel mode gre
                                  source <sourceIp>
                                  destination <destIp>
                                  [ ttl <value> ]
                                  [ dscp <value> ]
                                  [ protocol <value> ]
                                  [ vrf <value> ]
```

The **rx** keyword specifies that incoming packets should be mirrored.

11.4.4.1.6 Security ACL Filtered Mirroring

Security ACL Filtered Mirroring is configured using port security ACLs.

Configuring Security ACL Filtered Mirroring

The following configures Ethernet interface 8 as the destination port for the redirect_1 mirroring session, and Ethernet interface 9 as the destination port for the redirect_2 mirroring session. A source port is not needed to create a mirror session. Other destination options for monitor sessions such as GRE or CPU are also configurable.

```
switch (config)#monitor session redirect_1 destination ethernet 8
switch (config)#monitor session redirect_2 destination ethernet 9
```

Examples

Egress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to Ethernet interface 7 in the out direction with the following rules.

- matching Rule 10 will be mirrored to ***Ethernet interface 8***.
- matching Rule 20 will not be mirrored.
- matching Rule 30 will be mirrored to ***Ethernet interface 9***.
- matching Rule 40 will be dropped and not mirrored.

Specifying a mirror session in a deny rule for egress ACL has no effect.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#10 permit ip host 10.0.0.4 any mirror session
 redirect_1
switch(config-acl-acl1)#20 permit ip host 10.0.0.5 any
switch(config-acl-acl1)#30 permit ip host 10.0.0.6 any mirror session
 redirect_2
switch(config-acl-acl1)#40 deny ip any any

switch(config)#interface ethernet 7
switch(config-if-Et7)#ip access-group acl1 out
```

Note: Security ACL Filtered Mirroring has higher priority over standard Port Mirroring.

Using the same configuration as above with ***Ethernet interface 7*** as the source port of ***redirect_1***, the following configuration displays the impact on packets egressing from ***Ethernet interface 7***.

```
switch(config)#monitor session redirect_1 source ethernet 7
```

- matching Rule 10 and Rule 20 will be mirrored to ***Ethernet interface 8***.
- matching Rule 30 will be mirrored to ***Ethernet interface 9***.
- matching Rule 40 will be dropped and not mirrored.

Egress IPv6 ACL

The following commands create an IPv6 access-list, and then attach the access-list to ***interface ethernet 7*** in the egress direction.

```
switch(config)#ipv6 access-list acl1
switch(config-ipv6-acl-acl1)#10 permit ipv6 host 10:10:10:10:10:10:10:1
 any mirror session redirect1
switch(config-ipv6-acl-acl1)#20 permit ipv6 host 10:10:10:10:10:10:10:5
 any
switch(config-ipv6-acl-acl1)#30 permit ipv6 host 10:10:10:10:10:10:10:6
 any mirror session redirect2
switch(config-ipv6-acl-acl1)#40 deny ipv6 any any

switch(config)#interface ethernet 7
```

```
switch(config-if-Et7)#ipv6 access-group acl1 out
```

Note: The mirroring behavior of egress IPv6 ACL is identical to egress IPv4 ACL. The egress IPv6 ACL is supported only on R3 Series and forward.

Egress MAC ACL

The following commands create a MAC access-list, and then attach the access-list to ***Ethernet interface 7*** in the out direction. The mirroring behavior of egress MAC ACL is identical to egress IPv4 ACL.

```
switch(config)#mac access-list acl1
switch(config-mac-acl-acl1)#10 permit 0000.1111.4444 0000.0000.0000 any
 mirror session redirect_1
switch(config-mac-acl-acl1)#20 permit 0000.1111.5555 0000.0000.0000 any
switch(config-mac-acl-acl1)#30 permit 0000.1111.6666 0000.0000.0000 any
 mirror session redirect_2
switch(config-mac-acl-acl1)#40 deny any any

switch(config)#interface ethernet 7
switch(config-if-Et7)#mac access-group acl1 out
```

Ingress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to ***Ethernet interface 7*** in the in direction with the following rules.

- matching Rule 10 and Rule 20 will be mirrored to ***Ethernet interface 8***.
- matching Rule 30 will be mirrored to ***Ethernet interface 9*** since Security ACL Filtered Mirroring has higher priority.
- matching Rule 40 will be dropped and mirrored to ***Ethernet interface 8***.

```
switch(config)#ip access-list acl2
switch(config-acl-acl2)#10 permit ip host 10.0.0.4 any mirror session
 redirect_1
switch(config-acl-acl2)#20 permit ip host 10.0.0.5 any
switch(config-acl-acl2)#30 permit ip host 10.0.0.6 any mirror session
 redirect_2
switch(config-acl-acl2)#40 deny ip host 10.0.0.7 any mirror session
 redirect_1

switch(config)#interface ethernet 7
switch(config-if-Et7)#ip access-group acl2 in

switch(config)#monitor session redirect_1 source ethernet 7
```

Note: Unlike egress ACL, mirror session specified in a deny rule for ingress ACL will take effect.

The mirroring behavior of ingress IPv6 and MAC ACLs are identical to ingress IPv4 ACL.

Limitations

- The feature is not supported in AlgoMatch mode.
- Egress Security ACL Filtered Mirroring works on IPv4 - permit rules, and MAC - permit rules.
- By default, egress MAC ACL is disabled. Egress MAC ACL is required to be enabled.
- By default, bridged traffic is not subject to Egress IP ACLs, therefore, the bridged packets will not be mirrored.
- RACL and subinterface ACL are not supported for filtering mirroring.

- If a packet is dropped by an ingress ACL and the destination is GRE, the metadata of the GRE packet cannot be computed as expected.

11.4.4.2 Storm Control

A traffic storm is a flood of packets entering a network, resulting in excessive traffic and degraded performance. Storm control prevents network disruptions by limiting traffic beyond specified thresholds on individual physical LAN interfaces.

Storm control monitors inbound traffic levels over one-second intervals and compares the traffic level with a specified benchmark.

Storm control has three modes:

- **Storm control all**: When inbound traffic exceeds the specified threshold within a one-second control interval, all traffic is dropped until the end of the interval.
- **Storm control broadcast**: When inbound broadcast traffic exceeds the specified threshold within a one-second control interval, broadcast traffic is dropped until the end of the interval.
- **Storm control multicast**: When inbound multicast traffic exceeds the specified threshold within a one-second control interval, multicast traffic is dropped until the end of the interval.

Broadcast and multicast storm control are independent features and can be enabled simultaneously. The **`storm control all`** threshold overrides broadcast and multicast thresholds.

Storm Control Configuration

The **storm-control** command configures and enables broadcast or multicast storm control on the configuration mode interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **`storm-control all`** threshold overrides broadcast and multicast thresholds.

When storm control is enabled, the switch monitors inbound traffic levels over one second intervals and compares the traffic level with a specified threshold. The threshold is a percentage of the total available port bandwidth and is configurable on each interface for each transmission mode.

Examples

- These commands enable multicast storm control on Ethernet interfaces ***2*** through ***4*** and set a threshold of ***65%***. During each one second interval, the interface drops inbound multicast traffic in excess of ***65%*** of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et4/4/4)#storm-control multicast level 65
switch(config-if-Et4/4/4)#
```

- These commands clear multicast storm control on Ethernet interfaces ***2*** through ***4***.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#no storm-control multicast
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces ***2*** through ***4*** and set broadcast traffic to ***50%***. During each one second interval, the interface drops inbound multicast traffic in excess of ***50%*** of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
```

```
switch(config-if-Et2/3/4)#storm-control broadcast level 50
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces ***2*** through ***4*** and set a threshold of ***5000*** packets per second (pps).

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#storm-control broadcast level pps 5000
switch(config-if-Et2/3/4)#
```

Note: User cannot configure a PPS setting and a percentage setting on the same interface at the same time, they are mutually exclusive.

- These commands clear broadcast storm control on Ethernet interfaces ***2*** through ***4***.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#no storm-control broadcast
switch(config-if-Et2/3/4)#
```

The **show storm-control** command displays the storm-control level and interface inbound packet capacity for the specified interface.

Examples

- This command displays the storm control configuration for Ethernet ports ***2*** through ***4***.

```
switch(config-if-Et2/3/4)#show storm-control
Port            Type     Level   Units Rate(Mbps)   Status   Drops
 Reason
Et2/3/4          all     75.00       %       7500   active       0
           multicast     55.00       %       5500   active       0
           broadcast     50.00       %       5000   active       0
switch(config-if-Et2/3/4)#
```

- The output of **show stormcontrol** command displaying the PPS settings:

```
switch(config-if-Et5)#show storm-control
show storm-control
Port Type      Level Units Rate(Mbps) Status Drops Reason
Et5  broadcast 5000  pps   -          active 101
```

11.4.4.3 Switched and Routed Ports

A switched port is an Ethernet or port channel interface that is configured as a Layer 2 interface. Switched ports bridge frames and are assigned to at least one VLAN. Switched ports are not associated with any IP addresses. By default, Ethernet and port channel interfaces are in switched port mode.

A routed port is an Ethernet or port channel interface that is configured as a Layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

Configuring an interface as a routed port is similar to creating a VLAN with spanning-tree disabled, making the port the only member of that VLAN and configuring the IP address on the switch virtual interface (SVI) associated with the VLAN.

All IP-level interface configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. If the interface is reverted to switched port mode, ***running-config*** maintains IP level interface configuration statements. These changes become active again if the interface is configured back to routed port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration is not propagated to the LAG from its component members.

The broadcast queue towards the CPU is shared among all interfaces of the forwarding chip. Broadcast storm on a single port adversely impacts other interfaces of the same chip by potentially dropping even low rate broadcast frames. Routed port storm control attempts to mitigate this effect by performing storm control on the broadcast frames for routed ports.

Routed Port Configuration

The switching-routing configuration of Ethernet and port channel interfaces is specified by the **switchport** and **no switchport** commands. These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

The no switchport command places the configuration mode interface in **routed port** mode. Routed ports behave as Layer 3 interfaces. They do not bridge packets and are not VLAN members. An IP address can be assigned to a routed port for the direct routing of packets to and from the interface.

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. **Allocating Internal VLANs** describes VLAN allocation configuration procedures.

Example

This command places ***Ethernet interface 5*** in routed port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
```

Switched Port Configuration

The switchport command places the configuration mode interface in **switched port (Layer 2)** mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments. By default, Ethernet and port channel interfaces are switched ports.

Example

This command places ***Ethernet interface 5*** in switched port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport
```

The switchport default mode routed command places the configuration mode interface for a switch with all ports in **switched port (Layer 3) routed** mode, changing the switch with all ports from **switchport default mode access**.

Examples

- This command places a switch with all ports in routed mode.

  ```
  switch(config)#switchport default mode routed
  ```

- This command places a switch with all ports in access mode.

  ```
  switch(config)#switchport default mode access
  ```

11.4.4.4 Loopback Ports

A loopback interface is a virtual network interface implemented in software and does not connect to any hardware. Traffic sent to the loopback interface is immediately received on the sending interface. The switch provides loopback configuration mode for creating loopback interfaces and modifying their operating parameters.

Internet protocols reserve specific addresses for loopback network segments:

- IPv4 designates 127/8 as loopback subnet, which includes ***127.0.0.0*** through ***127.255.255.255***.
- IPv6 designates ::1/128 as the loopback address, which includes ***0:0:0:0:0:0:0:1*** (also written as ::1).

Arista switches support the configuration of ***1001*** loopback interfaces, numbered from ***0*** to ***1000***.

Loopback Interface Configuration

Loopback ports are instantiated by entering loopback interface mode for the desired port number. Loopback interface mode also provides access to loopback configuration commands. Previously instantiated ports are edited by entering loopback interface mode for the specified port.

The **interface loopback** command places the switch in interface-loopback configuration mode for the specified interfaces, creating loopback interfaces for each specified port not previously created.

Example

These commands instantiate ***loopback interface 2*** and assigns it IP address ***10.1.1.42/24***.

```
switch(config)#interface loopback 2
switch(config-if-Lo2)#ip address 10.1.1.42
switch(config-if-Lo2)#show active
interface Loopback2
   ip address 10.1.1.42/24
switch(config-if-Lo2)#
```

11.4.4.5 MAC Security

MAC security restricts input to a switched port by limiting the number of MAC addresses that can access the port. Ports with MAC security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. When the limit is exceeded, the port becomes errdisabled.

Port Security Configuration

MAC address security is enabled by **switchport port-security** . The default MAC address limit on an interface where port security is enabled is one; to change that default limit, use the **switchport port-security mac-address maximum** command.

Example

These commands enable MAC security on ***Ethernet interface 7***, set the maximum number of assigned MAC addresses to 2, assign two static MAC addresses to the interface, and clear the dynamic MAC addresses for the interface.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport port-security
switch(config-if-Et7)#switchport port-security mac-address maximum 2
switch(config-if-Et7)#exit
switch(config)#mac address-table static 0034.24c2.8f11 vlan 10 interface ethernet
7
switch(config)#mac address-table static 4464.842d.17ce vlan 10 interface ethernet
7
switch(config)#clear mac address-table dynamic interface ethernet 7
```

```
switch(config)#show port-security
Secure Port      MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
                    (Count)        (Count)      (Count)
-------------------------------------------------------------------------------
     Et7              2             2           0            Shutdown
-------------------------------------------------------------------------------
Total Addresses in System: 1
switch(config)#show port-security mac-address
          Secure Mac Address Table
-----------------------------------------------------------
Vlan    Mac Address       Type                      Ports   Remaining Age
                                                              (mins)
----    -----------       ----                      -----   -------------
  10    0034.24c2.8f11    SecureConfigured          Et7     N/A
  10    4464.842d.17ce    SecureConfigured          Et7     N/A
-----------------------------------------------------------------------
Total Mac Addresses for this criterion: 2
switch(config)#
```

MAC Security LLDP Bypass

When MAC address security configuration is applied on the interface, it encrypts and decrypts all the other protocols PDU and other data packets. **LLDP bypass** allows LLDP packets to be sent or received from the port even when the port is not authorized.

The following configuration allows LLDP packets to be received or sent from an interface where the MAC security profile is applied.

```
switch(config)#mac security
switch(config-mac-security)#profile test
switch(config-mac-security-profile-test)#l2-protocol lldp bypass
 unauthorized
```

unauthorized allows the LLDP packet to be received and sent out when MKA session between the MACsec peers is yet to come up.

Show Command

The following command shows LLDP packets is bypassed for encryption or decryption.

```
switch(config)#show mac security interface ethernet 4/4/1 detail
Interface: Ethernet4/4/1
Profile: profile1
SCI: d4:af:f7:2e:67:b0::786
SSCI: 00000002
Controlled port: True
Key server priority: 1
Session rekey period: 30
Traffic: Protected
Bypassed protocols: LLDP
Key in use: c0645d4332ba2e1d4d5fb17f:129
Latest key: None
Old key: c0645d4332ba2e1d4d5fb17f:129(RT)
```

11.4.4.6 Null0 Interface

The **null0 interface** is a virtual interface that drops all inbound packets. A null0 route is a network route whose destination is **null0 interface**. Inbound packets to a null0 interface are not forwarded to any valid address. Many interface configuration commands provide **null0** as an interface option.

11.4.4.7 Maximum Transmission Units (MTU)

The MTU of a communications protocol refers to the size in bytes of the largest frame (Ethernet) or packet (IP) that can be sent on the network.

Different protocols support a variety of MTU sizes. Most IP over Ethernet implementations use the Ethernet V2 frame format, which specifies an MTU of ***1500*** bytes. Jumbo frames are Ethernet frames containing more than ***1500*** bytes.

11.4.4.7.1 Switching interface MTU size

On Arista devices, layer two interfaces (either trunk or access ports) are set with a default ethernet MTU of 9236 bytes. This value cannot be changed and is derived as follows: 9214 + 6 (source MAC) + 6 (dst MAC) + 4 (VLAN tag) + 2 (ether type) + 4 (crc) totals 9236 bytes.

The output of a **show interfaces** command for a layer two interface displays the following:

Trunk

```
Ethernet1 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.731c.5073 (bia 001c.731c.5073)
Ethernet MTU 9214 bytes , BW 1000000 kbit
```

Access

```
Ethernet3 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.731c.5075 (bia 001c.731c.5075)
 Ethernet MTU 9214 bytes , BW 1000000 kbit
```

11.4.4.7.2 Routing Interface MTU Size

The MTU size on Layer 3 interfaces varies between a minimum of ***68*** to the maximum ***9214*** bytes. The default size is ***1500*** bytes. The **`show interface`** output for a Layer 3 interface displays the following:

VLAN Routed Interface

```
Vlan100 is up, line protocol is up (connected)
 Hardware is Vlan, address is 001c.731c.5072 (bia 001c.731c.5072)
 Internet address is 10.1.1.2/24
 Broadcast address is 255.255.255.255
 Address determined by manual configuration
 IP MTU 9214 bytes
```

Physical Routed Interface

```
Ethernet4 is down, line protocol is down (connect)
 Hardware is Ethernet, address is 001c.731c.5072
 Internet address is 10.10.10.10/24
 Broadcast address is 255.255.255.255
 Address determined by manual configuration
 IP MTU 9214 bytes
```

A routed interface fragments packets that exceed the configured IP MTU on the interface. For example, if a ***2000*** byte packet is received on routed interface 1 and is forwarded from routed interface 2 then routed interface 2 fragments the packet into a ***1500*** byte packet plus an additional packet containing the remaining data. This fragmentation should be avoided by configuring a consistent IP MTU across all systems within the operational domain.

The IP MTU set on a routed interface is valid for both IPv4 and IPv6 packets.

MTU Configuration

The mtu command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. An interface's MTU value is displayed with the **`show interface`** command. The command is valid for all routable interfaces.

Examples

- This command sets the MTU size of ***1492*** bytes on ***VLAN interface 20***.

```
switch(config-if-Vl20)#mtu 1492
switch(config-if-Vl20)#
```

- This command displays status for a routed interface.

```
switch(config-if-Et3)#show interface e3
Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.731c.5072
  Internet address is 10.1.1.2/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes , BW 1000000 kbit
  Full-duplex, 1Gb/s, auto negotiation: on, uni-link: unknown
  Up 22 days, 7 hours, 47 minutes, 58 seconds
switch(config)#
```

- Using ping on a Linux host, you can test the maximum transmission through the interface.
-

```
[user@linux ~]$ ping -M do -s 1472 10.1.1.2
PING 10.1.1.2 (10.1.1.2) 1472(1500) bytes of data.
1480 bytes from 10.1.1.2: icmp_seq=1 ttl=64 time=0.206 ms
1480 bytes from 10.1.1.2: icmp_seq=2 ttl=64 time=0.191 ms
--- 10.1.1.2 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 999ms
rtt min/avg/max/mdev = 0.191/0.198/0.206/0.015 ms
```

The size ***1472*** has ***8*** bytes of ICMP information added and ***20*** bytes of IP headers added, generating a total packet size of ***1500*** bytes.

- The option **-M do** specifies that fragmentation is prohibited for this test.
- The option **-s** specifies the size of the packet being generated.
- A capture of the frame displays total length of ***1514*** bytes on the wire which includes the Ethernet headers and type field.

11.4.5 Monitoring Links

These section describes link monitoring and object tracking processes:

- Object Tracking
- Errdisabled Ports
- Error Disable Detect Cause for ACL
- Configuring Error Disable Recovery Interval for each Cause
- Link Flap Monitoring
- Fabric Link Monitoring
- Rapid Automated Indication of Link-Loss

11.4.5.1 Object Tracking

Object tracking makes it possible for the switch to take action in response to changes in specific switch properties by creating an object to track those properties. When the tracked property changes, the object then changes state, allowing configured agents to react accordingly.

Object Tracking Configuration

The **track** command creates an object that changes state to reflect changes in a specific switch property. Agents configured to track that object are then able to react to the change.

Example

These commands create an object that tracks the line protocol state on ***Ethernet interface 8***, then configures ***Ethernet interface 5*** to disable VRRP when that tracked object changes state to **down**.

```
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#interface ethernet 5
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

These commands use object tracking:

- link tracking group
- vrrp tracked-object

11.4.5.2 Errdisabled Ports

The switch places an Ethernet or management interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. Conditions that error-disable an interface include:

- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr_unsupported**

Most conditions are programmed by the configuration of other features, such as Spanning Tree protocol (bpduguard). Link flap error-disabling is configured through errdisable commands or link flap monitor commands (**Link Flap Monitoring**).

Error-disabled interfaces are recovered either through manual or automated methods.

To manually recover an interface, enter its configuration mode and execute **shutdown** and **no shutdown** commands.

Example

These commands manually recover *Ethernet interface 30* from the errdisable state.

```
switch(config)#interface ethernet 30
switch(config-if-Et30)#shutdown
switch(config-if-Et30)#no shutdown
switch(config-if-Et30)#
```

Automated recovery of Ethernet interfaces that are error-disabled by a specified condition is enabled by **errdisable recovery cause** . The **errdisable recovery interval** specifies the period that an interface remains disabled until it is enabled and begins operating normally. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

Example

These commands configure automated recovery for all interfaces that are error-disabled from link flap and **bpduguard** conditions. Automated recovery begins five minutes after the port is disabled.

```
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery cause bpduguard
switch(config)#errdisable recovery interval 300
switch(config)#
```

11.4.5.3 Error Disable Detect Cause for ACL

The **no errdisable detect cause acl** command configures routed ports, subinterfaces, and physical ports to not get into the **errdisabled** state on ACL failure, the default behavior. To reestablish the default behavior, use the **errdisable detect cause acl** command.

The following displays the output when ***errdisabling*** is enabled for ACLs.

```
switch(config)#show errdisable detect
   Errdisable Reason            Detection Status
------------------------------ ----------------
   acl                          Enabled
```

The following displays the output when ***errdisabling*** is disabled for ACLs.

```
switch(config)#show errdisable detect
   Errdisable Reason            Detection Status
------------------------------ ----------------
   acl                          Disabled
```

11.4.5.4 Configuring Error Disable Recovery Interval for each Cause

The duration after which an interface tries to recover from being error disabled is programmable for each trigger which causes the interface to be error disabled using the **errdisable recovery cause NAME_OF_CAUSE interval DURATION** command. The command applies only to interfaces that are enabled for error recovery after being error disabled.

Example

This command configures interfaces to recover in ***30*** seconds when the cause is **bpduguard**.

```
switch(config)#errdisable recovery cause bpduguard interval 30
```

Example

Either of these commands revert the interval to the global value when the cause is **bpduguard**.

```
switch(config)#no errdisable recovery cause bpduguard interval
```

```
switch(config)#default errdisable recovery cause bpduguard
 interval
```

This command displays the status of the interfaces.

```
switch#show errdisable recovery
Errdisable Reason              Timer Status   Timer Interval
------------------------------ ---------------- --------------
   bpduguard                      Disabled                 30
   hitless-reload-down            Disabled                300
   lacp-no-portid                 Disabled                N/A
   lacp-rate-limit                Disabled                300
   license-enforce                Disabled                N/A
   link-flap                      Disabled                300
   no-internal-vlan               Disabled                300
   uplink-failure-detection       Disabled                300
```

11.4.5.5 Link Flap Monitoring

Link flap frequency is the quantity of link flaps (connection state changes) over a specified period. Excessive link flaps result in network stability issues, including spanning tree and routing recalculations. Link flaps are often caused by Layer 1 issues, such as a bad cable or duplex mismatch. Link flap monitoring specifies link flap thresholds and disables a port when a threshold is exceeded.

Link flap monitoring can be enabled on all interfaces through errdisable link flap commands or on individual interfaces with the link flap monitor.

11.4.5.5.1 Global Link Flap Monitor

Global link flap detection is configured through two global configuration mode commands:

- **errdisable flap-setting cause link-flap** configures the link-flap frequency that defines link-flap errors on an Ethernet interface.
- **errdisable detect cause link-change** enables the error-disabling of Ethernet interfaces that exceed the threshold link flap frequency.

Link-flap detection is enabled by default.

Example

These commands sets the link flap error criteria of ***15*** connection state changes over a ***30*** second period, then enables error detection on all interfaces.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time
 30
switch(config)#errdisable detect cause link-change
switch(config)#
```

11.4.5.5.2 Interface Link Flap Monitor

An interface is monitored for link flap errors with link flap profiles. A link flap profile specifies conditions that define a link-flap error. Profiles are assigned to Ethernet interfaces. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

The global link flap monitor is used by interfaces that are not individually monitored for link flap errors.

Configuring Link Flap Profiles

Link flap profiles are configuration statements that define a link flap error in terms of these criteria:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

The **monitor link-flap policy** command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. The **profile max-flaps (Link Flap Configuration)** command configures link flap profiles.

The default-profile set is a list of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled but link-flap profiles are not assigned. The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, **errdisable flap-setting cause link-flap** specifies default error-disable criteria. When the default-profile set contains multiple profiles, the criteria is satisfied when conditions match any profile.

Example

These commands enter link flap configuration mode and create four link flap profiles.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5
 intervals 10
switch(config-link-flap)#profile LF03 max-flaps 20 time 75 violations 2
 intervals 6
switch(config-link-flap)#profile LF04 max-flaps 30 time 100 violations 4
 intervals 7
switch(config-link-flap)#show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF02 max-flaps 20 time 75 violations 2 intervals 6
   profile LF02 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)#
```

The **default-profiles** command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a **default-profile** command replaces the current default-profile statement in ***running-config***.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, **errdisable flap-setting cause link-flap** specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single **default-profiles** command.

Example

This command assigns configures ***LF01*** and ***LF02*** as the default-profile set.

```
switch(config)#monitor link-flap policy
```

```
switch(config-link-flap)#default-profiles LF01 LF02
switch(config-link-flap)#show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF02 max-flaps 20 time 75 violations 2 intervals 6
   profile LF02 max-flaps 30 time 100 violations 4 intervals 7
   default-profiles LF01 LF02
switch(config-link-flap)#
```

Interface Link Flap Profile Assignments

Link flap monitoring is enabled on individual Ethernet interfaces and can optionally specify one or more profiles to define link-flap error-disabling criteria. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions; a port is disabled when conditions match any of the profiles assigned to an interface.

The **monitor link-flap profiles** command controls link-flap monitoring on a configuration mode interface. The command provides these link flap detection options:

- **`monitor link-flap`** ***(no profiles listed)***: Interface detects link flaps using default-profile set criteria.
- **`monitor link-flap`** ***(at least one profile listed)***: Interface detects link flaps using listed profile criteria.
- **`default monitor link-flap`**: The interface uses global link flap monitor commands (**Global Link Flap Monitor**).
- **`no monitor link-flap`**: The interface does not detect link flaps.

Examples

- This command assigns ***LF03*** and ***LF04*** link flap profiles to ***Ethernet interface 33***.

```
switch(config)#interface ethernet 33
switch(config-if-Et33)#monitor link-flap profiles LF03 LF04
switch(config-if-Et33)#show active
interface Ethernet33
   monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on ***Ethernet interface 34***.

```
switch(config)#interface ethernet 34
switch(config-if-Et34)#no monitor link-flap
switch(config-if-Et34)#show active
interface Ethernet34
   no monitor link-flap
switch(config-if-Et34)#
```

- This command assigns the default-profile set to ***Ethernet interface 35***.

```
switch(config)#interface ethernet 35
switch(config-if-Et35)#monitor link-flap
switch(config-if-Et35)#show active
interface Ethernet35
   monitor link-flap
switch(config-if-Et35)#
```

- This command configures ***Ethernet interface 36*** to use the global link flap monitoring commands.

```
switch(config)#interface ethernet 36
```

```
switch(config-if-Et36)#default monitor link-flap
switch(config-if-Et36)#show active
interface Ethernet36
switch(config-if-Et36)#
```

11.4.5.6 Fabric Link Monitoring

Fabric link monitoring enables EOS to monitor low error rate errors on all fabric links for long durations, and automatically isolates fabric links on consistent error detection over an extended time interval. Isolated fabric links are restored when the error rate drops below a configured threshold.

The error rate over each configurable polling interval is derived by comparing the number of cells with CRC errors against the total number of received cells. Links are automatically isolated when the error rate is above the configured threshold for the configured consecutive number of polling intervals.

On an isolated fabric link, control cells (but not data cells) are sent. Once the error rate drops below a set threshold for the configured consecutive number of polling intervals, EOS revives the fabric link to continue sending data traffic.

11.4.5.6.1 Configuring Fabric Link Monitoring

Configuration mode commands globally enable and disable fabric link monitoring and syslog messages for the settings described below.

The **`no platform sand monitor`** command disables fabric link monitoring.

Generate Serdes Error Syslog

The **platform sand monitor serdes error log** command generates syslog fabric link monitoring for serdes error logging.

Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)#platform sand monitor serdes error log
switch(config)#
```

The following syslog messages are not enabled by default. Fabric link monitoring syslog is enabled by configuring the **platform sand monitor serdes error log** command.

Examples

- The following Syslog message is generated when a fabric link for serdes is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes withdrawn from the switch
 fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes Arad10/5-FabricSerdes-11
 withdrawn from the switch fabric.
```

- The following Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes restored to the switch
 fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes Arad10/5-FabricSerdes-11
 restored to the switch fabric.
```

Generate Serdes Error Threshold

The platform sand monitor serdes error threshold command generates a fabric link monitoring serdes error threshold.

Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between ***200*** and ***30000*** received cells.

```
switch(config)#platform sand monitor serdes error threshold 200 30000
switch(config)#
```

Enable Serdes Poll Period

The **platform sand monitor serdes poll period** command sets the serdes poll period.

Example

This command changes the serdes polling period for fabric link monitoring to ***6*** seconds.

```
switch(config)#platform sand monitor serdes poll period 6
switch(config)#
```

Monitor Serdes Poll Threshold Isolation

The **platform sand monitor serdes poll threshold isolation** command sets and enables fabric link monitoring for serdes poll threshold isolation.

Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is ***5*** consecutive polls.

```
switch(config)#platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

Monitor Serdes Poll Threshold Recovery

The **platform sand monitor serdes poll threshold recovery** command sets and enables fabric link monitoring for serdes poll threshold recovery.

Example

This command changes the number of consecutive serdes polls used for threshold recovery to ***6*** seconds.

```
switch(config)#platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

Show Fabric Monitoring Health

The **show fabric monitoring health** command displays the fabric monitoring connected state status with isolated links.

Example

When fabric links are isolated, their connected state status is shown with isolated links.

```
switch(config)#show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

11.4.5.7 Rapid Automated Indication of Link-Loss

Rapid Automated Indication of Link-Loss (RAIL) is a software feature that reduces the wait time of applications on hosts that are blocked due to a failed link. When a link goes down because of link-flapping or the unavailability of a directly connected server, the switch drops all traffic to servers whose next-hop destination was learned on the port connected to the link. Applications that drive the traffic (clients on source hosts) are blocked because of the dropped edge-switch traffic. Connection timeout varies by application and is usually measured in seconds or minutes.

RAIL is functional on a switch if it is routing-enabled and available for servers that set the switch as the default router.

11.4.5.7.1 RAIL Method

When a link monitored by RAIL goes down, the switch performs these steps for servers that the switch proxies:

1. IP addresses of servers on the failed link are extracted from ARP cache. The interface that accesses the server is determined by searching for the MAC address in the hardware MAC address tables.
2. Upon link shutdown, a dynamic MAC entry is added in the MAC address table for each server that was learned on the failed interface. Each new entry lists its interface as **CPU**.

The figure below titled **RAIL Scenarios** depicts three switch-server scenarios: link is up, link is down with RAIL disabled, and link is down with RAIL enabled. A failed link with RAIL enabled results in these behaviors:

1. All ingress packets whose destination MAC address matches an address added to the MAC address table are sent to the CPU.
2. For packets scheduled to be forwarded to the source address, the switch sends one of the following, based on the type of received segment:
   - **TCP**: TCP RST segment to the source IP address and port.

- **UDP**: ICMP unreachable segment to the source IP address and port.

3. The client closes the socket associated with the transmitted segment and notifies the application. The application reacts immediately instead of maintaining the block until connection timeout expiry.

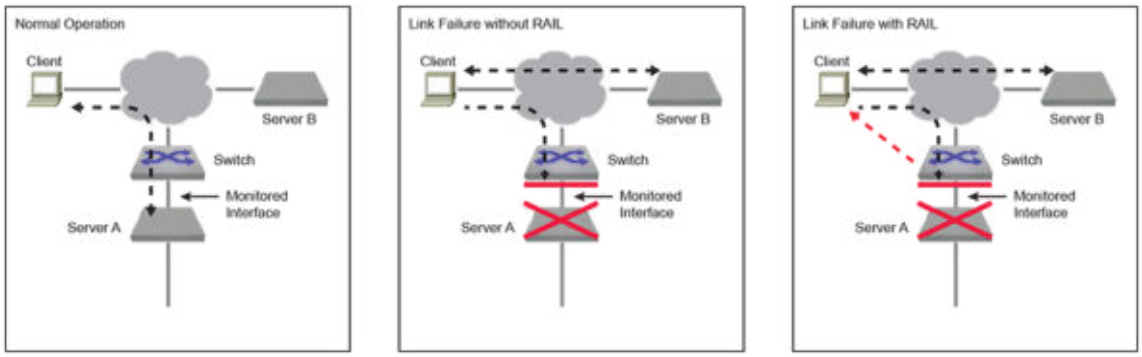

Figure 25: RAIL Scenarios

11.4.5.7.2 RAIL Implementation

RAIL defines a state machine that manages the RAIL activity level relative to a specified server. The state machine consists of four states:

- **Up**: Transitions to this state from ***Inactive*** when ARP and MAC entries are added for the server.
- **Proxying**: Transitions to this state from ***Up*** when Link Down is detected and RAIL proxying is enabled. The switch is a proxy for messages to the server.
- **Down**: Transitions to this state from ***Up*** when Link Down is detected and RAIL proxying is not enabled. Messages from the client remain unanswered and the application recovers only after timeout expiry.
- **Inactive**: Transitions to this state upon any of the following conditions:
  - Server's MAC address or ARP entry is deleted (from any state).
  - Proxy timeout expiry (from ***Proxying*** state).
  - Link down timeout expiry (from ***Down*** state).

11.4.5.7.3 RAIL Configuration

Server-failure configuration mode commands globally enable RAIL and configure RAIL parameters. RAIL is functional on individual interfaces only when it is globally enabled and enabled on the interface. RAIL monitors an interface for link errors when RAIL is globally enabled and enabled on the interface.

Entering Server-failure Configuration Mode

The **monitor server-failure** command places the switch in server-failure configuration mode. The **`exit`** command returns the switch to global configuration mode. Server-failure mode is not a group change mode; ***running-config*** is changed when commands are entered and not affected by exiting the mode.

The **`no monitor server-failure`** deletes all server-failure mode commands from ***running-config***.

Examples

- These commands place the switch in the ***server-failure*** configuration mode.

```
switch(config)#monitor server-failure
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from ***running-config***.

```
switch(config)#no monitor server-failure
switch(config)#
```

Enabling RAIL on the Switch

RAIL is disabled by default and is enabled by **no shutdown (server-failure configuration mode)** . The **shutdown** command disables RAIL without removing RAIL commands from ***running-config***.

Examples

- These commands enable RAIL globally.

```
switch(config)#monitor server
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command disables RAIL globally.

```
switch(config-server-failure)#shutdown
switch(config-server-failure)#
```

Enabling Proxy Mode

The **proxy (server-failure configuration mode)** command sets the RAIL proxy setting to ***enabled*** and specifies the interval that RAIL responds to messages sent to servers on failed links. The proxy timeout is measured individually for each server whose link has failed. The switch enters RAIL proxy state only when the proxy setting is enabled.

When RAIL is enabled but the proxy setting is disabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The RAIL proxy setting is ***disabled*** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to ***disabled***. The **no proxy lifetime** and **default proxy lifetime** commands set the proxy timeout to its default of three minutes if the RAIL proxy setting is **enabled**. The lifetime commands have no effect if RAIL proxy is **disabled**.

Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of ***10*** minutes.

```
switch(config)#monitor server
switch(config-server-failure)#proxy lifetime 10
switch(config-server-failure)#show active
monitor server-failure
   proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of ***3*** minutes.

```
switch(config-server-failure)#no proxy lifetime
switch(config-server-failure)#show active
monitor server-failure
   proxy
```

```
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)#no proxy
switch(config-server-failure)#show active
switch(config-server-failure)#
```

Selecting Networks to Monitor

The **network (server-failure configuration mode)** command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. ***Running-config*** can contain multiple **network** statements, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or ***ICMP Unreachable*** segments to devices sending packets to the unavailable server.

Example

These commands specify two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)#monitor server
switch(config-server-failure)#network 10.1.1.0/24
switch(config-server-failure)#network 10.2.1.96/28
switch(config-server-failure)#show active
monitor server-failure
   network 10.2.1.96/28
   network 10.1.1.0/24
switch(config-server-failure)#
```

Enabling RAIL on an Interface

RAIL monitors an interface for link errors only when RAIL is globally enabled and enabled for the interface. The **monitor server-failure link** command enables RAIL on the configuration mode interface. Configuration settings are effective for all Ethernet and port channel interfaces that enable RAIL.

Example

These commands enable RAIL on ***port channel interface 100***.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#monitor server-failure link
switch(config-if-Po100)#show active
interface Port-Channel100
   monitor server-failure link
switch(config-if-Po100)#
```

11.4.5.7.4 Displaying RAIL Status

The switch provides commands to display RAIL configuration and status information:

Displaying RAIL Configuration settings

The **show monitor server-failure** command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch>show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
   10.2.1.96/28      : 0 servers
   10.1.1.0/24       : 0 servers
   10.3.0.0/16       : 3 servers
switch>
```

Displaying RAIL History for All Connected Servers

The **show monitor server-failure history** command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

Example

This command displays the link failure history from the time RAIL is instantiated on the switch.

```
switch>show monitor server-failure history
Total server failures: 4

Server IP   Server MAC              Interface           Last Failed
----------- -----------------       -----------         -------------
------
10.1.67.92  01:22:ab:cd:ee:ff       Ethernet17          2013-02-02
 11:26:22
44.11.11.7  ad:3e:5f:dd:64:cf       Ethernet23          2013-02-10
 00:07:56
10.1.1.1    01:22:df:42:78:cd       Port-Channel6       2013-02-09
 19:36:09
10.1.8.13   01:33:df:ee:39:91       Port-Channel5       2013-02-10
 00:03:39

switch>
```

Displaying Server Configuration and Status

The show monitor server-failure servers command displays status and configuration data about each server that RAIL monitors. The display format depends on the parameter specified by the command:

Examples

- This command displays RAIL information for the server at IP address ***10.11.11.7***.

```
switch>show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address        : 10.11.11.7
MAC Address              : ad:3e:5f:dd:64:cf
Current state            : down
Interface                : Ethernet23
Last Discovered          : 2013-01-06 06:47:39
Last Failed              : 2013-02-10 00:07:56
Last Proxied             : 2013-02-10 00:08:33
Last Inactive            : 2013-02-09 23:52:21
Number of times failed   : 3
Number of times proxied  : 1
Number of times inactive : 18
```

```
switch>
```

- This command displays RAIL information for the all servers on configured interfaces.
-

```
switch>show monitor server-failure servers all
Total servers monitored: 5

switch>
```

11.4.6 PHY test pattern CLI

Use the Ethernet Physical Layer (PHY) test pattern CLI to check the quality of the physical layer for an Ethernet interface. You can do this by generating a specific test pattern to a peer, and having the peer check the test pattern that is received, and vice versa. Because the test pattern is a well-known sequence of bits, the peer can check that the pattern received matches this well-known sequence; any difference is a bit error introduced by the peculiarities of the physical layer. The quality of the link is determined based on the acceptable bit errors, as published by the hardware vendors.

To enable the test pattern generator, configure a specific test pattern on the transmitter side of an interface. The test pattern checker is enabled by configuring the test pattern to be checked on the receiver side of the interface. PRBS is the test pattern supported by EOS.

Note: Physical links are bidirectional; to test both directions, the generator and checker both need to be enabled on both sides of the link. Both directions can be tested simultaneously or separately. The order of testing does not matter.

11.4.6.1 Configuration

You can configure a test pattern is configured using the **phy diag** interface configuration mode command.

1. Enter interface configuration mode, entering the targeted interface name.

```
switch(config)#interface interfaceName
```

2. Enable a test pattern on an interface using the **phy diag** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)#phy diag [ transmitter | receiver ] test pattern ?
  PRBS11  Configure the PRBS11 test pattern
  PRBS15  Configure the PRBS15 test pattern
  PRBS23  Configure the PRBS23 test pattern
  PRBS31  Configure the PRBS31 test pattern
  PRBS49  Configure the PRBS49 test pattern
  PRBS58  Configure the PRBS58 test pattern
  PRBS7   Configure the PRBS7 test pattern
  PRBS9   Configure the PRBS9 test pattern
```

3. To disable a test pattern on an interface, enter the following command. You can select the tranmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)#no phy diag [transmitter|receiver] test
 pattern TestPattern
```

4. By default, a test pattern is disabled.

```
switch(config-if)#default phy diag [transmitter|receiver] test pattern
```

5. The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to ***0*** and link states are marked as **`not locked`**.

```
switch#clear phy diag test pattern
```

11.4.6.2 Show Commands

To display the configured and operational test pattern, as well as the test patterns available for an interface, use the **`show interfaces`** command.

In the following example, interfaces ***ethernet 36/1*** and ***ethernet 31/1*** are selected for display. The user-configured test pattern is displayed under the **`Configured`** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **`Operational`** column. The **`Available`** column lists the test patterns available for the interface.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern
                    Configured       Operational
Interface         Transmit Receive Transmit Receive Available

----------------- -------- ------- -------- ------- -------------
-----------
Ethernet26/1      PRBS15   PRBS15  PRBS15   PRBS15  PRBS
 7,9,11,15,23,31,58
Ethernet31/1      PRBS7    PRBS31  PRBS7    PRBS31  PRBS
 7,9,11,15,23,31,58
```

Use the **`show interfaces [<interface range>] phy detail`** command to display the operational test pattern for an interface. In the example below, the **`Test pattern`** field will not be available, on disabling the test pattern.

Note: This command is not available on DCS-7060PX4 and DCS-7060DX4.

```
switch#show interfaces ethernet 26/1 phy detail | i Test pattern
  Test pattern                 enabled
switch#show interfaces ethernet 31/1 phy detail | i Test pattern
  Test pattern                 enabled
```

Use the **`show interfaces [<interface range>] phy diag test pattern counters`** to display test pattern link state and error information.

Available error information:

- **Link state:** whether or not the checker locked on to the configured test pattern.
- **Bit Errors:** the accumulated number of bit errors.
- **Largest Burst:** the largest burst of errors that occurred.
- **Burst Count:** the number of occurrences of errors.

- **Last Error Time:** the last time an error has occurred, ‘never’ if no errors have occurred.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern
 counters
Current System Time: Wed May 30 22:24:32 2018
                                                    Largest    Burst

Ethernet31/1     3     not locked  1817413      923941     3
   0:03:20 ago
```

Use the **`show interfaces [<interface range>] phy diag test pattern counters`** to display the lock state of an interface along with a detailed information on the recorded bit errors.

Available detailed information:

- **Last clear:** the time when the test pattern results were last cleared.
- **Operational test pattern:** the test pattern operational at the receiver side.
- **Bit rate:** the transmission bit rate.
- **Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
  - **locked:** receiver is able to lock on to the incoming test pattern.
  - **not locked:** receiver is not able to lock on to the incoming test pattern.
- **Largest burst:** the largest burst of errors that occurred.
- **Bit errors*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The * suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Total Bits:** the total bits received.
- **Bit error rate (BER)*:**the ratio of captured bit errors to the total bit received. The * suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
- **Total bits since last lock:** the total bits received since last lock.

- **BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern
 counters detail
*: Data may not be accurate due to loss of lock.

11.4.6.3 Bit Error Rate (BER)

Bit error rate is the ratio of the recorded bit errors to the total bits received for the duration of the test run. To achieve a reliable transmission, BER should be relatively small. As per IEEE 802.3 standard, the minimum BER requirement for Ethernet links is 1E-12. Therefore, links with BER lower than 1E-12 are to be considered reliable.

The BER reported by the **test pattern** CLI is the pre-FEC (Forward Error Correction) BER. For links that have FEC enabled, it is expected to see a higher BER, in the range of ***1E-4*** to ***1E-8***, because they are calculated before FEC is applied on the link. Based on the type of FEC applied on the link, these errors could get corrected to achieve the minimum BER requirement of 1E-12 or less.

11.4.6.4 Limitations

The configuration of test patterns is supported only on a few types of ports. The available test patterns that may be configured on an interface are found in the **`Available`** field of the **`show interfaces phy diag test pattern`** CLI command.

The test pattern CLI calculates only pre-FEC BER.

If one end of the system is from another vendor, consult the vendor's documentation for the equivalent command(s) to achieve the appropriate behavior.

11.4.7 Data Transfer Commands

Control Plane and Data Plane Commands

- ip access-group (Control Plane mode)
- show switch forwarding-mode
- switch forwarding-mode
- system control-plane

Errdisable Commands

- errdisable detect cause link-change
- errdisable flap-setting cause link-flap
- errdisable recovery cause
- errdisable recovery interval
- show errdisable recovery

Fabric Link Monitoring Commands

- platform sand monitor serdes error log
- platform sand monitor serdes error threshold
- platform sand monitor serdes poll period
- platform sand monitor serdes poll threshold isolation
- platform sand monitor serdes poll threshold recovery
- show fabric monitoring health
- show platform trident mirroring

RAIL Commands

- clear server-failure servers inactive
- monitor server-failure
- monitor server-failure link
- network (server-failure configuration mode)
- proxy (server-failure configuration mode)
- show monitor server-failure
- show monitor server-failure history
- show monitor server-failure servers
- shutdown (server-failure configuration mode)

Link Flap Monitor Commands

- default-profiles
- monitor link-flap policy
- monitor link-flap profiles
- profile max-flaps (Link Flap Configuration)

MAC Address Table Commands

- clear mac address-table dynamic
- mac address-table aging-time
- mac address-table static
- show bridge mac-address-table aging timeout
- show mac address-table

- show mac address-table count
- show mac address-table mlag-peer
- show mac address-table multicast
- show mac address-table multicast brief
- switchport mac address learning

Port Configuration Commands

- clear counters
- description
- interface loopback
- load interval
- mtu
- phy diag
- show interfaces
- show interfaces description
- show interfaces phy diag
- switchport
- switchport default mode access
- switchport default mode routed

Port Mirroring Commands

- monitor session destination
- monitor session destination cpu
- monitor session forwarding-drop
- monitor session ip access-group
- monitor session source
- monitor session source ip access-group
- monitor session truncate
- no monitor session
- show monitor session

Port Security Commands

- show port-security
- show port-security interface
- show port-security mac-address
- switchport port-security
- switchport port-security mac-address maximum
- switchport port-security violation

Storm Control Commands

- show storm-control
- storm-control

Tracking Commands

- links minimum
- link tracking group
- link tracking group (interface)
- show link tracking group

- show track
- track
- traffic-loopback

11.4.7.1 clear counters

The **`clear counters`** command resets the counters to zero for the specified interfaces. The command provides the following options:

- ***No parameter*:** When no option is selected, the counters are reset on the switch.
- ***Session parameter*:** The command resets the counters in software for the current CLI session, establishing a baseline upon which subsequent **`show interfaces`** or **`show interfaces counters`** commands are relative. Counters are not affected for other CLI sessions.

Note: The **`clear counters`** command (and other commands that reset counters to zero) do not reset SNMP counters (such as IF-MIB::ifInOctets). As specified in ***RFC 2578***, ***sections 7.1.6*** and ***7.1.10***, a single value of a counter in SNMP has no information content. Instead, meaningful information is given by the difference between two separate fetches of a particular counter. SNMP counters automatically reset to ***0*** when they reach their maximum values.

Command Mode

Privileged EXEC

Command Syntax

`clear counters` [**INTERFACE**][**SCOPE**]

Parameters

- **INTERFACE** Interface type and number. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.
- Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, ***v_range***, and ***vx_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **SCOPE** Duration of the reset results. Options include:
  - ***no parameter*** counters are cleared on the switch.
  - **session** counters are reset only for the current session.

Example

These commands display interface counters, clear the counters, then display the counters again.

```
switch#show interfaces ethernet 1
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7302.2fff (bia 001c.7302.2fff)
  MTU 9212 bytes, BW 10000000 Kbit

switch#
```

11.4.7.2 clear mac address-table dynamic

The **`clear mac address-table dynamic`** command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

- To remove a specific entry, include its VLAN and interface in the command.
- To remove all dynamic entries for a VLAN, do not specify an interface.
- To remove all dynamic entries for an interface, do not specify a VLAN.
- To remove all dynamic entries, do not specify a VLAN or an interface.

Command Mode

Privileged EXEC

Command Syntax

`clear mac address-table dynamic` [**VLANS**][**INTERFACE**]

Parameters

- **VLANS** Table entries are cleared for specified VLANs. Options include:
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLAN specified by ***v_num***.
- **INTERFACE** Table entries are cleared for specified interfaces. Options include:
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **interface ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **interface port-channel *p_range*** port channel interfaces specified by ***p_range***.
  - **vxlan *vx_range*** VXLAN interfaces specified by ***vx_range***.

  Valid ***range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command clears all dynamic mac address table entries for ***port channel 5*** on ***VLAN 34***.

```
switch#clear mac address-table dynamic vlan 34 interface port-channel 5
switch#
```

11.4.7.3 clear server-failure servers inactive

The **clear server-failure servers inactive** command removes all inactive server entries from the server failed history list. The switch maintains this list, even after a server's ARP entry is removed, to maintain a list of servers that are connected to the switch and log the most recent time of the failure of the link that connects the switch to the server.

Command Mode

Privileged EXEC

Command Syntax

clear server-failure servers inactive

Related Command

show monitor server-failure history

Example

This command clears the inactive servers from the server failed history list.

```
switch#clear server-failure servers inactive
switch#
```

11.4.7.4 default-profiles

The **default-profiles** command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a **default-profile** command replaces the current default-profile statement in ***running-config***.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, **errdisable flap-setting cause link-flap** specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single **default-profiles** command.

The **no default-profiles** and **default default-profiles** commands restore the empty default-profile set by deleting the **default-profiles** command from ***running-config***.

Command Mode

Link-flap Configuration

Command Syntax

default-profiles [**LF_PROFILES**]

no default-profiles

default default-profiles

Parameters

LF_PROFILES Name of link-flap profiles assigned to default profile set. Parameter may contain zero, one, or multiple link-flap profile names:

- ***no parameter*** default-profile set is empty.
- ***profile*** name of single link-flap profile.
- ***profile_1 profile_2 ... profile_N*** list of link-flap profile names.

Related Commands

- **monitor link-flap policy** places the switch in ***link-flap-profiles*** configuration mode.
- **profile max-flaps (Link Flap Configuration)** configures link flap profiles.

Guidelines

The **errdisable flap-setting cause link-flap** statement is also configurable through the **profile max-flaps (Link Flap Configuration)** command.

Example

This command assigns configures ***LF01*** and ***LF02*** as the default-profile set.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#default-profiles LF01 LF02
switch(config-link-flap)#show active
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
   profile LF03 max-flaps 25 time 100 violations 2 intervals 12
   profile LF04 max-flaps 5 time 15 violations 1 intervals 3
   default-profiles LF01 LF02
switch(config-link-flap)#
```

11.4.7.5 description

The **description** command adds comment text for the configuration mode interface. The text provides information about the interface and has no effect on interface functions. The **show interfaces description** command displays interface description text.

The **no description** command removes the description text for the configuration mode interface from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

description *label_text*

no description

default description

Parameters

label_text character string assigned to description attribute.

Example

These commands add description text to ***interface Ethernet 23***, then displays the text through a **show interfaces description** command.

```
switch(config)#interface ethernet 23
switch(config-if-Et23)#description external line
switch(config-if-Et23)#show interfaces ethernet 23 description
Interface              Status     Protocol    Description
Et23                   up         up          external line
```

11.4.7.6 errdisable detect cause link-change

The **errdisable detect cause link-change** command enables the error-disabling of Ethernet interfaces when the switch detects a link flap error on the interface. The **errdisable flap-setting cause link-flap** command defines a link flap error in terms of the frequency of connection state changes.

The switch places an interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. To re-enable an error-disabled interface, enter **shutdown** and **no shutdown** command in the configuration mode for the interface.

By default, link flap detection is enabled. The **no errdisable detect cause link-change**command disables the triggering of error-disable actions. The **errdisable detect cause link-change** and **default errdisable detect cause link-change** commands enable the triggering of error-disable actions by removing the **no errdisable detect cause link-change** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable detect cause link-change

no errdisable detect cause link-change

default errdisable detect cause link-change

Examples

- This command disables error detection on the switch.

```
switch(config)#no errdisable detect cause link-change
switch(config)#
```

- These commands sets the link flap error criteria of ***15*** connection state changes over a ***30*** second period, then enables error detection on the switch.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15
 time 30
switch(config)#errdisable detect cause link-change
switch(config)#
```

11.4.7.7 errdisable flap-setting cause link-flap

The **errdisable flap-setting cause link-flap** command configures the link-flap frequency that defines an link-flap error on an Ethernet interface. The **errdisable detect cause link-change** command uses this criteria to trigger an error-disable action.

The link-flap frequency is defined by the quantity of link flaps (connection state changes) over a specified period. The default settings are five link flaps and ten seconds.

The **no errdisable flap-setting cause link-flap** and **default errdisable flap-setting cause link-flap** commands restore the default link flap cause settings by removing the **errdisable flap-setting cause link-flap** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable flap-setting cause link-flap max-flaps *quantity* time *period*

no errdisable flap-setting cause link-flap

default errdisable flap-setting cause link-flap

Parameters

- ***quantity*** Number of link flaps. Value ranges from ***1*** to ***100***. Default value is ***5***.
- ***period*** Interval over which link flaps accumulate to trigger an error condition (seconds). Value ranges from ***1*** to ***1800***. Default value is ***10***.

Example

This command sets the link flap error criteria of ***15*** connection state changes over ***30*** second periods.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time
 30
switch(config)#
```

11.4.7.8 errdisable recovery cause

The **errdisable recovery cause** command enables the automated recovery of error-disabled Ethernet interfaces. An interface that is disabled as a result of a specified condition attempts normal operation after a specified interval. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

Running-config can simultaneously store **errdisable recovery cause** statements for each error-disable condition. By default, error-disable recovery is disabled for all conditions.

The **no errdisable recovery cause** and **default errdisable recovery cause** commands disable automated recovery for interfaces disabled by the specified condition by removing the corresponding **errdisable recovery cause** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable recovery cause **CONDITION**

no errdisable recovery cause **CONDITION**

default errdisable recovery cause **CONDITION**

Parameters

CONDITION Disabling condition for which command automates recovery. Options include:

- **arp-inspection**
- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr_unsupported**

Related Command

errdisable recovery interval configures the period that an ethernet interface remains disabled before automated recovery begins.

Example

This command enables error-disable recovery for interfaces that are disabled by link-flap and bpduguard conditions and sets the errdisable recovery period at ***10*** minutes.

```
switch(config)#errdisable recovery cause bpduguard
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config

errdisable recovery cause bpduguard
errdisable recovery cause link-flap
errdisable recovery interval 600
!
```

```
switch(config)#
```

11.4.7.9 errdisable recovery interval

The **errdisable recovery interval** command specifies the period that an error-disabled Ethernet interface remains disabled before automated errdisable recovery begins. This command affects only interfaces whose automated recovery is enabled for the disabling condition (**errdisable recovery cause**). When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

The **no errdisable recovery interval** and **default errdisable recovery interval** commands restore the default error recovery period of ***300*** seconds by removing the **errdisable recovery interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

errdisable recovery interval *period*

no errdisable recovery interval

default errdisable recovery interval

Parameters

period Error disable recovery period (seconds). Value ranges from ***30*** to ***86400***. Default value is ***300***.

Related Command

errdisable recovery cause enables the automated recovery of error-disabled Ethernet interfaces.

Example

This command enables error-disable recovery for interfaces that are disabled by link-flap conditions and sets the errdisable recovery period at ***10*** minutes.

```
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config

!
errdisable recovery cause link-flap
errdisable recovery interval 600
!

!
i
switch(config)#
```

11.4.7.10 interface loopback

The **interface loopback** command places the switch in loopback-interface configuration mode for the specified interfaces. The command creates loopback interfaces for previously unconfigured interfaces.

The command can specify a single interface or multiple interfaces:

- **Single interface:** Command creates an interface if it specifies one that was not previously created.
- **Multiple interfaces:** Command is valid only if all specified interfaces were previously created.

The **no interface loopback** command removes the specified interfaces from **running-config**, including all interface configuration statements. The **default interface loopback** command removes all configuration statements for the specified loopback interface without deleting the loopback interface from ***running-config***.

The following commands are available in loopback configuration mode:

- **description**
- **exit**
- **ip address**
- **ip proxy-arp**
- **ipv6 address**
- **ipv6 enable**
- **load interval**
- **logging event**
- **mtu**
- **shutdown (Interfaces)**
- **snmp trap**

Command Mode

Global Configuration

Command Syntax

interface loopback *l_range*

no interface loopback *l_range*

default interface loopback *l_range*

Parameters

l_range Loopback interfaces (number, range, or comma-delimited list of numbers and ranges). Loopback number ranges from ***0*** to ***1000***.

Examples

- This command enters interface configuration mode for loopback interfaces ***1*** through ***5***.

```
switch(config)#interface loopback 1-5
switch(config-if-Lo1-5)#
```

- This command creates ***interface 23*** and enters interface configuration mode.

```
switch(config)#interface loopback 23
switch(config-if-Lo23)#
```

- This command removes loopback interfaces ***5*** through ***7*** from ***running-config***.

```
switch(config)#no interface loopback 5-7
switch(config)#
```

11.4.7.11 ip access-group (Control Plane mode)

The **ip access-group** command applies an IPv4 or standard IPv4 access control list (ACL) to the control plane.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from ***running-config***.

Command Mode

Control-plane Configuration

Command Syntax

ip access-group *list_name* [**VRF_INSTANCE**] **DIRECTION**

no ip access-group [*list_name*][**VRF_INSTANCE**] **DIRECTION**

default ip access-group [*list_name*][**VRF_INSTANCE**] **DIRECTION**

Parameters

- ***list_name*** name of ACL assigned to interface.
- **VRF_INSTANCE** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - **vrf *vrf_name*** changes are made to the specified user-defined VRF.
- **DIRECTION** transmission direction of packets, relative to interface. Valid options include:
  - **in** inbound packets.

Example

These commands apply the IPv4 ACL named ***test2*** to the control plane.

```
switch(config)#system control-plane
switch(config-system-cp)#ip access-group test2 in
switch(config-system-cp)#
```

11.4.7.12 link tracking group (interface)

The **`link tracking group`** command adds the configuration mode interface to a link-state group and specifies whether it is upstream or downstream.

The **`no link tracking group`** and **`default link tracking group`** commands remove the specified link-state group assignment for the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

`link tracking group` *group_name* **DIRECTION**

`no link tracking group` [*group_name*]

`default link tracking group` [*group_name*]

Parameters

- ***group_name*** link tracking group name.
- **DIRECTION** position of the interface in the link-state group. Valid options include:
  - **upstream**
  - **downstream**

Example

These commands create link-state group "***xyz***" and add ***VLAN interface 100*** to the group as an upstream interface.

```
switch(config)#link tracking group xyz
switch(config-link-state-xyz)#show active
link tracking group xyz
switch(config-link-state-xyz)#exit
switch(config)#interface vlan 100
switch(config-if-Vl100)#link tracking group xyz upstream
switch(config-if-Vl100)#show active
 interface Vlan100
   link state group xyz upstream
switch(config-if-Vl100)#
```

11.4.7.13 link tracking group

The **`link tracking group`** command creates and enables a link-state group and places the switch in link-state-group configuration mode. A link-state group consists of “upstream” interfaces (connections to servers) and “downstream” interfaces (connections to switches and clients). In the event of a failure of all upstream interfaces in the link-state group, the downstream interfaces are shut down.

The **`no link tracking group`** and **`default link tracking group`** commands delete the link tracking group from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`link tracking group` *group_name*

`no link tracking group` *group_name*

`default link tracking group` *group_name*

Parameters

group_name link-state group name.

Commands available in link-state Configuration Mode

links minimum configures the minimum number of links that the link-state group requires.

Example

This command creates and enables ***link-state group 1***.

```
switch(config)#link tracking group 1
switch(config-link-state-1)#
```

11.4.7.14 links minimum

The **links minimum** command specifies the minimum number of links the configuration mode link-state group requires.

The **no links minimum** and **default links minimum** commands restore the default minimum value of 1 by deleting the corresponding **links minimum** statement from ***running-config***.

Command Mode

Link-State Configuration

Command Syntax

links minimum *quantity*

no links minimum

default links minimum

Parameters

quantity Minimum number of links. Value ranges from ***1*** to ***100000***. Default value is ***1***.

Related Commands

- **link tracking group** creates and enables a link-state group and places the switch in ***link-state*** configuration mode.
- **link tracking group (interface)** adds the configuration mode interface to the specified link-state group.

Example

These commands configure link-state tracking group ***link-a*** to have at least ***60*** links.

```
switch(config)#link tracking group link-a
switch(config-link-state-link-a)links minimum 60
switch(config-link-state-link-a)
```

11.4.7.15 load interval

The **load-interval** command changes the load interval for the configuration mode interface. Load interval is the time period over which data is used to compute interface rate counters. Interface rates are exponentially weighted moving averages; recent data samples have greater influence than older samples. Statistics calculated with shorter load intervals are usually more sensitive to short traffic bursts.

The **no load-interval** and **default load-interval** commands restore the default value of 300 seconds by removing the corresponding **load-interval** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

Command Syntax

load-interval *delay*

no load-interval

default load-interval

Parameters

delay Load interval delay. Values range from ***5*** to ***600*** (seconds). Default value is ***300*** (five minutes).

Example

These commands set the load interval for ***Ethernet interface 7*** at ***60*** seconds.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#load-interval 60
switch(config-if-Et7)#
```

11.4.7.16 mac address learning

The **mac address learning** command enables MAC address learning on a VLAN configuration mode. By default, MAC address learning is enabled by on a VLAN.

The **no mac address learning** command disables MAC address learning for the VLAN configuration mode. The **mac address learning** and **default mac address learning** commands enable MAC address learning for the VLAN configuration mode by deleting the corresponding **no mac address learning** command from the ***running-config***.

Command Mode

Interface-VLAN Configuration

Command Syntax

mac address learning

no mac address learning

default mac address learning

Examples

- These commands enable MAC address learning on ***VLAN 10*** configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#mac address learning
```

- These commands disable MAC address learning on ***VLAN 10*** configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#no mac address learning
```

11.4.7.17 mac address-table aging-time

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

The **no mac address-table aging-time** and **default mac address-table aging-time** commands reset the aging time to its default by removing the **mac address-table aging-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`mac-address-table aging-time` *period*

`no mac-address-table aging-time`

`default mac-address-table aging-time`

Parameters

- ***period*** MAC address table aging time. Default is ***300*** seconds. Options include:
  - ***0*** disables deletion of table entries on the basis of aging time.
  - ***10*** through ***1000000*** (one million) aging period (seconds).

Example

This command sets the MAC address table aging time to two minutes (***120*** seconds).

```
switch(config)#mac address-table aging-time 120
switch(config)#
```

11.4.7.18 mac address-table static

The **mac address-table static** command adds a static entry to the MAC address table. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The command replaces existing dynamic or static table entries with the same VLAN-MAC address. Static entries are not removed by aging (**mac address-table aging-time**). Static MAC entries for mirror destinations or LAG members are typically avoided.

The most important byte of a MAC address distinguishes it as a unicast or multicast address:

- **Unicast:** most significant byte is an even number. Examples: ***0200.0000.0000*** ***1400.0000.0000***.
- **Multicast:** most significant byte is an odd number. Examples: ***0300.0000.0000*** ***2500.0000.0000***.

The **no mac address-table static** and **default mac address-table static** commands remove corresponding **mac address-table static** commands from ***running-config*** and MAC address table entries.

Command Mode

Global Configuration

Command Syntax

mac address-table static *mac_address* vlan *v_num* [**DESTINATION**]

no mac address-table static *mac_address* vlan *v_num* [**DESTINATION**]

default mac address-table static *mac_address* vlan *v_num* [**DESTINATION**]

Parameters

- ***mac_address*** Table entry's MAC address (dotted hex notation – H.H.H).
- ***v_num*** Table entry's VLAN.
- **DESTINATION** Table entry's port list.

  For multicast MAC address entries, the command may contain multiple ports, listed in any order. The CLI accepts only one interface for unicast entries.
- **drop** creates drop entry in table. Valid only for unicast addresses.
  - **interface ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **interface port-channel *p_range*** Port channel interfaces specified by ***p_range***.
  - ***no parameter*** Valid for **no** and **default** commands that remove multiple table entries.

    e_range and ***p_range*** formats include number, range, comma-delimited list of numbers and ranges.

Examples

- This command adds a static entry for unicast MAC address ***0012.3694.03ec*** to the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3
 interface
Ethernet 7
switch(config)#show mac address-table static
          Mac Address Table
```

```
---------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
   3    0012.3694.03ec    STATIC      Et7
Total Mac Addresses for this criterion: 1

          Multicast Mac Address Table
---------------------------------------------------------------

Vlan    Mac Address       Type        Ports
----    -----------       ----        -----
Total Mac Addresses for this criterion: 0

switch(config)#
```

- These commands adds a static drop entry for MAC address ***0012.3694.03ec*** to the MAC address table, then displays the entry in the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3 drop
switch(config)#show mac address-table static
          Mac Address Table
---------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move

----    -----------       ----        -----
   4    0112.3057.8423    STATIC      Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#
```

11.4.7.19 monitor link-flap policy

The **monitor link-flap policy** command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. Link-flap configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Link flap profiles are assigned to Ethernet interfaces and specify conditions that define a link-flap error. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

Command Mode

Global Configuration

Command Syntax

monitor link-flap policy

Commands Available in link-flap Configuration Mode

- **default-profiles** configures the set of profiles that define the default-profile set.
- **profile max-flaps (Link Flap Configuration)** configures a link-flap profile.

Examples

- These commands place the switch in ***link-flap*** configuration mode.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#
```

- This command returns the switch to ***global*** configuration mode.

```
switch(config-link-flap)#exit
switch(config)#
```

11.4.7.20 monitor link-flap profiles

The **monitor link-flap profiles** command enables link-flap monitoring on the configuration mode interface and specifies the error-disable criteria for the interface. Entering a **monitor link-flap profiles** command replaces the corresponding statement in ***running-config***.

The command enables the following link flap detection options:

- **monitor link-flap** (***no profiles listed***): The interface detects link flaps using the criteria defined by the default-profile set (**default-profiles**).
- **monitor link-flap profiles** (***at least one profile listed***): The interface detects link flaps using the criteria of the listed profiles. Error-disable criteria require conditions that match at least one profile.
- **default monitor link-flap**: The interface detects link flaps using the **errdisable flap-setting cause link-flap** and **errdisable recovery cause** commands.
- **no monitor link-flap**: The interface does not detect link flaps.
- **Default monitor link flap** is the default setting.

Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

Command Syntax

monitor link-flap [**LF_PROFILES**]

no monitor link-flap

default monitor link-flap

Parameters

LF_PROFILES Name of link-flap profiles assigned to interface. Parameter may contain zero, one, or multiple link-flap profile names:

- ***no parameter*** Link flap criteria determined by default-profile set.
- **profiles *profile_name*** Name of single link-flap profile.
- **profiles *profile_name_1 profile_name_2 ... profile_name_N*** List of link-flap profile names.

Examples

- This command applies the ***LF03*** and ***LF04*** link flap profiles to ***Ethernet interface 33***.

```
switch(config)#interface ethernet 33
switch(config-if-Et33)#monitor link-flap profiles LF03 LF04
switch(config-if-Et33)#show active
interface Ethernet33
   monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on ***Ethernet interface 34***.

```
switch(config)#interface ethernet 34
switch(config-if-Et34)#no monitor link-flap
switch(config-if-Et34)#show active
interface Ethernet34
   no monitor link-flap
switch(config-if-Et34)#
```

11.4.7.21 monitor server-failure link

The **monitor server-failure link** command enables Rapid Automated Indication of Link-Loss (RAIL) on the configuration mode interface. RAIL must be properly configured globally or this command has no effect on switch operation.

When an interface monitored by RAIL goes down, the switch performs these steps for servers that the switch accesses from the interface:

1. IP addresses of the servers are removed from ARP cache.
2. A dynamic MAC entry is added to the MAC address table for each server. The port for each entry is listed as CPU.

The **no monitor server-failure link** and **default monitor server-failure link** commands disable RAIL on the configuration mode interface by deleting the corresponding **monitor server-failure link** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

monitor server-failure link

no monitor server-failure link

default monitor server-failure link

Related Commands

monitor server-failure places the switch in server-failure configuration mode for configuring RAIL.

Example

These commands enable RAIL on ***port-channel interface 100***.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#monitor server-failure link
switch(config-if-Po100)#show active
interface Port-Channel100
   monitor server-failure link
switch(config-if-Po100)#
```

11.4.7.22 monitor server-failure

The **monitor server-failure** command places the switch in server-failure configuration mode. Rapid Automated Indication of Link-Loss (RAIL) settings are configured in server-failure configuration mode. RAIL is disabled by default and is enabled by the **no shutdown** command in server-failure configuration mode.

The **no monitor server-failure** and **default monitor server-failure** commands disable RAIL and restore all settings to their default state by removing all server-failure configuration mode statements from ***running-config***.

Server-failure configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting server-failure configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

monitor server-failure

no monitor server-failure

default monitor server-failure

Commands Available in server-failure Configuration Mode

- network (server-failure configuration mode)
- proxy (server-failure configuration mode)
- shutdown (server-failure configuration mode)

Examples

- These commands place the switch in server-failure configuration mode and enables RAIL.

```
switch(config)#monitor server-failure
switch(config-server-failure)#show active
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from ***running-config***.

```
switch(config)#no monitor server-failure
switch(config)#
```

11.4.7.23 monitor session destination cpu

The **monitor session destination cpu** command configures the CPU as the destination port of a specified port mirroring session. The **monitor session source** command configures the source port of the mirroring session. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction.

The CPU can only be configured as a destination for a mirroring session, not as a source. However, the CPU can serve as the destination for multiple mirroring sessions. Traffic mirrored to the CPU can be viewed using tcpdump.

The **no monitor session destination cpu** and **default monitor session destination cpu** commands remove the mirror session destination assignment by deleting the corresponding **monitor session destination cpu** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* **destination cpu**

no monitor session *session_name* **destination cpu**

default monitor session *session_name* **destination cpu**

Parameters

session_name Label assigned to port mirroring session.

Guidelines

To view the traffic mirrored to the CPU from a source port, use tcpdump from the Bash shell, with the source interface as an argument. This causes tcpdump to capture packets from the kernel interface of the source port.

Examples

- These commands configure ***Ethernet interface 35*** as the source and the CPU as the destination port for the ***redirect_1*** mirroring session, then display the mirror interface.

```
switch(config)#monitor session redirect_1 destination cpu
switch(config)#monitor session redirect_1 source ethernet 35
switch(config)#show monitor session

Session redirect_1
------------------------
Source Ports:

  Both:        Et35

Destination Ports:

    Cpu :  active (mirror0)

switch(config)#
```

- This command uses tcpdump to view the traffic mirrored by the ***redirect_1*** mirroring session. The CPU mirror interface specified in the previous output must be used in the tcpdump expression (in this case, ***mirror0***).

```
switch#bash tcpdump -i mirror0
tcpdump: WARNING: mirror0: no IPv4 address assigned
```

```
tcpdump: verbose output suppressed, use -v or -vv for full protocol
 decode
listening on mirror0, link-type EN10MB (Ethernet), capture size 65535
 bytes

switch#
```

11.4.7.24 monitor session destination

The **`monitor session destination`** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The monitor session source command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

Note: On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

The **`no monitor session destination`** and **`default monitor session destination`** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from ***running-config***. The **`no monitor session`** removes the entire mirroring session.

Command Mode

Global Configuration

Command Syntax

`monitor session` *session_name* **`destination`**{cpu | ethernet *e_range* | port-channel *p_range* | tunnel mode}

`no monitor session` *session_name* **`destination`**

`default monitor session` *session_name* **`destination`**

Parameters

- ***session_name*** label assigned to the port mirroring session.
- **cpu** configures a CPU as the destination interface.
- **ethernet *e_range*** configures Ethernet interfaces specified by ***e_range*** as the destination interface. The ethernet interface value ranges from ***1*** to ***50***.
- **port-channel *p_range*** configures port channel interfaces specified by ***p_range*** as the destination interface. The port-channel value ranges from ***1*** to ***2000***.
- **tunnel mode** configures a tunnel as the destination interface. Option includes:
  - **gre** configures GRE-tunnel as the destination interface.

Guidelines

Tunnel mode is supported on select platforms only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:

- **Arad Platform:** Ethernet interfaces (one).
- **FM6000 Platform:** Ethernet interfaces (any count), Port channel interfaces (any count), CPU.
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (one).
- **Trident II Platform:** Ethernet interfaces (one).

When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

Allowed VLANs on the ***ethernet8*** source interface are ***10***, ***20*** and ***30***. Allowed VLANs on ***ethernet9*** source interface are ***30***, ***40***, and ***50***. The frames going out of ***ethernet9*** tagged with ***10***, ***20***, and ***30*** appears at the mirrored destination as tagged frames. The tagged frames with ***40*** or ***50*** on ***ethernet9***

appears at the mirrored destination as untagged frames. Since ***ethernet8*** is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

Examples

- This command configures ***Ethernet interface 8*** as the destination port for the ***redirect_1*** mirroring session.

```
switch(config)#monitor session redirect_1 destination ethernet 2
switch(config)#show monitor session

Session redirect_1
------------------------
Source Ports:

Destination Ports:

    Et2 :  active

switch(config)#
```

- This command configures a GRE tunnel with source and destination addresses as ***1.1.1.1*** and ***2.2.2.2*** respectively as the destination interface for the ***redirect_2*** mirroring.

```
switch(config)#monitor session redirect_2 destination tunnel mode gre source
1.1.1.1 destination 2.2.2.2
switch(config)#show monitor session

Session redirect_2
-----------------------
Source Ports:

Destination Ports:

         status  source    dest    TTL  DSCP  proto    VRF     fwd-drop
 Gre1 :  active  1.1.1.1   2.2.2.2 128  0     0x88be   default no

switch(config)#
```

11.4.7.25 monitor session forwarding-drop

The **monitor session forwarding-drop** command configures a forwarding-drop session for mirroring ingress packets that are dropped during ASIC forwarding.

The **no monitor session forwarding-drop** and **default monitor session forwarding-drop** commands delete the current forwarding-drop configuration.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* **forwarding-drop destination tunnel mode**

no monitor session *session_name* **forwarding-drop destination tunnel mode**

default monitor session *session_name* **forwarding-drop destination tunnel mode**

Parameters

- **destination** specifies to mirror packets at destination.
- **tunnel mode** specifies to mirror packets that pass through a tunnel. Options include:
  - **gre** configures GRE-tunnel as the destination interface.

Related Commands

- monitor session destination
- monitor session destination cpu
- show monitor session

Guidelines

The forwarding-drop configuration is supported on select platforms only.

Example

This command configures a forwarding-drop session to ***1.1.1.1*** as the destination.

```
switch(config)#monitor session 1 forwarding-drop destination tunnel mode
 gre source 1.1.1.1 destination
2.2.2.2
switch(config)#show monitor session

Session 1
------------------------
Programmed in HW: No
Source Ports:
Destination Ports:
            status   source    dest      TTL   DSCP  proto    VRF
 fwd-drop
    Gre1 :  active   1.1.1.1   2.2.2.2   128    0    0x88be   default
 yes

switch(config)#
```

11.4.7.26 monitor session ip access-group

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port.ACLs applied to a source port affect the RX side of the interface, and do not impact the TX side of the interface. TX mirrored packets cannot be filtered, and will continue to be sent to the mirror destination.

The **no monitor session ip access-group** and **default monitor session ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session ip access-group** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* **ip access-group** *acl_name*

no monitor session *session_name* **ip access-group**

default monitor session *session_name* **ip access-group**

Parameters

- ***session_name*** Label assigned to port mirroring session.
- ***acl_name*** The ACL to be applied to filter traffic for the specified session.

Examples

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session ***redirect_1***.

```
switch(config)#ip access-list allow-host
switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host)#20 deny ip any any
switch(config-acl-allow-host)#exit
switch(config)#
switch(config)#monitor session redirect_1 ip access-group allow-host
switch(config)#
```

- Use the **show monitor session** command to verify the configuration.

```
switch#show monitor session
Session redirect_1
------------------------
Source Ports:
Both:        Et35(Acl:allow-host)
Destination Ports:
Cpu :  active (mirror0)
ip access-group: allow-host
switch#
```

11.4.7.27 monitor session source ip access-group

The **monitor session source ip access-group** command configures an ACL to filter the traffic being mirrored from a specific source port. This enables the ability to filter traffic using a different ACL on each source port and have the combined matched traffic sent to the destination port.

The **no monitor session source ip access-group** and **default monitor session source ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session source ip access-group** command from ***running-config***. The **no monitor session** command removes the entire mirror session.

Command Mode

Global Configuration

Command Syntax

monitor session *s_name* **source** **INT_NAME** [**DIRECT**] **ip access-group** *acl_name*

no monitor session *s_name* **source** **INT_NAME** [**DIRECT**] **ip access-group** *acl_name*

default monitor session *s_name* **source** **INT_NAME** [**DIRECT**] **ip access-group** *acl_name*

Parameters

- ***s_name*** Label assigned to port mirroring session.
- **INT_NAME** Source interface for the mirroring session.
  - **ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel** ***p_range*** Port channel interfaces specified by ***p_range***.
- **DIRECT** transmission direction of traffic to be mirrored. Options include:
  - ***no parameter*** mirrors received traffic only.
  - **rx** mirrors received traffic only.
- ***acl_name*** The ACL to be applied to filter traffic for the specified session.

Example

These commands create ACLs and apply them to filter the traffic mirrored from two source ports by session ***redir_1***.

```
switch(config)#ip access-list allow-host-x
switch(config-acl-allow-host-x)#10 permit ip host 192.168.11.24 host
 10.0.215.23
switch(config-acl-allow-host-x)#20 deny ip any any
switch(config-acl-allow-host-x)#exit
switch(config)#ip access-list allow-host-y
switch(config-acl-allow-host-y)#10 permit ip host 172.16.233.80 host
 10.0.215.23
switch(config-acl-allow-host-y)#20 deny ip any any
switch(config-acl-allow-host-y)#exit
switch(config)#monitor session redir_1 source ethernet 5,9 rx
switch(config)#monitor session redir_1 source ethernet 5 ip access-group
allow-host-x
switch(config)#monitor session redir_1 source ethernet 9 ip access-group
allow-host-y
switch(config)#
```

11.4.7.28 monitor session source

The **monitor session source** command configures the source port of a specified port mirroring session. The **monitor session destination** or **monitor session destination cpu** command configures the destination port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. An interface which is part of a port channel cannot be used as a source, but a port channel which is a member of an MLAG can be used. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

The **no monitor session source** and **default monitor session source** commands remove the mirroring session source assignment by deleting the corresponding **monitor session source** command from ***running-config***. The **no monitor session** removes entire the mirroring session.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* **source INT_NAME DIRECTION**

no monitor session *session_name* **source INT_NAME DIRECTION**

default monitor session *session_name* **source INT_NAME DIRECTION**

Parameters

- ***session_name*** Label assigned to port mirroring session.
- **INT_NAME** Source interface for the mirroring session.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **DIRECTION** transmission direction of traffic to be mirrored.
  - ***no parameter*** mirrors transmitted and received traffic.
  - **both** mirrors transmitted and received traffic.
  - **rx** mirrors received traffic only.
  - **tx** mirrors transmitted traffic only.

Guidelines

On DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series, due to limitations of the switch ASIC, all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device is unable to process VLAN tags in a desirable manner mirroring should be configured exclusively for ingress traffic by specifying **rx**.

Restrictions

Port mirroring capacity varies by platform. Session source capacity for each platform is listed below:

- **FM6000 Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Arad Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Trident II Platform:** Ethernet interfaces (any number), port channel interfaces (any number).

  The number of interfaces that can be effectively mirrored is restricted by the destination port speed.

Example

This command configures ***Ethernet interface 7*** as the source port for ***redirect_1*** mirroring session.

```
switch(config)#monitor session redirect_1 source ethernet 7
switch(config)#
```

11.4.7.29 monitor session truncate

The **monitor session truncate** command configures a port mirroring session to truncate mirrored packets, retaining only the first ***160*** bytes. Packet truncation can be used to prevent oversubscription of the session's destination port.

Packet truncation applies to the mirroring session as a whole, and cannot be applied to individual source ports.

The **no monitor session truncate** and **default monitor session truncate** commands restores mirroring of full packets by deleting the corresponding **monitor session truncate** command from ***running-config***. The **no monitor session** removes the entire mirroring session.

Command Mode

Global Configuration

Command Syntax

monitor session *session_name* **truncate**

no monitor session *session_name* **truncate**

default monitor session *session_name* **truncate**

Parameters

session_name Label assigned to port mirroring session.

Example

This command configures mirroring session ***redirect_1*** to truncate mirrored packets.

```
switch(config)#monitor session redirect_1 truncate
switch(config)#
```

11.4.7.30 mtu

The **mtu** command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. The switch fragments IP packets that are larger than the MTU value for the outbound interface. An interface's MTU value is displayed with the **show interfaces** command.

MTU is independently configurable on all routable interfaces.

The **no mtu** and **default mtu** commands restore the interface's MTU to the default value by removing the corresponding mtu command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

mtu *bytes*

no mtu

default mtu

Parameters

bytes MTU size (bytes). Values range from ***68*** to ***9214***. The default MTU size is ***1500*** bytes.

Example

This command sets the MTU size of ***1492*** bytes on ***VLAN interface 20***.

```
switch(config)#interface vlan 20
switch(config-if-Vl20)#mtu 1492
switch(config-if-Vl20)#
```

11.4.7.31 network (server-failure configuration mode)

The **network** command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. RAIL reduces the wait time for applications on directly connected servers that are blocked due to a failed link. ***Running-config*** supports simultaneous network command, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

The **no network** and **default network** commands terminate the RAIL monitoring of the specified IPv4 address space by deleting the corresponding **network** command from ***running-config***.

Command Mode

Server-failure Configuration

Command Syntax

network *netv4_address*

no network *netv4_address*

default network *netv4_address*

Parameters

netv4_addr IPv4 subnet address to be monitored (CIDR or address-mask notation).

Related Command

monitor server-failure places the switch in server-failure configuration mode.

Example

This command specifies two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)#monitor server
switch(config-server-failure)#network 10.1.1.0/24
switch(config-server-failure)#network 10.2.1.96/28
switch(config-server-failure)#show active
monitor server-failure
   network 10.2.1.96/28
   network 10.1.1.0/24
switch(config-server-failure)#
```

11.4.7.32 no monitor session

The **no monitor session** and default monitor session commands remove the specified monitor session from the switch by deleting all corresponding monitor commands from ***running-config***. Commands that remove or alter individual commands within a session configuration are described in the **monitor session destination** and monitor session source commands.

Command Mode

Global Configuration

Command Syntax

no monitor session *session_name*

default monitor session *session_name*

Parameters

session_name Label assigned to port mirroring session.

Example

This command displays the configuration of the ***redirect_1*** mirroring session, deletes the session, then confirms that the session was removed.

```
switch(config)#show monitor session redirect_1
Session redirect_1
-----------------------
Source Ports
  Both:        Et7
Destination Port: Et8
switch(config)#no monitor session redirect_1
switch(config)#show monitor session redirect_1
Session not created

switch(config)#
```

11.4.7.33 phy diag

Use the **phy diag** command to configure a test pattern in the interface configuration mode. The **no** and **default** forms of the command disables the test pattern.

Command Mode

Interface configuration mode

Command Syntax

phy diag [transmitter | receiver] test pattern *TestPattern*

no phy diag [transmitter | receiver] test pattern *TestPattern*

default phy diag [transmitter | receiver] test pattern *TestPattern*

Parameters

- **transmitter** Configures the physical transmitter.
- **receiver** Configures the physical receiver.
- **test pattern *TestPattern*** Configures the named test pattern.

Examples

- Enable a test pattern on an interface using the **phy diag** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)#phy diag [ transmitter | receiver ] test pattern ?
  PRBS11  Configure the PRBS11 test pattern
  PRBS15  Configure the PRBS15 test pattern
  PRBS23  Configure the PRBS23 test pattern
  PRBS31  Configure the PRBS31 test pattern
  PRBS49  Configure the PRBS49 test pattern
  PRBS58  Configure the PRBS58 test pattern
  PRBS7   Configure the PRBS7 test pattern
  PRBS9   Configure the PRBS9 test pattern
```

- To disable a test pattern on an interface, enter the following command. You can select the tranmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)#no phy diag [ transmitter | receiver ] test
 pattern TestPattern
```

- By default, a test pattern is disabled.

```
switch(config-if)#default phy diag [ transmitter | receiver ] test
 pattern
```

- The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to ***0*** and link states are marked as **not locked**.

```
switch#clear phy diag test pattern
```

11.4.7.34 platform sand monitor serdes error log

The **platform sand monitor serdes error log** command is used for enabling the serdes error log for fabric link monitoring.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes error log

Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)#platform sand monitor serdes error log
switch(config)#
```

11.4.7.35 platform sand monitor serdes error threshold

The **platform sand monitor serdes error threshold** command is used for generating a fabric link monitoring serdes error threshold.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes error threshold

Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between ***200*** and ***30000*** received cells.

```
switch(config)#platform sand monitor serdes error threshold 200 30000
switch(config)#
```

11.4.7.36 platform sand monitor serdes poll period

The **platform sand monitor serdes poll period** command is used to enable the serdes poll period.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll period

Example

This command changes the serdes polling period for fabric link monitoring to ***6*** seconds.

```
switch(config)#platform sand monitor serdes poll period 6
switch(config)#
```

11.4.7.37 platform sand monitor serdes poll threshold isolation

The **platform sand monitor serdes poll threshold isolation** command is used to set and enables fabric link monitoring for serdes poll threshold isolation.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll threshold isolation

Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is ***5*** consecutive polls.

```
switch(config)#platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

11.4.7.38 platform sand monitor serdes poll threshold recovery

The **platform sand monitor serdes poll threshold recovery** command is used to set and enable fabric link monitoring for serdes poll threshold recovery.

Command Mode

Global Configuration

Command Syntax

platform sand monitor serdes poll threshold recovery

Example

This command changes the number of consecutive serdes polls used for threshold recovery to **6** seconds.

```
switch(config)#platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

11.4.7.39 profile max-flaps (Link Flap Configuration)

The **`profile max-flaps`** command creates a link flap profile that, when assigned to an Ethernet interface, specifies the conditions that result in an error-disable action. Link flap profile parameters include:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

By default, **violations** and **intervals** are each set to one, resulting in a profile that triggers a link-flap error when the specified frequency is exceeded once. By configuring violations and intervals, link-flap errors are defined when the frequency is exceeded multiple times over a specified set of intervals.

Default is a reserved profile name that modifies the **errdisable flap-setting cause link-flap** statement in ***running-config***. When configuring the **default** profile, **violations** and **intervals** are disregarded.

The **`no profile max-flaps`** command removes the specified profile by deleting the corresponding **`profile max-flaps`** command from ***running-config***. The **`no profile max-flaps default`** command restores default errdisable flap-setting cause link-flap values by removing that command from ***running-config***.

Command Mode

Link-flap Configuration

Command Syntax

`profile` **PROFILE_NAME** **`max-flaps`** *flap_max* time *period* [**EXTENTIONS**]

`no profile` **LF_PROFILE**

Parameters

- **PROFILE_NAME** Name of link flap profile. Options include:
  - **default** command modifies default values (**errdisable flap-setting cause link-flap**).
  - ***profile_name*** command modifies specified link-flap profile.
- ***flap_max*** Threshold number of interface state changes. Value ranges from ***1*** to ***100***.
- ***period*** Interval when flaps accumulate toward threshold (seconds). Value ranges from ***1*** to ***1800***.
- **EXTENSIONS** Configures multi-flap triggers. Options include:
  - ***no parameter*** Sets errors and episodes to default values (one).
  - **violations *errors* intervals *episodes*** Link flap errors (***errors***) and number of periods (***episodes***).
    - ***Errors*** range is ***1*** to ***1000***. Default value is ***1***.
    - ***Episodes*** range is ***1*** to ***1000***. Default value is ***1***.

Related Command

monitor link-flap policy places the switch in ***link-flap*** configuration mode.

Example

These commands create two link flap profiles with various trigger settings.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5
 intervals
10
switch(config-link-flap)#show active
```

```
monitor link-flap policy
   profile LF01 max-flaps 15 time 60 violations 1 intervals 1
   profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#
```

11.4.7.40 proxy (server-failure configuration mode)

The **proxy** command enables the Rapid Automated Indication of Link-Loss (RAIL) proxy setting and specifies the interval that RAIL responds to messages sent to servers on failed links, starting from when the switch detects the failed link. The RAIL state machine is in the proxying state during the timeout interval this command specifies. When RAIL proxy is not enabled, the switch maintains a list of unavailable servers without responding to messages sent the servers. The switch can enter RAIL proxy state only when this command is enabled.

The RAIL proxy setting is **disabled** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to disabled by removing the proxy statement from ***running-config***.

The **no proxy lifetime** and **default proxy lifetime** command sets the proxy time setting to its default value of three minutes if the RAIL proxy setting is **enabled**. These commands have no effect if the RAIL proxy setting is **disabled**.

Command Mode

Server-failure Configuration

Command Syntax

proxy [lifetime *time_span*]

no proxy [lifetime]

default proxy [lifetime]

Parameters

timespan proxy timeout period (minutes). Value ranges from *1* to ***10080***. Default value is ***3***.

Related Command

monitor server-failure places the switch in server-failure configuration mode.

Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of **10** minutes.

```
switch(config)#monitor server
switch(config-server-failure)#proxy lifetime 10
switch(config-server-failure)#show active
monitor server-failure
   proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of **3** minutes.

```
switch(config-server-failure)#no proxy lifetime
switch(config-server-failure)#show active
monitor server-failure
   proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)#no proxy
switch(config-server-failure)#show active
monitor server-failure
switch(config-server-failure)#
```

11.4.7.41 show bridge mac-address-table aging timeout

The **`show bridge mac-address-table aging timeout`** command displays the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries that exceed the aging time.

Aging time ranges from ***10*** seconds to ***1000000*** seconds with a default of ***300*** seconds (five minutes).

Command Mode

EXEC

Command Syntax

```
show bridge mac-address-table aging timeout
```

Example

This command shows the MAC address table aging time.

```
switch>show bridge mac-address-table aging timeout
Global Aging Time:  120
switch>
```

11.4.7.42 show errdisable recovery

The `show errdisable recovery` command displays information about the recovery intervals and error disable causes.

Command Mode

EXEC

Command Syntax

`show errdisable recovery`

Parameters

- ***no parameter*** state of the system.

The following output is for a system where the causes are listed and interval timer for each cause is identified along with the timer status.

```
switch#show errdisable recovery
Errdisable Reason              Timer Status   Timer Interval
------------------------------ ---------------- --------------
   bpduguard                      Disabled                30
   hitless-reload-down            Disabled               300
   lacp-no-portid                 Disabled               N/A
   lacp-rate-limit                Disabled               300
   license-enforce                Disabled               N/A
   link-flap                      Disabled               300
   no-internal-vlan               Disabled               300
   uplink-failure-detection       Disabled               300
```

11.4.7.43 show fabric monitoring health

The **platform sand monitor health** command is used to display the fabric monitoring connected state status with isolated links.

Command Mode

Global Configuration

Command Syntax

platform sand monitor health

Example

This command displays the connected state status with isolated links.

```
switch(config)#show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

11.4.7.44 show interfaces

The **show interfaces** command displays operational status and configuration information of specified interfaces. The output includes speed, duplex, flow control information and basic interface statistics.

The input and output bit rates, as displayed, do not include framing bits that are part of the Ethernet standard, the inter-frame gap and preamble that total 20 bytes per packet. The percentage number includes those framing bits to provide a better link utilization estimate.

Command Mode

EXEC

Command Syntax

show interfaces [**INT_NAME**]

Parameters

INT_NAME Interface type and numbers. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command display configuration and status information for Ethernet interface ***1*** and ***2***.

```
switch>show interfaces ethernet 1-2
Ethernet1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7647 (bia 001c.2481.7647)
  Description: mkt.1
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 33.5 Mbps (0.3% with framing), 846 packets/sec
  5 seconds output rate 180 kbps (0.0% with framing), 55 packets/sec
     76437268 packets input, 94280286608 bytes
     Received 2208 broadcasts, 73358 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     6184281 packets output, 4071319140 bytes
     Sent 2209 broadcasts, 345754 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output
Ethernet2 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2481.7648 (bia 001c.2481.7648)
  Description: mkt.2
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 711 kbps (0.0% with framing), 271 packets/sec
  5 seconds output rate 239 kbps (0.0% with framing), 65 packets/sec
```

```
     73746370 packets input, 78455101010 bytes
     Received 11 broadcasts, 83914 multicast
     0 runts, 0 giants
     0 input errors, 0 CRC, 0 alignment, 0 symbol
     0 PAUSE input
     5687714 packets output, 4325064454 bytes
     Sent 15 broadcasts, 107279 multicast
     0 output errors, 0 collisions
     0 late collision, 0 deferred
     0 PAUSE output
switch>
```

11.4.7.45 show interfaces description

The **`show interfaces description`** command displays the status and description text of the specified interfaces. The description command configures an interface's description parameter.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INT_NAME**] **`description`**

Parameters

INT_NAME Interface type and labels. Options include:

- ***no parameter*** all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***vx_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Range formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays description text and status of ***ethernet interfaces 1-10***.

```
switch>show interfaces ethernet 1-10 description
Interface                      Status         Protocol Description
Et1                            up             up       ctar_01
Et2                            up             up       ctar_02
Et3                            up             up       ctar_03
Et4                            up             up       fobd_01
Et5                            up             up       fobd_02
Et6                            up             up       yzrq_01
Et7                            up             up       yzrq_02
Et8                            down           down     yzrq_03
Et9                            up             up       yzrq_04
Et10                           up             up       yzrq_05
switch>
```

11.4.7.46 show interfaces phy diag

Command Mode

EXEC

Command Syntax

`show interfaces` [interface type *interface range*] `phy diag` [error-correction | test pattern]

Parameters

- **interface type *interface range*** Type of interface and range.
- **error-correction** Forwards error correction.
- **test pattern** Displays test patterns.

Guidelines

The user-configured test pattern is displayed under the **`Configured`** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **`Operational`** column. The **`Available`** column lists the test patterns available for the interface.

Example

- In this example, interfaces ethernet 26/1 and ethernet 31/1 in the **`show interfaces ethernet 26/1,31/1 phy diag test pattern`** command are selected to display the the configured and operational test pattern, and the available test patterns.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern
                Configured       Operational
Interface     Transmit Receive Transmit Receive Available
------------- -------- ------- -------- ------- ----------------------
Ethernet26/1  PRBS15   PRBS15  PRBS15   PRBS15  PRBS 7,9,11,15,23,31,58
Ethernet31/1  PRBS7    PRBS31  PRBS7    PRBS31  PRBS 7,9,11,15,23,31,58
```

  The user-configured test pattern is displayed under the **`Configured`** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **`Operational`** column. The **`Available`** column lists the test patterns available for the interface.
- In this example, the **`show interfaces ethernet 26/1 phys detail | i Test pattern`** command displays the operational test pattern for an interface. Here the **`Test pattern`** field will not be available, on disabling the test pattern.

```
switch#show interfaces ethernet 26/1 phy detail | i Test pattern
  Test pattern                 enabled
switch#show interfaces ethernet 31/1 phy detail | i Test pattern
  Test pattern                 enabled
```

- In this example, the **`show interfaces ethernet 26/1,31/1 phy diag test pattern counters`** command displays test pattern link state and error information.

  The following information is listed in the display output:

  - **Link state:** whether or not the checker locked on to the configured test pattern.
  - **Bit Errors:** the accumulated number of bit errors.
  - **Largest Burst:** the largest burst of errors that occurred.
  - **Burst Count:** the number of occurrences of errors.
  - **Last Error Time:** the last time an error has occurred, ‘never’ if no errors have occurred.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern counters
Current System Time: Wed May 30 22:24:32 2018
                                          Largest    Burst
Interface        Lane  Link State  Bit Errors   Burst      Count  Last Error Time
---------------- ----- ----------- ------------ ---------- ------ ----------------
Ethernet26/1     0     locked      409266       409266     1       0:21:27 ago
```

```
Ethernet26/1     1     locked      347084       347084     1       0:21:27 ago
Ethernet26/1     2     locked      420681       420681     1       0:21:27 ago
Ethernet26/1     3     locked      392969       392969     1       0:21:27 ago
Ethernet31/1     0     not locked  1417655      651822     3       0:03:20 ago
Ethernet31/1     1     not locked  1782238      736819     3       0:03:20 ago
Ethernet31/1     2     not locked  1760538      866185     3       0:03:20 ago
Ethernet31/1     3     not locked  1817413      923941     3       0:03:20 ago
```

- In this example, the **`show interfaces ethernet 26/1,31/1 phy diag test pattern counters`** command displays the lock state of an interface along with a detailed information on the recorded bit errors.

  The following information is listed in the display output:

  - **Last clear:** the time when the test pattern results were last cleared.
  - **Operational test pattern:** the test pattern operational at the receiver side.
  - **Bit rate:** the transmission bit rate.
  - **Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
    - **locked:** receiver is able to lock on to the incoming test pattern.
    - **not locked:** receiver is not able to lock on to the incoming test pattern.
  - **Largest burst:** the largest burst of errors that occurred.
  - **Bit errors*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The * suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
  - **Total Bits:** the total bits received.
  - **Bit error rate (BER)*:**the ratio of captured bit errors to the total bit received. The * suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
  - **Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
  - **Total bits since last lock:** the total bits received since last lock.
  - **BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

```
switch#show interfaces ethernet 26/1,31/1 phy diag test pattern counters detail
*: Data may not be accurate due to loss of lock.

11.4.7.47 show link tracking group

The **show link tracking group** command displays information about a specified link-state group or about all groups.

Command Mode

EXEC

Command Syntax

show link tracking group [**DATA_LEVEL**][**GROUPS**]

Parameters

- **DATA_LEVEL** device for which the command provides data. Options include:
  - ***no parameter*** information about all groups in group list.
  - **detail** detailed information about all groups in group list.
- **GROUPS**
  - ***no parameter*** all link-state groups.
  - ***group_name*** link-state group name.

Example

This command displays all the link-state group information.

```
switch#show link tracking group detail
Link State Group: 1 Status: up
Upstream Interfaces : Vlan100
Downstream Interfaces : Vlan200
Number of times disabled : 2
Last disabled 0:10:29 ago

Link State Group: group3 Status: down
Upstream Interfaces : Ethernet24
Downstream Interfaces : Ethernet8
Number of times disabled : 2
Last disabled 0:30:35 ago

Link State Group: 2 Status: up
Upstream Interfaces : Ethernet2 Ethernet5
Downstream Interfaces : Ethernet12
Number of times disabled : 0
Last disabled never
switch#
```

11.4.7.48 show mac address-table count

The **show mac-address-table count** command displays the number of entries in the MAC address table for the specified VLAN or for all VLANs.

Command Mode

EXEC

Command Syntax

show mac address-table count [**VLANS**]

Parameters

VLANS The VLANs for which the command displays the entry count.

- ***no parameter*** all configured VLANs.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command displays the number of entries on ***VLAN 39***.

```
switch>show mac address-table count vlan 39

Mac Entries for Vlan 39:
---------------------------
Dynamic Address Count            : 1
Unicast Static  Address Count    : 1
Multicast Static  Address Count  : 0
Total Mac Addresses              : 2

switch>
```

11.4.7.49 show mac address-table mlag-peer

The **`show mac-address-table mlag-peer`** command displays the specified MAC address table entries learned from the MLAG peer switch.

Command Mode

EXEC

Command Syntax

`show mac address-table mlag-peer` [**ENTRY_TYPE**][**MAC_ADDR**][**INTF_1 ... INTF_N**] [**VLANS**]

Parameters

- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - ***no parameter*** all MLAG peer entries.
  - **configured** static entries on MLAG peer; includes unconfigured VLAN entries.
  - **dynamic** entries learned on MLAG peer.
  - **static** MLAG entries entered by CLI commands and include a configured VLAN.
  - **unicast** MLAG entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table
- show mac address-table multicast

11.4.7.50 show mac address-table multicast brief

The **`show mac-address-table`** command displays a summary of multicast MAC address table entries.

Command Mode

EXEC

Command Syntax

`show mac address-table multicast` [**VLANS**] **`brief`**

Parameters

VLANS command filters display by VLAN.

- ***no parameter*** all VLANs.
- **vlan *v_num*** VLANs specified by ***v_num***.

Related Command

show mac address-table multicast.

11.4.7.51 show mac address-table multicast

The **`show mac-address-table`** command displays the specified multicast MAC address table entries.

Command Mode

EXEC

Command Syntax

`show mac address-table multicast` [**MAC_ADDR**][**INTF**][**VLANS**]

Parameters

- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table
- show mac address-table multicast brief

11.4.7.52 show mac address-table

The **show mac-address-table** command displays the specified MAC address table entries.

Command Mode

EXEC

Command Syntax

show mac address-table [**ENTRY_TYPE**][**MAC_ADDR**][**INTF_1 ... INTF_N**][**VLANS**]

Parameters

- **ENTRY_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - ***no parameter*** all table entries.
  - **configured** static entries; includes unconfigured VLAN entries.
  - **dynamic** entries learned by the switch.
  - **static** entries entered by CLI commands and include a configured VLAN.
  - **unicast** entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - ***no parameter*** all MAC addresses table entries.
  - **address *mac_address*** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - ***no parameter*** all Ethernet and port channel interfaces.
  - **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **VLANS** command filters display by VLAN.
  - ***no parameter*** all VLANs.
  - **vlan *v_num*** VLANs specified by ***v_num***.

Related Commands

- show mac address-table mlag-peer
- show mac address-table multicast

Examples

- This command displays the MAC address table.

11.4.7.53 show monitor server-failure history

The **show monitor server-failure history** command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

The history is cleared by removing RAIL from the switch (**no monitor server-failure**).

Command Mode

EXEC

Command Syntax

show monitor server-failure history

Related Command

clear server-failure servers inactive

Example

This command displays the Fast Server Failure link failure history from the time RAIL is instantiated on the switch.

```
switch>show monitor server-failure history
Total server failures: 4

Server IP   Server MAC           Interface       Last Failed

```

11.4.7.54 show monitor server-failure servers

The **show monitor server-failure servers** command displays status and configuration information about each server that RAIL is monitoring. The display format depends on the parameter specified by the command:

- **single IP address:** command displays information about the server at the specified address, including IP address, MAC address, RAIL state, the time of most recent entry of all RAIL states, and the number of failed, proxied, and inactive state entries.
- **no parameter, key specifying a server list:** command displays a table. Each row corresponds to a monitored server. Information that the command displays includes IP address, MAC address, RAIL state, the time of most recent link failure.

Command Mode

EXEC

Command Syntax

show monitor server-failure servers [**SERVER_LIST**]

Parameters

SERVER_LIST Servers for which command displays information. Valid options include:

- ***no parameter*** all servers in up, down, and proxying states.
- ***ipv4_addr*** individual server; command displays detailed information.
- **all** all servers on monitored networks.
- **inactive** all servers in inactive state.
- **proxying** all servers in proxying state.

Examples

- This command displays RAIL information for the server at IP address ***10.11.11.7***.

```
switch>show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address        : 10.11.11.7

```

11.4.7.55 show monitor server-failure

The **show monitor server-failure** command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

Command Mode

EXEC

Command Syntax

show monitor server-failure

Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch>show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
   10.2.1.96/28      : 0 servers
   10.1.1.0/24       : 0 servers
   10.3.0.0/16       : 3 servers
switch>
```

11.4.7.56 show monitor session

The **show monitor session** command displays the configuration of the specified port mirroring session. The command displays the configuration of all mirroring sessions on the switch when the session name parameter is omitted.

Command Mode

EXEC

Command Syntax

show monitor session **SESSION_NAME**

Parameters

SESSION_NAME Port mirroring session identifier. Options include:

- ***no parameter*** displays configuration for all sessions.
- ***label*** command displays configuration of the specified session.

Example

This command displays the mirroring configuration of the specified monitor session.

```
switch>show monitor session redirect_1

Session redirect_1
------------------------

Source Ports

  Both:        Et7

Destination Port: Et8
switch(config)>
```

11.4.7.57 show platform trident mirroring

The **show platform trident mirroring** command displays current parameters of all configured mirroring sessions in Trident series platforms.

Command Mode

Privileged EXEC

Command Syntax

show platform trident mirroring [detail | session]

Parameters

- **detail** displays the detailed information of all configured mirroring sessions.
- **session *session_name*** displays the information of specified mirroring session.

Guidelines

This command is supported on DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

Examples

- This command displays the detailed information of all configured mirroring sessions.

```
switch(config)#show platform trident mirroring detail

switch(config)#
```

11.4.7.58 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the **clear counters** command.

Command Mode

EXEC

Command Syntax

show port-channel load-balance [**MEMBERS**]

Parameters

MEMBERS List of port channels for which information is displayed. Options include:

- ***no parameter*** All configured port channels.
- ***c_range*** Ports in specified channel list (number, number range, or list of numbers and ranges).

Example

This command displays traffic distribution for all configured port channels.

```
switch>show port-channel load-balance

11.4.7.59 show port-security interface

The **show port-security interface** command displays the switchport port-security status of all specified interfaces.

Command Mode

EXEC

Command Syntax

show port-security interface [**INT_NAME**]

Parameters

INT_NAME Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command display port-security configuration and status for the specified interfaces.

```
switch>show port-security interface ethernet 7-8
Interface                   : Ethernet7
Port Security               : Enabled
Port Status                 : Secure-down
Violation Mode              : Shutdown

Maximum MAC Addresses       : 1
Aging Time                  : 5 mins
Aging Type                  : Inactivity
SecureStatic Address Aging  : Disabled
switch>
```

11.4.7.60 show port-security mac-address

The **show port-security mac-address** command display static unicast MAC addresses assigned to interfaces where switchport port security is enabled.

Command Mode

EXEC

Command Syntax

show port-security mac-address

Example

This command displays MAC addresses assigned to port-security protected interfaces.

```
switch>show port-security mac-address
Secure Mac Address Table
------------------------------------------------------------------------
Vlan    Mac Address       Type                Ports   Remaining Age
                                                              (mins)

switch>
```

11.4.7.61 show port-security

The **show port-security** command displays a summary of MAC address port security configuration and status on each interface where switchport port security is enabled.

Command Mode

EXEC

Command Syntax

show port-security

Display Values

Each column corresponds to one physical interface. The table displays interfaces with port security enabled.

- **Secure Port:** Interface with switchport port-security enabled.
- **MaxSecureAddr:** Maximum quantity of MAC addresses that the specified port can process.
- **CurrentAddr:** Static MAC addresses assigned to the interface.
- **SecurityViolation:** Number of frames with unsecured addresses received by port.
- **Security Action:** Action triggered by a security violation.

These are the value displayed by the command.

- **Aging Time:** Age of Mac address.
- **MAC Moveable:** Mac address movement.
- **Port Security:** Enabled or disabled status

Examples

- This command displays switchport port security configuration and status data.

```
switch>show port-security
Secure Port    MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
               (Count)        (Count)      (Count)

```

11.4.7.62 show storm-control

The **`show storm-control`** command displays the storm-control level and interface inbound packet capacity for the specified interface.

The configured value (**storm-control**) differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. This command displays the broadcast or multicast rate after this adjustment.

Command Mode

Privileged EXEC

Command Syntax

`show storm-control` [**INT_NAME**]

Parameters

- ***no parameter*** Command returns data for all interfaces configured for storm control.
- **INT_NAME** interface type and port range. Settings include:
  - **ethernet *e_range*** Ethernet interfaces that ***e_range*** denotes.
  - **port-channel *p_range*** Port channel interfaces that ***p_range*** denotes.

    When storm control commands exist for a port-channel and an Ethernet port that is a member of the port channel, the command for the port-channel takes precedence.

    Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the storm control configuration for ***Ethernet port 2*** through ***Ethernet port 4***.

```
switch#show storm-control
Port          Type  Level Rate(Mbps)   Status      Drops Reason
Et10/2         all     75       7500   active          0
Et10/3   multicast     55       5500   active          0
Et10/4   broadcast     50       5000   active          0
switch#
```

11.4.7.63 show switch forwarding-mode

The **show switch forwarding-mode** command displays the switch's current and available forwarding plane hardware modes.

Command Mode

EXEC

Command Syntax

show switch forwarding-mode

Related Command

switch forwarding-mode configures the switch's forwarding mode setting.

Example

This command changes the switch's forward mode to **store-and-forward**, then displays the forwarding mode.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#show switch forwarding-mode
Current switching mode:    store and forward
Available switching modes: cut through, store and forward
```

11.4.7.64 show track

The **show track** command displays information about tracked objects configured on the switch.

Command Mode

EXEC

Command Syntax

show track [**OBJECT**][**INFO_LEVEL**]

Parameters

- **OBJECT** tracked object for which information is displayed. Options include:
  - ***no parameter*** displays information for all tracked objects configured on the switch.
  - ***object_name*** displays information for the specified object.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** displays complete information including object status, number of status changes, time since last change, and client process tracking the object (if any).
  - **brief** displays brief list of all tracked objects and their current status.

Examples

- This command displays all information for tracked object ***ETH8***.

```
switch#show track ETH8
Tracked object ETH8 is up
   Interface Ethernet8 line-protocol
      4 change, last change time was 0:36:12 ago
   Tracked by:
      Ethernet5/1 vrrp instance 50
switch#
```

- This command displays summary information for all tracked objects.

```
switch#show track brief
Tracked object ETH2 is up
Tracked object ETH4 is down
Tracked object ETH6 is up
Tracked object ETH8 is up
switch#
```

11.4.7.65 shutdown (server-failure configuration mode)

The **shutdown** command disables Rapid Automated Indication of Link-Loss (RAIL). By default, RAIL is disabled.

After entering server-failure configuration mode, a **no shutdown** command is required to enable RAIL.

The **no shutdown** command enables RAIL on the switch. The **shutdown** and **default shutdown** commands disable RAIL by removing the shutdown command from ***running-config***.

Command Mode

Server-failure Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- This command enables RAIL on the switch.

```
switch(config)#monitor server
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
   no shutdown
switch(config-server-failure)#
```

- This command disables RAIL on the switch.

```
switch(config-server-failure)#shutdown
switch(config-server-failure)#show active
monitor server-failure
switch(config-server-failure)#
```

11.4.7.66 storm-control

The **storm-control** command configures and enables storm control on the configuration mode physical interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **storm-control all** threshold overrides broadcast and multicast thresholds.

The threshold is a percentage of the available port bandwidth and is configurable on each interface for each transmission mode.

The **no storm-control** and **default storm-control** commands remove the corresponding **storm-control** statement from ***running-config***, disabling storm control for the specified transmission type on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

storm-control MODE level *threshold*

no storm-control MODE

default storm-control MODE

Parameters

- **MODE** packet transmission type. Options include:
  - **all**
  - **broadcast**
  - **multicast**
- ***threshold*** Inbound packet level that triggers storm control, as a percentage of port capacity. Value ranges from ***0.01*** to ***100***. Storm control is suppressed by a level of ***100***.

  The configured value differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. The **show storm-control** command displays the broadcast or multicast rate after this adjustment.

Restrictions

The **storm-control all** option is not available on Arad platform switches.

Example

These commands enable multicast and broadcast storm control on ***Ethernet port 20*** and sets thresholds of ***65%*** (multicast) and ***50%*** (broadcast). During each one second interval, the interface drops inbound multicast traffic and broadcast traffic in excess of the specified thresholds.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#storm-control multicast level 65
switch(config-if-Et20)#storm-control broadcast level 50
switch(config-if-Et20)#show active
interface Ethernet20
   storm-control broadcast level 50
   storm-control multicast level 65
switch(config-if-Et20)#
```

11.4.7.67 switch forwarding-mode

The **`switch forwarding-mode`** command specifies the mode of the switch's forwarding plane hardware. The default forwarding mode is **cut through**.

The **`no switch forwarding-mode`** and **`default switch forwarding-mode`** commands restore the default forwarding mode by removing the **`switch forwarding-mode`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`switch forwarding-mode` **MODE_SETTING**

`no switch forwarding-mode`

`default switch forwarding-mode`

Parameters

MODE_SETTING Specifies the switch's forwarding plane hardware mode. Options include:

- **cut-through** the switch begins forwarding frames before their reception is complete.
- **store-and-forward** the switch accumulates entire packets before forwarding them.

Guidelines

The forwarding plane mode is **store-and-forward** on Petra and Arad platform switches.

Related Command

show switch forwarding-mode displays the current forwarding mode.

Example

This command changes the forwarding mode to **store-and-forward**.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#
```

11.4.7.68 switchport default mode access

The **`switchport default mode access`** command places the configuration mode interface in ***switched port default access*** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

Command Mode

Global Configuration

Command Syntax

`switchport default mode access`

Related Command

switchport default mode routed puts a switch with all ports in routed port mode.

Example

This command puts a switch with all ports in access port mode.

```
switch(config)#switchport default mode access
```

11.4.7.69 switchport default mode routed

The **`switchport default mode routed`** command places the configuration mode interface in ***switched port default routed*** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

By default, on a switch with default startup config or no config, all ports come up in access mode. By adding the CLI command **`switchport default mode routed`** to kickstart config, all ports will come up in routed mode after boot up. On boot up, Zero Touch Provisioning (ZTP) is enabled by default if the startup config (/mnt/flash/startupconfig) is deleted. ZTP can be disabled by setting DISABLE=True in ZTP config (/mnt/flash/zerotouchconfig). Kickstart config (/mnt/flash/kickstart-config) is used when startup config is missing and ZTP is disabled.

Command Mode

Global Configuration

Command Syntax

`switchport default mode routed`

Related Command

switchport default mode access puts a switch with all ports in access port mode.

Example

This command puts a switch with all ports in routed port mode.

```
switch(config)#switchport default mode routed
```

11.4.7.70 switchport mac address learning

The **switchport mac address learning** command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The **no switchport mac address learning** command disables MAC address learning for the configuration mode interface. The **switchport mac address learning** and **default switchport mac address learning** commands enable MAC address learning for the configuration mode interface by deleting the corresponding **no switchport mac address learning** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport mac address learning

no switchport mac address learning

default switchport mac address learning

Example

These commands disables MAC address learning for Ethernet interface 8, then displays the active configuration for the interface.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
interface Ethernet8
   no switchport mac address learning
switch(config-if-Et8)#
```

11.4.7.71 switchport port-security mac-address maximum

The **switchport port-security mac-address maximum** command specifies the maximum MAC address limit for the configuration mode interface when configured as a secure port. When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. Once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port becomes errdisabled. The **switchport port-security** command configures an interface as a secure port.

The **no switchport port-security mac-address maximum** and **default switchport port-security mac-address maximum** commands restore the maximum MAC address limit of one on the configuration mode interface by removing the corresponding **switchport port-security mac-address maximum** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security mac-address maximum *max_addr*

no switchport port-security mac-address maximum

default switchport port-security mac-address maximum

Parameters

max_addr maximum number of MAC addresses. Value ranges from ***1*** to ***1000***. Default value is ***1***.

Example

These commands configure a maximum of five incoming addresses for secure ***port channel interface 14***.

```
switch(config)#interface port-channel 14
switch(config-if-Po14)#switchport port-security mac-address maximum 5
switch(config-if-Po14)#
```

11.4.7.72 switchport port-security violation

The **switchport port-security violation** command configures port security in protect mode (with the option of enabling logging) or the shutdown mode.

The **no switchport port-security** and **no switchport port-security violation protect log** commands disable port security protect mode and port security protect mode logging on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security violation {protect [log]| shutdown}

no switchport port-security violation protect log

default switchport port-security violation protect log

Parameters

- **protect** configures the port security in the protect mode.
- **shutdown** configures the port security in the shutdown mode.
- **log** the log of new addresses seen after limit is reached in the protect mode.

Guidelines

When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. The **switchport port-security** command configures an interface as a secure port.

In the protect mode, the ACLs are dynamically created to block incoming MAC addresses when the configured maximum MAC value is reached.

In the shutdown mode, once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port is set to be errdisabled.

Examples

- These commands configure port security violation protect mode for ***secure port channel interface 14***.

```
switch(config)#interface port-channel 14
switch(config-if-Po14)#switchport port-security violation protect
switch(config-if-Po14)#
```

- These commands configure port security violation protect logging mode for ***secure port channel interface 14***.

```
switch(config)#interface port-channel 14
switch(config-if-Po14)#switchport port-security violation protect log
switch(config-if-Po14)#
```

- These commands configure port security violation shutdown mode for ***secure port channel interface 15***.

```
switch(config)#interface port-channel 15
switch(config-if-Po15)#switchport port-security violation shutdown
switch(config-if-Po15)#
```

11.4.7.73 switchport port-security

The **switchport port-security** command enables MAC address port security on the configuration mode interface. Ports with port security enables restrict traffic to a limited number of hosts, as determined by their MAC addresses. On enabling the **switchport port-security** command, the port-security mode would be 'shutdown', by default.

The **switchport port-security mac-address maximum** command specifies the maximum number of MAC addresses. The **switchport port-security violation** command enables port security in protect mode.

The **no switchport port-security** and **default switchport port-security** commands disable port security on the configuration mode interface by removing the corresponding **switchport port-security** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport port-security

no switchport port-security

default switchport port-security

Example

These commands enable port security on ***ethernet interface 7***.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport port-security
switch(config-if-Et7)#
```

11.4.7.74 switchport

The **switchport** command places the configuration mode interface in ***switched port*** (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

The no switchport command places the configuration mode interface in ***routed port*** (Layer 3) mode. Routed ports are not members of any VLANs and do not switch or bridge packets. All IP level configuration commands, including IP address assignments, apply directly to the routed port interface.

By default, Ethernet and Port Channel interfaces are in switched port mode. The **default switchport** command also places the configuration mode interface in switched port mode by removing the corresponding **no switchport** command from ***running-config***.

These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport

no switchport

default switchport

Guidelines

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. The **vlan internal order** command specifies the method that VLANs are allocated.

All IP-level configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. Any IP-level configuration changes made to a routed interface are maintained when the interface is toggled to switched port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration statements are not propagated to the LAG from its component members.

Examples

- These commands put ***Ethernet interface 5*** in routed port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#
```

- These commands returns ***Ethernet interface 5*** to switched port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport
switch(config-if-Et5)#
```

11.4.7.75 system control-plane

The **`system control-plane`** command places the switch in ***control-plane*** configuration mode. Control-plane mode is used for assigning an ACL (access control list) to the control plane.

The ***control-plane*** configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. Exiting ***control-plane*** configuration mode does not affect the configuration.

The **`exit`** command returns the switch to ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

`system control-plane`

Command Available in control-plane Configuration Mode

ip access-group (Control Plane mode)

Examples

- This command places the switch in the ***control plane*** mode.

```
switch(config)#system control-plane
switch(config-system-cp)
```

- This command assigns the ***control-plane-2*** ACL to the control plane.

```
switch(config-system-cp)#ip access-group control-plane-2
switch(config-system-cp)
```

- This command exits the ***control plane*** mode.

```
switch(config-system-cp)#exit
switch(config)
```

11.4.7.76 track

The **track** command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The **no track** and **default track** commands remove the specified tracked object by removing the corresponding **track** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

track *object_name* interface **INTERFACE_NAME PROPERTY**

no track *object_name*

default track *object_name*

Parameters

- ***object_name*** User-created name for the tracked object.
- **INTERFACE_NAME** Interface associated with the tracked object. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **PROPERTY** Tracked property. Options include:
  - **line-protocol** Object changes when the state of the associated interface changes.

Example

This command creates a tracked object which tracks the state of the line protocol on ***Ethernet interface 8***.

```
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#
```

11.4.7.77 traffic-loopback

The **traffic-loopback** command is used to create loopbacks to verify the functionality of interfaces and partner links. The **source** determines whether outgoing traffic is being looped back to the interface (**system**) to test the interface itself, or incoming traffic is being looped back to the link partner (**network**) to test the link between the systems. The **device** determines whether **system** traffic is looped on the physical level (**phy**) or Layer-2 level (**mac**). Only the **phy** level is available for **network** traffic.

The **no traffic-loopback** command deletes the loopback configuration.

Command Mode

Interface Configuration

Command Syntax

traffic-loopback source [system|network] device [phy|mac]

no traffic-loopback

Parameters

- **system** loops outgoing traffic back to the interface.
- **network** loops incoming traffic back to the link partner.
- **phy** implements loopback in the physical layer.
- **mac** implements loopback in the MAC layer (available only for **system** traffic).

Examples

- These commands cause outgoing traffic on ***Ethernet interface 1*** to be looped back to the interface at the MAC level.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#traffic-loopback source system device mac
switch(config-if-Et1)#
```

- These commands cause incoming traffic on ***Ethernet interface 1*** to be looped back to the link partner at the physical level.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#traffic-loopback source network device phy
switch(config-if-Et1)#
```

- These commands delete the loopback configuration from ***Ethernet interface 1***.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#no traffic-loopback
switch(config-if-Et1)#
```

11.5 Octal Port Renumber to Four Interfaces

For an octal port such as a QSFPDD or OSFP, this feature renumbers the ports on a system to have 4 configurable interfaces instead of eight. The original octal would have had eight interfaces named ***x/1*** to ***x/8*** where x is the front panel port number.

The four interfaces created by this feature are named ***x/1*** to ***x/4*** instead and each interface has two transceiver lanes attached to it. Thus each interface can be configured to two-lane, four-lane or eight-lanes speeds as appropriate. However, the interfaces are restricted from any single-lane speeds and are not capable of a full breakout.

The entire chassis must be renumbered. This feature is not supported on a per-line card or per-port basis. Any cards in the same chassis that do not support this feature are unaffected. For affected line cards, both the configurable speeds and the default speeds of all interfaces are affected.

Supported Speeds

Table 67: Supported Speeds on Octal Ports

Interface Name With Feature	Interface Name Without Feature	Supported Speeds with Feature	Default Speed
Ethernetx/1	Ethernetx/1	400G-8, 200G-4, 100G-2, 100G-4	400G-8
Nonexistent	Ethernetx/2	N/A	N/A
Ethernetx/2	Ethernetx/3	100G-2	100G-2
Nonexistent	Ethernetx/5	N/A	N/A
Ethernetx/3	Ethernetx/5	200G-4, 100G-2, 100G-4	100G-2
Nonexistent	Ethernetx/6	N/A	N/A
Ethernetx/4	Ethernetx/7	100G-2	100G-2
Nonexistent	Ethernetx/8	N/A	N/A

11.5.1 Configuring Octal Port Renumber to 4 Interfaces

In order to configure a chassis to octal port renumbering with four interfaces, a boot command is used.

The boot command is different from a standard CLI command since it takes effect very early in the boot process but can be configured in the same way. Therefore it requires a reboot after the CLI command in order to take effect.

Since the ports will be renumbered for all cards that support the feature, the current configuration of the switch may no longer make sense after the reboot. Please ensure all interface configurations reflect the new naming scheme. The following items should be addressed prior to enabling or disabling the feature and performing a reboot:

1. Change interface naming appropriately.
2. Review interface speeds to ensure they are supported with the feature.
3. Review change in interface defaults to ensure the feature's defaults are desired.
4. Review changes to SNMP OIDs for affected interfaces.

From the CLI configuration mode, use the following command to enable the feature:

```
switch(config)#boot port numbering octal interfaces 4
```

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

From the CLI configuration mode, use the following command to disable the feature:

```
switch(config)#no boot port numbering octal interfaces 4
```

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

11.5.2 Show Commands

To confirm the command has taken effect, expose inactive interfaces with the **`service interface inactive expose`** CLI command and confirm the affected linecards only have four interfaces for each front panel port.

```
switch#(config-if-Et16/1,16/3)#show interfaces et15/1-16/1 status
Port       Name   Status       Vlan     Duplex Speed  Type         Flags
 Encapsulation
Et15/1            connected    1        full   400G   400GBase-CR8
Et15/2            inactive     1        full   100G   Not Present
Et15/3            inactive     1        full   100G   Not Present
Et15/4            inactive     1        full   100G   Not Present
Et16/1            connected    1        full   400G   400GBase-CR8
```

11.5.3 Limitations

- A config replace of the startup config does not affect the configuration of this feature.
- Since the feature is stored in flash:boot-config, removing or overwriting the boot-config can affect the presence of the feature on the next reboot.

11.5.4 Commands

- boot port numbering octal interfaces 4

11.5.4.1 boot port numbering octal interfaces 4

The **`boot port numbering octal interfaces 4`** command configures a chassis to octal port renumbering with four interfaces.

The **`no boot port numbering octal interfaces 4`** command disable the ***boot port numbering octal interfaces 4*** configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

`boot port numbering octal interfaces 4`

`no boot port numbering octal interfaces 4`

Example

To enable ***boot port numbering octal interfaces 4***, use the following command:

```
switch(config)#boot port numbering octal interfaces 4
```

Chapter 12

Layer 2 Configuration

This chapter contains the following sections:

- Spanning Tree Protocol
- Link Layer Discovery Protocol
- Virtual LANs (VLANs)
- DCBX and Flow Control
- IP Locking
- Layer 2 Subinterfaces

12.1 Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols.

These sections describe the Arista Spanning Tree Protocol implementation.

- Introduction to Spanning Tree Protocols
- Spanning Tree Overview
- Configuring a Spanning Tree
- STP Commands

12.1.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

12.1.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:

- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:

- Spanning Tree Protocol Versions
- Structure of a Spanning Tree Instance
- BPDUs

12.1.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as ***IEEE 802.1D***:

- Slow convergence to the new spanning tree topology after a network change.
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

12.1.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in ***802.1w*** and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard ***802.1D-2004*** incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

12.1.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance Layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

12.1.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends Rapid Spanning Tree Protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

MST Regions

An *MST region* is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

MST Instances

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance.

- *Multiple Spanning Tree instances* (MSTIs) consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

MSTP-Rapid PVST+ Interoperation

MSTP-Rapid PVST+ interoperation allows protocol-level interaction between MSTP and Rapid PVST + by consuming and transmitting PVST BPDUs through MSTP at the border ports. While transmitting from Rapid PVST+ to MSTP or vice-versa, you can deploy MSTP in certain regions and Rapid PVST + in other regions based on their merits or other factors. MSTP-Rapid PVST+ interoperation allows MSTP to work with any Rapid PVST+ implementation.

MSTP inter-operation can be viewed as bi-directional BPDU conversion occurring at MSTP PVST+ border ports as following:

- The outgoing Common Internal Spanning Tree (CIST) BPDU is projected as Rapid PVST+ BPDUs across various VLANs.
- Incoming PVST+ topology BPDU is mapped to corresponding MSTI based on incoming VLAN.

The following restrictions are enforced based on port role. These are relevant only for border ports with roles designated or root (for CIST) that can potentially forward.

- Case (A): If the MSTP-Rapid PVST+ border port role is designated for CIST, it should not receive any superior PVST BPDU (with respect to CIST). Root of all VLANs in the PVST region should be towards the MSTP region.
- Case (B): If the MSTP-Rapid PVST+ border port role is root for CIST, it should not receive any inferior Rapid PVST+ BPDU (with respect to CIST). Root of all VLANs in the Rapid PVST+ region should be within the PVST+ region.

Note: If the restrictions are violated, the port enters blocking state. The BPDU translation occurs only on MSTP-Rapid PVST+ border ports with the forwarding state for CIST.

It is desirable to configure multiple MSTP-Rapid PVST+ border ports confirming to Case(A) for a specified Rapid PVST+ region as it allows VLAN load balancing across the ports. This can be achieved by adjusting the per-VLAN port cost towards the Rapid PVST+ region such that the per-VLAN root port is evenly distributed across the border ports.

12.1.2.1.4 Version Interoperability

A network can contain switches running different spanning tree versions. The Common Spanning Tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST**: VLAN 1
- **MST**: IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.
- An MST bridge detects a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.
- MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The **`clear spanning-tree detected-protocols`** command forces MST ports to renegotiate with their neighbors.

12.1.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- STP is disabled on ports configured as primary or backup interfaces.
- Static MAC addresses should be configured after primary-backup pairs are established.

12.1.2.2 Structure of a Spanning Tree Instance

A Layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.

The following sections describe spanning tree configuration parameters.

12.1.2.2.1 Root and Designated Bridges

The **root bridge** is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network components distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A **designated bridge** is defined for each network segment as the switch that provides the segments shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in **Spanning Tree Network Example** assume that each path has the same cost:

- ***Switch B*** is the root bridge its bridge ID is lowest because it has the smallest port priority.
- ***Switch A*** is the designated bridge for ***VLAN 11***.
- ***Switch B*** is the designated bridge for ***VLAN 10***, ***VLAN 13***, ***VLAN 16***, ***VLAN 18***, ***VLAN 19***.
- ***Switch C*** is the designated bridge for ***VLAN 25***.
- ***Switch D*** is the designated bridge for ***VLAN 21***, ***VLAN 23***.

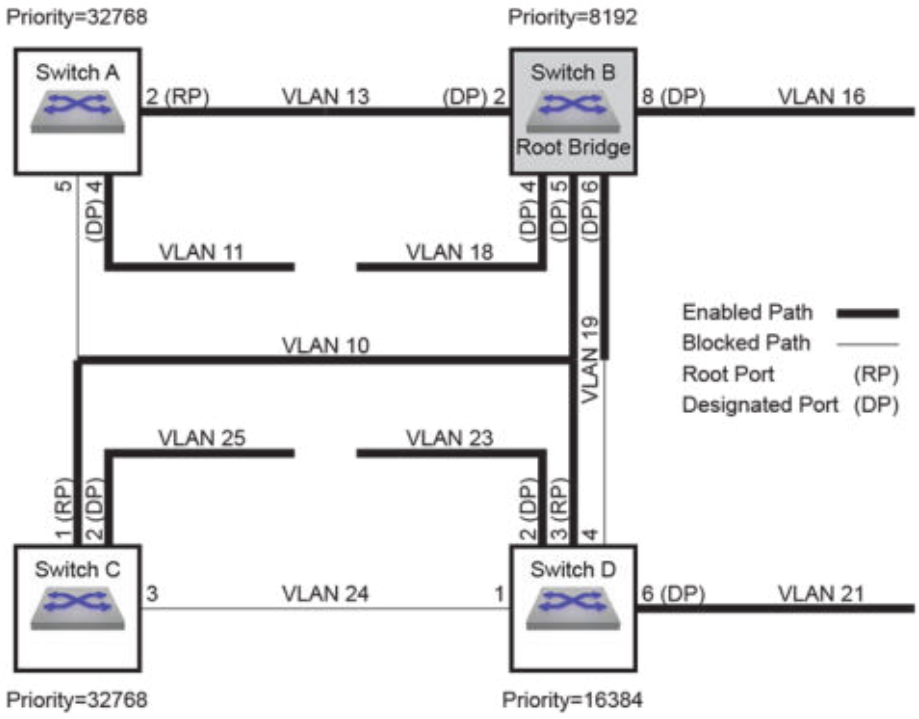

Figure 26: Spanning Tree Network Example

12.1.2.2.2 Port Roles

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least cost-path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- Root Port (RP) accesses the bridges least-cost path to the root bridge. Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

  The following ports in **Spanning Tree Network Example** are root ports:

  - ***Switch A***: ***port 2***
  - ***Switch C***: ***port 1***
  - ***Switch D***: ***port 3***
- Designated Port (DP) accesses a network segments designated bridge. Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

The following ports in **Spanning Tree Network Example** are designated ports:

- ***Switch A***: ***port 4*** (***VLAN 11***)
- ***Switch B***: ***port 2*** (***VLAN 13***), ***port 4*** (***VLAN 18***), ***port 5*** (***VLAN 10***), ***port 6*** (***VLAN 19***), ***port 8*** (***VLAN 16***)
- ***Switch C***: ***port 2*** (***VLAN 25***)
- ***Switch D***: ***port 2*** (***VLAN 23***), ***port 6*** (***VLAN 21***)

- Alternate ports provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.
- Backup ports provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

12.1.2.2.3 Port Activity States

A ports activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding:** The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.
- **Discarding:** The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.
- **Learning:** The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

12.1.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes. RSTP port types include normal, network, and edge ports. **Normal** is the default port type.

- **Normal** ports have an unspecified topology.
- **Network** ports connect only to switches or bridges.

  RSTP immediately transitions network ports to the discarding state.
- **Edge** ports connect directly to end stations.

  Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

12.1.2.2.5 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- The default link type for full-duplex ports is **point-to-point**.
- The default link type for half-duplex ports is **shared**.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

12.1.2.3 BPDUs

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch.

Switches exchange topology information through Bridge Protocol Data Units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

12.1.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
- Topology Change Notification (TCN) BPDU, announces network topology changes.
- Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:

- Source address: outbound port's MAC address.
- Destination address: STP multicast address ***01:80:C2:00:00:00***.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The **hello timer** specifies the period between consecutive BPDU messages; the default is two seconds.

12.1.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When **edge** ports and **point-to-point** links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.

12.1.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

- RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
- RSTP bridges increment the **message age timer** only once while data flows through an MST region; MSTP measures **time to live** with a **remaining hops** variable, instead of the message age timer.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are *boundary ports*.

12.1.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- Version Configuration and Instance Creation
- Spanning Tree Instance Configuration
- Port Roles and Rapid Convergence
- Configuring BPDU Transmissions

12.1.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The **spanning-tree mode** global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

12.1.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the **spanning-tree mode** command with the **mstp** option. MSTP is the default STP version.

Example

This command enables Multiple Spanning Tree.

```
switch(config)#spanning-tree mode mstp
switch(config)#
```

Configuring MST Regions

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. MST configuration mode commands sets the region parameters. The ***MST*** configuration mode is a group-change mode where changes are saved by exiting the mode.

Example

The **spanning-tree mst configuration** command places the switch in the ***MST*** configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#
```

The **instance** command assigns VLANs to MST instances. The **name (mst-configuration mode)** and **revision (mst-configuration mode)** commands configure the MST region name and revision.

Examples

- These commands assign ***VLANs 4-7*** and ***9*** to instance ***8*** and remove ***VLAN 6*** from instance ***10***.

```
switch(config-mst)#instance 8 vlans 4-7,9
switch(config-mst)#no instance 10 vlans 6
switch(config-mst)#
```

- These commands assign the **name** (***corporate_1***) and **revision** (***3***) to the switch.

```
switch(config-mst)#name corporate_1
switch(config-mst)#revision 3
switch(config-mst)#
```

The **exit (mst-configuration mode)** command transitions the switch out of the ***MST*** configuration mode and saves all pending changes. The **abort (mst-configuration mode)** command exits the ***MST*** configuration mode without saving the pending changes.

Example

This command exits the ***MST*** configuration mode and saves all pending changes.

```
switch(config-mst)#exit
switch(config)#
```

Configuring MST Instances

These STP commands provide an optional MST instance parameter. These commands apply to instance ***0*** when the optional parameter is not included.

- **spanning-tree priority**
- **spanning-tree root**
- **spanning-tree port-priority**

Examples

- This command configures priority for MST instance ***4***.

```
switch(config)#spanning-tree mst 4 priority 4096
switch(config)#
```

- Each of these commands configure priority for MST instance ***0***.

```
switch(config)#spanning-tree mst 0 priority 4096
```

or

-

```
switch(config)#spanning-tree priority 4096
```

12.1.3.1.2 Rapid Spanning Tree (RST)

Rapid spanning tree is enabled through the **spanning-tree mode** command with the **rstp** option.

Example

- This command enables Rapid Spanning Tree.

```
switch(config)#spanning-tree mode rstp
switch(config)#
```

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance ***0*** also apply to the RSTP instance.

- **spanning-tree priority**
- **spanning-tree root**
- **spanning-tree port-priority**

Examples

- These commands apply to the RST instance.

```
switch(config)#spanning-tree priority 4096
```

and

```
switch(config)#spanning-tree mst 0 priority 4096
```

- These commands do not apply to the RST instance.

```
switch(config)#spanning-tree mst 4 priority 4096
```

and

```
switch(config)#spanning-tree vlan-id 3 priority 4096
```

Show commands (such as **show spanning-tree**) displays the RSTP instance as MST0 (MST instance ***0***).

Example

- This command, while the switch is in RST mode, displays RST instance information.

```
switch(config)#show spanning-tree
MST0
  Spanning tree enabled protocol rstp<---RSTP mode indicator
  Root ID    Priority    32768
             Address     001c.730c.1867
             This bridge is the root

  Bridge ID  Priority    32768  (priority 32768 sys-id-ext 0)
             Address     001c.730c.1867
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15
 sec

Interface        Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- -----
Et51             designated forwarding 2000      128.51   P2p

switch(config)#
```

12.1.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)

Rapid-PVST mode is enabled by the **spanning-tree mode** command with the **rapid-pvst** option.

Example

- This command enables Rapid Per-VLAN Spanning Tree.

```
switch(config)#spanning-tree mode rapid-pvst
switch(config)#
```

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- **spanning-tree priority**
- **spanning-tree root**
- **spanning-tree port-priority**
- **spanning-tree mst pvst border**

Examples

- This command configures bridge priority for ***VLAN 4***.

```
switch(config)#spanning-tree vlan-id 4 priority 4096
switch(config)#
```

- This command enables MSTP PVST+ border ports. The command is effective only if spanning-tree mode is MSTP.

```
switch(config)#spanning-tree mst pvst border
```

12.1.3.1.4 Switchport Backup Mode

Switchport backup interface pairs are enabled through the **spanning-tree mode** command with the **backup** option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the **Loop Protection** feature.

Example

This command enables switchport backup.

```
switch(config)#spanning-tree mode backup
switch(config)#
```

The **switchport backup-link** command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

Example

These commands establish ***Ethernet interface 7*** as the backup port for ***Ethernet interface 1***.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport backup-link ethernet 7
switch(config-if-Et1)#
```

The **prefer** option of the **switchport backup-link** command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

Examples

These steps perform the following:

- configures ***Ethernet interface 1*** as a trunk port that handles VLANs ***4*** through ***9*** traffic.
- configures ***Ethernet interface 2*** as the backup interface.
- assigns ***Ethernet 2*** as the preferred interface for VLANs ***7*** through ***9***.

1. Enter configuration mode for the primary interface.

```
switch(config)#interface ethernet 1
```

2. Configure the primary interface as a trunk port that services VLANs ***4-9***

```
switch(config-if-Et1)#switchport mode trunk
switch(config-if-Et1)#switchport trunk allowed vlan 4-9
```

3. Configure the backup interface and specify the VLANs that it normally services.

```
switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan 7-9
switch(config-if-Et1)#
```

12.1.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

Note: Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the **monitor loop-protection** command to enter loop-protection configuration mode, then use the **no shutdown (Loop-protection)** command to enable the feature. To enable loop protection on a VLAN, use the **protect vlan** command. To exclude a port from loop protection, use the **no loop-protection** command.

The feature is configured with the following additional commands:

- **transmit-interval**
- **disabled-time**
- **rate-limit**

Examples

- This command enters loop protection configuration mode.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#
```

- These commands enable loop protection on VLANs ***1025-2000***.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#no shutdown
switch(config-monitor-loop-protect)#protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

- These commands exclude ***Ethernet interface 38*** from loop protection.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#no loop-protection
switch(config-if-Et38)#
```

- These commands configure loop protection with a transmission interval of ***10*** seconds, a disabled time of two days, and a maximum rate of ***500*** loop detection frames per second.

```
switch(config-monitor-loop-protect)#transmit-interval 10
switch(config-monitor-loop-protect)#disabled-time 172800
switch(config-monitor-loop-protect)#rate-limit 500
switch(config-monitor-loop-protect)#
```

12.1.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the **spanning-tree mode** command with the **none** option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.

Example

This command disables all STP functions.

```
switch(config)#spanning-tree mode none
switch(config)#
```

12.1.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

1. The bridge with the lowest ID is elected root bridge.
2. Root ports (RP) are selected on all other bridges.
3. Designated bridges are selected for each network segment.
4. Designated ports (DP) are selected on each designated bridge.
5. Networks begin forwarding data through RPs and DPs. All other ports are blocked.

12.1.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is:

- Priority (four bits)

  Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.
- Protocol Dependent (twelve bits)
  - **Rapid-PVST:** VLAN number
  - **MST:** Instance number
  - **RST:** 0
- MAC address of switch (six bytes)

Example

The switch defines bridge IDs for three MST instances:

- **MST 0:** ***32768*** (Priority (***32768***)+Instance number(***0***)) and ***001c.7301.23de*** (MAC address)
- **MST101:** ***32869*** (Priority (***32768***)+Instance number(***101***)) and ***001c.7301.23de*** (MAC address)
- **MST102:** ***32870*** (Priority (***32768***)+Instance number(***102***)) and ***001c.7301.23de*** (MAC address)

This command displays a table of root bridge information.

```
switch>show spanning-tree root
                  Root ID          Root    Hello  Max  Fwd
Instance    Priority    MAC addr Cost    Time   Age  Dly  Root Port
----------  ----------------- ------ -----  ---  ---  ----------
MST0         32768 001c.7301.23de     0    2    20  15   Po937
MST101       32869 001c.7301.23de  3998    0     0   0   Po909
MST102       32870 001c.7301.23de  3998    0     0   0   Po911
```

The switch provides two commands that configure the switch priority: **spanning-tree priority** and **spanning-tree root**. The commands differ in the available parameter options:

- **spanning-tree priority** options are integer multiples of ***4096*** between ***0*** and ***61440***.
- **spanning-tree root** options are **primary** and **secondary**.
- **primary** assigns a priority of ***8192***.
- **secondary** assigns a priority of ***16384***.

The default priority value is ***32768***.

The following examples configure bridge IDs with both commands.

Examples

- These commands configure MST instance bridge priorities with the **root** command:

```
switch(config)#spanning-tree mst 0 root primary
switch(config)#spanning-tree mst 1 root secondary
switch>show spanning-tree root
                    Root ID          Root    Hello  Max  Fwd
Instance    Priority   MAC addr  Cost    Time   Age  Dly  Root Port
----------  ----------------- ------- -----  ---  ---  ----------
MST0          8192 001c.7301.6017      0    2    20  15   None
MST1         16385 001c.7301.6017      0    0     0   0   None
MST2         32770 001c.7301.6017      0    0     0   0   None
```

  - Instance ***0*** root priority is ***8192***: primary priority plus the instance number of ***0***.
  - Instance ***1*** root priority is ***16385***: secondary priority plus the instance number of ***1***.
  - Instance ***2*** root priority is ***32770***: default priority plus the instance number of ***2***.

These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

- These priority commands configure Rapid-PVST VLAN bridge priorities:

```
switch(config)#spanning-tree vlan-id 1 priority 8192
switch(config)#spanning-tree vlan-id 2 priority 16384
switch(config)#spanning-tree vlan-id 3 priority 8192
switch(config)#no spanning-tree vlan-id 4 priority
switch(config)#show spanning-tree root
                  Root ID          Root    Hello  Max  Fwd
Instance    Priority    MAC addr  Cost   Time   Age  Dly  Root Port
----------  ------------------- ------- -----  ---  ---  ----------
VL18193       001c.7301.6017       0        2     20   15   None
VL216386      001c.7301.6017       0        2     20   15   None
VL38195       001c.7301.6017       0        2     20   15   None
VL432788      001c.7301.6017       0        2     20   15   None
```

  - VLAN ***1*** root priority is ***8193***: configured priority plus the VLAN number of ***1***.
  - VLAN ***2*** root priority is ***16386***: configured priority plus the VLAN number of ***2***.
  - VLAN ***3*** root priority is ***8195***: configured priority plus the VLAN number of ***3***.

  These priority settings normally program the switch to be the primary root bridge for VLANs ***1*** and ***3***, the secondary root bridge for ***VLAN2***, and a normal bridge for ***VLAN 4***. Primary and secondary root bridge elections also depend on the configuration of other network bridges.***VLAN 4*** root priority is ***32788***: default priority plus the VLAN number of ***4***.

12.1.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from *1* to ***200000000*** (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of ***20000***.
- 10 gigabit interfaces have a default cost of ***2000***.

The **`spanning-tree cost`** command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

Examples

- These commands configure a port cost of ***25000*** to ***Ethernet interface 5***. This cost is valid for RSTP or MSTP instance ***0***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree cost 25000
switch(config-if-Et5)#
```

- This command configures a path cost of ***300000*** to ***Ethernet interface 5*** in MST instance ***200***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree mst 200 cost 300000
switch(config-if-Et5)#
```

- This command configures a path cost of ***10000*** to ***Ethernet interface 5*** in Rapid-PVST VLAN ***200-220***.

```
switch(config)#interface ethernet 5
```

```
switch(config-if-Et5)#spanning-tree vlan-id 200-220 cost 10000
switch(config-if-Et5)#
```

12.1.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between ***0*** and ***240***; the default is ***128***.

The **spanning-tree port-priority** command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

Examples

- This command sets the access port priority of ***144*** for Ethernet ***5*** interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```

- This command sets the access port priority of ***144*** for Ethernet ***5*** interface in MST instance ***10***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree mst 10 port-priority 144
switch(config-if-Et5)#
```

12.1.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:

- **portfast**: Allows ports to skip learning state before entering the forwarding state.
- **port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **root guard**: Ensures that a port will not become the root port.
- **loop guard**: Prevents loops resulting from unidirectional failure of links.
- **bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

12.1.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A **portfast** port that receives a BPDU sets its operating state to **non-portfast** while remaining in **portfast** configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The **spanning-tree portfast** command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

Example

This command unconditionally enables portfast on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```

12.1.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

Port Type

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The **spanning-tree portfast <port type>** command sets the configuration mode interfaces port type. Spanning tree ports can be configured as **edge** ports, **network** ports, or **normal** ports. The default port type is **normal**.

- **edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **normal ports** have an unspecified topology.

Examples

- This command configures ***interface ethernet 5*** as a network port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

- Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The spanning-tree portfast auto command enables auto-edge detection on the configuration mode interface, superseding the **spanning-tree portfast** command. Auto-edge detection is enabled by default.

  This command enables auto-edge detection on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
switch(config-if-Et5)#
```

Link Type

The switch derives a ports default link type from its duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared link**.

The **spanning-tree link-type** command specifies the configuration mode interfaces link-type. RSTP fast transition is not allowed on **shared link** ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is **point-to-point**.

Example

This command configures ***interface ethernet 5*** as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
switch(config-if-Et5)#
```

12.1.3.3.3 Root Guard and Loop Guard

Root guard stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked

(root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The **spanning-tree guard** command, with the root option, enables root guard on the configuration mode interface.

Example

This command enables root guard on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
switch(config-if-Et5)#
```

Loop guard prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.

If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch.

When using loop guard:

- Do not enable loop guard on portfast-enabled ports.
- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channels first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Dissembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- **spanning-tree guard loop default** command enables loop guard as a default on all switch ports.
- **spanning-tree guard** control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

Examples

- This command enables loop guard as the default on all switch ports.

```
switch(config)#spanning-tree guard loop default
switch(config)#
```

- This command enables loop guard on ***interface ethernet 6***.

```
switch(config)#interface ethernet 6
switch(config-if-Et6)#spanning-tree guard loop
```

```
switch(config-if-Et6)#
```

12.1.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on **network** ports with **point-to-point** links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an inconsistent blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the **spanning-tree portfast <port type>** command. The **no spanning-tree transmit active** command disables bridge assurance globally.

Example

These commands enable bridge assurance on the switch, then enable bridge assurance on ***interface ethernet 5*** by designating it a network port.

```
switch(config)#spanning-tree transmit active
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

12.1.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

12.1.3.4.1 Configuring Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for **forward_delay** and **max_age** periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The **spanning-tree hello-time** command configures the hello time.

Examples

- This command configures a hello-time of ***1*** second (***1000*** ms).

```
switch(config)#spanning-tree hello-time 1000
switch(config)#
```

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max hop value to ***40***.

```
switch(config)#spanning-tree max-hops 40
switch(config)#
```

The **spanning-tree forward-time** command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the forward delay timer value to ***25*** seconds.

```
switch(config)#spanning-tree forward-time 25
switch(config)#
```

The **spanning-tree max-age** command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max age timer value to ***25*** seconds.

```
switch(config)#spanning-tree max-age 25
switch(config)#
```

12.1.3.4.2 BPDU Transmit Hold-Count

The **spanning-tree bpdu tx hold-count** command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from ***1*** to ***10*** BPDUs with a default of ***6*** BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

Example

This command configures a transmit hold-count of ***8*** BPDUs.

```
switch(config)#spanning-tree bpdu tx hold-count 8
switch(config)#
```

12.1.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the ports portfast state.

The **spanning-tree edge-port bpduguard default** global configuration command enables BPDU guard by default on all portfast ports. BPDU guard is disabled on all ports by default.

The **spanning-tree bpduguard** interface configuration command controls BPDU guard on the configuration mode interface. This command takes precedence over the default setting configured by **spanning-tree edge-port bpduguard default**.

- **spanning-tree bpduguard** enables BPDU guard on the configuration mode interface.
- **spanning-tree bpduguard disable** disables BPDU guard on the configuration mode interface.

- **no spanning-tree bpduguard** reverts the configuration mode interface to the default BPDU guard setting.

Example

These commands enable BPDU guard by default on all portfast ports, then disable BPDU guard on ***Ethernet 5***.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard disable
switch(config-if-Et5)
```

12.1.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.

Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The **spanning-tree bpdufilter** command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

Example

These commands enable BPDU filtering on ***Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enable
switch(config-if-Et5)#
```

12.1.3.4.5 BPDU Rate Limit

BPDU input rate limiting restricts the number of BPDUs that a port with BPDU guard and BPDU filter disabled, can process during a specified interval. The port discards all BPDUs that it receives in excess of the specified limit. Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

Establishing the Rate Limit Threshold

The **spanning-tree bpduguard rate-limit count (interface)** command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The **spanning-tree bpduguard rate-limit count** global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

  Note: Arista Networks recommends to retain the default values of rate limit. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The **spanning-tree bpduguard rate-limit count** interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

Examples

- This command configures the global limit of ***5000*** BPDUs over a ***4*** second interval.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

- These commands configure a limit of *7500* BPDUs over an *8* second interval on the ***interface ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500
 interval 8
switch(config-if-Et2)#
```

Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- **spanning-tree bpduguard rate-limit default** enables ratelimiting on all ports that are not covered by the interface rate limiting command. The default setting is **enabled**.
- **spanning-tree bpduguard rate-limit enable / disable** interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

Examples

- This command enables rate limiting on ports that are not covered by interface rate limit commands.

```
switch(config)#spanning-tree bpduguard rate-limit default
switch(config)#
```

- These commands enable rate limiting on the ***interface ethernet 15***.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

12.1.4 STP Commands

Spanning Tree Commands: Global Configuration

- spanning-tree bpdu tx hold-count
- spanning-tree bpduguard rate-limit default
- spanning-tree bpduguard rate-limit count (global)
- spanning-tree edge-port bpdufilter default
- spanning-tree edge-port bpduguard default
- spanning-tree forward-time
- spanning-tree guard loop default
- spanning-tree hello-time
- spanning-tree max-age
- spanning-tree max-hops
- spanning-tree mode
- spanning-tree mst configuration
- spanning-tree mst pvst border
- spanning-tree portchannel guard misconfig
- spanning-tree priority
- spanning-tree root
- spanning-tree transmit active
- spanning-tree vlan-id

Loop Protection Commands

- disabled-time
- loop-protection
- monitor loop-protection
- protect vlan
- rate-limit
- shutdown (Loop-protection)
- transmit-interval

Spanning Tree Commands: Interface Configuration Mode

- spanning-tree bpdufilter
- spanning-tree bpduguard
- spanning-tree bpduguard rate-limit count (interface)
- spanning-tree bpduguard rate-limit enable / disable
- spanning-tree cost
- spanning-tree guard
- spanning-tree link-type
- spanning-tree port-priority
- spanning-tree portfast
- spanning-tree portfast auto
- spanning-tree portfast <port type>
- switchport backup-link

MST Configuration Commands

- abort (mst-configuration mode)

- exit (mst-configuration mode)
- instance
- name (mst-configuration mode)
- revision (mst-configuration mode)
- show (mst-configuration mode)

Display Commands

- show spanning-tree
- show spanning-tree blockedports
- show spanning-tree counters
- show spanning-tree instance
- show spanning-tree instance detail
- show spanning-tree interface
- show spanning-tree mst
- show spanning-tree mst configuration
- show spanning-tree mst interface
- show spanning-tree mst test information
- show spanning-tree root
- show spanning-tree topology status
- show spanning-tree transmit active

Clear Commands

- clear spanning-tree counters
- clear spanning-tree counters session
- clear spanning-tree detected-protocols

12.1.4.1 abort (mst-configuration mode)

The **abort** command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The **exit (mst-configuration mode)** command saves MST region changes to ***running-config*** before returning the switch to global configuration mode.

Command Mode

MST-configuration

Command Syntax

abort

Example

This command discards changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)#abort
switch(config)#
```

12.1.4.2 clear spanning-tree counters session

The **clear spanning-tree counter session** command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

Command Mode

Privileged EXEC

Command Syntax

clear spanning-tree counters session

Example

This command resets the BPDU counters in the current CLI session.

```
switch#show spanning-tree counters
            Port       Sent      Received       Tagged Error    Other
 Error
-------------------------------------------------------------------------
----
      Ethernet15      32721             0                  0
 0
  Port-Channel10       8487             0                  0
 0

switch#clear spanning-tree counters session
switch#show spanning-tree counters
            Port      Sent       Received       Tagged Error    Other
 Error
-------------------------------------------------------------------------
----
      Ethernet15        11              0                  0
 0
  Port-Channel10         7              2                  6
 0

switch#
```

12.1.4.3 clear spanning-tree counters

The **`clear spanning-tree counters`** command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

Command Mode

Privileged EXEC

Command Syntax

`clear spanning-tree counters` [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Options include:

- ***no parameter*** resets counters for all interfaces.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface management *m_num*** Management interface specified by ***m_num***.
- **interface port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command resets the BPDU counters on ***interface ethernet 15***.

```
switch#show spanning-tree counters
            Port    Sent      Received    Tagged Error   Other Error
-------------------------------------------------------------------
      Ethernet15    32721          0           0              0
  Port-Channel10     8487          0           0              0

switch#clear spanning-tree counters interface ethernet 15<---Clear
 command
switch#show spanning-tree counters
            Port    Sent       Received   Tagged Error    Other Error
-------------------------------------------------------------------
      Ethernet15      11            0           0              0
  Port-Channel10    84942           6           0

switch#
```

12.1.4.4 clear spanning-tree detected-protocols

The **clear spanning-tree detected-protocols** command restarts the spanning tree protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

Command Mode

Privileged EXEC

Command Syntax

clear spanning-tree detected-protocols [**INT_NAME**]

Parameters

INT_NAME Interface type and number. Values include:

- ***no parameter*** all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Example

This command restarts the STP migration machine on all switch interfaces.

```
switch#clear spanning-tree detected-protocols
switch#
```

12.1.4.5 disabled-time

The **disabled-time** command sets the time for which the port remains disabled after a loop is detected by loop protection. The **no disabled-time** and **default disabled-time** commands reset the disabled time to the default of ***604800*** seconds (seven days).

Note: If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

Command Mode

Loop-protection Configuration

Command Syntax

disabled-time [*period*]

no disabled-time [*period*]

default disabled-time [*period*]

Parameters

period Time in seconds for which the port remains disabled. Values range from ***0*** to ***604800*** (seven days). Default is ***604800***. A value of ***0*** disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

Example

This command configures loop protection to disable a port on which a loop is detected for a period of two days (***172800*** seconds).

```
switch(config-monitor-loop-protect)#disabled-time 172800
switch(config-monitor-loop-protect)#
```

12.1.4.6 exit (mst-configuration mode)

The **exit** command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

Command Mode

MST-configuration

Command Syntax

exit

Examples

- This command saves changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)#exit
switch(config)#
```

- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.

```
switch(config-mst)#interface ethernet 3
switch(config-if-Et3)#
```

12.1.4.7 instance

The **instance** command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switchs MST region.

The **no instance** command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The **no instance** and **default instance** commands function identically.

Command Mode

MST-Configuration

Command Syntax

instance *mst_inst* vlans *v_range*

no instance *mst_inst* [vlans *v_range*]

no default instance *mst_inst* [vlans *v_range*]

Parameters

- ***mst_inst*** MST instance number. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- ***v_range*** VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command maps VLANs ***20-39*** to MST instance ***2***.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#instance 2 vlans 20-39
switch(config-mst)#
```

- This command removes all VLAN mappings to MST instance ***10***.

```
switch(config-mst)#no instance 10
switch(config-mst)#
```

12.1.4.8 loop-protection

The **loop-protection** command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The **no loop-protection** and **default loop-protection** commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

Command Mode

Interface-Ethernet Configuration

Command Syntax

loop-protection

no loop-protection

default loop-protection

Example

These commands disable loop protection on ***interface ethernet 2/4***. If the interface is currently errdisabled by loop protection, the errdisable is removed.

```
switch(config)#interface ethernet 2/4
switch(config-if-Et2/4)#no loop-protection
switch(config-if-Et2/4)#
```

12.1.4.9 monitor loop-protection

The **`monitor loop-protection`** command places the switch in loop-protection configuration mode.

Command Mode

Global Configuration

Command Syntax

`monitor loop-protection`

Commands available in loop-protection configuration mode:

- shutdown (Loop-protection)
- protect vlan
- transmit-interval
- disabled-time
- rate-limit

Example

This command places the switch in ***loop-protection*** configuration mode.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#
```

12.1.4.10 name (mst-configuration mode)

The **name** command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switchs MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from ***running-config***.

Command Mode

MST-Configuration

Command Syntax

name *label_text*

no name

default name

Parameters

label_text character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

Example

This command assigns ***corporate_100*** as the MST region name.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#name corporate_100
switch(config-mst)#show pending
Active MST configuration
Name      [corporate_100]
Revision  0    Instances configured 1

Instance  Vlans mapped
------------------------------------------------------------
0         1-4094
------------------------------------------------------------
```

12.1.4.11 protect vlan

The **protect vlan** command specifies which VLANs participate in loop protection. The **no protect vlan** and **default protect vlan** commands remove loop protection from the specified VLANs.

Command Mode

Loop-protection Configuration

Command Syntax

protect vlan *vlan-range*

Parameters

vlan-range List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from ***1*** to ***4094***.

Example

This command enables loop protection on VLANs ***1025-2000***.

```
switch(config-monitor-loop-protect)#protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

12.1.4.12 rate-limit

The **rate-limit** command sets the maximum number of loop detection frames which can be sent by the switch per second. The **no rate-limit** and **default rate-limit** commands return the rate limit to the default value of ***1000***.

Command Mode

Loop-protection Configuration

Command Syntax

rate-limit [*frames*]

no rate-limit [*frames*]

default rate-limit [*frames*]

Parameters

frames Maximum number of frames sent per second. Values range from ***0-1000***, default is ***1000***. A value of ***0*** disables throttling.

Example

This command sets the maximum number of loop detection frames to ***500*** per second.

```
switch(config-monitor-loop-protect)#rate-limit 500
switch(config-monitor-loop-protect)#
```

12.1.4.13 revision (mst-configuration mode)

The **revision** command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switchs MST region. Revision numbers range from ***0*** to ***65535***. The default revision number is *0*.

The **no revision** and **default revision** commands restore the revision number to its default value by removing the revision command from ***running-config***.

Command Mode

MST-Configuration

Command Syntax

revision *rev_number*

no revision

default revision

Parameters

rev_number revision number. Possible ranges from ***0*** to ***65535*** with a default of ***0***.

Example

This command sets the revision number to ***15***.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#revision 15
switch(config-mst)#show pending
Active MST configuration
Name      []
Revision 15Instances configured 1

Instance  Vlans mapped
--------  ------------------------------------------------
0         1-4094
---------------------------------------------------------------
```

12.1.4.14 show (mst-configuration mode)

The **show** command displays the current and pending MST configuration:

Exiting MST configuration mode stores all pending configuration changes to ***running-config***.

Command Mode

MST-Configuration

Command Syntax

show [EDIT_VERSION]

Parameters

EDIT_VERSION specifies configuration version that the command displays. Options include:

- ***no parameter*** command displays pending MST configuration.
- **active** command displays MST configuration stored in ***running-config***.
- **current** command displays MST configuration stored in ***running-config***.
- **pending** command displays pending MST configuration.

Example

These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```
switch(config-mst)#show pending
Active MST configuration
Name      []
Revision  0    Instances configured 1

Instance  Vlans mapped
-------------------------------------------------------
0         1-4094
-------------------------------------------------------
switch(config-mst)#instance 2 vlan 20-29,102
switch(config-mst)#revision 2
switch(config-mst)#name baseline
switch(config-mst)#show pending
Pending MST configuration
Name      [baseline]
Revision  2    Instances configured 2

Instance  Vlans mapped
-------------------------------------------------------
0         1-19,30-101,103-4094
2         20-29,102
-------------------------------------------------------
switch(config-mst)#show active
Active MST configuration
Name      []
Revision  0    Instances configured 1

Instance  Vlans mapped
-------------------------------------------------------
0         1-4094
-------------------------------------------------------
```

12.1.4.15 show loop-protection

The **show loop-protection** command displays loop protection status.

Command Syntax

show loop-protection [**detail**]

Examples

- This command displays basic loop protection information.

```
switch#show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800(or Permanent)
Packets Transmitted rate: 12/second(or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch#show loop-protection detail
Loop protection is enabled

Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable

Vlan        Loop      Disabled Intfs Total Latest
Detected              Intfs Disabled Time
----------- --------- -------------- ----- -------------
1           Yes       Et1-2          20     18:01

switch#
```

12.1.4.16 show spanning-tree blockedports

The **show spanning-tree blockedports** command displays the list of blocked (discarding) ports.

Command Mode

EXEC

Command Syntax

show spanning-tree blockedports

Example

This command shows the ports that are in discarding state.

```
switch#show spanning-tree blockedports
Name   Blocked Interfaces List
-------------------------------------------------------------------------
MST0   Po903, Po905, Po907, Po909, Po911, Po913, Po915, Po917, Po919, Po921, Po923

       Po925, Po927, Po929, Po931, Po933, Po935, Po939, Po941, Po943, Po945, Po947

Number of blocked ports (segments) in the system : 22
switch#
```

12.1.4.17 show spanning-tree counters

The **show spanning-tree counters** command displays the number of BPDU transactions on each interface running spanning tree.

Command Mode

EXEC

Command Syntax

show spanning-tree counters

Example

This command displays the BPDU counter status on each interface running spanning tree.

```
switch#show spanning-tree counters
          Port      Sent   Received   Tagged Error   Other Error  sinceTimer
-------------------------------------------------------------------------------
    Ethernet2   1008399          0               0             0            0
    Ethernet3   1008554          0               0             0            0
    Ethernet4    454542          0               0             0            0
    Ethernet5   1008556          0               0             0            0
    Ethernet6    827133          0               0             0            0
    Ethernet8   1008566          0               0             0            0
   Ethernet10    390732          0               0             0            0
   Ethernet11   1008559          0               0             0            0
   Ethernet15    391379          0               0             0            0
   Ethernet17    621253          0               0             0            0

Port-Channel1   1008551          0               0             0            0
Port-Channel2    334854     678589               0             0            3
Port-Channel3   1010420          4               0             0            0

switch#
```

12.1.4.18 show spanning-tree instance

The **show spanning-tree instance** command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes **Bridge ID**, **Hello Time**, **Max Age**, and **Forward Delay** times.

The command also displays the restartability of the STP agent when the **detail** option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

Command Mode

EXEC

Command Syntax

show spanning-tree instance [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies level of information detail provided by the command.

- ***no parameter*** command displays information in a data table.
- **detail** command displays bridge information in data blocks for each instance.

Examples

- This command displays a bridge data table.

```
switch#show spanning-tree instance
                          Bridge ID                    Hello  Max  Fwd
Instance            Priority             MAC addr       Time   Age  Dly

12.1.4.19 show spanning-tree instance detail

The **show spanning-tree instance detail** command displays detailed MST information including MSTP-Rapid PVST+ interoperation status.

Command Mode

EXEC

Command Syntax

show spanning-tree instance detail

Example

This command displays detailed MST information.

```
switch#show spanning-tree instance detail
Stp Detailed Status:
 Stp agent restartable : True
 MST-PVST interoperation : Enabled
 Stp heartbeat timeout : 2.0
 Last local heartbeat timeout : 36 days, 19:10:46 ago
 Local heartbeat timeout since reboot : 1
MST0
 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.7374.8572
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
switch#
```

12.1.4.20 show spanning-tree interface

The **show spanning-tree interface** command displays spanning tree protocol information for the specified interface.

Command Mode

EXEC

Command Syntax

show spanning-tree interface **INT_NAME** [**INFO_LEVEL**]

Parameters

- **INT_NAME** Interface type and number. Values include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **peer ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **peerport-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - ***no parameter*** command displays a table of STP data for the specified interface.
  - **detail** command displays a data block for the specified interface.

Examples

- This command displays an STP table for Ethernet interface 5.

```
switch#show spanning-tree interface ethernet 5
Instance         Role       State      Cost      Prio.Nbr Type
---------------- ---------- ---------- --------- -------- ----
MST0             designated forwarding 20000     128.5    P2p
switch#
```

- This command displays a data block for Ethernet interface 5.

```
switch#show spanning-tree interface ethernet 5 detail
 Port 5 (Ethernet5) of MST0 is designated forwarding
   Port path cost 20000, Port priority 128, Port Identifier 128.5.
   Designated root has priority 32768, address 001c.7301.07b9
   Designated bridge has priority 32768, address 001c.7304.195b
   Designated port id is 128.5, designated path cost 1999 (Ext) 0 (Int)
   Timers: message age 1, forward delay 15, hold 20
   Number of transitions to forwarding state: 1
   Link type is point-to-point by default, Internal
   BPDU: sent 1008766, received 0, taggedErr 0, otherErr 0,
 rateLimiterCount 0
   Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400

switch#
```

12.1.4.21 show spanning-tree mst configuration

The **show spanning-tree mst configuration** command displays information about the MST regions VLAN-to-instance mapping. The command provides two display options:

- **default** displays a table that lists the instance to VLAN map.
- **digest** displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

Command Mode

EXEC

Command Syntax

show spanning-tree mst configuration [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies data provided by the output. Options include:

- ***no parameter*** command displays VLAN-to-instance map.
- **digest** command displays the MST configuration digest.

Examples

- This command displays the MST regions VLAN-to-instance map.

```
switch#show spanning-tree mst configuration
Name      []
Revision  0    Instances configured 3

Instance  Vlans mapped
------------------------------------------------------------
01,4-4094
22
33
------------------------------------------------------------
switch#
```

- This command displays the MST regions configuration digest.

```
switch#show spanning-tree mst configuration digest
Name      []
Revision  0    Instances configured 1
Digest         0xAC36177F50283CD4B83821D8AB26DE62
switch#
```

12.1.4.22 show spanning-tree mst interface

The **show spanning-tree mst interface** command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

Command Mode

EXEC

Command Syntax

show spanning-tree mst [**INSTANCE**] interface **INT_NAME** [**INFO_LEVEL**]

Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - ***no parameter*** all MST instances.
  - **mst_inst** denotes a single MST instance. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- **INT_NAME** Interface type and number. Values include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **peerethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **peerport-channel *p_num*** Port-channel interface specified by ***p_num***.
- **INFO_LEVEL** specifies level of detail provided by the output. Options include:
  - ***no parameter*** command displays a table of STP instance data for the specified interface.
  - **detail** command displays a data block for all specified instance-interface combinations.

Examples

- This command displays an table of STP instance data for ***interface ethernet 1***:

```
switch#show spanning-tree mst interface ethernet 1
Ethernet1 of MST0 is root forwarding
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0

Instance Role Sts CostPrio.Nbr Vlans mapped
-------- ---- --- --------- -------- -------------------------
0RootFWD2000128.11,4-4094
2DesgFWD2000128.12
3RootFWD2000128.13
```

- This command displays blocks of STP instance information for ***interface ethernet 1***.

```
switch#show spanning-tree mst 3 interface ethernet 1 detail
Edge port: nobpdu guard: disabled

12.1.4.23 show spanning-tree mst test information

The **show spanning-tree mst test information** displays diagnostic spanning tree protocol information.

Command Mode

EXEC

Command Syntax

show spanning-tree mst test information

Example

This command displays diagnostic STP information.

```
switch#show spanning-tree mst test information
bi = MstInfo.BridgeInfo( "dut" )
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo( "Mst" )
bi.stpiInfoIs( "Mst", si )
si.cistRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo( "Mst0" )
bmi.bridgeId = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
bmi.designatedRoot = Tac.Value( "Stp::BridgeId", priority=32768,
 systemId=0,
address='00:1c:73:01:60:17' )
si.mstiInfoIs( "Mst0", bmi )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Ethernet15" )
bmii.portId = Tac.Value( "Stp::PortId",
                    portPriority=128, portNumber=15 )
bmii.role = "designated"
bmii.operIntPathCost = 2000
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Ethernet15", bmii )
bii = MstInfo.BridgeIntfInfo( "Ethernet15" )
bii.operExtPathCost = 2000
si.intfInfoIs( "Ethernet15", bii )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Port-Channel10" )
bmii.portId = Tac.Value( "Stp::PortId",
                    portPriority=128, portNumber=101 )
bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Port-Channel10", bmii )
bii = MstInfo.BridgeIntfInfo( "Port-Channel10" )
bii.operExtPathCost = 1999
si.intfInfoIs( "Port-Channel10", bii )

12.1.4.24 show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree Protocol (MST) instances.

Command Mode

EXEC

Command Syntax

show spanning-tree mst [**INSTANCE**] [**INFO_LEVEL**]

Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - ***no parameter*** all MST instances.
  - **mst_inst** MST instance number. Value of ***mst_inst*** ranges from ***0*** to ***4094***.
- **INFO_LEVEL** type and amount of information in the output. Options include:
  - ***no parameter*** output is interface data in tabular format.
  - **detail** output is a data block for each interface.

Examples

- This command displays interface data blocks for MST instance ***3***.

```
switch#show spanning-tree mst 3 detail
##### MST3vlans mapped:3

12.1.4.25 show spanning-tree root

The **show spanning-tree root** command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

Command Mode

EXEC

Command Syntax

show spanning-tree root [**INFO_LEVEL**]

Parameters

INFO_LEVEL specifies output format. Options include:

- ***no parameter*** output displays data in tabular format.
- **detail** output displays a data block for each instance.

Examples

- This command displays a table of root bridge information.

```
switch#show spanning-tree root
                  Root ID          Root    Hello  Max  Fwd

12.1.4.26 show spanning-tree topology status

The **show spanning-tree topology status** command displays the forwarding state of ports on the specified VLANs.

Command Mode

EXEC

Command Syntax

show spanning-tree topology [**VLAN_NAME**] **status** [**INFO_LEVEL**]

Parameters

- **VLAN_NAME** specifies the VLANs that the output displays. Options include:
  - ***no parameter*** output includes all VLANs.
  - **vlan** output includes all VLANs.
  - **vlan *v_num*** command includes specified VLAN; ***v_num*** ranges from ***1*** to ***4094***.
- **INFO_LEVEL** specifies information provided by output. Options include:
  - ***no parameter*** output lists forwarding state of interfaces.
  - **detail** output lists forwarding state and change history of interfaces.

Examples

- This command displays forwarding state for ports mapped to all VLANs.

```
switch#show spanning-tree topology status
Topology: Cist
Mapped Vlans: 1-4,666,1000-1001,1004-1005
Cpu:               forwarding
Ethernet2:         forwarding
Ethernet3:         forwarding
Ethernet4:         forwarding
Ethernet5:         forwarding
Ethernet6:         forwarding
Ethernet8:         forwarding
Ethernet10:        forwarding
Port-Channel1:     forwarding
Port-Channel2:     forwarding
Port-Channel3:     forwarding

switch>
```

- This command displays forwarding state and history for ports mapped to ***VLAN 1000***.

```
switch#show spanning-tree topology vlan 1000 status detail
Topology: Cist
Mapped Vlans: 1000
Cpu:               forwarding (1 changes, last 23 days, 22:54:43 ago)
Ethernet2:         forwarding (3 changes, last 23 days, 22:48:59 ago)
Ethernet4:         forwarding (3 changes, last 10 days, 19:54:17 ago)
Ethernet5:         forwarding (3 changes, last 23 days, 22:54:38 ago)

Port-Channel3:     forwarding (5 changes, last 21 days, 4:56:41 ago)

switch>
```

12.1.4.27 show spanning-tree transmit active

The **show spanning-tree transmit active** command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

Command Mode

EXEC

Command Syntax

show spanning-tree transmit active **INFO_LEVEL**

Parameters

INFO_LEVEL specifies level of information detail provided by the command.

- ***no parameter*** command displays bridge assurance information for network ports.
- **detail** command displays bridge assurance information for all ports.

Example

This command displays the bridge assurance status of network ports.

```
switch#show spanning-tree transmit active
Name                 Bridge Assurance Status
-------------------------------------------
VL1        Et5/1       consistent

Number of bridge assurance inconsistent ports in the system : 0
switch>
```

12.1.4.28 show spanning-tree

The **show spanning-tree command** displays spanning tree protocol (STP) data, organized by instance.

Command Mode

EXEC

Command Syntax

show spanning-tree [**VLAN_ID**][**INFO_LEVEL**]

Parameters

- **VLAN_ID** specifies the VLANs for which the command displays information. Formats include:
  - ***no parameter*** displays information for all VLANs.
  - **vlan** displays data for instances containing the first VLAN listed in running-config.
  - **vlan *v_range*** displays data for instances containing a VLAN in the specified range.
- **INFO_LEVEL** specifies level of information detail provided by the command.
  - ***no parameter*** displays table for each instance listing status, configuration, and history.
  - **detail** displays data blocks for each instance and all ports on each instance.

Display Values

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority** Priority of the bridge. Default value is ***32768***.
  - **Address** MAC address of the bridge.
- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority** Priority of the bridge. The default priority is ***32768***.
  - **Address** MAC address of the bridge.
  - **Hello Time** Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age** Maximum time that a BPDU is saved.
  - **Forward Delay** Time (in seconds) that is spent in the learning state.
- **Interface** STP configuration participants. Link-down interfaces are not shown.
- **Role** Role of the port as one of the following:
  - **Root** The best port for a bridge to a root bridge used for forwarding.
  - **Designated** A forwarding port for a LAN segment.
  - **Alternate** A port acting as an alternate path to the root bridge.
  - **Backup** A port acting as a redundant path to another bridge port.
- **State** Displays the interface STP state as one of the following:
  - **Learning**
  - **Discarding**
  - **Forwarding**
- **Cost** STP port path cost value.
- **Prio. Nbr.** STP port priority. Values range from **0** to **240**. Default is **128**.
- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
  - **shr Peer (STP)** Shared half duplex port running standard STP.

Examples

- This command displays STP data, including a table of port parameters.

```
switch#show spanning-tree vlan 1000
MST0
```

```
  Spanning tree enabled protocol rstp
  Root ID    Priority    32768

```

```
switch#
```

12.1.4.29 shutdown (Loop-protection)

The **shutdown** command disables loop protection globally. The feature is disabled by default, and is enabled by using the **no shutdown** command.

Note: To function, loop protection must also be enabled on a per-VLAN basis using the **protect vlan** command.

Command Mode

Loop-protection Configuration

Command Syntax

shutdown

no shutdown

Example

This command enables loop protection globally on the switch.

```
switch(config-monitor-loop-protect)#no shutdown
switch(config-monitor-loop-protect)#
```

12.1.4.30 spanning-tree bpdu tx hold-count

The **spanning-tree bpdu tx hold-count** command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from ***1*** to ***10*** BPDUs with a default of ***6*** BPDUs.

The **no spanning-tree bpdu tx hold-count** and **default spanning-tree bpdu tx hold-count** commands restore the transmit hold count default of ***6*** BPDUs by removing the **spanning-tree bpdu tx hold-count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpdu tx hold-count *max_bpdu*

no spanning-tree bpdu tx hold-count

default spanning-tree bpdu tx hold-count

Parameters

max_bpdu BPDU packets. Value ranges from ***1*** to ***10***. Default is ***6***.

Example

This command configures a transmit hold-count of ***8*** BPDUs.

```
switch(config)#spanning-tree bpdu tx hold-count 8
switch(config)#
```

12.1.4.31 spanning-tree bpdufilter

The **spanning-tree bpdufilter** command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- **spanning-tree bpdufilter enabled** enables BPDU filtering.
- **spanning-tree bpdufilter disabled** disables BPDU filtering by removing the **spanning-tree bpdufilter** command from ***running-config***.

The BPDU filter default setting for portfast ports is configured by the **spanning-tree edge-port bpdufilter default** command; BPDU filter is disabled by default on all non-portfast ports.

The **no spanning-tree bpdufilter** and **default spanning-tree bpdufilter** commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding **spanning-tree bpdufilter** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpdufilter FILTER_STATUS

no spanning-tree bpdufilter

default spanning-tree bpdufilter

Parameters

FILTER_STATUS BPDU filtering status. Options include:

- **enabled** BPDU filter is enabled on the interface.
- **disabled** BPDU filter is disabled on the interface.

Example

This command enables BPDU filtering on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enabled
switch(config-if-Et5)#
```

12.1.4.32 spanning-tree bpduguard rate-limit count (global)

The **spanning-tree bpduguard rate-limit count** command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a **spanning-tree bpduguard rate-limit count (interface)** command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs they receive in excess of the specified limit. BPDU rate limiting is enabled or disabled by **spanning-tree bpduguard rate-limit enable / disable** commands.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the global setting to its default value by removing the **spanning-tree bpduguard rate-limit count** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpduguard rate-limit count *max_bpdu* [interval period]

no spanning-tree bpduguard rate-limit count

default spanning-tree bpduguard rate-limit count

Parameters

-
- ***max_bpdu*** configures the maximum number of BPDUs per timer interval. The value of *BPDU quantity* ranges from ***1*** to ***20000***.
- **interval** ***period*** configures the timer interval in seconds. The value of ***period*** ranges from ***1*** to ***15***.

Guidelines

Arista Networks recommends to retain the default values of rate limit.

In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add ***300*** more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

Example

This command configures the global rate limit as ***5000*** BPDUs per ***4*** second period.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

12.1.4.33 spanning-tree bpduguard rate-limit count (interface)

The **`spanning-tree bpduguard rate-limit count`** command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the **spanning-tree bpduguard rate-limit count (global)** command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limiting is enabled or disabled by **spanning-tree bpduguard rate-limit enable** / **disable** commands.

The **`no spanning-tree bpduguard rate-limit count`** and **`default spanning-tree bpduguard rate-limit count`** commands restore the interface value to the global setting by removing the corresponding **`spanning-tree bpduguard rate-limit count`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree bpduguard rate-limit count` *max_bpdu* [**TIMER**]

`no spanning-tree bpduguard rate-limit count`

`default spanning-tree bpduguard rate-limit count`

Parameters

- ***max_bpdu*** BPDU quantity. Value ranges from *1* to *20000*.
- **TIMER** BPDU reception interval (seconds). Options include:
  - ***period*** reception interval defaults to **hello-time**.
  - **interval** ***period*** Value of ***period*** ranges from ***1*** to ***15***.

Example

These commands configure rate limit as ***7500*** BPDUs per ***8*** second period on ***interface Ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500
 interval 8
switch(config-if-Et2)#
```

12.1.4.34 spanning-tree bpduguard rate-limit default

The **spanning-tree bpduguard rate-limit default** command configures the global BPDU rate limit setting. The global BPDU rate limit setting provides the default for individual ports whose configuration does not include a **spanning-tree bpduguard rate-limit enable** / **disable** command. The default global setting is enabled.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by **spanning-tree bpduguard rate-limit count (global)** commands.

The **no spanning-tree bpduguard rate-limit default** sets the global BPDU rate limit setting to disabled. The **spanning-tree bpduguard rate-limit default** and **default spanning-tree bpduguard rate-limit default** commands restore the default global rate limit setting to enabled by removing the **nospanning-tree bpduguard rate-limit default** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree bpduguard rate-limit default

no spanning-tree bpduguard rate-limit default

default spanning-tree bpduguard rate-limit default

Example

This command enables rate limiting on all ports not covered by an interface rate limit command.

```
switch(config)#spanning-tree bpduguard rate-limit default
switch(config)#
```

12.1.4.35 spanning-tree bpduguard rate-limit enable / disable

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- **`spanning-tree bpduguard rate-limit enable`** enables BPDU rate limiting.
- **`spanning-tree bpduguard rate-limit disable`** disables BPDU rate limiting.

The **spanning-tree bpduguard rate-limit default** command enables BPDU rate limiting on all ports not configured with a **`spanning-tree bpduguard rate-limit`** command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by **spanning-tree bpduguard rate-limit count (interface)** commands.

The **`no spanning-tree bpduguard rate-limit`** and **`default spanning-tree bpduguard rate-limit`** commands restore the global rate limit setting on the configuration mode interface by removing the corresponding **`spanning-tree bpduguard rate-limit`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree bpduguard rate-limit enable`

`spanning-tree bpduguard rate-limit disable`

`no spanning-tree bpduguard rate-limit`

`default spanning-tree bpduguard rate-limit`

Example

These commands enable rate limiting on ***interface Ethernet 15***.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

12.1.4.36 spanning-tree bpduguard

The **spanning-tree bpduguard** command controls BPDU guard on the configuration mode interface. A BPDU guard-enabled port is disabled when it receives a BPDU packet.

The BPDU guard default setting for portfast ports is configured by the **spanning-tree edge-port bpduguard default** command; BPDU guard is disabled by default on all non-portfast ports.

The **no spanning-tree bpduguard** and **default spanning-tree bpduguard** commands restore the global BPDU guard setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree bpduguard GUARD_ACTION

no spanning-tree bpduguard

default spanning-tree bpduguard

Parameters

GUARD_ACTION BPDU guard setting. Options include:

- **disable** Disable bpduguard.
- **enable** Enable bpduguard.
- **rate-limit** BPDU Input Rate Limiter options.

Example

These commands enable BPDU guard on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard enabled
switch(config-if-Et5)
```

12.1.4.37 spanning-tree cost

The **`spanning-tree cost`** command configures the path cost of the configuration mode interface. Cost values range from ***1*** to ***200000000*** (***200*** million). The default cost depends on the interface speed:

- ***1*** gigabit interface: cost = ***20000***
- ***10*** gigabit interface: cost = ***2000***

The **`spanning-tree cost`** command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the **mst** mode option.
- MST instance cost is configured with the **mst** mode option.
- Rapid-PVST VLAN cost is configured with the **vlan** mode option.

The **`no spanning-tree cost`** and **`default spanning-tree cost`** commands restore the default cost on the configuration mode interface by removing the corresponding **`spanning-tree cost`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree` **MODE** **`cost`** *value*

`no spanning-tree` **MODE** **`cost`**

`default spanning-tree` **MODE** **`cost`**

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - ***no parameter*** RST instance, MST instance ***0***, or all Rapid-PVST instances permitted on the interface.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.***value*** path cost assigned to interface. Values range from ***1*** to ***200000000*** (***200*** million). Default values are ***20000*** (1 G interfaces) or ***2000*** (10 G interfaces).

Examples

- These commands configure a port cost of ***25000*** for ***interface Ethernet 5*** when configured as an RST port, as a port in MST instance ***0***, or all unconfigured Rapid-PVST instances that are not explicitly configured.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning tree cost 25000
```

- This command configures a port cost of ***30000*** for ***interface Ethernet 5*** when configured as a port in MST instance ***200***.

```
switch(config-if-Et5)#spanning tree mst 200 cost 30000
```

- This command configures a port cost of ***100000*** for ***interface Ethernet 5*** when configured as a port in VLANs ***200-220***.

```
switch(config-if-Et5)#spanning tree vlan 200-220 cost 100000
```

```
switch(config-if-Et5)#
```

12.1.4.38 spanning-tree edge-port bpdufilter default

The **`spanning-tree edge-port bpdufilter default`** command configures the global BPDU filter setting as **enabled**. Ports not covered by a **spanning-tree bpdufilter** command use the global BPDU filter setting.

Command Mode

Global Configuration

Command Syntax

`spanning-tree edge-port bpdufilter default`

`no spanning-tree edge-port bpdufilter default`

`default spanning-tree edge-port bpdufilter default`

Example

This command configures the BPDU filter global setting to **enabled**.

```
switch(config)#spanning-tree edge-port bpdufilter default
switch(config)#
```

12.1.4.39 spanning-tree edge-port bpduguard default

The **`spanning-tree edge-port bpduguard default`** command sets the global BPDU guard setting as **enabled**. Ports not covered by a **spanning-tree bpduguard** command use the global BPDU guard setting.

Command Mode

Global Configuration

Command Syntax

`spanning-tree edge-port bpduguard default`

`no spanning-tree edge-port bpduguard default`

`default spanning-tree edge-port bpduguard default`

Example

This command configures the global BPDU guard setting to enabled.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#
```

12.1.4.40 spanning-tree forward-time

The **spanning-tree forward-time** command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from ***4*** to ***30*** seconds with a default of ***15*** seconds.

The **no spanning-tree forward-time** and **default spanning-tree forward-time** commands restore the forward delay timer default of ***15*** seconds by removing the **spanning-tree forward-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree forward-time ***period***

no spanning-tree forward-time

default spanning-tree forward-time

Parameters

period forward delay timer (seconds). Value ranges from ***4*** to ***30***. Default is ***15***.

Example

This command sets the forward delay timer value to ***25*** seconds.

```
switch(config)#spanning-tree forward-time 25
switch(config)#
```

12.1.4.41 spanning-tree guard loop default

The **spanning-tree guard loop default** command configures the global loop guard setting as **enabled**. Ports not covered by a **spanning-tree guard** command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The **spanning-tree guard** interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is disabled.

The **no spanning-tree guard loop default** and **default spanning-tree guard loop default** commands restore the global loop guard setting of disabled by removing the **spanning-tree guard loop default** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree guard loop default

no spanning-tree guard loop default

default spanning-tree guard loop default

Example

This command enables loop guard as the default on all switch ports.

```
switch(config)#spanning-tree guard loop default
switch(config)#
```

12.1.4.42 spanning-tree guard

The **spanning-tree guard** command enables root guard or loop guard on the configuration mode interface. The **spanning-tree guard loop default** command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The **no spanning-tree guard** and **default spanning-tree guard** commands sets the configuration mode interface to the global loop guard mode by removing the **spanning-tree guard** statement from ***running-config***. The **spanning-tree guard none** command disables loop guard and root guard on the interface, overriding the global setting.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree guard **PORT_MODE**

no spanning-tree guard

default spanning-tree guard

Parameters

PORT_MODE the port mode. Options include:

- **loop** enables loop guard on the interface.
- **root** enables root guard on the interface.
- **none** disables root guard and loop guard.

Example

This command enables root guard on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
switch(config-if-Et5)#
```

12.1.4.43 spanning-tree hello-time

The **spanning-tree hello-time** command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from ***0.2*** seconds to ***10*** seconds with a default of ***2*** seconds.

The **no spanning-tree hello-time** and **default spanning-tree hello-time** commands restore the hello time default of 2 seconds by removing the **spanning-tree hello-time** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree hello-time ***period***

no spanning-tree hello-time

default spanning-tree hello-time

Parameters

period hello-time (milliseconds). Value ranges from ***200*** to ***10000***. Default is ***2000***.

Example

This command configures a hello-time of ***1*** second.

```
switch(config)#spanning-tree hello-time 1000
switch(config)#
```

12.1.4.44 spanning-tree link-type

The **`spanning-tree link-type`** command specifies the configuration mode interfaces link type, which is normally derived from the ports duplex setting. The default setting depends on a ports duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared**.

The **`no spanning-tree link-type`** and **`default spanning-tree link-type`** commands restore the default link type on the configuration mode interface by removing the corresponding **`spanning-tree link-type`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree link-type` **TYPE**

`no spanning-tree link-type`

`default spanning-tree link-type`

Parameters

TYPE link type of the configuration mode interface. Options include:

- **point-to-point**
- **shared**

Example

This command configures ***interface Ethernet 5*** as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
switch(config-if-Et5)#
```

12.1.4.45 spanning-tree max-age

The **spanning-tree max-age** command configures the switchs max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from ***6*** to ***40*** seconds with a default of ***20*** seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The **no spanning-tree max-age** and **default spanning-tree max-age** commands restore the max-age default of 20 seconds by removing the **spanning-tree max-age** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree max-age ***period***

no spanning-tree max-age

default spanning-tree max-age

Parameters

period max age period (seconds). Value ranges from ***6*** to ***40***. Default is ***20***.

Example

This command sets the max age timer value to ***25*** seconds.

```
switch(config)#spanning-tree max-age 25
switch(config)#
```

12.1.4.46 spanning-tree max-hops

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded. The max-hop value ranges from ***1*** to ***40*** with a default of ***20***.

The **no spanning-tree max-hops** and **default spanning-tree max-hops** commands restore the max-hops setting to its default value of ***20*** by removing the **spanning-tree max-hops** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree max-hops *ports*

no spanning-tree max-hops

default spanning-tree max-hops

Parameters

ports max hops (bridges). Value ranges from ***1*** to ***40***. Default is ***20***.

Example

This command sets the max hop value to ***40***.

```
switch(config)#spanning-tree max-hop 40
switch(config)#
```

12.1.4.47 spanning-tree mode

The **spanning-tree mode** command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree (MSTP).

The **no spanning-tree mode** and **default spanning-tree mode** commands restore the default spanning tree protocol version.

Note: The **spanning-tree mode** command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

Command Mode

Global Configuration

Command Syntax

spanning-tree mode VERSION

no spanning-tree mode

default spanning-tree mode

Parameters

VERSION spanning tree version that the switch runs. Options include:

- **mstp** multiple spanning tree protocol described in the ***IEEE 802.1Q-2005*** specification and originally specified in the ***IEEE 802.1s*** specification.
- **rstp** rapid spanning tree protocol described in the ***IEEE 802.1D-2004*** specification and originally specified in the ***IEEE 802.1w*** specification.
- **rapid-pvst** rapid per-VLAN spanning tree protocol described in the ***IEEE 802.1D-2004*** specification and originally specified in the ***IEEE 802.1w*** specification.
- **backup** disables STP and enables switchport interface pairs configured with the **switchport backup-link** command.
- **none** disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

Guidelines

Backup mode is not available on Trident platform switches.

Example

This command configures the switch to run multiple spanning tree protocol.

```
switch(config)#spanning-tree mode mstp
switch(config)#
```

12.1.4.48 spanning-tree mst configuration

The **spanning-tree mst configuration** command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the **abort** command.

These commands are available in MST-configuration mode:

- **abort (mst-configuration mode)**
- **exit (mst-configuration mode)**
- **instance**
- **name (mst-configuration mode)**
- **revision (mst-configuration mode)**
- **show (mst-configuration mode)**

The **no spanning-tree mst configuration** and **default spanning-tree mst configuration** commands restore the MST default configuration.

Command Mode

Global Configuration

Command Syntax

spanning-tree mst configuration

no spanning-tree mst configuration

default spanning-tree mst configuration

Examples

- This command enters MST configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#
```

- This command exits MST configuration mode, saving MST region configuration changes to ***running-config***.

```
switch(config-mst)#exit
switch(config)#
```

- This command exits MST configuration mode without saving MST region configuration changes to ***running-config***.

```
switch(config-mst)#abort
switch(config)#
```

12.1.4.49 spanning-tree mst pvst border

The **spanning-tree mst pvst border** command configures MSTP PVST border feature to automatically detect border ports facing PVST+ regions. By default, spanning-tree mst pvst border is disabled.

The **no spanning-tree mst pvst border** and **default spanning-tree mst pvst border** commands restore the default MST configuration.

Command Mode

MST Configuration

Command Syntax

spanning-tree mst pvst border

no spanning-tree mst pvst border

default spanning-tree mst pvst border

Example

This command enters the MST configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#spanning-tree mst pvst border
```

12.1.4.50 spanning-tree portchannel guard misconfig

The **spanning-tree portchannel guard misconfig** command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives ***75*** inconsistent BPDUs within ***30*** seconds, the switch error disables the port. When a port channel receives ***5*** BPDUs with the same source BPDU during the ***30*** second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The **no spanning-tree portchannel guard misconfig**and **default spanning-tree portchannel guard misconfig**commands disables the detection of misconfigured port channels by removing the **spanning-tree portchannel guard misconfig** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree portchannel guard misconfig

no spanning-tree portchannel guard misconfig

default spanning-tree portchannel guard misconfig

spanning-tree etherchannel guard misconfig

no spanning-tree etherchannel guard misconfig

default spanning-tree etherchannel guard misconfig

Guidelines

The **spanning-tree portchannel guard misconfig** and **spanning-tree etherchannel guard misconfig** commands are equivalent.

Examples

- This command enables port channel misconfiguration detection on the switch.

```
switch(config)#spanning-tree portchannel guard misconfig
switch(config)#show running-config
!
spanning-tree mode mstp
spanning-tree portchannel guard misconfig
!

!
end
switch(config)#
```

- This command disables port channel misconfiguration detection on the switch.

```
switch(config)#no spanning-tree portchannel guard misconfig
switch(config)#show running-config
!
spanning-tree mode mstp
!

!
end
switch(config)#
```

12.1.4.51 spanning-tree portfast auto

The **spanning-tree portfast auto** command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The **spanning-tree portfast** command, when configured, has priority over this command.

The **no spanning-tree portfast auto** command disables auto-edge port detection. This command is removed from ***running-config*** with the **spanning-tree portfast auto** and **default spanning-tree portfast auto** commands.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree portfast auto

no spanning-tree portfast auto

default spanning-tree portfast auto

Example

This command enables auto-edge detection on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
switch(config-if-Et5)#
```

12.1.4.52 spanning-tree portfast <port type>

The **`spanning-tree portfast`** command specifies the STP port mode for the configuration mode interface. Default port mode is **normal**.

Port modes include:

- **Edge**: Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network**: Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal**: Normal ports function as normal STP ports and can connect to any type of device.

The **`no spanning-tree portfast <port-type>`** and **`default spanning-tree portfast <port-type>`** commands restore the default port mode of normal by removing the corresponding **`spanning-tree portfast <port-type>`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

`spanning-tree portfast` **PORT_MODE**

`no spanning-tree portfast` **PORT_MODE**

`default spanning-tree portfast` **PORT_MODE**

Parameters

PORT_MODE STP port mode. Options include:

- **edge**
- **network**
- **normal**

  The **normal** option is not available for the **no** and **default** commands.

Related Commands

The **`spanning-tree portfast`** command also affects the **`spanning-tree portfast auto`** and **`spanning-tree portfast`** configuration for the configuration mode interface:

- **spanning-tree portfast normal**: **`spanning-tree portfast auto`** is enabled.
- **spanning-tree portfast edge**: **`spanning-tree portfast`** is enabled.
- **spanning-tree portfast network**: **`spanning-tree portfast auto`** is disabled.

Example

This command configures ***interface Ethernet 5*** as a network port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

12.1.4.53 spanning-tree portfast

The **spanning-tree portfast** command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the **spanning-tree portfast auto** command.

The **no spanning-tree portfast** and **default spanning-tree portfast** commands remove the corresponding **spanning-tree portfast** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree portfast

no spanning-tree portfast

default spanning-tree portfast

Example

This command unconditionally enables portfast on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```

12.1.4.54 spanning-tree port-priority

The **spanning-tree port-priority** command specifies the configuration mode interfaces port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of ***16*** between ***0*** and ***240***. Default value is ***128***. Ports with lower numerical priority values are selected over other ports.

The **no spanning-tree port-priority** and default spanning-tree port-priority commands restore the default of ***128*** for the configuration mode interface by removing the **spanning-tree port-priority** command from ***running-config***.

The **spanning-tree port-priority** command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance ***0*** port-priority is configured by not including a mode or with the **mst** mode option.
- MST instance port-priority is configured with the **mst** mode option.
- Rapid-PVST VLAN port-priority is configured with the **vlan** mode option.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

spanning-tree [**MODE**] **port-priority** *value*

no spanning-tree [**MODE**] **port-priority**

default spanning-tree [**MODE**] **port-priority**

Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - ***no parameter*** RST instance or MST instance 0.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- ***value*** bridge priority number. Values range from ***0*** to ***240*** and must be a multiple of ***16***.

Example

This command sets the port priority of ***interface Ethernet 5*** to ***144***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```

12.1.4.55 spanning-tree priority

The **spanning-tree priority** command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from ***0*** to ***65535*** (***16*** bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of ***4096*** between ***0*** and ***61440***. Default value is ***32768***.

The **spanning-tree priority** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance ***0*** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree priority** and **default spanning-tree priority** commands restore the bridge priority default of ***32768*** for the specified mode by removing the corresponding **spanning-tree priority** command from ***running-config***.

Another method of adding **spanning-tree priority** commands to the configuration is through the **spanning-tree root** command. Similarly, the **no spanning-tree root** command removes the corresponding **spanning-tree priority** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`spanning-tree` [**MODE**] `priority` *level*

`no spanning-tree` [**MODE**] `priority`

`default spanning-tree` [**MODE**] `priority`

Parameters

- **MODE** spanning tree instances for which the command configures priority. Options include:
  - ***no parameter*** RST instance or MST instance ***0***.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- ***level*** priority number. Values include multiples of ***4096*** between ***0*** and ***61440***. Default is ***32768***.

Examples

- This command configures a bridge priority value of ***20480*** for Rapid-PVST VLANs ***20***, ***24***, ***28***, and ***32***.

```
switch(config)#spanning-tree vlan-id 20,24,28,32 priority 20480
switch(config)#
```

- This command configures a bridge priority value of ***36864*** for the RST instance. When MST is enabled, this command configures a priority of ***36864*** for MST instance ***0***.

```
switch(config)#spanning-tree priority 36864
switch(config)#
```

12.1.4.56 spanning-tree root

The **`spanning-tree root`** command configures the bridge priority number by adding a **spanning-tree priority** command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to ***8192***.
- **secondary** sets the bridge priority to ***16384***.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from ***0*** to ***65535*** (***16*** bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The **`spanning-tree root`** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance ***0*** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **`no spanning-tree root`** and **`default spanning-tree root`** commands restore the bridge priority default of ***32768*** by removing the corresponding **spanning-tree priority** command from ***running-config***. The **`no spanning-tree root`**, **`no spanning-tree priority`**, **`default spanning-tree root`** and **`default spanning-tree priority`** commands perform the same function.

Command Mode

Global Configuration

Command Syntax

`spanning-tree` [**MODE**] **`root`** **TYPE**

`no spanning-tree` [**MODE**] **`root`**

`default spanning-tree` [**MODE**] **`root`**

Parameters

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - ***no parameter*** RST instance or MST instance ***0***.
  - **mst** ***m_range*** specified MST instances. ***m_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from ***0*** to ***4094***.
  - **vlan** ***v_range*** specified Rapid-PVST instances. ***v_range*** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.
- **TYPE** sets the bridge priority number. Values include:
  - **primary** sets the bridge priority to ***8192***.
  - **secondary** sets the bridge priority to ***16384***.

Examples

- This command configures a bridge priority value of ***8192*** for Rapid-PVST VLANs ***20*** to ***36***.

```
switch(config)#spanning-tree vlan-id 20-36 root primary
```

- This command configures a bridge priority value of ***16384*** for the RSTP instance and MST instance ***0***.

```
switch(config)#spanning-tree root secondary
```

12.1.4.57 spanning-tree transmit active

The **spanning-tree transmit active** command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of **network**. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree **network** ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

The **no spanning-tree transmit active** command disables bridge assurance.

The **spanning-tree transmit active** and **default spanning-tree transmit active** commands restore the default behavior by removing the **no spanning-tree transmit active** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

spanning-tree transmit active

no spanning-tree transmit active

default spanning-tree transmit active

Example

This command enables bridge assurance on the switch.

```
switch(config)#spanning-tree transmit active
switch(config)#
```

12.1.4.58 spanning-tree vlan-id

The **spanning-tree vlan-id** command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding **no spanning-tree vlan-id** statements from ***running-config***. Spanning-tree is enabled on all VLANs by default.

The **no spanning-tree vlan-id** command disables STP on the specified interfaces. The **default spanning-tree vlan-id** enables STP on the specified interfaces.

Note: Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a **vlan** option for configuring Rapid-PVST VLAN instances:

- **spanning-tree priority**
- **spanning-tree root**

Command Mode

Global Configuration

Command Syntax

spanning-tree vlan-id *v_range*

no spanning-tree vlan-id *v_range*

default spanning-tree vlan-id *v_range*

Parameters

v_range VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from ***1*** to ***4094***.

Examples

- This command disables STP on ***VLANs 200-205***.

```
switch(config)#no spanning-tree vlan-id 200-205
switch(config)#
```

- This command enables STP on ***VLAN 203***.

```
switch(config)#spanning-tree vlan-id 203
switch(config)#
```

12.1.4.59 switchport backup-link

The **switchport backup-link** command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The **show interfaces switchport backup-link** command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces:

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The **prefer vlan** option balances the load across the primary and backup interfaces. When the command includes the **prefer vlan** option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, prefer option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The **no switchport backup-link** and **default switchport backup-link** commands remove the primary-backup configuration for the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

Command Syntax

switchport backup-link **INT_NAME** [**BALANCE**]

no switchport backup-link

default switchport backup-link

Parameters

- **INT_NAME** the backup interface. Options include:
  - **ethernet** ***e_num*** Ethernet interface specified by ***e_num***.
  - **loopback** ***l_num*** Loopback interface specified by ***l_num***.
  - **management** ***m_num*** Management interface specified by ***m_num***.
  - **port-channel** ***p_num*** Channel group interface specified by ***p_num***.
  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.
- **BALANCE** VLANs whose traffic is normally handled on the backup interfaces. Values include:
  - ***no parameter*** backup interface handles no traffic if the primary interface is operating.
  - **prefer vlan** ***v_range*** list of VLANs whose traffic is handled by backup interface.

Examples

- These commands establish ***interface Ethernet 7*** as the backup port for ***interface ethernet 1***.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport backup-link ethernet 7
switch(config-if-Et1)#
```

- These commands configure the following:
  - ***interface ethernet 1*** as a trunk port that handles VLAN ***4*** through ***9*** traffic.
  - ***interface ethernet 2*** as its backup interface.
  - ***interface ethernet 2*** as the preferred interface for VLANs ***7*** through ***9***.

```
switch(config-if-Et1)#switchport mode trunk
switch(config-if-Et1)#switchport trunk allowed vlan 4-9
switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan
 7-9
switch(config-if-Et1)#
```

12.1.4.60 transmit-interval

The **`transmit-interval`** command sets the interval at which loop detection packets are transmitted. The **`no transmit-interval`** and **`default transmit-interval`**commands restore the transmission interval to the default of 5 seconds.

Command Mode

Loop-protection Configuration

Command Syntax

`transmit-interval` *interval*

Parameters

interval Interval in seconds at which loop-detection packets are transmitted. Values range from ***1*** to ***10***; default is ***5***.

Example

This command sets the loop detection packet transmission interval to ***10*** seconds.

```
switch(config-monitor-loop-protect)#transmit-interval 10
switch(config-monitor-loop-protect)#
```

12.2 Link Layer Discovery Protocol

This section describes Link Layer Discovery Protocol (LLDP) configuration tasks. Refer to the command descriptions for information about commands used in this chapter.

Topics in this section include:

- LLDP Introduction
- LLDP Overview
- LLDP Configuration Procedures
- LLDP Configuration Commands

12.2.1 LLDP Introduction

Link Layer Discovery Protocol (LLDP) lets Ethernet network devices to advertise details about themselves, such as capabilities, identification, and device configurations to directly connected devices on the network that are also using LLDP.

12.2.2 LLDP Overview

LLDP is a discovery protocol that allows devices to advertise information about themselves to peer devices that are on the same physical LAN and store information about the network. LLDP allows a device to learn higher layer management reachability and connection endpoint information from adjacent devices.

Each switch with an active LLDP agent sends and receives messages on all physical interfaces enabled for LLDP transmission. These messages are sent periodically and are typically configured for short time intervals to ensure that accurate information is always available. These messages are then stored for a configurable period of time, and contained within the received packet. The message information expires and is discarded when the configured value is met. The only other time an advertisement is sent is when a relevant change takes place in the switch. If information changes for any reason, the LLDP agent is notified and sends out and update the new values.

12.2.2.1 LLDP Data Units

A single LLDP Data Unit (LLDPDU) is transmitted in a single 802.3 Ethernet frame. The basic LLDPDU includes a header and a series of type-length-value elements (TLVs). Each TLV advertises different types of information, such as its device ID, type, or management addresses.

LLDP advertises the following TLVs by default:

- port-description
- system-capabilities
- system-description
- system-name
- management-address
- port-vlan

12.2.2.2 Transmission and Reception

Every device that uses LLDP has its own LLDP agent. The LLDP agent is responsible for the reception, transmission, and management of LLDP. When LLDP is enabled on a port, transmission and reception of LLDPDUs are both enabled by default, but the agent can be configured to only transmit or only receive.

Transmission

When LLDP transmission is enabled, the LLDP agent advertises information about the switch to neighbors at regular intervals. Each transmitted LLDPDU contains the mandatory TLVs, and any enabled optional TLVs.

Reception

When LLDP reception is enabled, the LLDP agent receives and stores advertised information from neighboring devices.

12.2.2.3 Storing LLDP Information

Whenever the switch receives a valid and current LLDP advertisement from a neighbor, it stores the information in a Simple Network Management Protocol (SNMP) Management Information Base (MIB).

12.2.2.4 Guidelines and Limitations

LLDP has the following configuration limitations:

- LLDP must be enabled globally before it can be enabled on an interface.
- LLDP is not supported on virtual interfaces.
- LLDP can discover only one device per port.

12.2.3 LLDP Configuration Procedures

These sections describe the following configuration processes:

- Enabling LLDP Globally
- Enabling LLDP on an Interface
- Optional LLDP Parameters
- Clearing LLDP Statistics
- Displaying LLDP Information

12.2.3.1 Enabling LLDP Globally

The **lldp run** command globally enables LLDP on the Arista switch. Once LLDP is enabled, the switch will transmit advertisements from the ports that are configured to send TLVs. The neighbor information table is populated as advertisements from the neighbors arrive on the ports.

Example

This command enables LLDP globally on the Arista switch.

```
switch(config)#lldp run
switch(config)#
```

12.2.3.2 Enabling LLDP on an Interface

When enabling LLDP, it is enabled on all interfaces by default. By using the **lldp transmit** and **lldp receive** commands, LLDP can be enabled or disabled on individual interfaces or configured to only send or only receive LLDP packets.

Example

- These commands enable ***interface ethernet port 3/1*** to transmit LLDP packets.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#lldp transmit
```

```
switch(config-if-Et3/1)#
```

- These commands enable ***interface ethernet port 3/1*** to receive LLDP packets.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#lldp receive
switch(config-if-Et3/1)#
```

12.2.3.3 Optional LLDP Parameters

The following sections describe these tasks:

- Setting the LLDP Timer
- Setting the LLDP Hold Time
- Setting the LLDP Re-initialization Timer
- Setting the IP Management Address to be used in the TLV
- Selecting the LLDP TLVs
- Configuring LLDP for Power over Ethernet

12.2.3.3.1 Setting the LLDP Timer

The **lldp timer** command specifies the time in seconds between LLDP updates sent by the switch.

Examples

- This command specifies that the LLDP updates should be sent every ***120*** seconds.

```
switch(config)#lldp timer 120
switch(config)#
```

- This command reverts the LLDP timer to its default value of ***30*** seconds.

```
switch(config)#no lldp timer 120
switch(config)#
```

12.2.3.3.2 Setting the LLDP Hold Time

The **lldp hold-time** command sets the amount of time a receiving device should retain the information sent by the device.

Examples

- This command specifies that the receiving device should retain the information for ***180*** seconds before discarding it.

```
switch(config)#lldp hold-time 180
switch(config)#
```

- This command reverts the LLDP hold time and to the default value of ***120*** seconds.

```
switch(config)#no lldp hold-time 180
switch(config)#
```

12.2.3.3.3 Setting the LLDP Re-initialization Timer

The **lldp run** command specifies the amount in time in seconds to delay the re-initialization attempt by the switch.

Example

This command specifies that the switch waits ***10*** seconds before attempting to re-initialize.

```
switch(config)#lldp timer reinitialization 10
switch(config)#
```

12.2.3.3.4 Setting the IP Management Address to be used in the TLV

The **lldp management-address** command specifies the IP management address or the IP address of the VRF interface in LLDP type-length-value (TLV) triplets.

Example

This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

12.2.3.3.5 Selecting the LLDP TLVs

The **lldp tlv transmit** command specifies which type, length, and value elements (TLVs) are to be included in LLDP packets. The **`no lldp tlv transmit`** command removes the TLV configuration.

Example

This command enables the system descriptions to be included in the TLVs.

```
switch(config)#lldp tlv transmit system-description
switch(config)#
```

12.2.3.3.6 Configuring LLDP for Power over Ethernet

Initial power over Ethernet (PoE) power-level negotiation with a powered device (PD) takes place in hardware (see **Configuring Power over Ethernet (PoE)**). Once hardware negotiation has taken place, IEEE 802.3at Power Via MDI type-length-value elements (TLVs) are included by default in LLDP packets sent to connected PDs to allow LLDP to further negotiate power needs. LLDP allows the switch to deal with more granular power requests from PDs, and also allows dynamic power-level setting. TLVs received from connected power-sourcing equipment (PSE) are ignored.

Note: Power Via MDI TLVs are not sent (even when enabled) under the following circumstances:

1. there is a user-configured power limit on the port, or
2. hardware negotiation sets the power to higher than class 4 because ***IEEE 802.3bt***, which increases the maximum power output for PoE, is not yet supported by LLDP.

To disable Power Via MDI TLVs globally, use the **no lldp tlv transmit** command and specify the Power Via MDI TLV. Hardware negotiation and manual power limits will remain in effect.

Example

This command disables the sending of Power Via MDI TLVs globally.

```
switch(config)#no lldp tlv transmit power-via-mdi
switch(config)#
```

To disable Power Via MDI TLVs on an individual interface, use the **poe negotiation lldp disabled** command. Hardware negotiation and manual power limits will remain in effect.

Example

These commands disable the sending of Power Via MDI TLVs on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe negotiation lldp disabled
switch(config-if-Et5)#
```

New LLDP Fields Defined by IEEE 802.3at-2009

Arista switches *do not* support the following new LLDP/SNMP fields defined in ***IEEE standard 802.3at-2009***:

- **Power type** a LldpXdot3RemPowerType
- **Power source** a LldpXdot3RemPowerSource
- **Power priority** a LldpXdot3RemPowerPriority
- **PD requested power value** a LldpXdot3RemPDRequestedPowerValue
- **PSE allocated power value** a LldpXdot3RemPSEAllocatedPowerValue

12.2.3.4 Clearing LLDP Statistics

- clear lldp counters
- clear lldp table

12.2.3.5 Displaying LLDP Information

- Viewing LLDP Global Information
- Viewing LLDP Local Information
- Viewing LLDP Neighbors
- Viewing LLDP Traffic

12.2.3.5.1 Viewing LLDP Global Information

The **show lldp** command displays LLDP information.

Examples

- This command displays global information about LLDP.

```
switch#show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size
Port       Tx Enabled  Rx Enabled
Et3/1      Yes         Yes

switch#
```

- This command displays LLDP information.

```
switch#show lldp ethernet interface 3/1
```

```
LLDP transmit interval      : 30 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
switch#
```

12.2.3.5.2 Viewing LLDP Local Information

The **show lldp local-info** command displays the information contained in the LLDP TLVs to be sent about the local system.

Example

This command displays information contained in the TLVS about the local systems.

```
switch#show lldp local-info management 1
Local System:
  - Chassis ID type: MAC address (4)
    Chassis ID     : 001c.730f.11a8
  - System Name: "switch.aristanetworks.com"
  - System Description: "Arista Networks EOS version 4.13.2F running on
 an Arista
Networks DCS-7150S-64-CL"
  - System Capabilities : Bridge, Router
    Enabled Capabilities: Bridge

Interface Management1:
  - Port ID type: Interface name (5)
    Port ID     : "Management1"
  - Port Description: ""
  - Management Address Subtype: IPv4 (1)
    Management Address        : 172.22.30.154
    Interface Number Subtype  : ifIndex (2)
    Interface Number          : 999001
    OID String                :
  - IEEE802.1 Port VLAN ID: 0
  - IEEE802.1/IEEE802.3 Link Aggregation
    Link Aggregation Status: Not Capable (0x00)
    Port ID                : 0
  - IEEE802.3 Maximum Frame Size: 1518 bytes
switch(config)#
```

12.2.3.5.3 Viewing LLDP Neighbors

The **show lldp neighbors** command displays information about LLDP neighbors.

Examples

- This command shows information about LLDP neighbors.

```
switch#show lldp neighbor
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0
```

```
Port      Neighbor Device ID              Neighbor Port ID           TTL
Et3/1     tg104.sjc.aristanetworks.com    Ethernet3/2                120

Ma1/1     dc1-rack11-tor1.sjc             1/1                        120
switch#
```

- This command displays detailed information about the neighbor ***Ethernet 3/1***.

```
switch# show lldp neighbor ethernet 3/1
Last table change time   : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID              Neighbor Port ID           TTL
Et3/1     tg104.sjc.aristanetworks.com    Ethernet3/2                120
switch#
```

12.2.3.5.4 Viewing LLDP Traffic

The **show lldp counters** command displays the LLDP traffic information for the switch.

Example

This command displays the LLDP counters on the switch.

```
switch#show lldp counters
Port          Tx Frames Tx Length Exceeded

Et20              69485                  0
Et21              69394                  0
Et22              69203                  0
Et23              57546                  0
Et24                  0                  0
Ma1               69665                  0
Port      Rx Frames     Rx Errors    Rx Discard  TLVs Discard  TLVs Unknown

Et20          69470             0             0             0             0
Et21          69383             0             0             0             0
Et22          69143             0             0             0             0
Et23          55370             0             0             0             0
Et24              0             0             0             0             0
Ma1           69078         69078             0         69078             0
switch#
```

12.2.4 LLDP Configuration Commands

Global Configuration Commands

- lldp hold-time
- lldp management-address
- lldp management-address vrf
- lldp run
- lldp receive packet tagged drop
- lldp timer
- lldp timer reinitialization
- lldp tlv transmit

Interface Configuration Commands – Ethernet Interface

- lldp receive
- lldp transmit
- poe negotiation lldp disabled

Privileged EXEC Commands

- clear lldp counters
- clear lldp table

EXEC Commands

- show lldp
- show lldp counters
- show lldp local-info
- show lldp neighbors

12.2.4.1 clear lldp counters

The **clear lldp counters** command resets the LLDP counters to zero.

Command Mode

Privileged EXEC

Command Syntax

clear lldp counters [**SCOPE**]

Parameters

SCOPE Session affected by command. Options include:

- ***no parameter*** command affects counters on all CLI sessions.
- **session** clears LLDP counters for the current CLI session only.

Examples

- This command resets all the LLDP counters to zero.

```
switch(config)#clear lldp counters
switch(config)#
```

- This command resets only the LLDP counters for the current CLI session.

```
switch(config)#clear lldp counters session
switch(config)#
```

12.2.4.2 clear lldp table

The **clear lldp table** command clears neighbor information from the LLDP table.

Command Mode

Privileged EXEC

Command Syntax

clear lldp table

Example

This command clears neighbor information from the LLDP table.

```
switch(config)#clear lldp table
switch(config)#
```

12.2.4.3 lldp hold-time

The **lldp hold-time** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it.

Command Mode

Global Configuration

Command Syntax

lldp hold-time *period*

no lldp hold-time

default lldp hold-time

Parameters

period The amount of time a receiving device should hold LLDPDU information before discarding it. Value ranges from ***10*** to ***65535*** second; default value is ***120*** seconds.

Examples

- This command sets the amount of time before the receiving device discards LLDPDU information to ***180*** seconds.

```
switch(config)#lldp hold-time 180
switch(config)#
```

- This command restores the hold-time to its default value of ***120*** seconds.

```
switch(config)#no lldp hold-time 180
switch(config)#
```

12.2.4.4 lldp management-address vrf

The **lldp management-address vrf** command enables the user to add the IP address of the VRF interface used in LLDP type-length-value (TLV).

Command Mode

Global Configuration

Command Syntax

lldp management-address vrf VRF_INSTANCE

no lldp management-address vrf VRF_INSTANCE

default lldp management-address vrf VRF_INSTANCE

Parameters

VRF_INSTANCE specifies the VRF instance.

Examples

- This command specifies the management address VRF to be used in the TLV.

```
switch(config)#lldp management-address vrf test 1
switch(config)#
```

- This command removes the management VRF used in the TLV.

```
switch(config)#no lldp management-address vrf test 1
switch(config)#
```

12.2.4.5 lldp management-address

The **lldp management-address** command enables the user to add the IP management address used for LLDP type-length-value (TLV).

Command Mode

Global Configuration

Command Syntax

lldp management-address [**INTERFACE**]

no lldp management-address [**INTERFACE**]

default lldp management-address [**INTERFACE**]

Parameters

INTERFACE Interface type and number. Options include:

- **all** all interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.

Examples

- This command specifies the IP management address to be used in the TLV.

```
switch(config)#lldp management-address ethernet 3/1
switch(config)#
```

- This command removes the IP management address used in the TLV.

```
switch(config)#no lldp management-address ethernet 3/1
switch(config)#
```

- This command specifies that ***VLAN 200*** is used in the TLV.

```
switch(config)#lldp management-address vlan 200
switch(config)#
```

- This command removes the VLAN ID used in the TLV.

```
switch(config)#no lldp management-address vlan 200
switch(config)#
```

12.2.4.6 lldp receive

The **lldp receive** command enables LLDP packets on an interface. The **no lldp receive** command disables the acceptance of LLDP packets.

Command Mode

Interface-Ethernet configuration

Interface-Management configuration

Command Syntax

lldp receive

no lldp receive

default lldp receive

Examples

- These commands enable the reception of LLDP packets on ***interface ethernet 4/1***.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#lldp receive
switch(config-if-Et4/1)#
```

- These commands disable LLDP the reception of LLDP packets on ***interface ethernet 4/1***.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#no lldp receive
switch(config-if-Et4/1)#
```

12.2.4.7 lldp receive packet tagged drop

The **lldp receive packet tagged drop** command is a global configuration command and when configured the LLDP ignores all the packets with **VLAN-tag**. By default, this command is disabled.

Command Mode

Global Configuration

Command Syntax

lldp receive packet tagged drop

Example

This command when configured, the LLDP ignores all the packets with **VLAN-tag**.

```
switch(config)#lldp receive packet tagged drop
```

12.2.4.8 lldp run

The **lldp run** command enables LLDP on the switch.

Command Mode

Global Configuration

Command Syntax

lldp run

no lldp run

default lldp run

Examples

- This command enables LLDP globally on the switch.

```
switch(config)#lldp run
switch(config)#
```

- This command disables LLDP globally on the switch.

```
switch(config)#no lldp run
switch(config)#
```

12.2.4.9 lldp timer reinitialization

The **lldp timer reinitialization** command sets the time delay in seconds for LLDP to initialize.

Command Mode

Global Configuration

Command Syntax

lldp timer reinitialization *delay*

no lldp timer reinitialization

default lldp timer reinitialization

Parameters

delay the amount of time the device should wait before re-initialization is attempted. Value ranges from ***1*** to ***20*** seconds; default value is ***2*** seconds.

Examples

- This command specifies that the switch should wait ***10*** seconds before attempting to re-initialize.

```
switch(config)#lldp timer reinitialization 10
switch(config)#
```

- This command restores the default initialization delay of ***2*** seconds.

```
switch(config)#no lldp timer reinitialization 10
switch(config)#
```

12.2.4.10 lldp timer

The **lldp timer** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it. The **no lldp timer** command removes the configured LLDP timer.

Command Mode

Global Configuration

Command Syntax

lldp timer *transmission_time*

no lldp timer

default lldp timer

Parameters

transmission_time the period of time at which LLDPDUs are transmitted. Values range from ***5*** to ***32768*** seconds; the default is ***30*** seconds.

Examples

- This command configures a period of ***180*** seconds at which the LLDPDUs are transmitted.

```
switch(config)#lldp timer 180
switch(config)#
```

- This command removes the configured period of time at which the LLDPDUs are transmitted.

```
switch(config)#no lldp timer 180
switch(config)#
```

12.2.4.11 lldp tlv transmit

The **lldp tlv transmit** command allows the user to specify the type-length-values (TLVs) to include in LLDP packets.

Command Mode

Global Configuration

Command Syntax

lldp tlv transmit TLV_NAME

no lldp tlv transmit TLV_NAM

default lldp tlv transmit TLV_NAME

Parameters

TLV_NAME Options include:

- **link-aggregation** specifies the link aggregation TLV.
- **management-address** specifies the management address TLV.
- **max-frame-size** specifies the Frame size TLV.
- **port-description** specifies the port description TLV.
- **port-vlan** specifies the port VLAN ID TLV.
- **power-via-mdi** specifies the power over Ethernet TLV.
- **system-capabilities** specifies the system capabilities TLV.
- **system-description** specifies the system description TLV.
- **system-name** specifies the system name TLV.

Examples

- This command enables the system description TLV:

```
switch(config)#lldp tlv transmit system-description
switch(config)#
```

- This command disables the system description TLV:

```
switch(config)#no lldp tlv transmit system-description
switch(config)#
```

- This command enables the max-frame-size TLV:

```
switch(config)#lldp tlv transmit max-frame-size
switch(config)#
```

- This command disables the max-frame-size TLV:

```
switch(config)#no lldp tlv transmit max-frame-size
switch(config)#
```

12.2.4.12 lldp transmit

The **lldp transmit** command enables the transit of LLDP packets on an interface.

Command Mode

Interface-Ethernet configuration

Interface-Management configuration

Command Syntax

lldp transmit

no lldp transmit

default lldp transmit

Examples

- These commands enable the transmission of LLDP packets.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#lldp transmit
switch(config-if-Et4/1)#
```

- These commands disable the transmission of LLDP packets.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#no lldp transmit
switch(config-if-Et4/1)#
```

12.2.4.13 poe negotiation lldp disabled

Power Via MDI TLVs are included by default in LLDP packets sent to power over Ethernet (PoE) powered devices (PDs) to allow dynamic negotiation of power levels. The **poe negotiation lldp disabled** command disables the sending of Power Via MDI TLVs from the configuration-mode interface.

The **no poe negotiation lldp disabled** and **default poe negotiation lldp disabled** commands restore the default behavior (sending Power Via MDI TLVs) by removing the corresponding **poe negotiation lldp disabled** command from ***running-config***.

To disable Power Via MDI TLVs globally, use the **no lldp tlv transmit** command and specify the Power Via MDI TLV.

Command Mode

Interface-Ethernet configuration

Command Syntax

poe negotiation lldp disabled

no poe negotiation lldp disabled

default poe negotiation lldp disabled

Example

These commands disable the sending of Power Via MDI TLVs on ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe negotiation lldp disabled
switch(config-if-Et5)#
```

12.2.4.14 show lldp counters

The **show lldp counters** command displays LLDP traffic information for the switch.

Command Mode

EXEC

Command Syntax

show lldp counters [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the LLDP counters on the switch.

```
switch#show lldp counters

Port          Tx Frames Tx Length Exceeded

Et20               69485                  0
Et21               69394                  0
Et22               69203                  0
Et23               57546                  0
Et24                   0                  0
Ma1                69665                  0

Port          Rx Frames     Rx Errors    Rx Discard  TLVs Discard  TLVs Unknown

Et20               69470             0             0             0             0
Et21               69383             0             0             0             0
Et22               69143             0             0             0             0
Et23               55370             0             0             0             0
Et24                   0             0             0             0             0
Ma1                69078         69078             0         69078             0
```

12.2.4.15 show lldp local-info

The **show lldp local-info** command displays LLDP errors and overflows.

Command Mode

EXEC

Command Syntax

show lldp local-info [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the specific LLDP errors and overflows on ***management interface 1***.

```
switch#show lldp local-info management 1

12.2.4.16 show lldp neighbors

The **show llpd neighbors** command displays information about the switch's LLDP neighbors.

Command Mode

EXEC

Command Syntax

show lldp neighbors [**INTERFACE**][**INFO_LEVEL**]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** displays information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** Displays information for all interfaces.
  - **detailed** LLDP information for all the adjacent LLDP devices.

Examples

- This command displays the neighbor's information about LLDP.

```
switch(config)#show lldp neighbors
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0

switch#
```

12.2.4.17 show lldp

The **show lldp** command displays LLDP information.

Command Mode

EXEC

Command Syntax

show lldp [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.

  Valid ***e_range*** and ***m_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays all LLDP information.

```
switch#show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : test

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

Port       Tx Enabled  Rx Enabled
Et3/1      Yes         Yes

switch#
```

- This command displays specific information about LLDP for ***interface ethernet 3/1***.

```
switch#show lldp ethernet 3/1
LLDP transmit interval      : 30 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
switch#
```

- This command displays specific information about LLDP for ***management interface 1/1***.

```
switch#show lldp management 1/1
```

```
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime      : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size

Port       Tx Enabled  Rx Enabled
Ma1/1      Yes         Yes
switch#
```

12.3 Virtual LANs (VLANs)

This chapter describes Arista's Virtual LANs (VLANs) implementation and MAC address tables.

Sections in this chapter include:

- VLAN Introduction
- VLAN Conceptual Overview
- VLAN Configuration Procedures
- VLAN Configuration Commands

12.3.1 VLAN Introduction

Arista switches support industry standard 802.1q VLANs. Arista EOS provides tools to manage and extend VLANs throughout the data center network.

12.3.2 VLAN Conceptual Overview

12.3.2.1 VLAN Definition

A virtual local area network (VLAN) allows a group of devices to communicate as if they were in the same network regardless of their physical location. VLANs are Layer 2 structures based on the 802.1Q standard.

These parameters are associated with a VLAN:

- VLAN number (***1-4094***): VLAN numbers uniquely identify the VLAN within a network. VLAN 1 exists by default; all other VLANs only exist after they are configured.
- VLAN name (optional): The VLAN name is a text string that describes the VLAN.
- VLAN state (***active*** or ***suspended***): The state specifies the VLAN transmission status within the switch. In the ***suspended*** state, VLAN traffic is blocked on all switch ports. The default state is ***active***.

VLANs define Layer 2 broadcast domains in a Layer 2 network, in which each device can receive broadcast frames sent by any other within the domain. Switches accommodating multiple broadcast domains serve as multi-port bridges where each broadcast domain is a distinct virtual bridge. Traffic does not pass directly between different VLANs within a switch or between two switches.

12.3.2.2 VLAN Switching

Ethernet and port channel interfaces are configured as switched ports by default. Switched ports are configurable as members of one or more VLANs. Switched ports ignore all IP-level configuration commands, including IP address assignments.

12.3.2.2.1 VLAN Trunking and Trunk Groups

Trunking extends multiple VLANs beyond the switch through a common interface or port channel.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs, i.e., VLANs configured in a trunk group are pruned of all ports that are not associated with the trunk group. See the Trunk Ports example section for further details.

Note: Be cautious when using allowed VLAN lists or trunk groups to ensure that the VLAN topology is consistent with any Layer-2 control protocol topology, or unpredictable results can occur.

VLAN traffic is carried through Ethernet or LAG ports. A port's switchport mode defines the number of VLANs for which the port can carry traffic.

- Access ports carry traffic for one VLAN – the access VLAN. Access ports associate untagged frames with the access VLAN. Access ports drop tagged frames that are not tagged with the access VLAN.
- Trunk ports carry traffic for multiple VLANs. Tag frames specify the VLAN for which trunk ports process packets.

12.3.2.2.2 Q-in-Q Trunking

A Q-in-Q network is a multi-tier layer 2 VLAN network. A typical Q-in-Q network is composed of a service provider network (tier 1) where each node connects to a customer network (tier 2).

802.1ad is a networking standard that supports Q-in-Q networks by allowing multiple 802.1Q tags in an Ethernet frame.

Each interface in a customer network is assigned to a customer-VLAN (c-VLAN). Packets in c-VLANs contain 802.1q tags that switch traffic within the network. c-VLANs access the service provider VLAN (s-VLAN) through a provider switch. Customer switch ports connect to an s-VLAN through provider switch edge ports, which are configured as dot1q ports and operate as follows:

- **Inbound traffic (from customer switches)**: adds an s-VLAN tag, then forwards packets to the provider network.
- **Outbound traffic (to customer switches)**: removes the s-VLAN tag, then forwards packets to the customer network.

12.3.2.2.3 TPID (Configurable Ethertypes)

By default, VLAN-tagged packets carry a Tag Protocol Identifier (TPID) of 0x8100. On some Arista platforms, however, the TPID of a switchport can be modified in accordance with IEEE 802.1ad to allow for the use of 802.1q TPIDs other than 0x8100. Well known and standard tags include:

0x8100 customer VLAN.

- **0x88a8** service VLAN tag used in provider bridging.
- **0x9100** service VLAN tag used in provider bridging (common, but not standardized).

Other non-standard TPID values may also be configured for interoperability with legacy equipment or non-standard systems. Values range from 0x600 (1536) through 0xFFFF (65535).

Non-default TPID values are most commonly used for provider bridging on a network-to-network interface.

12.3.2.3 VLAN Routing

Each VLAN can be associated with a Switch Virtual Interface (SVI), also called a VLAN interface. The VLAN interface functions in a routed network (Layer 3) with an assigned IP subnet address. Connecting different VLANs requires Layer 3 networking.

12.3.2.3.1 VLAN Interfaces

A Switched Virtual Interface (SVI) connects to the VLAN segment on the switch to provide Layer 3 processing for packets from the VLAN. An SVI can be activated only after it is connected to a VLAN. SVIs are typically configured for a VLAN to a default gateway for a subnet to facilitate traffic routing with other subnets.

In a Layer 3 network, each VLAN SVI is associated with an IP subnet, with all stations in the subnet members of the VLAN. Traffic between different VLANs is routed when IP routing is enabled.

12.3.2.3.2 Internal VLANs

A routed port is an Ethernet or port channel interface that functions as a Layer 3 interface. Routed ports do not bridge frames nor switch VLAN traffic. Routed ports have IP addresses assigned to them and packets are routed directly to and from the port.

The switch allocates an internal VLAN for an interface when it is configured as a routed port. The internal VLAN is assigned a previously unused VLAN ID. The switch prohibits the subsequent configuration of VLANs and VLAN interfaces with IDs corresponding to allocated internal VLANs.

12.3.2.3.3 Support for Private VLAN

Private VLAN is a feature that segregates a regular VLAN broadcast domain while maintaining all ports in the same IP subnet. There are three types of VLAN within a private VLAN:

1. **Primary VLAN**: Ports in the primary VLAN can send and or receive traffic from ports in all the corresponding PVLANs. There is only one primary VLAN in a private VLAN.
2. **Community VLAN**: This is a secondary VLAN. Hosts in a community VLAN forward traffic to each other as well as ports in the primary VLAN. There are multiple community VLANs in a private VLAN.
3. **Isolated VLAN**: This is a secondary VLAN. Hosts in an isolated VLAN only forward traffic to ports in the primary VLAN. Hosts within an isolated VLAN can not communicate with each other useing bridging. There are multiple isolated VLANs in a private VLAN.

12.3.2.3.3.1Limitations

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- Private VLAN and Algomatch features are mutually exclusive. Disable algomatch with the **`hardware access-list mechanism tcam`** command . Note that this requires a reload of the system to take effect.
- L2 and L3 multicast traffic is not supported.

On All Platforms except 7300X3, CCS-720XP, DCS-7050X3

Private VLAN and IPv4/IPv6 uRPF features are mutually exclusive.

On All Platforms

- Tunnel termination on PVLAN ports is not supported.
- Ingress IPv4/IPv6 RACLs on the primary VLAN are not honored for packets ingressing through ports in secondary VLANs.
- Only isolated private VLAN trunks and normal trunk ports are supported. It allows trunk ports to forward and receive traffic for all primary and or secondary VLANs. An isolated trunk translates traffic coming in on a primary VLAN to the lowest valued secondary VLAN on the trunk port.
- Private VLAN is not supported on L2 subinterfaces.
- Hardware accelerated Sflow is not supported on Private VLAN ports.
- VLAN Mapping and or Translation is not supported with Private VLAN.

12.3.2.3.3.2Show Commands

- Use the **`show vlan private-vlan`** command to display the primary and secondary defined VLANs:

```
switch#show vlan private-vlan
Primary Secondary Type         Ports
------- --------- ----------- ------------------------
100      101      community    Et1, Et6
```

```
100      102      isolated     Et1, Et7, Et8
200      201      community    Et10, Et9
```

- Use the **show vlan 100,101,102,200,201** command to diplay which interfaces are member of which VLANs:

```
#show vlan 100,101,102,200,201
VLAN  Name          Status    Ports
----- ------------- --------- -------------------------------
100   VLAN0100      active    Et1, Et6+, Et7+, Et8+
101   VLAN0101      active    Et1+, Et6
102   VLAN0102      active    Et1+, Et7, Et8
200   VLAN0200      active    Et10
201   VLAN0201      active    Et10+, Et9

+ indicates a private VLAN promoted port
```

Promoted ports are displayed to indicate they are part of the same broadcast domain as the indicated VLAN. Interfaces in a primary VLAN are included in the display of all its associated secondary VLANs. Interfaces in secondary VLANs are included in the display of both its primary VLAN and its own domain.

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

Use the **show platform sand pvlan interfaces** command to display the status of the interfaces to configure a private VLAN.

```
switch#show platform sand pvlan interfaces
Interface           Secondary   Primary     State
                         VLAN       VLAN
-----------------  ----------  ----------  ---------
Ethernet6                 101         100  enabled
Ethernet7                 102         100  enabled
Ethernet8                 102         100  enabled
Po1                       102         100  enabled
Ethernet9                 201         200  failed
Po2                       202         200  failed
```

In this output, the **Secondary VLAN** column indicates the VLAN which is configured on the interface. The **Primary VLAN** column indicates the primary VLAN to which the secondary VLAN belongs to. The **State** field has three possible values - enabled, failed, configured. The **enabled** state indicates that the private VLAN is configured and enabled on that interface. The **failed** state indicates that the private VLAN configuration has failed for that interface The **configured** state indicates that private VLAN is configured on that interface but has not taken effect. When port channels are configured in a private VLAN, it is enabled only if entries for all the member interfaces are successfully programmed in the hardware. If the hardware entries for any one of the member interfaces fails, the entries for other member interfaces are also removed from the hardware and the state is marked as failed.

12.3.2.3.4 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the VID field (VLAN ID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

- VLAN translation is only supported for tagged packets.
- BPDUs from STP, LLDP and other protocols are not affected by this mapping.
- VLAN translation is not applicable for access ports.
- Untagged packets entering the switch on the trunk native VLAN are not mapped.
- TPID and VLAN priority does not get re-written during the translation.

12.3.3 VLAN Configuration Procedures

These sections describe basic VLAN configuration tasks.

- Creating and Configuring VLANs
- Configuring VLAN Switching
- Creating and Configuring VLAN Interfaces
- Allocating Internal VLANs
- Private VLAN Configuration
- Configuring VLAN Translation

12.3.3.1 Creating and Configuring VLANs

The CLI provides two methods of creating VLANs.

- Explicitly through the **vlan** command.
- Implicitly through the **switchport access vlan** command.

The **switchport access vlan** command generates a warning message when it creates a VLAN.

To create a VLAN, use the **vlan** command in global configuration mode. Valid VLAN numbers range between ***1*** and ***4094***. To create multiple VLANs, specify a range of VLAN numbers.

To edit an existing VLAN, enter the **vlan** command with the number of the existing VLAN.

Examples

- This command creates ***VLAN 45*** and enters VLAN configuration mode for the new VLAN.

```
switch(config)#vlan 45
switch(config-vlan-45)#
```

- Use the **name (VLAN configuration mode)** command to assign a name to a VLAN.

  These commands assign the name Marketing to VLAN 45.

```
switch(config)#vlan 45
switch(config-vlan-45)#name Marketing
switch(config-vlan-45)#show vlan 45

VLAN Name                            Status    Ports
---- ------------------------------- --------- -------
45   Marketing                       active    Et1

switch(config-vlan-45)#
```

- To change a VLAN's state, use the **state** command in VLAN configuration mode.

  These commands suspend ***VLAN 45***. VLAN traffic is blocked on all switch ports.

```
switch(config)#vlan 45
switch(config-vlan-45)#state suspend
switch(config-vlan-45)#show vlan 45
```

```
VLAN Name                              Status    Ports
---- --------------------------------- --------- ------
45   Marketing                         suspended

switch(config-vlan-45)#
```

- These commands activate ***VLAN 45***.

```
switch(config)#vlan 45
switch(config-vlan-45)#state active
switch(config-vlan-45)#show vlan 45

VLAN Name                              Status    Ports
---- --------------------------------- --------- ------
45   Marketing                         active    Et1

switch(config-vlan-45)#
```

12.3.3.1.1 VLAN Policy

The VLAN policy configuration command enables a switch to configure a VLAN policy when it receives a packet with unknown destination MAC address on a VLAN. The **mac address forwarding** command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default behavior is to flood the L2 miss packets on all ports of the VLAN.

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

Examples

- These commands create a ***VLAN 333*** and then set the unicast policy to ‘drop’ and the multicast policy to ‘log’ for the specific ***VLAN 333***.

```
switch(config)#vlan 333
switch(config-vlan-333)#mac address forwarding unicast miss action drop
switch(config-vlan-333)#mac address forwarding multicast miss action
 log
```

- These commands display the VLAN policy that was defined when ***VLAN 333*** is created.

```
switch(config)#show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  flood         flood
```

- These commands display the VLAN policy type that was defined when ***VLAN 333*** is configured with the ‘drop’ unicast policy and the ‘log’ multicast policy.

```
switch(config)#show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  drop          log

switch(config)#show vlan mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
   1  flood         flood
 333  drop          log
```

12.3.3.2 Configuring VLAN Switching

The following describe the configuration of VLAN ports.

12.3.3.2.1 Access Ports

Access ports carry traffic for one VLAN, as designated by a **switchport access vlan** command. Access ports associate untagged frames with the access VLAN. Tagged frames received by the interface are dropped unless they are tagged with the access VLAN.

To configure an interface group as an access port, use the **switchport mode** command.

Examples

- These commands configure ***interface Ethernet 1*** as an access port.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport mode access
switch(config-if-Et1)#
```

- To specify the port’s access VLAN, use the **`switchport access vlan`** command.

  These commands configure ***VLAN 15*** as the access VLAN for ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport access vlan 15
switch(config-if-Et5)#
```

- These commands configure interface Ethernet ***1*** through ***3*** as access ports that process untagged frames as ***VLAN 5*** traffic.

```
switch(config)#interface Ethernet 1-3
switch(config-if-Et1-3)#switchport mode access
switch(config-if-Et1-3)#switchport access vlan 5
switch(config-if-Et1-3)#show interfaces ethernet 1-3 vlans
Port       Untagged Tagged
Et1        None     23,25
Et2        18       -
Et3        None     14
switch(config-if-Et1-3)#
```

12.3.3.2.2 Trunk Ports

Trunk ports carry traffic for multiple VLANs. Messages use tagged frames to specify the VLAN for which trunk ports process traffic.

- The **vlan trunk list** specifies the VLANs for which the port handles tagged frames. The port drops any packets tagged for VLANs not in the VLAN list.
- The **native vlan** is the VLAN where the port switches untagged frames.

To configure an interface group as a trunk port, use the **switchport mode** command.

Example

These commands configure ***interface Ethernet 8*** as a trunk port.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#switchport mode trunk
switch(config-if-Et8)#
```

By default all VLANs are permitted on a port configured with 'switchport mode trunk'. To limit the port's VLAN trunk list, use the **switchport trunk allowed vlan** command. Only VLANs in the allowed list will be permitted.

Examples

- These commands configure VLAN ***15***, ***20***, ***21***, ***22***, ***40***, and ***75*** as the explicitly permitted VLAN trunk list for ethernet interface ***12-16***.

  ```
  switch(config)#interface ethernet 12-16
  switch(config-if-Et12-16)#switchport trunk allowed vlan 15,20-22,40,75
  switch(config-if-Et12-16)#
  ```

- These commands explicitly permit VLAN ***100*** through ***120*** to the VLAN trunk list for ***interface ethernet 14***.

  ```
  switch(config)#interface ethernet 14
  switch(config-if-Et14)#switchport trunk allowed vlan add 100-120
  switch(config-if-Et14)#
  ```

- To specify the port's native VLAN, use the **switchport trunk native vlan** command.

  These commands configure ***VLAN 12*** as the native VLAN trunk for ***interface Ethernet 10***.

  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)#switchport trunk native vlan 12
  switch(config-if-Et10)#
  ```

- By default, ports send native VLAN traffic with untagged frames. The **switchport trunk native vlan** command can also configure the port to send native VLAN traffic with tag frames.

  These commands configure ***interface ethernet 10*** to send native VLAN traffic as tagged.

  ```
  switch(config)#interface ethernet 10
  switch(config-if-Et10)#switchport trunk native vlan tag
  switch(config-if-Et10)#
  ```

- These commands configure ***interface Ethernet 12*** as a trunk with ***VLAN 15*** as the native VLAN. The port's trunk list includes all VLANs except ***201-300***.

  ```
  switch(config)#interface ethernet 12
  switch(config-if-Et12)#switchport mode trunk
  switch(config-if-Et12)#switchport trunk native vlan 15
  switch(config-if-Et12)#switchport trunk allowed vlan except 201-300
  switch(config-if-Et12)#
  ```

- Assume that all ports on the switch are configured with switchport mode trunk similar to Ethernet ***1*** and ***2*** shown below:

```
!
interface ethernet 1
    switchport mode trunk
!
interface ethernet 2
    switchport mode trunk
!
```

- Further assume that ***VLAN 30*** is not configured as part of a trunk group.

```
switch#show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- ----------
1     default                          active    Et1, Et2
30    vlan30                           active    Et1, Et2
```

- Now configure ***VLAN 30*** as part of ***trunk group 30***:

```
switch(config)#vlan 30
switch(config-vlan-30)#trunk group 30
```

- This updates the VLAN membership for ***VLAN 30***.

```
switch#show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- -----------
1     default                          active    Et1, Et2
30    vlan30                           active
```

Note: ***Vlan 30*** is no longer on Et1, Et2 i.e. it has been 'pruned' due to the trunk group command in the vlan configuration.

- To permit ***VLAN 30*** on ***Et1***, you need to associate the interface with the trunk group as follows:

```
switch(config-if-Et1)#switchport trunk group 30

Now we see Et1 included in the vlan 30 list

switch#show vlan
VLAN  Name                             Status    Ports
----- -------------------------------- --------- ----------
1     default                          active    Et1, Et2
30    vlan30                           active    Et1
```

- The trunk group command is not additive to the allowed VLAN command.

```
interface ethernet 1
        switchport mode trunk
        switchport trunk allowed vlan 10
        switchport trunk group trunk30

Vlan 30 will not be permitted on the interface as it is not listed in
 the allowed
vlan list.
```

12.3.3.2.3 Dot1q Tunnel Ports

Dot1q (802.1Q) is a tunneling protocol that encapsulates traffic from multiple customer (c-tag) VLANs in an additional single outer service provider (s-tag) VLAN for transit across a larger network structure

that includes traffic from all customers. Tunneling eliminates the service provider requirement that every VLAN be configured from multiple customers, avoiding overlapping address space issues.

Tunneling preserves the inner VLANs through the tunneled network; these inner VLANs are ignored by intermediate devices that make forwarding decisions based only on the outermost VLAN tag (S-Tag)

A dot1q-tunnel port sits at the edge of the tunneled network. Unlike regular access ports, a dot1q-tunnel port does not drop traffic that arrives with ***802.1Q*** tags in place; it ignores existing 802.1Q information and associates arriving traffic (with or without ***802.1Q*** headers) with a new tunnel VLAN ID.

Packets arriving at a tunnel port are encapsulated with an additional ***802.1Q*** tag that can be trunked between multiple devices like any traditional VLAN. When exiting a dot1-tunnel port, the S-Tag is removed to revert the customer traffic to its original tagged or untagged state.

To configure an interface group as a dot1q tunnel port, use the **`switchport mode`** command.

Example

These commands configure ***interface ethernet 12*** as a dot1q tunnel port.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport mode dot1q-tunnel
switch(config-if-Et12)#
```

To specify the dot1q-tunnel port's access VLAN, use the **`switchport access vlan`** command. The port then handles all inbound traffic as untagged VLAN traffic.

Example

These commands configure ***VLAN 60*** as the access VLAN for ***interface Ethernet 12***.

```
switch(config)#interface ethernet 12
switch(config-if-Et12)#switchport access vlan 60
switch(config-if-Et12)#
```

12.3.3.2.4 TPID Configuration

The default tag protocol identifier (TPID, also called dot1q ethertype) on all switch ports is 0x8100. To configure a different TPID on a port, use the **switchport dot1q ethertype** command. This feature is available only on 7280E and 7500E platforms.

Note: If dot1q tunneling is enabled on the interface, a TPID configured on the interface becomes irrelevant.

Example

In this provider bridging example, ***interface ethernet 1*** is the user network interface and ***interface ethernet 2*** is the network-to-network interface. These commands configure dot1q tunneling on ***interface ethernet 1*** and set the TPID of ***interface ethernet 2*** to 0x9100.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport mode dot1q-tunnel
switch(config-if-Et1)#interface ethernet 2
switch(config-if-Et2)#switchport mode trunk
switch(config-if-Et2)#switchport dot1q ethertype 0x9100
switch(config-if-Et2)#
```

In the above configuration, packets from ***Et1*** to ***Et2*** will undergo dot1q-tunneling (stacking of an additional dot1q tag), with an outer TPID of 0x9100 at egress, while packets with outer TPID 0x9100 going from ***Et2*** to ***Et1*** will have the outer tag removed at egress.

12.3.3.2.5 Layer 2 802.1Q Encapsulation

Layer 2 traffic encapsulation is enabled on the configuration mode interface for a specified VLAN through **l2-protocol encapsulation dot1q vlan**.

Example

These commands enable traffic encapsulation for ***VLAN 200*** traffic passing through ***interface ethernet 5/2***.

```
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#l2-protocol encapsulation dot1q vlan 200
```

12.3.3.2.6 Port VLAN Scaling on DCS-7160

Port VLAN scaling allows the user to configure a subset of ports in the scale mode. The **switchport vlan forwarding** command forwards packets between the ports belonging to VLAN in the interface configuration mode. Port-VLAN table is used for storing the configuration on a per port/VLAN combination. The scaling configuration is applicable on a per-port basis and supports a maximum of ***128*** ports.

Note: The configuration is applicable to trunk ports only.

Example

- This command enables VLAN scaling on a port with an ***interface Ethernet 2***.

```
switch#config terminal
switch(config)#interface Ethernet 2
switch(config-if-Et2)#switchport vlan forwarding accept all
```

- This command disables VLAN scaling on a port.

```
switch#config
switch(config)#interface Ethernet 2
switch(config-if-Et2)#no switchport vlan forwarding accept all
```

12.3.3.3 Creating and Configuring VLAN Interfaces

The **interface vlan** command places the switch in ***VLAN-interface*** configuration mode for modifying an SVI. An SVI provides a management address point and Layer 3 processing for packets from all VLAN ports.

Example

This command enters ***VLAN-interface*** configuration mode for ***VLAN 12***. The command also creates ***VLAN 12*** interface if it was not previously created.

```
switch#config t
switch(config)#interface vlan 12
switch(config-if-Vl12)#
```

12.3.3.4 Allocating Internal VLANs

The **vlan internal order** command specifies the VLANs that the switch allocates as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order. The default allocation range is between VLAN ***1006*** and VLAN ***4094***.

The **no switchport** command converts an Ethernet or port channel interface into a routed port, disabling Layer 2 switching for the interface.

Examples

- This command configures the switch to allocate internal VLANs in ascending order starting with ***1006***.

```
switch(config)#vlan internal order ascending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order starting with ***4094***.

```
switch(config)#vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order from ***4094*** through ***4000***.

```
switch(config)#vlan internal order descending range 4000 4094
switch(config)#
```

12.3.3.5 Private VLAN Configuration

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- On systems with algomatch hardware, the access-list mechanism must explicitly be set to TCAM using the following command. Ignore this step when on non-algomatch hardware based systems.

```
switch(config)#hardware access-list mechanism tcam
```

- To enable the private VLAN feature, you must also enable the forwarding-ID feature.

```
switch(config)#platform sand l2 forwarding-id sharing
```

On All Platforms

- Any regular VLAN can act as a primary without any extra configuration. The only requirement is that the VLAN must be active. Use the following command to configure a VLAN as active or inactive:

```
switch(config)#vlan 100
```

```
switch(config)#no vlan 100
```

```
switch(config)#default vlan 100
```

- Configure VLANs as secondary inside the ***VLAN*** configuration mode. Use the configuration to specify the primary VLAN as isolated and the type of secondary VLAN:

```
switch(config)#vlan 20
switch(config-vlan-20)#private-vlan isolated primary vlan 10
switch(config)#vlan 30
switch(config-vlan-30)#private-vlan community primary vlan 10
```

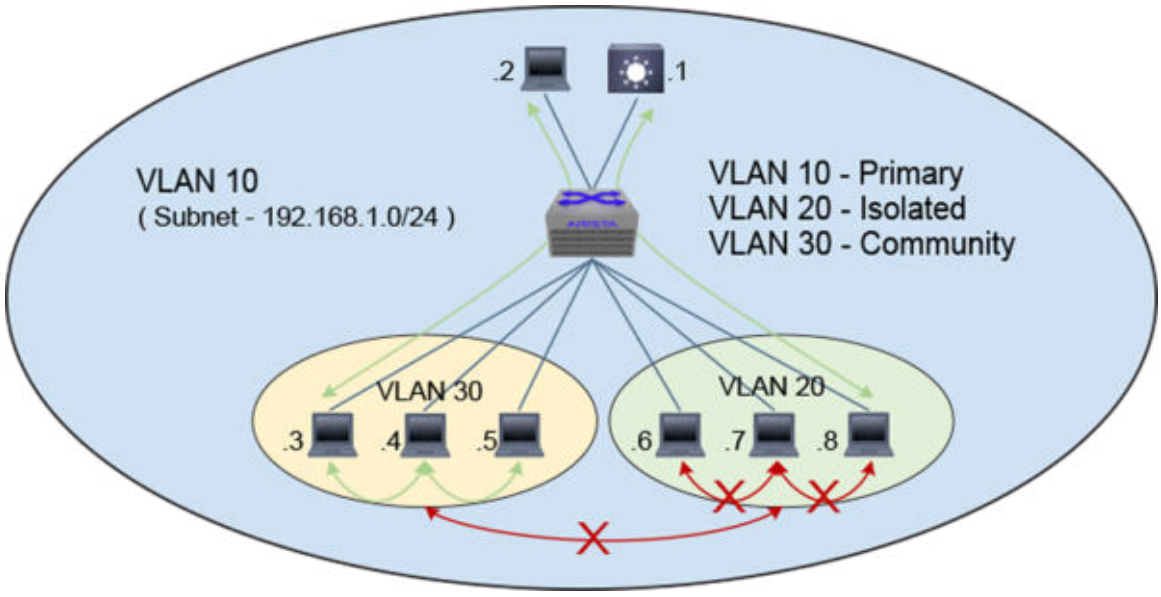

Figure 27: Support for Private VLAN

- Interfaces are assigned to primary or secondary VLANs in the same way as regular VLANs. It works with both access and trunk ports. The following shows the standard switchport command configuring an access interface to the secondary VLAN configured before:

```
switch(config)#interface Ethernet 1/1
switch(config-if-Et1/1)#switchport access vlan 20
```

- Trunk ports forward any traffic within the allowed VLANs configured on the interface, whether they are primary or secondary VLANs. To configure trunk ports to translate traffic from primary VLAN to secondary (this maps to the lowest secondary VLAN if multiple are allowed) configure the following on the trunk port:

```
switch(config)#interface Ethernet 1/1
switch(config-if-Et1/1)#switchport trunk private-vlan secondary
```

Steps to Unconfigure

On all Platforms

- To unconfigure a private VLAN, use the following command. This reverts the VLAN back to a regular VLAN. At this point, the broadcast domain for this VLAN adjusts and all hosts start to be learned in the regular VLAN, as opposed to the primary VLAN. The MAC table entries previously learned on the primary VLAN are not used anymore for forwarding.

```
switch(config-vlan-20)#no private-vlan
```

- To restore trunk port behavior to allow traffic on all primary and secondary VLANs:

```
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#no switchport trunk private-vlan secondary
```

On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

To unconfigure forwarding-id sharing:

```
switch(config)#no platform sand l2 forwarding-id sharing
```

```
Note: This configuration needs the device to be rebooted to take effect.
```

12.3.3.6 Configuring VLAN Translation

VLAN translation changes the VLAN ID of specified packets entering or leaving a port. The following sections describe the configuration of VLAN translation.

12.3.3.6.1 Per-port VLAN Translation on Switched Ports

The **switchport vlan translation** command allows translation of the VLAN tag of traffic entering or exiting a switched port.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the **switchport mode** command.

Examples

- This command configures ***interface ethernet 5*** as a trunk port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport mode trunk
switch(config-if-Et5)#
```

- By default, the translation is bidirectional: packets ingressing an interface through ***VLAN A*** are internally mapped to ***VLAN B***; ***VLAN B*** packets egressing the same interface are mapped to ***VLAN A***.
  - These commands map ***interface ethernet 5*** traffic with dot1q tag ***50*** to bridging ***VLAN 60***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#
```

  - These commands provides multiple 1:1 VLAN mappings under an interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#switchport vlan translation 61 71
switch(config-if-Et5)#switchport vlan translation 62 72
switch(config-if-Et5)#
```

  - These commands translate only incoming packets.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation in 50 60
switch(config-if-Et5)#
```

  - These commands translate only egress packets.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation out 60 50
switch(config-if-Et5)#
```

12.3.3.6.2 Per-port VLAN Translation on Routed Ports

On routed ports, the **encapsulation dot1q vlan** command (permitted only on routed ports) configures the VLAN on the interface to act as the native VLAN. This command will map packets ingressing with the specified VLAN ID to the internal VLAN ID of the routed port. All traffic egressing out of the routed port will be tagged with the VLAN ID specified in the command.

Example

These commands translate between ***vlan 50*** and the internal VLAN for ***interface ethernet 5*** (a routed port).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

12.3.3.6.3 Double VLAN Translation

Double VLAN translation creates mappings between an inner and outer VLAN ID pair of a double-tagged packet and a single bridging VLAN. On ingress, specified double-tagged packets are mapped to the bridging VLAN, and on egress packets with the ID of the bridging VLAN are double tagged as specified. By default, the translation is bidirectional, but it can be applied only on ingress or egress.

Example

These commands causes packets entering ***interface ethernet 3/1*** with an outer VLAN ID of ***1000*** and an inner VLAN ID of ***100*** to be processed in bridging ***VLAN 200***.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#switchport vlan translation in 1000 inner 100 200
switch(config-if-Et3/1)#
```

12.3.4 VLAN Configuration Commands

Global VLAN Configuration Commands

- interface vlan
- vlan
- vlan internal order

VLAN Configuration Mode Commands

- mac address forwarding
- name (VLAN configuration mode)
- state
- trunk group

Layer 2 Interface (Ethernet and Port Channel) Configuration Commands

- switchport access vlan
- switchport dot1q ethertype
- switchport mode
- switchport trunk allowed vlan
- switchport trunk group
- switchport trunk native vlan
- switchport vlan forwarding
- switchport vlan translation

VLAN Interface Configuration Mode Commands

- autostate
- encapsulation dot1q vlan
- l2-protocol encapsulation dot1q vlan
- name (VLAN configuration mode)
- pvlan mapping

Show Commands

- show dot1q-tunnel
- show interfaces switchport
- show interfaces switchport backup-link
- show interfaces switchport vlan mapping
- show interfaces trunk
- show interfaces vlans
- show pvlan mapping interfaces
- show vlan
- show vlan brief count
- show vlan dynamic
- show vlan internal allocation policy
- show vlan internal usage
- show vlan trunk group

12.3.4.1 vlan internal order

The **`vlan internal order`** command specifies the range that the switch can allocate as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order from VLAN ***1006*** to VLAN ***4094***.

The **`no vlan internal order`** and **`default vlan internal order`** commands revert the policy to its default.

Command Mode

Global Configuration

Command Syntax

`vlan internal order` **DIRECTION** [**RANGE_VLAN**]

`no vlan internal order`

`default vlan internal order`

Parameters

- **DIRECTION** VLAN allocation number direction. Options include:
  - **ascending** allocates internal VLANs from lower VLAN bound to upper VLAN bound.
  - **descending** allocates internal VLAN from upper VLAN bound to lower VLAN bound.
- **RANGE_VLAN** allocation range. Options include:
  - ***no parameter*** ***1006*** (lower bound) to ***4094*** (upper bound).
  - **range**, **lower**, **upper** specifies lower bound (**lower**) and upper bound (**upper**).

Examples

- This command configures the switch to allocate internal VLANS from ***3000*** through ***3999***.

```
switch(config)#vlan internal order ascending range 3000 3999
switch(config)#
```

- This command configures the switch to allocate internal VLANS from ***4094*** through ***1006***.

```
switch(config)#vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANS from ***4094*** down through ***4000***.

```
switch(config)#vlan internal order descending range 4000 4094
switch(config)#
```

- This command reverts the allocation policy to its default (ascending, between ***1006*** and ***4094***).

```
switch(config)#no vlan internal order
switch(config)#
```

12.3.4.2 vlan

The **vlan** command places the switch in VLAN configuration mode to configure a set of virtual LANs. The command creates the specified VLANs if they do not exist prior to issuing the command. A VLAN that is in use as an internal VLAN may not be created or configured. The switch rejects any **vlan** command that specifies an internal VLAN ID.

The **default vlan** and **no vlan** commands removes the VLAN statements from ***running-config*** for the specified VLANs.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

vlan *vlan_range*

no vlan *vlan_range*

default vlan *vlan_range*

Parameters

vlan_range VLAN list.

Formats include a name, number, number range, or comma-delimited list of numbers and ranges.

Commands Available in VLAN Configuration Mode

- name (VLAN configuration mode)
- state
- trunk group

Guidelines

In MLAG configurations, VLANs operate as follows:

- The VLAN must be configured identically on both MLAG peer switches.
- The port-specific bridging configuration originates on the switch where the port is physically located. This configuration includes the switchport access VLAN, switchport mode (trunk or access), trunk-allowed VLANs, the trunk native VLAN, and the switchport trunk groups.

Example

This command creates ***VLAN 49*** and enters ***VLAN*** configuration mode for the new VLAN:

```
switch(config)#vlan 49
switch(config-vlan-49)#
```

12.3.4.3 autostate

When **autostate** is **enabled**, the VLAN interface will be up when:

- the corresponding VLAN exists and is in the active state.
- one or more Layer 2 ports in the VLAN are up and in spanning-tree forwarding state.
- the VLAN interface exists and is not in a shutdown state.

Autostate is **enabled** by default. When autostate is **disabled**, the VLAN interface is forced to be active.

- The **no autostate** command disables autostate on the configuration mode interface. The **no autostate** command is stored to ***running-config***.
- The **autostate** command enables the autostate function on the configuration mode VLAN SVI by removing the corresponding **no autostate** statement from ***running-config***.
- The **default autostate** command restores the autostate default state of **enabled** by removing the corresponding **no autostate** statement from ***running-config***.

Command Mode

Interface-VLAN Configuration

Command Syntax

autostate

no autostate

default autostate

Guidelines

Autostate should be disabled on SVIs configured as an MLAG local interface.

Examples

- These commands disable autostate on ***VLAN 100***.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#no autostate
switch(config-if-Vl100)#
```

- These commands enable autostate on ***VLAN 100***.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#autostate
switch(config-if-Vl100)#
```

12.3.4.4 encapsulation dot1q vlan

Routed Port VLAN Translation

In the configuration mode for an Ethernet or port channel interface, the **`encapsulation dot1q vlan`** translates packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port, and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

Subinterface VLAN Assignment

When used in the configuration mode for an Ethernet or port channel subinterface, however, the **`encapsulation dot1q vlan`** command assigns a dot1q tag to the subinterface. Traffic ingressing on the parent interface with that dot1q tag will then be sent to the configured subinterface. See **Subinterfaces** and **Subinterface Configuration** for details.

The **`no encapsulation dot1q vlan`** and **`default encapsulation dot1q vlan`** commands restore the default VLAN to the configuration mode interface by removing the corresponding **`encapsulation dot1q vlan`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-port-channel Configuration

Subinterface-Ethernet Configuration

Subinterface-port-channel Configuration

Command Syntax

`encapsulation dot1q vlan` *vlan_id*

`no encapsulation dot1q vlan`

`default encapsulation dot1q vlan`

Parameters

vlan_id For VLAN translation, the ID of the external VLAN to be translated; for subinterface configuration, the VLAN of the subinterface. Values range from ***1*** to ***4094***.

Examples

- These commands translate between ***vlan 50*** and the internal VLAN for ***interface ethernet 5*** (a routed port).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

- These commands assign packets ingressing on ***interface ethernet 1/1*** with ***VLAN ID 100*** to subinterface ***ethernet 1/1.1***.

```
switch(config)#interface ethernet1/1.1
switch(config-if-Et1/1.1)#no switchport
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100
switch(config-if-Et1/1.1)#
```

12.3.4.5 interface vlan

The **`interface vlan`** command places the switch in VLAN-interface configuration mode for modifying parameters of the Switch Virtual Interface (SVI). An SVI provides Layer 3 processing for packets from all ports associated with the VLAN. There is no physical interface for the VLAN.

When entering configuration mode to modify existing SVIs, the command can specify multiple interfaces. The command creates an SVI if the specified interface does not exist prior to issuing the command. When creating an SVI, the command can only specify a single interface.

The **`no interface vlan`** command deletes the specified SVI interfaces from **`running-config`**. The **`default interface vlan`** commands remove all configuration statements for the specified SVI interfaces from ***running-config*** without deleting the interfaces.

Command Mode

Global Configuration

Command Syntax

`interface vlan` *v_range*

`no interface vlan` *v_range*

`default interface vlan` *v_range*

Parameter

v_range VLAN interfaces (number, range, or comma-delimited list of numbers and ranges). VLAN number ranges from ***1*** to ***4094***.

Restrictions

Internal VLANs: A VLAN interface cannot be created or configured for internal VLAN IDs. The switch rejects any **`interface vlan`** command that specifies an internal VLAN ID.

Example

This example creates an SVI for ***VLAN 12***:

```
switch#config
switch(config)#interface vlan 12
switch(config-if-Vl12)#
```

12.3.4.6 l2-protocol encapsulation dot1q vlan

The **`l2-protocol encapsulation dot1q vlan`** command enables Layer 2 802.1Q traffic encapsulation on the configuration mode interface for a specified VLAN. The default VLAN for all interfaces is VLAN 1.

The **`no l2-protocol encapsulation dot1q vlan`** and **`default l2-protocol encapsulation dot1q vlan`** commands disable the specified encapsulation on the configuration mode interface by removing the corresponding **`l2-protocol encapsulation dot1q vlan`** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

`l2-protocol encapsulation dot1q vlan` *vlan_id*

`no l2-protocol encapsulation dot1q vlan`

`default l2-protocol encapsulation dot1q vlan`

Parameters

vlan_id the ID of the native VLAN. Values range from ***1*** to ***4094***.

Example

These commands enable 802.1Q encapsulation of traffic on ***vlan 200***.

```
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)#show active
interface Ethernet5/2
   l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)#
```

12.3.4.7 mac address forwarding

The **mac address forwarding** command enables a switch to configure a VLAN policy when it receives a packet with an unknown destination MAC address on a VLAN. The command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default state is to flood the L2 miss packets on all ports of the VLAN.

The **show vlan** command displays information about the VLAN policy that is being configured.

The **no** form and the **default** form of the command removes the previously configured VLAN policy on the VLAN.

Command Mode

VLAN Configuration

Command Syntax

mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

no mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

default mac address forwarding [unicast | multicast] **miss action** [drop | flood | log]

Parameters

- **unicast** the unicast type of transmission.
- **multicast** the multicast type of transmission.
- **drop** the selected packets are dropped.
- **flood** the selected packets are flooded in the specific VLAN.
- **log** the selected packets are sent to the CPU for logging purpose.

Guidelines

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

Examples

- These commands create a ***VLAN 333*** and then set the unicast policy to **drop** and the multicast policy to **log** for the specific ***VLAN 333***.

```
switch(config)#vlan 333
switch(config-vlan-333)#mac address forwarding unicast miss action drop
switch(config-vlan-333)#mac address forwarding multicast miss action
 log
```

- These commands display the VLAN policy that was defined when ***VLAN 333*** is created.

```
switch(config)#show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
```

```
----  ------------  ------------
 333  flood         flood
```

- These commands display the VLAN policy type that was defined when ***VLAN 333*** is configured with the **drop** unicast policy and the **log** multicast policy.

```
switch(config)#show vlan 333 mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
 333  drop          log

switch(config)#show vlan mac address forwarding

VLAN  UcMissAction  McMissAction
----  ------------  ------------
   1  flood         flood
 333  drop          log
```

12.3.4.8 name (VLAN configuration mode)

The **name** command configures the VLAN name. The name can have up to 32 characters. The default name for VLAN 1 is **default**. The default name for all other VLANs is VLANxxxx, where xxxx is the VLAN number. The default name for ***VLAN 55*** is ***VLAN0055***. The **show vlan** command displays the VLAN name.

The **name** command accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from ***running-config***.

Command Mode

VLAN Configuration

Command Syntax

name *label_text*

no name

default name

Parameters

label_text character string assigned to name attribute. Maximum length is ***32*** characters. The space character is not permitted in the name string.

Example

These commands assign ***corporate_100*** as the name for ***VLAN 25***, then displays the VLAN name.

```
switch(config)#vlan 25
switch(config-vlan-25)#name corporate_100
switch(config-vlan-25)#show vlan 25
VLAN  Name                            Status    Ports
----- ------------------------------- --------- ---------
25    corporate_100                   active

switch(config-vlan-25)#
```

12.3.4.9 pvlan mapping

The pvlan mapping command maps a switch virtual interface (SVI) available in the primary VLAN to the secondary VLAN or VLANs in the VLAN configuration mode. The **show pvlan mapping interfaces** command displays the list of mapped VLANs.

The **no pvlan mapping** and **default pvlan mapping** commands restore the default state of the private VLAN mapping.

Command Mode

VLAN Configuration

Command Syntax

pvlan mapping{add | remove | vlan ID}

no pvlan mapping{add | remove | vlan ID}

default pvlan mapping{add | remove | vlan ID}

Parameters

- **add** adding VLANs to the PVLAN mapping of the current VLAN interface.
- **remove** removing VLANs from the PVLAN mapping of the current VLAN interface.
- **vlan ID** The secondary VLAN IDs of the private VLAN mapping. The IDs range from ***1*** to ***4094***.

Related Commands

show pvlan mapping interfaces

Example

These commands assign a secondary VLAN ID of ***50*** to the primary VLAN.

```
switch(config)#vlan 25
switch(config-vlan-25)#pvlan mapping 50
switch(config-vlan-25)#
```

12.3.4.10 show dot1q-tunnel

The **show dot1q-tunnel** command displays the ports that are configured in dot1q-tunnel switching mode. The **switchport mode** command configures the switching mode for the configuration mode interface.

Command Mode

EXEC

Command Syntax

show dot1q-tunnel [**INTERFACE**]

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.
- **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

  Valid ***range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the ports that are configured in dot1q-tunnel switching mode.

```
switch>show dot1q-tunnel
dot1q-tunnel mode LAN Port (s)
------------------------------
Po4
Po21
Po22
switch>
```

12.3.4.11 show interfaces switchport backup-link

The **show interfaces switchport backup-link** command displays interfaces that are configured as switchport backup pairs and the operational status of each interface. For each pair, the command displays the names, roles, status, and VLAN traffic of each interface.

Command Mode

EXEC

Command Syntax

show interfaces [INTERFACE] **switchport backup-link**

show interfaces switchport backup-link [module{Fabric *f_num* | Linecard *lc_num* | Supervisor *svr_num* | Switchcard | *1-2* | *3-6*}]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.

    Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, and ***v_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **module** Displays interfaces of the specified module. Options include:
  - **Fabric *f_num*** Displays interfaces of the specified fabric module. Value ranges from ***1*** to ***6***.
  - **Linecard *lc_num*** Displays interfaces of the specified linecard module. Value ranges from ***3*** to ***6***.
  - **Supervisor *svr_num*** Displays interfaces of the specified supervisor module. Accepted values are ***1*** and ***2***.
  - **Switchcard** Displays interfaces of switchcard modules.
  - ***1-2*** Displays interfaces of the specified supervisor module.
  - ***3-6*** Displays interfaces of the specified linecard module.

Display Values

- **State** Operational status of the interface. Values include:
  - **Up** Spanning tree mode is *backup*, interface status is **up**.
  - **Down** Spanning tree mode is *backup*, interface status is **down**.
  - **Inactive Configuration** The spanning tree mode is not **backup**.
- **Forwarding vlans** VLANs forwarded by the interface. Depends on interface operation status and prefer option specified by the **switchport backup** command.

Examples

- This command displays the configured switchport primary-backup pairs.

```
switch>show interfaces switchport backup-link
Switch backup interface pair: Ethernet3/17, Ethernet3/8
Primary Interface: Ethernet3/17     State:  Inactive Configuration
Backup Interface:  Ethernet3/8      State:  Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
```

```
Mac move destination: ff:ff:ff:ff:ff:ff
```

- This command displays interfaces of the module for ***linecard 4***.

```
switch(config)#show int switchport backup-link module Linecard 4
Switch backup interface pair: Ethernet4/19/1, Ethernet4/19/2
Primary Interface: Ethernet4/19/1   State:  Inactive Configuration
Backup Interface:  Ethernet4/19/2   State:  Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
Mac move destination: ff:ff:ff:ff:ff:ff
```

12.3.4.12 show interfaces switchport vlan mapping

The **show interfaces switchport vlan mapping** command displays mapping information of the configured VLANs in an interface mode.

Command Mode

EXEC

Command Syntax

show interfaces switchport vlan mapping

Examples

- This command displays mapping information of the configured VLAN IDs.

```
switch#show interfaces switchport vlan mapping
--------------
Ethernet3
                                    Direction   Direction
Original Vlan  New Vlan  Status    Configured  Active
-------------- --------- --------- ----------- -----------
10             100       Active    In/Out      In/Out
11             200       Active    In          In
300            12        Active    Out         Out
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
--------------
Ethernet3/1
Direction     Direction
Outer Tag     Inner Tag     VLAN ID     Status      Configured    Active Dot1  qTunnel
-----------   -----------   ---------   ---------   -----------   -----------  -----------
1000          100           200         active        In/Out        In/Out      -

1001          101           201         active        In            In          -

1002          102           202         active        Out           Out          -
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
--------------
Ethernet1/1
                                                  Direction     Direction
Outer Tag    Inner Tag     VLAN ID     Status     Configured    Active
-----------  -----------   ---------   ---------  -----------   -----------
70             -             300         Active     In/Out        In/Out
10             50            100         Active     In/Out        In/Out
20             60            100         Active     In            In
30             40            200         Active     Out           Out
```

12.3.4.13 show interfaces switchport

The **`show interfaces switchport`** command displays the switching configuration and operational status of the specified ports.

Command Mode

EXEC

Command Syntax

`show interfaces` [**INTERFACE**] `switchport`

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display the switching status for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **loopback *l_range*** Loopback interface specified by ***l_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
- **vlan *v_range*** VLAN interface range specified by ***v_range***.

  Valid ***e_range***, ***l_range***, ***m_range***, ***p_range***, and ***v_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Examples

- This command displays the switching status for all interfaces.

```
switch(config)#show interface switchport
Default switchport mode: access

Name: Et5/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

Name: Et5/2
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

[...]

switch(config)#
```

- This command displays the switching status of port channel interfaces ***21*** and ***22***.

```
switch>show interface port-channel 21-22 switchport
```

```
Name: Po21
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 100 (VLAN0100)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups: foo

Name: Po22
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups:

switch>
```

- This command displays the configured status of VLAN scaling for the ***interface ethernet 2/1*** port.

```
switch#show interface Ethernet 2/1 switchport
Name: Ethernet 2/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
MAC Address Learning: enabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allConfiguredVlans

switch>
```

12.3.4.14 show interfaces trunk

The **show interfaces trunk** command displays configuration and status information for interfaces configured in switchport trunk mode.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] trunk

Parameters

INTERFACE Interface type and numbers. Options include:

- ***no parameter*** Display information for all interfaces.
- **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
- **management *m_range*** Management interface range specified by ***m_range***.
- **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.

  Valid ***e_range***, ***m_range***, and ***p_range*** formats include number, number range, or comma-delimited list of numbers and ranges.

Example

This command displays the trunk status for all interfaces configured in switchport trunk mode.

```
switch>show interfaces trunk
Port            Mode            Status          Native vlan
Po1             trunk           trunking        1
Po2             trunk           trunking        1

Port            Vlans allowed
Po1             1-15
Po2             16-30

Port            Vlans allowed and active in management domain
Po1             1-10
Po2             21-30

Port            Vlans in spanning tree forwarding state
Po1             1-10
Po2             21-30

switch>
```

12.3.4.15 show interfaces vlans

The **show interfaces vlans** command displays a table that lists the VLANs that are carried by the specified interfaces. Interfaces that do not carry VLANs are not listed in the table. The table lists the untagged (native or access) and tagged VLANs for each interface.

Command Mode

EXEC

Command Syntax

show interfaces [**INT_NAME**] vlans

Parameters

INT_NAME Interface type and number. Values include:

- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.

Example

This command displays the VLANs carried by all L2 ports.

```
switch>show interfaces vlans
Port       Untagged Tagged
Et9        3910     -
Et11       3912     -
Et16       500      -
Et17       3908     -
Et18       3908     -
Po1        1        101-102,500,721,3000,
Po2        101      -
Po4        3902     -
Po5        3903     -
Po6        3992     -
Po7        661      -
Po8        3911     -
```

12.3.4.16 show pvlan mapping interfaces

The **show pvlan mapping interfaces** command displays information about the private VLAN mapping interfaces.

Command Mode

EXEC

Command Syntax

show pvlan mapping interfaces

Example

This command displays information about the private VLAN mapping interfaces.

```
switch(config)#int vlan 50
switch(config-if-Vl50)#pvlan mapping 70
switch(config-if-Vl50)#show pvlan mapping interfaces
Interface    Secondary Vlans
---------    ---------------
Vlan50       70
```

12.3.4.17 show vlan brief count

The **show vlan brief count** command displays the number of VLANs that are configured on the switch.

Command Mode

EXEC

Command Syntax

show vlan brief count

Example

This command displays the number of VLANs on the switch.

```
switch>show vlan brief count
Number of existing VLANs           : 18

switch>
```

12.3.4.18 show vlan dynamic

The **show vlan dynamic** command displays the source and quantity of dynamic VLANs on the switch. Dynamic VLANs support VM Tracer monitoring sessions.

Command Mode

EXEC

Command Syntax

show vlan dynamic

Example

This command displays the source and quantity of dynamic VLANs on the switch.

```
switch>show vlan dynamic
Dynamic VLAN source       VLANS
vmtracer-poc              88
switch>
```

12.3.4.19 show vlan internal allocation policy

The **show vlan internal allocation policy** command displays the method the switch uses to allocate VLANs to routed ports. The **vlan internal order** command configures the allocation method.

The allocation method consists of two configurable components:

- **range:** the list of VLANs that are allocated to routed ports.
- **direction:** the direction by which VLANs are allocated (ascending or descending).

Command Mode

EXEC

Command Syntax

show vlan internal allocation policy

Example

This command displays the internal allocation policy.

```
switch>show vlan internal allocation policy
Internal VLAN Allocation Policy: ascending
Internal VLAN Allocation Range: 1006-4094
switch>
```

12.3.4.20 show vlan internal usage

The **show vlan internal usage** command shows the VLANs that are allocated as internal VLANs for routed ports.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

When an interface is configured as a routed port, the switch allocates an SVI with a previously unused VLAN ID. The switch prohibits the configuration of VLANs with numbers corresponding to internal VLAN interfaces allocated to a routed port. VLAN interfaces corresponding to SVIs allocated to a routed port cannot be configured by VLAN interface configuration mode commands.

Command Mode

EXEC

Command Syntax

show vlan internal usage

Example

This command displays the VLANs that are allocated to routed ports.

```
switch>show vlan internal usage
1006  Ethernet3
1007  Ethernet4
switch>
```

12.3.4.21 show vlan trunk group

The **show vlan trunk group** command displays the trunk group membership of the specified VLANs.

Command Mode

EXEC

Command Syntax

show vlan [**VLAN_LIST**] trunk group

Parameters

VLAN_LIST VLAN list. Options include:

- ***no parameter*** all VLANs.
- ***v_range*** VLANs specified by ***v_range***.
- **id *v_range*** VLANs specified by ***v_range***.
- **name *v_name*** VLANs specified by the VLAN name ***v_name***.

Display Values

- **VLAN** VLAN ID.
- **Trunk Groups** Trunk groups associated with the listed VLANs.

Example

This command displays the trunk group membership of all configured VLANs.

```
switch>show vlan trunk group
VLAN     Trunk Groups
----     ------------------------------------
5
10       first_group
12
40       second_group
100      third_group
101      middle_group
102
200

switch>
```

12.3.4.22 show vlan

The **show vlan** command displays the VLAN ID, name, status, and member ports of all configured VLANs. The command only displays active ports by default; by specifying **configured-ports**, the command displays all ports that are members of a configured VLAN regardless of their activity status, including Ethernet ports that are members of a port channel.

Command Mode

EXEC

Command Syntax

show vlan [**VLAN_LIST**][**PORT_ACTIVITY**]

Parameters

- **VLAN_LIST** List of VLANs displayed by command. Options include:
  - ***no parameter*** all VLANs.
  - ***v_range*** VLANs specified by ***v_range***.
  - **id *v_range*** VLANs specified by ***v_range***.
  - **name *v_name*** VLANs specified by the VLAN name ***v_name***.

  v_range formats include number, number range, or comma-delimited list of numbers and ranges.
- **PORT_ACTIVITY** Ports listed in table. Options include:
  - ***no parameter*** table displays only active ports (same as **active-configuration** option).
  - **active-configuration** table displays only active ports.
  - **configured-ports** table displays all configured ports.

Display Values

- **VLAN** The VLAN ID.
- **Name** The name of the VLAN.
- **Status** The status of the VLAN.
- **Ports** The ports that are members of the VLAN.

Examples

- This command displays status and ports of VLANs ***1-1000***.

```
switch>show vlan 1-1000
VLAN  Name                    Status    Ports
----- ----------------------- --------- --------------
1     default                 active    Po1
184   fet.arka                active    Cpu, Po1, Po2
262   mgq.net                 active    PPo2, Po1
512   sant.test               active    Cpu, Et16, Po1
821   ipv6.net                active    Cpu, Po1, Po7

switch>
```

- This command displays the list of all the member interfaces under each SVI.

```
switch#show vlan
VLAN  Name                    Status    Ports
----- ----------------------- --------- ----------------
1     default                 active
2148  VLAN2148                active    Cpu, Et1, Et26
2700  VLAN2700                active    Cpu, Et18
```

12.3.4.23 state

The **state** command configures the VLAN transmission state of the configuration mode VLAN.

- **Active state**: Ports forward VLAN traffic.
- **Suspend state**: Ports block VLAN traffic.

The default transmission status is active.

The **no state** command restores the default VLAN transmission state to the configuration mode VLAN by removing the corresponding **state** command from ***running-config***.

Command Mode

VLAN Configuration

Command Syntax

state **OPERATION_STATE**

no state

default state

Parameters

OPERATION_STATE VLAN transmission state. Options include:

- **active** VLAN traffic is forwarded.
- **suspend** VLAN traffic is blocked.

Example

These commands suspend VLAN traffic on VLANs ***100***-***102***.

```
switch(config)#vlan 100-102
switch(config-vlan-100-102)#state suspend
switch(config-vlan-100-102)#
```

12.3.4.24 switchport access vlan

The **switchport access vlan** command specifies the access VLAN of the configuration mode interface. Ethernet or port channel interfaces that are in access mode are members of only the access VLAN. Untagged frames that the interface receives are associated with the access VLAN. Frames tagged with the access VLAN are also associated with the access VLAN. The interface drops all other tagged frames that it receives. By default, VLAN 1 is the access VLAN of all Ethernet and port channel interfaces.

An interface's access mode is effective only when the interface is in access mode or dot1q-tunnel mode, as specified by the switchport mode command. Interfaces in dot1q-tunnel mode handle inbound traffic as untagged traffic and associate all traffic with the access VLAN. Interfaces configured to switchport trunk mode maintain and ignore existing switchport access commands.

The **no switchport access vlan** and **default switchport access vlan** commands restore ***VLAN 1*** as the access VLAN of the configuration mode interface by removing the corresponding **switchport access vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport access vlan *v_num*

no switchport access vlan

default switchport access vlan

Parameters

v_num number of access VLAN. Value ranges from ***1*** to ***4094***. Default is ***1***.

Example

These commands assign ***VLAN 100*** as the access VLAN to ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport access vlan 100
switch(config-if-Et5)#
```

12.3.4.25 switchport dot1q ethertype

The **switchport dot1q ethertype** command configures the tag protocol identifier (TPID, also known as a dot1q ethertype), of the configuration mode interface. By default, all switch ports use the standard TPID of ***0x8100***.

The **no switchport dot1q ethertype** and **default switchport dot1q ethertype** commands restore the TPID to ***0x8100*** by removing the corresponding **switchport dot1q ethertype** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

switchport dot1q ethertype *ethertype*

no switchport dot1q ethertype

default switchport dot1q ethertype

Parameters

ethertype ethertype number (TPID). Value ranges from ***0x600*** (***1536***) through ***0xFFFF*** (***65535***), and can be entered in decimal or hexadecimal notation. Value is stored and displayed in hexadecimal form; the default value is ***0x8100***.

Example

These commands configure ***0x9100*** as the TPID of ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport dot1q ethertype 0x9100
switch(config-if-Et5)#
```

12.3.4.26 switchport mode

The **switchport mode** command specifies the switching mode of the configuration mode interface. The switch supports five switching modes: access, trunk, dot1q-tunnel, tap, and tool.

- **Access switching mode**: The interface is a member of one VLAN, called the access VLAN, as specified by the **switchport access vlan** command. Tagged frames received on the interface are dropped unless they are tagged with the access VLAN. Frames transmitted from the interface are always untagged.
- **Trunk switching mode**: The interface may be a member of multiple VLANs, as configured by the **switchport trunk allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport trunk native vlan** command.
- **Dot1q-tunnel switching mode**: The interface treats all inbound packets as untagged traffic and handles them as traffic of its access VLAN, as specified by the **switchport access vlan** command.
- **Tap mode**: The interface operates as a tap port. Tap ports receive traffic for replication on one or more tool ports.The interface may be a member of multiple VLANs, as configured by the **switchport tap allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport tap native vlan** command.

Tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool mode: The interface operates as a tool port. Tool ports replicate traffic received by tap ports. The interface may be a member of multiple VLANs, as configured by the **switchport tool allowed vlan** command. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool ports are in STP forwarding state and prohibit ingress traffic that uses port settings.

The status of switchport configured ports depends on the switch's tap aggregation mode (which can be viewed by using the **mode** command):

- tap aggregation mode enabled: tap and tool ports are enabled. Switching ports are errdisabled.
- tap aggregation mode disabled: tap and tool ports are errdisabled. Switching ports are enabled.

The **no switchport mode** and **default switchport mode** commands return the configuration mode interface to its default setting as an access port by deleting the corresponding **switchport mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport mode MODE_TYPE

no switchport mode

default switchport mode

Parameters

MODE_TYPE switching mode of the configuration mode interfaces. Options include:

- **access** access switching mode.
- **dot1q-tunnel** dot1q-tunnel switching mode.
- **tap** tap switching mode.
- **tool** tool switching mode.
- **trunk** trunk switching mode.

Restrictions

Dot1q-tunnel switching mode is not available on Petra platform switches.

Tap aggregation (tap and tool modes) is available on FM6000 and Arad platform switches.

Example

These commands configure ***interface ethernet 4*** as a trunk port.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#switchport mode trunk
switch(config-if-Et4)#
```

12.3.4.27 switchport trunk allowed vlan

The **switchport trunk allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in trunk mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in ***running-config*** without taking effect when the switch is in tap aggregation mode or the interface is not in trunk mode.

The **no switchport trunk allowed vlan** and **default switchport trunk allowed vlan** commands restore the trunk mode default allowed VLAN setting of **all** by removing the corresponding **switchport trunk allowed vlan** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport trunk allowed vlan **EDIT_ACTION**

no switchport trunk allowed vlan

default switchport trunk allowed vlan

Parameters

EDIT_ACTION modifications to the VLAN list.

- ***v_range*** Creates VLAN list from *v_range*.
- **add *v_range*** Adds specified VLANs to current list.
- **all** VLAN list contains all VLANs.
- **except *v_range*** VLAN list contains all VLANs except those specified.
- **none** VLAN list is empty (no VLANs).
- **remove *v_range*** Removes specified VLANs from current list.

Valid ***v_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

These commands create the trunk mode allowed VLAN list of 6-10 for ***interface ethernet 14***, then verifies the VLAN list.

```
switch(config)#interface ethernet 14
switch(config-if-Et14)#switchport trunk allowed vlan 6-10
switch(config-if-Et14)#show interfaces ethernet 14 switchport
Name: Et14
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: 6-10
Trunk Groups:

switch(config-if-Et14)#
```

12.3.4.28 switchport trunk group

The **switchport trunk group** command assigns the configuration mode interface to the specified trunk group. Trunk group ports handle traffic of the VLANs assigned to the group.

The **no switchport trunk group** and **default switchport trunk group** commands remove the configuration mode interface from the specified trunk group by deleting the corresponding statement from running-config. If the command does not specify a trunk group, the interface is removed from all trunk groups to which it is assigned.

Note: On platforms which support the use of port channels as mirror destinations, a port channel which is being used as a mirror destination *must not* be assigned to an MLAG.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport trunk group [*group_name*]

no switchport trunk group [*group_name*]

default switchport trunk group [*group_name*]

Parameters

group_name trunk group name.

Example

These commands assign ***port channel 4*** to trunk group ***fe-1***.

```
switch(config)#interface port-channel 4
switch(config-if-Po4)#switchport trunk group fe-1
switch(config-if-Po4)#
```

12.3.4.29 switchport trunk native vlan

The **switchport trunk native vlan** command specifies the trunk mode native VLAN for the configuration mode interface. Interfaces in trunk mode associate untagged frames with the native VLAN. Trunk mode interfaces can also be configured to drop untagged frames. The default native VLAN for all interfaces is VLAN 1.

The **no switchport trunk native vlan** and **default switchport trunk native vlan** commands restore ***VLAN 1*** as the trunk mode native VLAN to the configuration mode interface by removing the corresponding **switchport trunk native vlan** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport trunk native vlan **VLAN_ID**

no switchport trunk native vlan

default switchport trunk native vlan

Parameters

- **VLAN_ID** the ID of the native VLAN. Options include:
  - ***v_num*** VLAN number. Value ranges from ***1*** to ***4094***.
  - **tag** interface drops all untagged frames.

Example

These commands configure ***VLAN 100*** as the native VLAN for ***port channel 21***.

```
switch(config)#interface port-channel 21
switch(config-if-Po21)#switchport trunk native vlan 100
switch(config-if-Po21)#
```

12.3.4.30 switchport vlan forwarding

The **`switchport vlan forwarding`** command forwards packets between the ports belonging to VLAN in the interface configuration mode. The scaling configuration is applicable on a per-port basis. In the 7160 platform, the hardware uses a Port-VLAN table for storing the configuration on a per port/ VLAN combination and supports a maximum of ***128*** ports.

Note: The configuration is applicable to trunk ports only.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`switchport vlan forwarding` accept | all

Parameters

- **accept** accepts packets for VLAN.
- **all** all VLANs.

Example

This command forwards and accepts all the packets of VLAN of ***interface ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#switchport vlan forwarding accept all
switch(config-if-Et2)#
```

12.3.4.31 switchport vlan translation

The **switchport vlan translation** command allows you to map packets from one VLAN to another using VLAN translation. This is carried out on packets having a dot1q header (tagged frames) only. The translation rewrites the VLAN ID (VID) field in dot1q headers on packets passing through a switched port without changing any other fields.

By default, the translation is bidirectional. The packets ingressing an interface through ***VLAN A*** are internally mapped to ***VLAN B***; ***VLAN B*** packets egressing the same interface are mapped to ***VLAN A***.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the **switchport mode** command.

VLAN translation on routed ports is accomplished through the **encapsulation dot1q vlan** command.

The **no switchport vlan translation** and **default switchport vlan translation** commands remove VLAN mapping by removing the switchport vlan translation command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Command Syntax

switchport vlan translation [**DIRECTION**] *incoming_vlanid new_vlanid*

no switchport vlan translation *incoming_vlanid new_vlanid*

no switchport vlan translation **DIRECTION** *incoming_vlanid*

default switchport vlan translation *incoming_vlanid new_vlanid*

default switchport vlan translation **DIRECTION** *incoming_vlanid*

Parameters

- **DIRECTION** direction of traffic to be translated.
  - ***no parameter*** translates the specified VLAN IDs for transmitted and received traffic.
  - **in** translates the specified VLAN IDs for received traffic only.
  - **out** translates the specified VLAN IDs for transmitted traffic only.
  - ***incoming_vlanid*** Enter the VLAN ID to be translated. Value ranges from ***1*** to ***4094***.
- ***new_vlanid*** The new VLAN ID or bridging VLAN ID that will be used internally. Value ranges from ***1*** to ***4094***.

Example

- These commands translate only incoming packets, changing the VLAN ID to ***2008*** in the dot1q header of packets ingressing on ***vlan 201***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation in 201 2008
switch(config-if-Et5)#
```

- These commands translate multiple VLAN mappings on an ***interface ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#switchport vlan translation 61 71
switch(config-if-Et5)#switchport vlan translation 62 72
switch(config-if-Et5)#
```

12.3.4.32 trunk group

The **trunk group** command assigns the configuration mode VLAN to a specified trunk group.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs. Switchport commands specify the physical interfaces that carry trunk group traffic.

The **no trunk group** and **default trunk group** commands remove the configuration mode VLAN from the specified trunk group by removing the corresponding **trunk group** statement from ***running-config***. If a trunk group is not specified, the commands remove the configuration mode VLAN from all trunk groups.

Command Mode

VLAN Configuration

Command Syntax

trunk group [*name*]

no trunk group [*name*]

default trunk group [*name*]

Parameters

name a name representing the trunk group.

Example

These commands assigns ***VLAN 49*** to the trunk group ***mlagpeer***:

```
switch(config)#vlan 49
switch(config-vlan-49)#trunk group mlagpeer
switch(config-vlan-49)#
```

12.4 DCBX and Flow Control

This section describes Data Center Bridging Capability Exchange (DCBX) configuration tasks. Topics in this section include:

- Introduction
- Overview
- DCBX Configuration and Verification
- Configuring Priority-Flow-Control (PFC)
- Configuring PFC Watchdog
- DCBX and Flow Control Commands

12.4.1 Introduction

EOS implements Link Layer Discovery Protocol (LLDP) and the Data Center Bridging Capability Exchange (DCBX) protocol to help automate the configuration of Data Center Bridging (DCB) parameters, including the Priority-Based Flow Control (PFC) standard, which allows an end-to-end flow-control feature.

This feature enables a switch to recognize when it is connected to an iSCSI device and automatically configure the switch link parameters (such as priority flow control) to provide optimal support for that device. DCBX can be used to prioritize the handling of iSCSI traffic to help ensure that packets are not dropped or delayed. DCBX is off by default.

12.4.2 Overview

12.4.2.1 Data Center Bridging Capability Exchange (DCBX)

DCBX works with LLDP to allow switches to exchange information about their data center bridging (DCB) capabilities and configuration and automatically negotiate common Priority-Based Flow Control (PFC) parameters.

Data is exchanged in Type-Length-Value (TLV) format. For DCBX to function on an interface LLDP must be enabled on that interface as well.

12.4.2.2 Priority-Based Flow Control (PFC)

Priority-Based Flow Control (PFC) uses a new control packet defined in IEEE 802.1Qbb and is not compatible with 802.3x Flow Control (FC). An interface that is configured for PFC will be disabled for FC. When PFC is disabled on an interface, the FC configuration for the interface becomes active. Any FC frames received on a PFC configured interface are ignored.

Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

When PFC is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. PFC is disabled by default.

12.4.2.3 PFC Watchdog

The PFC watchdog identifies the egress queues that are unable to transmit packets for a long time due to receiving continuous PFC pause frames. On identifying such stuck tx-queue PFC watchdog error-disables the respective port with a error-disable reason of stuck-queue. When there is an error reported on a port the traffic is re-routed through a different port to the destination.

The PFC watchdog supports the following PFC watchdog configurations:

- PFC watchdog forced recovery of queues

- PFC watchdog polling interval configuration
- PFC Watchdog non-disruptive priorities configuration
- Displaying stuck queue and recovery counters

12.4.3 DCBX Configuration and Verification

12.4.3.1 Set the Priority Rank to the Traffic Class

The **dcbx application priority** command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports ***860*** and ***3260***) should be assigned the given priority of ***5***.

```
switch(config)#dcbx application tcp-sctp 860 priority 5
switch(config)#dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned are the given the priority ***5***.

```
switch(config)#dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority 5
switch(config)#no dcbx application tcp-sctp 3260 priority 5
```

12.4.3.2 Configuring CEE DCBX Priority Group

The **priority-flow-control priority** command configures the Enhanced Transmission Selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as ***7*** and sets traffic class priority to ***5***.

```
switch(config)#dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority as ***7*** and bandwidth value to ***70*** percent.

```
switch(config)#dcbx ets traffic-class 7 bandwidth 70
```

12.4.3.3 DCBX Verification

To display the DCBX status and the interfaces on which DCBX is enabled, use the **show dcbx** command.

Example

This command displays the DCBX status for ***Ethernet 50***.

```
switch#show dcbx Ethernet 50
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:06:01 2013
 No priority flow control configuration TLV received
 No application priority configuration TLV received
switch#
```

12.4.4 Configuring Priority-Flow-Control (PFC)

12.4.4.1 Enable Priority-Flow-Control (PFC)

The **priority-flow-control** command enables Priority-Flow-Control (PFC) on an individual port.

Example

The **priority-flow-control** command in DCBX mode enables PFC on an interface.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
```

12.4.4.2 Set the Priority Flow Control Priority

The **priority-flow-control priority** command in DCBX mode creates a priority group that pauses priority. Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

Examples

- The **priority-flow-control priority** command in DCBX mode creates a priority group that pauses priority ***5*** on ***interface ethernet 2***.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)# priority-flow-control priority 5 no-drop
  ```

- To enable lossy behavior, use the drop option of the **priority-flow-control priority** command.

  ```
  switch(config)#interface ethernet 2
  switch(config-if-Et2)#priority-flow-control on
  switch(config-if-Et2)#priority-flow-control priority 5 drop
  ```

12.4.4.3 Disable Priority-Flow-Control (PFC)

To disable Priority Flow Control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, use the **priority-flow-control priority** command.

Example

To disable PFC, use the **no priority-flow-control** command.

```
switch (config)#interface ethernet 2
switch(config-if-Et2)#no priority-flow-control
```

12.4.5 Configuring PFC Watchdog

12.4.5.1 Enabling PFC Watchdog

The **priority-flow-control pause watchdog default timeout** command starts monitoring all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled.

Note: To enable PFC watchdog, user is required to configure guaranteed bandwidth on the tx-queue to be monitored. Also, PFC must be enabled on the port for the traffic flowing into the queue that is being monitored.

Example

These commands enable the PFC watchdog monitoring on ***tx-queue 3*** of ***Ethernet 1/1***, and configures a PFC congestion timeout of ***10*** seconds which error-disables the port if the queue is stuck.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default timeout 10
```

12.4.5.2 Enabling PFC Watchdog Queue Recovery

The **priority-flow-control pause watchdog default recovery-time forced** command recovers a stuck queue after the PFC storm ceases. PFC watchdog supports the following two recovery methods.

- Auto Recovery – recover queue(s) after the PFC storm ceases.
- Forced Recovery – recover queue(s) after a fixed duration, irrespective of PFC storm being received.

Note: The default recovery mode is “auto”.

Example

This command recovers a stuck queue after a fixed duration of ***10*** seconds.

```
switch(config)#priority-flow-control pause watchdog default recovery-time
 10 forced
```

12.4.5.3 Configuring PFC Watchdog Polling Interval

The **priority-flow-control pause watchdog default polling-interval** command configures the frequency at which queues should be checked for stuck or recovery detection. By default, polling interval is calculated internally or it considers the value configured through the CLI.

Note: Configuring a very low polling interval may increase load on the CPU.

Example

This command configures a polling interval of ***10*** seconds on the switch.

```
switch(config)#priority-flow-control pause watchdog default polling-inter
val 10
```

12.4.5.4 Displaying Stuck Queue and Recovery Counters

The **show priority-flow-control counters watchdog** command displays the value of number of times a queue is identified as stuck and recovered. These counters are maintained only for those queues that have PFC watchdog functionality enabled. These counters are cleared when either PFC or PFC watchdog configuration is disabled. Alternatively, show interfaces priority-flow-control counters watchdog command can be used to display the counters.

Examples

- This command displays the value of number of times the queue was stuck and recovered for all the interfaces.

```
switch#show priority-flow-control counters watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
Et2/1      UC2            12            12
Et2/1      UC3            31            30
```

- This command displays the value of number of times the queue was stuck and recovered for a specific interface. In this case it is ***Et1/1***.

```
switch#show priority-flow-control interfaces Ethernet 1/1 counters
 watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
```

12.4.5.5 PFC Watchdog Non-disruptive Priorities

The PFC Watchdog acts to drop the traffic entering or leaving the port at the stuck PFC priority. Later when the queue recovers, this action is reversed. While applying these actions, some traffic (for all priorities) is dropped on that port. In such case, the priority-flow-control pause watchdog hardware non-disruptive priority command can be used to avoid the traffic drop on ports at stuck queues.

This traffic drop can be avoided by configuring specific PFC priorities as non-disruptive. When queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

Examples

- This command configures the specific PFC priorities as non-disruptive, and the priority is set to ***3***.

```
switch(config)#priority-flow-control pause watchdog hardware non-
disruptive priority 3
```

- This command configures all the ports, having a subset of non-disruptive priorities as a part of their no-drop priorities, start in non-disruptive mode.

```
switch(config)#priority-flow-control pause watchdog hardware port non-
disruptive-only
```

12.4.5.6 Displaying PFC Watchdog Information

The **show priority-flow-control** command displays the PFC watchdog status information. Note, if the PFC watchdog default timeout value is non-zero then PFC watchdog is active on the switch.

Example

This command displays the PFC watchdog default timeout value, in this show example the timeout value is ***3.0*** which means the PFC watchdog is active.

```
switch#show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port   Enabled Priorities Active Note
Et1/1   Yes       34      Yes    DCBX disabled
Et1/2   Yes       34      Yes    DCBX disabled
Et1/3   Yes       34      Yes    DCBX disabled
Et1/4   Yes       34      Yes    DCBX disabled
```

The **show interface status errdisabled** command displays the port which is error-disabled due to stuck- queue condition.

Example

This command displays the interface Ethernet ***Eth1/1*** status as errdisabled and the reason.

```
switch#show interface Eth1/1 status errdisabled

Port            Name          Status         Reason
---------- ---------------- ---------------- ---------
Et1/1                        errdisabled    stuck-queue
```

The **show priority-flow-control status** command displays the current PFC watchdog details.

Example

This command displays the PFC watchdog configuration details at global and interface level.

```
switch#show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port     Status  Priorities Note
Et1/1    E A W    1     7   DCBX disabled
Et1/2    E A -              DCBX disabled
Et1/3    D - -
Et1/4    D - -
Et2/1    D - -
..
..
```

12.4.6 DCBX and Flow Control Commands

Configuration Commands

- dcbx application priority
- dcbx ets
- dcbx mode
- no priority-flow-control
- platform fm6000 pfc-wm
- priority-flow-control
- priority-flow-control pause watchdog action
- priority-flow-control pause watchdog default
- priority-flow-control pause watchdog hardware
- priority-flow-control priority

Show Commands

- show dcbx
- show dcbx application-priority-configuration
- show dcbx priority-flow-control-configuration
- show dcbx status
- show interfaces priority-flow-control
- show platform fm6000 pfc-wm
- show priority-flow-control

12.4.6.1 dcbx application priority

The **dcbx application priority** command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

The **no dcbx application priority** and **default dcbx application priority** commands remove the specified DCBX traffic class priority assignment by deleting the corresponding **dcbx application priority** command from ***running-config***. When the command does not specify a traffic class, all DCBX traffic class priority assignments are removed.

Command Mode

Global Configuration

Command Syntax

dcbx application [**APPLICATION_TYPE** priority] *rank*

no dcbx application [**APPLICATION_TYPE** priority]

default dcbx application [**APPLICATION_TYPE** priority]

Parameters

- **APPLICATION_TYPE** traffic class receiving the priority assignment. Options include:
  - **ether** ***ethertype_number*** Ethernet traffic. ***ethertype_number*** varies from ***1536*** to ***65535***.
  - **iscsci** iSCSCI traffic. Maps to TCP/SCTP ports ***860*** and ***3260***.
  - **tcp-sctp** ***port_number*** TCP/SCTP traffic. Port number varies from ***1*** to ***65535***.
  - **tcp-sctp-udp** ***port_number*** TCP/SCTP/UDP traffic. Port number varies from ***1*** to ***65535***.
  - **udp** ***port_number*** UDP traffic. Port number varies from ***1*** to ***65535***.
- ***rank*** priority assigned to traffic class. Values range from ***0*** to ***7***.

Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports ***860*** and ***3260***) should be assigned the given priority of ***5***.

```
switch(config)#dcbx application tcp-sctp 860 priority 5
switch(config)#dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)#dcbx application tcp-sctp 860 priority 3
switch(config)#dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned to is given priority ***5***.

```
switch(config)#dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority
switch(config)#no dcbx application tcp-sctp 3260 priority
```

12.4.6.2 dcbx ets

The **dcbx ets** command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

The **no dcbx ets** and **default dcbx ets** commands remove the specified DCBX traffic classs priority assignment by deleting the corresponding **dcbx ets** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

dcbx ets [qos map cos *value* traffic-class *value* | traffic-class *value* bandwidth *value*]

no dcbx ets [qos map cos *value* traffic-class *value* | traffic-class *value* bandwidth *value*]

default dcbx ets [qos map cos *value* traffic-class *value* | traffic-class *value* bandwidth *value*]

Parameters

- **qos** QoS to configure.(The sub options include):
  - **map** QoS map to configure.
  - **cos** CoS value assigned to port. Value ranges from ***0*** to ***7***. Default value is ***0***.
  - **traffic-class** Assigns the traffic-class priority to the QoS map. The value ranges from ***0*** to ***7***.
- **traffic-class** Assigns the traffic class priority. The value ranges from ***0*** to ***7***. (The sub options include):
  - **bandwidth** The percentage of bandwidth assigned to the packets received from traffic class. The value ranges from ***0*** to ***100*** in percentage. The default value is ***0***.

Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as ***7*** and sets the traffic class priority to ***5***.

```
switch(config)#dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority value to ***7*** and sets the bandwidth value to ***70*** percent.

```
switch(config)#dcbx ets traffic-class 7 bandwidth 70
```

12.4.6.3 dcbx mode

The **dcbx mode** command enables DCBX mode on the configuration mode interface. The switch supports ***IEEE P802.1Qaz***. When DCBX is enabled, two TLVs are added to outgoing LLDPDUs, which instruct the peer on the interface to configure PFC (priority flow control) and the application priority table in the same way as the switch.

The **no dcbx mode**, **default dcbx mode**, and **dcbx mode none** commands disable DCBX on the configuration mode interface by removing the corresponding **dcbx mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

dcbx mode MODE_NAME

no dcbx mode

default dcbx mode

Parameters

MODE_NAME Specifies the DCBX version. Options include:

- **ieee** IEEE version.
- **cee** Converged Enhanced Ethernet version.
- **none** DCBX is disabled.

Examples

- These commands enable ***interface ethernet 2*** to use IEEE DCBX.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#dcbx mode ieee
switch(config-if-Et2)#
```

- These commands disable DCBX on ***interface ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#dcbx mode none
switch(config-if-Et2)
```

12.4.6.4 no priority-flow-control

The **`no priority-flow-control`** and **`default priority-flow-control`** commands disable the priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, which takes effect when PFC is re-enabled. The commands delete all corresponding **priority-flow-control** commands from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Command Syntax

`no priority-flow-control`

`default priority-flow-control`

Example

These commands disable Priority Flow Control (PFC) on ***interface Ethernet 3***.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#no priority-flow-control
switch(config-if-Et3)#
```

12.4.6.5 platform fm6000 pfc-wm

The **`platform fm6000 pfc-wm`** command configures the hardware buffer space allocated to the Priority Flow Control (PFC) RX-Private buffer. The command provides options to configure the buffer size and specify when PFC frames are sent to request that a neighbor stop sending traffic. The default values are as follows:

- **RX-Private:** ***18400*** bytes
- **on (watermark):** ***9280*** bytes
- **off (watermark):** ***1600*** bytes

Values that are entered in the command are rounded up to the closest multiple of ***160***. The **RX-Private** value must be greater than the **off** value, which must be larger than the **on** value.

The no **`platform fm6000 pfc-wm`** and **`default platform fm6000 pfc-wm`** commands restore the default settings by removing the **`platform fm6000 pfc-wm`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform fm6000 pfc-wm` [**RX-PRIVATE_SIZE**][**PFC-ON_WM**][**PFC-OFF_WM**]

`no platform fm6000 pfc-wm`

`default platform fm6000 pfc-wm`

The platform **`fm6000 pfc-wm`** command must explicitly configure at least one parameter.

Parameters

- **RX-PRIVATE_SIZE** Specifies size of rx-private buffer. Options include:
  - ***no parameter*** rx-private buffer retains previously configured size.
  - **rx-private** ***18268*** to ***102400*** Size of rx-private buffer (bytes).
- **PFC-ON_WM** Buffer capacity that triggers the switch to send PFC frames. Options include:
  - ***no parameter*** Parameter retains previously configured value.
  - **on** ***9134*** to ***102400*** Buffer capacity that triggers PFC frames (bytes).
- **PFC-OFF_WM** Buffer capacity that triggers the switch to stop PFC frame transmissions. Options include:
  - ***no parameter*** Parameter retains previously configured value.
  - **off** ***1536*** to ***102400*** Buffer capacity that turns off PFC frames.

Related Command

show platform fm6000 pfc-wm displays the PFC RX-Private buffer memory allocations.

Example

This command configures the rx-private hardware buffer.

```
switch(config)#platform fm6000 pfc-wm rx-private 24800 on 16000 off 3200
switch(config)#
```

12.4.6.6 priority-flow-control pause watchdog action

The **priority-flow-control pause watchdog** action command either drops the traffic on a stuck queue, or error disables the port which has a stuck queue, or notifies if there is no action on the stuck queue. The following actions are performed based on the queue status.

The **no priority-flow-control pause watchdog** action command removes the specified **priority-flow-control pause watchdog action configuration** by deleting the corresponding **priority-flow-control pause watchdog action** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog action

no priority-flow-control pause watchdog action

Parameters

action PFC watchdog action for stuck transmit queues. Options include.

- **drop** Drop traffic on the stuck queue.
- **errdisable** Error disable port which has the stuck transmit queue.
- **notify-only** No action on the stuck queue.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

Example

These commands enables the pfc-watchdog monitoring on ***tx-queue 3*** of ***Ethernet 1/1***, and configures a PFC watchdog action drop and drops the traffic if the queue is a stuck queue.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog action drop
```

12.4.6.7 priority-flow-control pause watchdog default

The **priority-flow-control pause watchdog** default command monitors all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled. Guaranteed bandwidth is needed to ensure starvation due to higher priority traffic is not wrongly flagged as a stuck-queue due to congestion. The stuck duration after which the port needs to be error disabled is also configurable.

The **no priority-flow-control pause watchdog default** command removes the specified priority-flow-control pause watchdog configuration by deleting the corresponding **priority-flow-control pause watchdog** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog default

no priority-flow-control pause watchdog default

Parameters

default Specifies the default value. Options include.

- ***polling-interval*** Configures the interval at which the watchdog should poll the queues. The polling interval value ranges from ***0.005*** to ***30*** seconds.
- ***recovery-time*** Configures recovery-time after which stuck queue should recover and start forwarding. The recovery-time value ranges from ***0.01*** to ***60*** seconds.
  - **forced** Force recover any stuck queue(s) after the recovery-time interval, irrespective of whether PFC frames are being received or not.
- ***timeout*** Configures timeout after which port should be errdisabled or should start dropping on congested priorities. The timeout value ranges from ***0.01*** to ***60*** seconds.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

- Polling Interval Discrepancy

  For user configured polling-interval to be valid, it must satisfy the following conditions

  When the recovery-mode is auto and timeout, recovery-time, and polling-interval are non-default, polling-interval <= min (timeout, recovery-time) / 2,

  When recovery-mode is forced or recovery-time is not configured, polling-interval <= (timeout / 2)

  For better functioning of PFC Watchdog, when user configured polling interval is too large compared to either timeout or recovery time values, Watchdog will use auto calculated value instead of user configured value until the discrepancy is resolved. Also, CLI warning and syslog messages are generated to inform user of the discrepancy.
- CLI Warnings

  When there is discrepancy between timeout and polling-interval, the format of the message is as shown below:

```
! User configured polling interval <user-cfgd polling-interval>
 second(s) is
greater than half of timeout <user-cfgd timeout> second(s). Setting
polling-interval to <to-be-used polling-interval> second(s)
```

When there is discrepancy between recovery-time and polling-interval, the format of the message is as shown below

```
! User configured polling interval <user-cfgd polling-interval>
 second(s) is
greater than half of recovery-time <user-cfgd recovery-time> second(s).
 Setting
polling-interval to <to-be-used polling-interval> second(s)
```

Examples

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***Ethernet 1/1***, and configures a PFC congestion timeout of ***10*** seconds which error-disables the port if the queue is stuck.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default timeout 10
```

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***Ethernet 1/1***, and configures a PFC forced recovery-time interval of ***30*** seconds after which the stuck queue(s) are recovered, irrespective of whether PFC frames are being received or not.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default recovery-
time 30 forced
```

- These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***Ethernet 1/1***, and configures a PFC polling-interval of ***20*** seconds after which queue is polled.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default polling-
interval 20
```

12.4.6.8 priority-flow-control pause watchdog hardware

The **priority-flow-control pause watchdog** hardware command configures specific PFC priorities as non-disruptive. This will avoid traffic drop on queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

The **no priority-flow-control pause watchdog hardware** command removes the specified **priority-flow-control pause watchdog non-disruptive configuration** by deleting the corresponding **priority-flow-control pause watchdog hardware** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

priority-flow-control pause watchdog hardware

no priority-flow-control pause watchdog hardware

Parameters

hardware Configure PFC priority through hardware. Options include:

- ***non-disruptive*** PFC watchdog non-disruptive configuration. The priority value ranges from ***0*** to ***7***.

Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

Example

These commands enable the pfc-watchdog monitoring on tx-queue ***3*** of ***Ethernet 1/1***, and configures PFC priorities as non-disruptive on PFC priorities ***3*** and ***4***.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog hardware non-
disruptive priority 3 4
```

12.4.6.9 priority-flow-control priority

The **priority-flow-control priority** command configures the packet resolution setting on the configuration mode interface. This setting determines if packets are dropped when priority flow control (PFC) is enabled on the interface. Packets are dropped by default.

The **no priority-flow-control priority** and **default priority-flow-control priority** commands restore the default packet drop setting on the configuration mode interface by deleting the corresponding **priority-flow-control priority** command from ***running-config***. The **priority-flow-control priority** command also restores the default setting on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

priority-flow-control priority pack-drop

no priority-flow-control priority

default priority-flow-control priority

Parameters

pack-drop denotes the interfaces. Options include:

- **drop** Packets are dropped. Default setting.
- **no drop** Packets are not dropped.

Examples

- These commands in DCBX mode create a priority group that pauses dot1p priority ***5*** on ***ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#priority-flow-control priority 5 no-drop
```

- These commands enable lossy behavior.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#priority-flow-control priority 5 drop
```

- These commands remove the priority group that pauses dot1p priority ***5*** on ***ethernet 2***.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#no priority-flow-control priority
```

12.4.6.10 priority-flow-control

The **priority-flow-control** command enables Priority Flow Control (PFC) on the configuration mode interface to pause selected traffic classes.

The **no priority-flow-control** and **default priority-flow-control** commands disable PFC on the configuration mode interface by deleting the corresponding **priority-flow-control** command from ***running-config***. The **priority-flow-control priority** command also disables PFC on the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

priority-flow-control on

no priority-flow-control on

default priority-flow-control on

Example

- These commands enable PFC on ***interface Ethernet 3***.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#priority-flow-control on
switch(config-if-Et3)#
```

- These commands disable PFC on ***interface Ethernet 3***.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#no priority-flow-control
switch(config-if-Et3)#
```

12.4.6.11 show dcbx application-priority-configuration

The **show dcbx application-priority-configuration** command displays the DCBX peer application priority configuration.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] application-priority-configuration

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** All configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Guidelines

This command and the **show priority-flow-control** command function identically.

Example

This command displays the DCBX peer application priority configuration for all DCBX-enabled interfaces.

```
switch#show dcbx application-priority-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

12.4.6.12 show dcbx priority-flow-control-configuration

The **show dcbx priority-flow-control-configuration** command displays the IEEE DCBX peer priority flow control configurations.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] priority-flow-control-configuration

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Example

This command displays the DCBX peer priority flow control configuration for the DCBX-enabled interfaces on the device.

```
switch#show dcbx priority-flow-control-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:11:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
    WARNING: peer PFC configuration does not match the local PFC
 configuration
switch#
```

12.4.6.13 show dcbx status

The **show dcbx status** command displays the DCBX status on the interfaces on which DCBX is enabled.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**] status

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Example

This command displays the DCBX status for the DCBX-enabled interfaces.

```
switch#show dcbx status
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:11:54 2013
switch#
```

12.4.6.14 show dcbx

The **show dcbx** command list DCBX status and the interfaces on which DCBX is enabled.

Command Mode

EXEC

Command Syntax

show dcbx [**INTERFACE**]

Parameters

INTERFACE Interface type and number. Options include:

- ***no parameter*** all configured DCBX interfaces.
- **ethernet *e-num*** Ethernet interface specified by ***e-num***.

Examples

- This command displays the DCBX status for ***Ethernet 50***.

```
switch#show dcbx Ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:06:01 2013
  No priority flow control configuration TLV received
  No application priority configuration TLV received
switch#
```

- This command displays the DCBX status for ***Ethernet 50*** when Priority Flow Control (PFC) is not enabled.

```
switch#show dcbx Ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
    WARNING: peer PFC configuration does not match the local PFC
 configuration
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

12.4.6.15 show interfaces priority-flow-control

The **show interfaces priority-flow-control** command displays the status of PFC on all interfaces.

Command Mode

EXEC

Command Syntax

show interfaces [**INTERFACE**] priority-flow-control [**INFO_LEVEL**]

Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - ***no parameter*** Display information for all interfaces.
  - **ethernet *e_range*** Ethernet interface range specified by ***e_range***.
  - **loopback *l_range*** Loopback interface specified by ***l_range***.
  - **management *m_range*** Management interface range specified by ***m_range***.
  - **port-channel *p_range*** Port-Channel Interface range specified by ***p_range***.
  - **vlan *v_range*** VLAN interface range specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interface range specified by ***vx_range***.

    Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO_LEVEL** specifies the type of information displayed. Options include:
  - ***no parameter*** Displays information about all DCBX neighbor interfaces.
  - **status** Displays the DCBX status.
  - **counters** Displays the DCBX counters.

Guidelines

This command and the **show priority-flow-control** command function identically.

Example

This command displays the PFC for all interfaces.

```
switch#show interfaces priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7

Port    Enabled Priorities Active Note
Et1     No                 No
Et2     No                 No
...
Et50    Yes          5     Yes
...
Port                RxPfc           TxPfc
Et1                     0               0
Et2                     0               0
...
Et50                    0               0
...
switch#
```

12.4.6.16 show platform fm6000 pfc-wm

The **show platform fm6000 pfc-wm** command displays the buffer space allocated to the RX-Private buffer and buffer levels that trigger PFC frame transmission activities.

Command Mode

Privileged EXEC

Command Syntax

show platform fm6000 pfc-wm

Related Command

priority-flow-control priority specifies the PFC RX-Private buffer memory allocation.

Example

This command displays the rx-private hardware buffer memory allocation.

```
switch#show platform fm6000 pfc-wm
Pfc_Rx_Private_WM: 24800 Bytes
Pfc_On_WM: 16000 Bytes
Pfc_Off_WM: 3200 Bytes
switch#
```

12.4.6.17 show priority-flow-control

The **show priority-flow-control** command displays the status and other PFC and PFC watchdog information on all interfaces if no specific interface is specified.

Command Mode

EXEC

Command Syntax

show priority-flow-control [status | counters | *interfaces*]

Parameters

- ***interfaces*** specifies the interface for which the information is displayed. Options include:
  - **Ethernet** Hardware Ethernet interface.
  - **Loopback** Loopback interface.
  - **Management** Management interface.
  - **Port-Channel** Lag interface.
  - **Recirc-Channel** Recirculation interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** VLAN interface.
  - **Vxlan** VXLAN Tunnel Interface.
- ***status*** displays the interface PFC status.
- ***counters*** displays the interface PFC counters. Options include:
  - ***detail*** displays the DCBX counters for each priority class. This option is available only on Trident switches.
  - ***watchdog*** displays the PFC watchdog counters.

Examples

- This command displays the PFC status on all interfaces.

```
switch#show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
Port    Enabled Priorities Active Note

Et1     No                 No

Et2     No                 No

...
Et50    Yes          5     Yes

...
Port                RxPfc           TxPfc
Et1                     0               0
Et2                     0               0
...
Et50                    0               0
...
```

- This command displays the PFC watchdog status. If PFC watchdog default timeout is non-zero (in this case it is 3.0) then PFC watchdog is actively running on the switch.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port   Enabled Priorities Active Note
```

```
Et1/1   Yes       34      Yes    DCBX disabled
Et1/2   Yes       34      Yes    DCBX disabled
Et1/3   Yes       34      Yes    DCBX disabled
Et1/4   Yes       34      Yes    DCBX disabled
...
```

- This command displays the current value of these counters for all the interfaces being monitored by PFC watchdog. Alternatively, show interfaces priority-flow-control counters watchdog command can be used for the same.

```
switch #show priority-flow-control counters watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
Et2/1      UC2            12            12
Et2/1      UC3            31            30
```

- This command displays the current value of these counters for a specific subset of interfaces. Alternatively, **`show interfaces priority-flow-control counters watchdog`** command can be used for the same.

```
switch #show priority-flow-control interfaces Ethernet 1/1 counters
 watchdog
Port       TxQ   Total times   Total times
                 stuck         recovered
-------   ----   -----------   -----------
Et1/1      UC2             2             2
Et1/1      UC3             3             3
```

- This command displays the configuration details of PFC watchdog at global and interface level.

```
switch #show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port     Status  Priorities Note
Et1/1    E A W    1     7   DCBX disabled
Et1/2    E A -              DCBX disabled
Et1/3    D - -
Et1/4    D - -
Et2/1    D - -
..
```

12.5 IP Locking

This section describes IP Locking configuration tasks. Topics in this section include:

- Release Updates
- Platform Compatibility
- IPv4 Locking Configuration Commands
- IPv6 Locking
- Show Commands
- Limitations
- IP Locking Commands

12.5.1 IP Locking

IP Locking is an EOS feature configured on an Ethernet Layer 2 port.

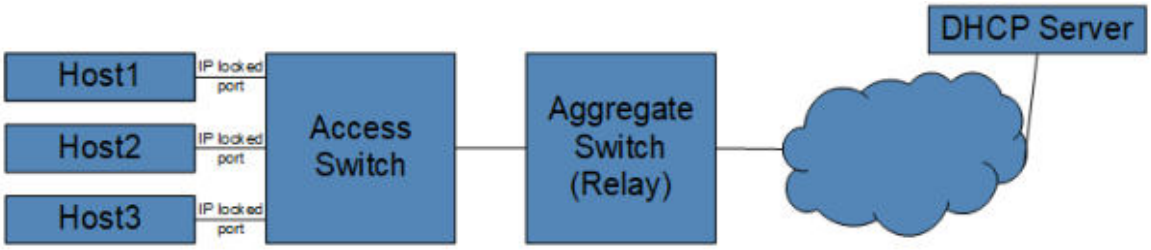
When enabled, IP Locking ensures that a port will only permit IP and ARP packets with IP source addresses that have been authorized. As of the ***EOS Release 4.25.0F*** release update, IP locking can run in two modes - IPv4 Locking (which will be referred to as IP Locking) and IPv6 Locking, which is configured using the commands mentioned in the following sections. IP Locking prevents another host on a different interface from claiming ownership of an IP address through ARP spoofing. IPv6 Locking extends this behavior to IPv6 packets, including ICMPv6 Neighbor Discovery (Router Advertisement, Redirect) and DHCP (server-to-client) packets. Mode specific commands are also discussed.

On an IP Locked Port,

- ARP probes with ***0.0.0.0*** as Sender Protocol Address (SPA) and is allowed for duplicate address detection (DAD).
- Incoming DHCP server response packets are dropped to avoid rogue device(s) acting as DHCP server(s).
- Incoming DHCP client request packets are allowed for devices to complete DHCP handshake and obtain DHCP leases.

On an IPv6 Locked Port,

- Incoming DHCPv6 server response packets are dropped and incoming DHCPv6 client request packets are allowed.
- Incoming ICMPv6 ND : Router Advertisement packets are dropped as only routers should send these packets.
- Incoming ICMPv6 ND : Router Solicitation packets are allowed.
- Incoming ICMPv6 ND : Redirect packets are dropped as only routers should send these packets.



IP Locking relies on DHCP LeaseQuery (***RFC4388***) and MAC address learning to determine that an IP address has been authorized on a particular port. It is necessary to ensure that DHCP servers used in the network allow LeaseQuery messages.

12.5.1.1 Release Updates

Refer to the release updates for IP Locking.

***EOS Release 4.25.1F*:**

Added support for disabling address filtering for IPv6 packets while still keeping all packet type specific drop rules such as ICMPv6 ND:RA, and ICMPv6 ND:Redirect and DHCPv6 (server-to-client) packets, using the **`locked-address ipv6 enforcement disabled`** command.

***EOS Release 4.24.0F*:**

- Added support for expiration modes of locked addresses, using the **`locked-address expiration mac disabled`** command.
- Added support for counters, using the **`show address locking counters`** and **`clear address locking counters`** commands.

***EOS Release 4.23.2F*:**

Added support for **`static lease`** command, **`lease <V4ADDR> mac <MACADDR>`**.

***EOS Release 4.23.1F*:**

Added support for **`clear address locking lease`** command.

***EOS Release 4.23.0F*:**

- Initial release.
- Supports IPv4 address locking.

12.5.1.2 Platform Compatibility

Support for IP Locking is found on the following platforms:

- CCS-720XP
- DCS-7050CX3
- DCS-7050SX3

12.5.1.3 IPv4 Locking Configuration Commands

Configure IP Locking commands in the ***address locking*** configuration mode.

Example

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#
```

To enable IP Locking, you must configure

- the DHCP servers from which hosts are expected to acquire leases. IP Locking communicates with these DHCP servers to learn the IP addresses that must be authorized on the switch.

```
switch(config-address-locking)#dhcp server ipv4 10.1.1.1
switch(config-address-locking)#dhcp server ipv4 10.30.1.3
```

- a local L3 interface to communicate with the DHCP server(s). This could be the management interface, a routed interface, or a Switch Virtual Interface (SVI). This interface requires a valid IP address assigned, routable to the configured DHCP server(s), and can reside in non-default VRF. The interface IP is used as the source IP in the switch's packets to the DHCP server.

```
switch#configure
switch(config)#interface Vlan2160
switch(config-if-Vl2160)#ip address 10.10.1.2/16

switch#configure
switch(config)#address locking
switch(config-address-locking)#local-interface Vlan2160
```

To activate IP Locking on ports connected to clients, IP Locking must be enabled in the interface configuration mode. Running this command only activates IPv4 Locking and overrides the previous configuration for the interface.

Example

```
switch(config)#interface Ethernet27/1
```

```
switch(config-if-Et27/1)#address locking ipv4
```

It is possible to disable IP Locking using the **disabled** command in address-locking mode. This turns off the feature and allows a host to use any IP address, authorized or unauthorized, on any port.

Example

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#disabled
```

12.5.1.3.1 Clear Commands

The **clear address locking lease...** command removes the lease from hardware. This enable mode command removes lease bindings at different granularities.

- The **clear address locking lease ipv4 V4ADDR** command removes a single lease associated with an IPv4 address.
- The **clear address locking lease ipv6 V6ADDR** removes a single lease associated with an IPv6 address.
- The **clear address locking lease intf ethernet slot** removes all leases associated with the specified interface.
- The **clear address locking lease all** removes all leases on the switch.

12.5.1.3.2 Static Lease Commands

The **lease mac** command within address locking configuration mode installs a lease into hardware for the configured IP address on the interface the configured MAC address is associated with. If the MAC address is not in the MAC table or the MAC address is on an interface that is not configured with IP Locking feature, the lease is not installed until the MAC address is added to an interface that is configured with IP Locking.

Note: Any lease from the DHCP server that matches either the same IP or MAC as a statically configured lease is removed from the switch.

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#lease 1.1.1.1 mac a.b.c
```

12.5.1.3.3 Locked Address Expiration Commands

The IP addresses remain authorized and installed even after their corresponding MAC addresses have aged out. IP Locking, by default, deauthorizes leases after their corresponding MAC addresses age out. The **locked-address expiration mac disabled** command configures IP Locking to keep leases installed, even after their corresponding MAC addresses have aged out.

Example

```
switch#configure
switch(config)#address locking
```

```
switch(config-address-locking)#locked-address expiration mac
 disabled
```

12.5.1.3.4 IP Locking Counters

The **show address locking counters** command displays DHCP lease query messages sent, received, and dropped. There are two sets of counters: first, the number of packets sent to and received from each DHCP server; and second, the number of packets sent and received for each locked interface. There are separate counters for the different kinds of messages communicated between the switch and the DHCP server.

Example

```
switch#show address locking counters
                  Lease Active Lease Unknown Lease Unassigned
DHCP Server Query  Rcvd   Drop   Rcvd   Drop Rcvd     Drop    Unknown
----------- ----- ----- ------ ------ ------ -------- ------- -------
80.80.80.80 32860  8002 34     8001   32     13423     134    3234

Interface Query Lease Active Lease Unknown Lease Unassigned
--------- ----- ------------ ------------- ----------------
Ethernet2  1747 1234         189           324
```

The **clear address locking counters** command resets all the counters associated with IP Locking to zero.

12.5.1.4 IPv6 Locking

12.5.1.4.1 IPv6 Locking Configuration Commands

To enable IPv6 locking, you must:

Disable enforcement of IPv6 address locking.

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#locked-address ipv6 enforcement disabled
```

To activate IPv6 Locking on ports connected to clients, IPv6 Locking must be enabled in the interface configuration mode. Running this command only activates IPv6 Locking and overrides the previous configuration for the interface.

Example

```
switch(config)#interface Ethernet27/1
switch(config-if-Et27/1)#address locking ipv6
```

Both IPv4 and IPv6 locking can be activated on a port by running commands similar to the following:

```
switch(config)#interface Ethernet27/1
switch(config-if-Et27/1)#address locking ipv4 ipv6
```

It is possible to disable IPv6 Locking using the **disabled** command in address-locking mode. This turns off the feature and allows a host to use any IP address, authorized or unauthorized, on any port. Note that this will also disable IP Locking as well.

Example

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#disabled
```

12.5.1.4.2 Locked Address IPv6 Enforcement Commands

The **locked-address ipv6 enforcement disabled** command disables address filtering for all ports that have IPv6 Locking enabled. This permits IPv6 packets while still keeping all other drop rules.

Example

```
switch#configure
switch(config)#address locking
switch(config-address-locking)#locked-address ipv6 enforcement
 disabled
```

12.5.1.5 Show Commands

Use the **show address locking** command to display the status of IP and IPv6 locking.

Example

```
switch#show address locking
IP Locking is active
   Interface           IPv4                    IPv6
-------------- -------------------   --------------------------
  Ethernet27/1           yes       no (not configured)
  Ethernet31/1  no (not configured)   no (not a layer 2
 interface)
```

The **show address locking** command also displays the reason as to why IP Locking is not enabled for an interface. For an interface, the following priority (highest at top) is imposed on the output when IP Locking is not enabled for an interface:

- not configured
- not a Layer 2 interface
- no local interface
- no dhcp server

The **show address locking table ipv4** command displays all the DHCP leases that IP Locking knows about, whether or not those leases are installed and the interfaces on which these IP addresses are authorized.

Example

```
switch#show address locking table ipv4
IP Address     MAC Address      Interface  Installed    Expiration Time
-------------- ---------------- ---------- ------------ ---------------
10.30.4.4      ba76.a467.7ff8   Et27/1     installed     in 0:01:57
```

12.5.1.6 Limitations

The IP Locking feature contains the following limitations:

- IP Locking is supported for IPv4 but has limited functionality for IPv6.
- IP Locking works only with DHCP servers that support ***RFC 4388*** (LeaseQuery) and are configured to allow lease queries. ISC DHCPD and BlueCat are currently known servers that support LeaseQuery.
- IP Locking can only be configured on Ethernet interfaces, excluding sub-interfaces.
- IP Locking and DHCP relay cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- IP Locking and DHCP snooping cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- IP Locking and DHCP server cannot be configured on the same switch. When both are configured, IP Locking is disabled.
- Do not configure IP Locking and the ARP inspection feature on the same switch.
- Do not configure IP Locking and the IP source guard feature on the same switch.
- IP Locking may not immediately invalidate a lease on an access port if the host moves to another port on a different access switch.
- IP Locking supports up to 3400 hosts on the DCS-7050X3 platform, and up to 3800 hosts on the CCS-720XP platform. This scale may reduce further with other features using TCAM resources.
- IPv6 Locking currently only allows disabling address filtering for IPv6 packets while keeping all packet type specific drop rules such as ND:RA, ND:RD, and DHCP Server-to-Client.
- Some DHCP server implementations (such as ISC DHCPD) do not respond to lease query if the **fixed-address** configuration is used. Use reserved leases instead.
- CVP Endpoint Identification is not able to identify hosts connected to an IP Locking enabled switch.

12.5.1.7 IP Locking Commands

IPv4 Clear Commands

- clear address locking lease

IPv4 Static Lease Commands

- lease mac

IPv4 Lock Address Expiration Commands

- locked-address expiration mac disabled

IP Locked Show Commands

- show address locking
- show address locking counters
- show address locking table ipv4

12.5.1.7.1 clear address locking lease

Use the **clear address locking lease** command to remove lease bindings at different granularities.

Support beginning with ***EOS Release 4.23.1F***:

- The **clear address locking lease...** command removes the lease from the hardware.
  - The **clear address locking lease ipv4 V4ADDR** command removes a single lease associated with an IPv4 address.
  - The **clear address locking lease ipv6 V6ADDR** command removes a single lease associated with an IPv6 address.
  - The **clear address locking lease intf ethernet slot** command removes all leases associated with the specified interface.
  - The **clear address locking lease all** command remove all leases on the switch.

Command Mode

Address locking mode

Command Syntax

clear address locking lease [all | interface [ethernet *slot*] | ipv4 *V4ADDR* | ipv6 *V6ADDR*]

Parameters

- **all** The entire lease table.
- **interface** The interface of the lease to be cleared.
  - **ethernet *slot*** Ethernet interface slot number.
- **ipv4 *V4ADDR*** IPv4 address of the lease to be cleared.
- **ipv6 *V6ADDR*** IPv6 address of the lease to be cleared.

Example

```
switch(config-address-locking)#clear address locking lease all
```

12.5.1.7.2 lease mac

The **lease mac** command within the address locking configuration mode installs a lease into hardware for the configured IP address on the interface the configured MAC address is associated with. If the MAC address is not in the MAC table or the MAC address is on an interface that is not configured with IP Locking feature, the lease is not installed until the MAC address is added to an interface that is configured with IP Locking. The **no** and **default** forms of the command removes the lease into hardware for the configured IP address on the interface the configured MAC address is associated with.

Command Mode

Address locking configuration mode

Command Syntax

lease *V4ADDR* mac *MACADDR*

no lease *V4ADDR* mac *MACADDR*

default lease *V4ADDR* mac *MACADDR*

Parameters

- **lease *V4ADDR*** The lease IP address.
- **mac *MACADDR*** The configured mac address for static lease.

Example

```
Arista#config t
Arista(config)#address locking
Arista(config-address-locking)#lease 1.1.1.1 mac a.b.c
```

12.5.1.7.3 locked-address expiration mac disabled

IP Locking, by default, deauthorizes leases after their corresponding MAC addresses age out. Use the **locked-address expiration mac disabled** command to configure IP Locking to keep leases installed, even after their corresponding MAC addresses have aged out.

Command Mode

Address locking configuration mode

Command Syntax

locked-address expiration mac disabled

no locked-address expiration mac disabled

default locked-address expiration mac disabled

Parameters

- **expiration** Configures expiration mode for locked addresses.
- **mac** Configures deauthorizing locked addresses upon MAC aging out.
- **disabled** Disables deauthorizing locked address upon MAC aging out.

Example

```
switch#configure t
switch(config)#address locking
switch(config-address-locking)#locked-address expiration mac disabled
```

12.5.1.7.4 show address locking

Use the **show address locking** command to display the status of IP and IPv6 locking.

The **show address locking** command also displays the reason as to why IP Locking is not enabled for an interface. For an interface, the following priority (highest at top) is imposed on the output when IP Locking is not enabled for an interface:

- not configured
- not a Layer 2 interface
- no local interface
- no dhcp server

Command Mode

EXEC

Command Syntax

show address locking

Example

```
switch#show address locking
IP Locking is active
   Interface    IPv4                    IPv6
-------------- -------------------   --------------------------
  Ethernet27/1  yes                     no (not configured)
  Ethernet31/1  no (not configured)    no (not a layer 2 interface)
```

12.5.1.7.5 show address locking counters

The **show address locking counters** command displays DHCP lease query messages sent, received, and dropped. There are two sets of counters: first, the number of packets sent to and received from each DHCP server; and second, the number of packets sent and received for each locked interface. There are separate counters for the different kinds of messages communicated between the switch and the DHCP server.

Command Mode

EXEC

Command Syntax

show address locking counters

Related Commands

The **clear address locking counters** command resets all the counters associated with IP Locking to zero.

Example

```
switch#show address locking counters
                  Lease Active Lease Unknown Lease Unassigned
DHCP Server Query  Rcvd   Drop   Rcvd   Drop Rcvd     Drop    Unknown
----------- ----- ----- ------ ------ ------ -------- ------- -------
80.80.80.80 32860  8002 34     8001   32     13423     134    3234

Interface Query Lease Active Lease Unknown Lease Unassigned
--------- ----- ------------ ------------- ----------------
Ethernet2  1747 1234         189           324
```

12.5.1.7.6 show address locking table ipv4

Use the **show address locking table ipv4** command to display all the DHCP leases that IP Locking knows about, whether or not those leases are installed and the interfaces on which these IP addresses are authorized.

Command Mode

EXEC

Command Syntax

show address locking table ipv4 [dynamic [installed | [interface Ethernet *slot*] | installed | interface [Ethernet [*slot*] | static [installed | interface [Ethernet *slot*]]]

Parameters

- **dynamic** Only display the dynamic leases.
  - **installed** Only display the leases that are installes in the hardware.
  - **interface** Only display the leases belonging to a specified interface.
- **installed** Only display the leases that are installes in the hardware.
- **interface** Only display the leases belonging to a specified interface.
  - **Ethernet *slot*** Specified Ethernet sub-interface.
- **static** Only display the static leases.
  - **installed** Only display the leases that are installes in the hardware.
  - **interface** Only display the leases belonging to a specified interface.
    - **Ethernet*slot*** Specified Ethernet sub-interface.

Example

```
switch#show address locking table ipv4
IP Address     MAC Address      Interface  Installed    Expiration Time
-------------- ---------------- ---------- ------------ ---------------
10.30.4.4      ba76.a467.7ff8   Et27/1     installed     in 0:01:57
```

12.6 L2 Protocol Forwarding

L2 Protocol Forwarding on Ethernet interfaces is supported, in addition to Type-5 PW. Also, selective forwarding of certain L2 Protocol packets (tagged/untagged/all) as opposed to forwarding all LACP frames (both tagged and untagged) is allowed. The protocol list on which L2 Protocol Forwarding is supported has been extended to PAUSE, LACP, LLDP, MACSEC, STP.

12.6.1 Configuring L2 Protocol Forwarding

The following commands allow creation of a profile that allows forwarding tagged/untagged/all types of PAUSE/LACP/LLDP/MACSEC/STP/E-LMI/ ISIS/micro-BFD frames.

```
switch(config-l2-protocol)#forwarding profile abc
switch(config-l2-protocol-abc)#isis forward
switch(config-l2-protocol-abc)#macsec tagged forward
switch(config-l2-protocol-abc)#pause untagged forward
switch(config-l2-protocol-abc)#exit
```

The following commands allow application of a profile on an interface or subinterface:

```
switch(config)#int Ethernet1/1
switch(config-if-Et1/1)#l2-protocol forwarding profile abc
switch(config-if-Et1/1)#exit
switch(config)#int Ethernet2/1.1
switch(config-if-Et2/1.1)#l2-protocol forwarding profile def
switch(config-if-Et2/1.1)#exit
```

12.6.1.1 TCAM Profile

A specific TCAM profile is required to configure L2 Protocol Forwarding profiles except if the L2 Protocol Forwarding profile has only ‘lacp forward’ and is configured on Type-5 PW ports on Type-1 platforms (mentioned above). One such TCAM profile is as follows:

```
switch(config)#hardware tcam
switch(config-tcam)#profile l2protocolfwd
switch(config-tcam-profile-12protocolfwd)#feature acl port ip
switch(config-tcam-feature-acl-port-ip)#sequence 45
switch(config-tcam-feature-acl-port-ip)#key size limit 160
switch(config-tcam-feature-acl-port-ip)#key field dscp dst-ip ip-frag ip-
protocol l4-dst-port l4-ops l4-src-port src-ip tcp-control ttl
switch(config-tcam-feature-acl-port-ip)#action count drop
switch(config-tcam-feature-acl-port-ip)#packet ipv4 forwarding bridged

```
switch(config-tcam-feature-tunnel-vxlan)#packet ipv4 vxlan forwarding
 bridged decap
```

For ISIS protocol forwarding, “snoop” action has to be present in the TCAM profile for l2-protocol forwarding feature as follows:

```
switch(config-tcam)#feature l2-protocol forwarding
switch(config-tcam-l2-protocol forwarding)#sequence 95
switch(config-tcam-l2-protocol forwarding)#key size limit 160
switch(config-tcam-l2-protocol forwarding)#key field dst-mac vlan-tag-
format
switch(config-tcam-l2-protocol forwarding)#action mirror redirect-to-cpu
 set-tc snoop
switch(config-tcam-l2-protocol forwarding)#packet non-ip forwarding
 bridged
switch(config-tcam-l2-protocol forwarding)#packet non-ip forwarding
 bridged sub-interface
```

For the special case of micro-BFD protocol forwarding the following TCAM profile needs to be applied:

```
switch(config)#hardware tcam
switch(config-tcam)#profile l2protocolfwd-bfd-rfc-7130
switch(config-tcam-profile l2protocolfwd-bfd-rfc-7130)#feature acl port
 ip egress mpls-tunnelled-match
switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-mat
ch)#sequence 95
switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-mat
ch)#feature acl port ipv6 egress
switch(config-tcam-feature-acl-port-ipv6-egress)#sequence 105
switch(config-tcam-feature-acl-port-ipv6-egress)#key field dst-ipv6 ipv6-

```

Once ‘l2protocolfwd’ or ‘l2protocolfwd-bfd-rfc-7130 tcam profile is created, the profile needs to be applied to the switch using the following command under config mode:

```
switch(config)#hardware tcam
switch(config-tcam)#system profile l2protocolfwd
```

Consumption of TCAM

The following table describes how TCAM is consumed when the **same** L2 Protocol Forwarding profile is applied:

Level of application	Type-1 platforms	Type-2 platforms
Front panel ports	Separate TCAM entries for each port	Same set of TCAM entries for ports on the same fap **and** core
Subinterfaces	Same set of TCAM entries for subinterfaces on the same fap	Same set of TCAM entries for subinterfaces on the same fap **and** core

12.6.2 L2 Protocol Forwarding Limitations

1. A maximum of ***31*** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces on the same FAP.
2. A maximum of ***31*** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces, and front panel ports on the same FAP on Type-2 platforms.
3. The feature is not supported for subinterfaces on Type-1 platforms if any of the below features are present in the TCAM Profile:
   - feature pbr subintf ip
   - feature pbr subintf ipv6
   - feature pbr subintf mpls

12.6.3 L2 Protocol Forwarding Show commands

The show l2-protocol forwarding interface displays the L2 protocol forwarding profile configuration corresponding to the interfaces or subinterfaces.

```
switch(config)#show l2-protocol forwarding interface

Interface     Profile
------------- -------
Ethernet1/1   abc
Ethernet2/1.1 def

switch> show l2-protocol forwarding interface Ethernet1/1

Interface   Profile
----------- --------
Ethernet1/1 abc
```

The following show commands displays all packets forwarding behaviour on an interface or a subinterface:

```
switch(config)#show l2-protocol forwarding interface detail

Tagging Types: T: tagged U: untagged
Actions: F: forward
                     BFD RFC-7130 E-LMI ISIS LACP LLDP MACSEC PAUSE STP
Interface     Profile   T     U    T  U  T U  T U  T U  T   U  T  U  T U
------------- ------- ----- ------ -- -- - -- - -- - -- -- --- -- -- - -

------------- ------- ----- ------ -- -- - -- - -- - -- -- --- -- -- - -

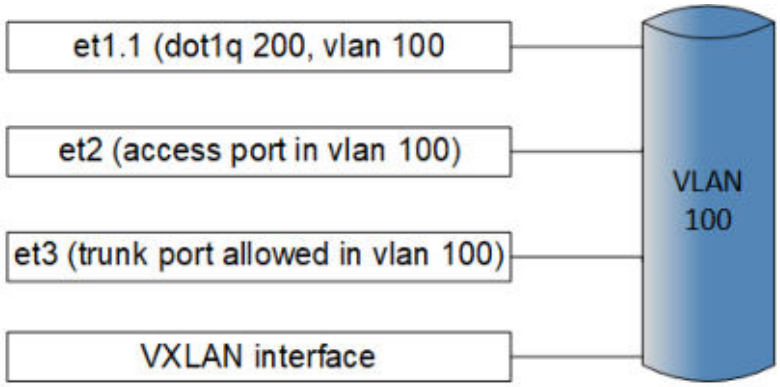
Ethernet2/2.1 def       -     -    -  -  - -  - -  - -  -   -  -  -  - -
```

12.7 Layer 2 Subinterfaces

A Layer 2 subinterface is a logical bridging endpoint associated with traffic on an interface distinguished by 802.1Q tags, where each ***interface, 802.1q tag*** tuple is treated as a first-class bridging interface.

Like other types of interfaces, an L2 subinterface is a normal bridging endpoint in the bridging domain.



12.7.1 Configurations

12.7.1.1 Creating a Layer 2 Subinterface

Complete the following steps to configure a layer 2 (L2) subinterface on an Arista switch:

1. Configure the parent interface to be a routed port.

```
switch(config)#interface et1
switch(config-if-Et1)#no switchport
```

2. Create a subinterface on the parent interface (***et1.1***), assign 802.1q encapsulation (***vlan 100***), and assign the forwarding VLAN ID (***vlan 200***).

```
switch(config-if-Et1)#interface et1.1
switch(config-if-Et1.1)#encapsulation dot1q vlan 100
switch(config-if-Et1.1)#vlan id 200
! VLAN does not exist. Creating vlan 200
```

3. An alternative to configuring a forwarding VLAN id is to use VLAN name (***office***).

```
switch(config)#vlan 200
switch(config-vlan-200)#name office
switch(config-vlan-200)#int et1.2
switch(config-if-Et1.2)#encapsulation dot1q vlan 101
switch(config-if-Et1.2)#vlan name office
```

4. Now subinterfaces ***et1.1*** and ***et1.2*** have been created and added to ***VLAN 200***.

```
switch#show interface et1.1-2 status
Port      Name   Status       Vlan     Duplex Speed  Type                Flags
 Encapsulation
Et1.1           connected    200      full   10G    dot1q-encapsulation       100

Et1.2           connected    200      full   10G    dot1q-encapsulation       101
```

12.7.1.2 MAC Address on Layer 2 Subinterface

MAC addresses can either be statically configured or dynamically assigned behind Layer 2 (L2) subinterfaces.

```
switch(config)#mac address-table static 0000.000a.000a vlan 200
 interface et1.1
```

```
switch#show mac address-table interface et1.1-2
          Mac Address Table
------------------------------------------------------------

Vlan  Mac Address     Type     Ports   Moves  Last Move
----  -----------     ----     -----   -----  ---------
 200  0000.000a.000a  STATIC   Et1.1
 200  0000.000b.000b  DYNAMIC  Et1.2   1      0:00:06 ago
Total Mac Addresses for this criterion: 2
```

MAC address learning can be enabled or disabled on an L2 subinterface using the following commands:

In the following example, the **`show interface ethernet1.1 switchport`** command has this ***running-config***:

```
switch(config-if-Et1.1)#show interface ethernet1.1 switchport
Name: Et1.1
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
MAC Address Learning: disabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allowedVlansOnly
```

To enable MAC address learning, use the **`no mac address learning disabled`** command:

```
switch(config-if-Et1.1)#no mac address learning disabled
```

12.7.1.3 QoS Feature

Supported QoS features are:

Shaping

After creating an L2 subinterface, you can configure a shape rate (in Kbps) on the sub-interface. For example, the shape rate is configured to ***50000000*** Kbps.

```
switch(config-if-Et1.1)#shape rate 50000000
```

The configuration of non-default shape rate results in the allocation of dedicated virtual output queues (VOQ) for the subinterface. Each subinterface allocates four (4) VOQs. Different TC traffic goes to the VOQ according to the following mapping:

TC6-7 :	VOQ3
TC4-5 :	VOQ2
TC2-3 :	VOQ1
TC0-1 :	VOQ0

VOQ3 is in strict-priority mode to the other VOQs.

VOQ2, VOQ1, and VOQ0 are in WRR with a static credit ratio 2:3:6 (higher ratio implies more credits).

The subinterface inherits the trust mode of the parent interface.

Before ***EOS Release 4.24.2F***, shaping is supported only on L2 subinterfaces of which the parents are Ethernet interfaces, for example, ***Et1.1***. Beginning with ***EOS Release 4.24.2F***, shaping on L2 subinterface over a parent interface which is port-channel (for example, ***Po1.1***), is supported.

Guaranteed Bandwidth

After configuring shaping on an L2 sub-interface, user can configure a guaranteed bandwidth (in Kbps or percent) on the subinterface using the `bandwidth guaranteed` command.

```
switch(config-if-Et1.1)#bandwidth guaranteed 10000000
switch(config-if-Et1.1)#bandwidth guaranteed percent 10
```

Policing

For policing to work on the L2 subinterface, you must switch to the QoS profile.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile qos

Sample Policy-map Configuration:

switch(config)#ip access-list a1
switch(config-acl-a1)#statistics per-entry
switch(config-acl-a1)#10 permit ip any any

switch(config)#class-map type qos match-any c1
switch(config-cmap-qos-c1)#match ip access-group a1

switch(config)#class-map type qos match-any c2
switch(config-cmap-qos-c2)#match vlan 100 0xfff

switch(config)#ipv6 access-list a1
switch(config-ipv6-acl-a1)#statistics per-entry
switch(config-ipv6-acl-a1)#10 permit ipv6 any any

switch(config)#class-map type qos match-any c3
```

```
switch(config-cmap-qos-c3)#match ipv6 access-group a1

switch(config)#policy-map type quality-of-service p1
switch(config-pmap-quality-of-service-p1)#class c1
switch(config-pmap-quality-of-service-p1-c1)#police cir 10 Mbps bc 100000
 bytes
    exit
exit
```

After you create an L2 subinterface, you can configure a policy-map on the sub-interface, similar to the following example.

```
switch(config-if-Et1.1)#service-policy type qos input p1
```

Interface Counters

To enable the hardware features for counting packets on L2 subinterfaces ingress and/or egress, use the **hardware counter feature** command, similar to the following example. In the example, subinterface ***layer2*** is enabled for ingress then enabled for egress.

Example

```
switch(config)#hardware counter feature subinterface in layer2
switch(config)#hardware counter feature subinterface out layer2
```

To display the L2 subinterface counters, use the **show interface counters** command similar to the following example. In the example, subinterface ***et1.1*** is configured to be displayed.

```
switch#show interfaces et1.1 counters

Port          InOctets       InPkts
Et1.1                0            0

Port               OutOctets      OutPkts
Et1.1                0            0
```

To clear all of the interface counters, use the **clear counters** command similar to the following example:

```
switch#clear counters
```

To learn counters for a specific L2 interface, use the **clear counters** command, and specify the L2 subinterface to clear, similar to the following example. In the example, L2 subinterface ***et1.1*** is to be cleared.

```
switch#clear counters et1.1
```

12.7.1.4 Limitations

The following limitations apply to the Layer 2 subinterface feature:

- A total of ***256*** Layer 2 subinterfaces with shaping are supported across the entire switch and they can be distributed across any number of Ethernet ports.
- When a shape rate is configured on an L2 subinterface over a parent interface which is port-channel (example: ***Po1.1***), traffic load-balancing is disabled and is directed to a selected port-channel member. Also, the bandwidth of the port-channel subinterface will be equal to the selected member. However, the **show interface** command continues to show the bandwidth of the port-channel which is incorrect.

- After configuring a shape rate on an L2 subinterface, the L2 subinterface must be flapped by using the **shut**" and **no shut** commands.
- Shaping of BUM traffic on L2 subinterfaces is supported only with "***ingress replication***".
- Layer 3 forwarding through SVIs is not supported.
- Routing through the parent interface of a subinterface is not supported.
- Control plane processing, such as IGMP snooping and STP BPDU is not supported.
- When IGMP protocol packets are expected to be forwarded on L2 subinterfaces, then IGMP snooping must be disabled globally on the entire switch using the **no ip igmp snooping** command. When IGMP snooping is configured on any VLAN, then IGMP protocol packets are discarded by L2 subinterfaces.
- Double tagged packets arriving on L2 subinterfaces with a single **encapsulation dot1q vlan <outer_vid>** command configured will match on the outer VLAN tag, and have only the outer VLAN tags terminated.
- Configuration of double tagged L2 subinterfaces through the **encapsulation dot1q vlan <outer_vid> inner <inner_vid>** command is not supported.
- Mixing of shaped and non-shaped subinterfaces under the same parent interface is not supported.
- Traffic classification on ingress traffic to l2 subinterface is disabled by default. To enable this feature, configure using the **qos trust cos** command on the parent interface.
- L2 subinterfaces are not supported in an MLAG environment.

12.7.2 QoS Show Commands

Use the **show interfaces status** command to display the subinterface status.

Example

```
switch#show interfaces status sub-interfaces
Port     Name   Status       Vlan     Duplex Speed  Type                Flags
 Encapsulation
Et1.1           connected    200      full   10G    dot1q-encapsulation       100
Et1.2           connected    200      full   10G    dot1q-encapsulation       101
```

Use the **show vlan** command to display the VLAN membership. In the following example, ***VLAN 200*** is configured to be displayed.

Example

```
switch#show vlan 200
VLAN  Name                  Status    Ports
----- --------------------- --------- --------------------
200   office                active    Et1.1, Et1.2, Et5
```

Use the **show qos interface** command to display the QoS configuration on an L2 subinterface. In the following example, QoS subinterface ***Ethernet 1.1*** is configured to be displayed.

Example

```
switch#show qos interface Ethernet 1.1
Ethernet1.1:

   Trust Mode: DSCP
   Default COS: 0
   Default DSCP: 0
```

```
   Port shaping rate: 50625 / 50000 kbps
```

Use the **`show interface counters`** with the queue keyword to display the L2 subinterface counters. For example subinterface ***Ethernet 1.1*** is configured to display the L2 subinterface counters.

Example

```
switch#show interface Ethernet 1.1 counters queue
Aggregate VoQ Counters
Egress   Traffic   Pkts     Octets     DropPkts  DropOctets
Port     Class
-----------------------------------------------------------
Et1.1    TC0-1      0        0          0         0
Et1.1    TC2-3      0        0          0         0
Et1.1    TC4-5      0        0          0         0
Et1.1    TC6-7      460266   276159600  109316    65589600
```

Use the **`show mac address-table`** command to display the MAC address on L2 subinterfaces. For example, subinterfaces ***Et1.1*** and ***Et1.2*** are configured to be displayed.

Example

```
switch#show mac address-table interface et1.1-2
          Mac Address Table
------------------------------------------------------------------

Vlan    Mac Address       Type        Ports      Moves   Last Move
----    -----------       ----        -----      -----   ---------
 200    0000.000a.000a    STATIC      Et1.1
 200    0000.000b.000b    DYNAMIC     Et1.2      1       0:00:16 ago
Total Mac Addresses for this criterion: 2
```

Chapter 13

Layer 3 Configuration

This chapter covers the following Layer 3 sections:

- IPv4
- IPv6
- Ingress and Egress Per-Port for IPv4 and IPv6 Counters
- ACLs and Route Maps
- VARP
- OpenFlow
- DirectFlow
- Decap Groups
- Nexthop Groups
- Global Knob to Set MTU for all Layer 3 Interfaces
- Support for L3 MTU on 7280R3/7500R3/7800R3
- Segment Security

13.1 IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv4 and includes these topics:

- IPv4 Addressing
- IPv4 Routing
- IPv4 Multicast Counters
- Route Management
- IPv4 Route Scale
- IP Source Guard
- DHCP Server
- DHCP Relay Global Configuration Mode
- DHCP Relay Across VRF
- DHCP Relay in VXLAN EVPN
- DHCP Snooping with Bridging
- TCP MSS Clamping
- IPv4 GRE Tunneling
- GRE Tunneling Support
- BfRuntime to use non-default VRFs
- IPv4 Commands

13.1.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- IPv4 Address Formats
- IPv4 Address Configuration
- Address Resolution Protocol (ARP)
- Displaying ARP Entries

13.1.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from `0` to `255`. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask:** The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
- **IP address and wildcard mask:** The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.
- **CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

Examples

- These subnets (subnet mask and CIDR notation) are calculated identically:

```
10.24.154.13 255.255.255.0
10.24.154.13/24
```

- The defined space includes all addresses between ***10.24.154.0*** and ***10.24.154.255***. These subnets (wildcard mask and CIDR notation) are calculated identically:

```
124.17.3.142 0.0.0.15
124.17.3.142/28
```

The defined space includes all addresses between ***124.17.3.128*** and ***124.17.3.143***.

13.1.1.2 IPv4 Address Configuration

Assigning an IPv4 Address to an Interface

The ip address command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

Example

These commands configure an IPv4 address with subnet mask for ***VLAN 200***:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip address 10.0.0.1/24
switch(config-if-Vl200)#
```

Assigning an IPv4 Class E Address to an Interface

The **ipv4 routable 240.0.0.0/4** command assigns a class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

Example

- These commands configure an IPv4 Class E (***240/4***) address to an interface.

```
switch(config)#router general
switch(config-router-general)#ipv4 routable 240.0.0.0/4
```

Detecting duplicate IP Addresses on an Interface

The **ip address duplicate detection disabled** command detects any duplicate IP address on the interface. When the duplicate IP address is detected, a syslog message is generated. It helps the network operator to identify IP addresses misconfiguration. By default, this feature is enabled.

Examples

- This command disables the feature on the switch.

```
switch(config)#ip address duplicate detection disabled
```

- This command enables the feature.

```
switch(config)#ip address duplicate detection logging
```

Note: Commands are in global configuration mode, and are not per VRF.

This is an example of a Syslog message, when a duplicate IP address is detected.

```
Mar 24 16:41:57 cd290 Arp: %INTF-4-DUPLICATE_ADDRESS_WITH_HOST: IP
 address 100.1.1.2
configured on interface Ethernet1/1 is in use by a host with
MAC address 00:00:01:01:00:00 on interface Ethernet1/1 in VRF default
```

13.1.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet's destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.

Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The arp aging timeout command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the Layer 3 interface. The default duration is ***14400*** seconds (four hours).

Entries are refreshed and expired at a random time that is in the range of ***80%-100%*** of the cache expiry time. The refresh is tried three times at an interval of ***2%*** of the configured timeout.

Static ARP entries never time out and must be removed from the table manually.

Example

This command specifies an ARP cache duration of ***7200*** seconds (two hours) for dynamic addresses added to the ARP cache that were learned through ***VLAN 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
   arp aging timeout 7200
switch(config-if-Vl200)#
```

The arp command adds a static entry to an Address Resolution Protocol (ARP) cache.

Example

This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
```

```
switch(config)#
```

13.1.1.3.1 Gratuitous ARP

Gratuitous ARP packets are broadcast by a device in response to an internal change rather than as a response to an ARP request. The gratuitous ARP packet is a request packet (no reply expected) that supplies an unrequested update of ARP information. In a gratuitous ARP packet, both the source and destination IP addresses are the IP of the sender, and the destination MAC address is the broadcast address (***ff:ff:ff:ff:ff:ff***).

Gratuitous ARP packets are generated to update ARP tables after an IPv4 address or a MAC address change occurs.

Configuring Gratuitous ARP

By default, Arista switch interfaces reject gratuitous ARP request packets. The **arp gratuitous accept** command configures an L3 interface to accept the gratuitous ARP request packets sent from a different device in the network and add their mappings to the ARP table. Gratuitous ARP can be configured on Ethernet interfaces, VLANs/SVI, or L3 port channels, but has no effect on L2 interfaces.

Example

These commands enable gratuitous ARP packet acceptance on ***interface Ethernet 2/1***.

```
switch (config)#interface ethernet 2/1
switch (config-if-Et2/1)#arp gratuitous accept
```

13.1.1.4 Displaying ARP Entries

The **show ip arp** command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the ***resolve*** argument.

Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp

Address         Age (min)  Hardware Addr   Interface
172.25.0.2              0  004c.6211.021e  Vlan101, Port-
Channel2
172.22.0.1              0  004c.6214.3699  Vlan1000, Port-
Channel1
172.22.0.2              0  004c.6219.a0f3  Vlan1000, Port-
Channel1

switch>
```

13.1.1.4.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command **ip arp inspection vlan** activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

Examples

- This command enables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)#ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)#no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs ***1*** through ***150***.

```
switch(config)#default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs ***1*** through ***150*** and ***200*** through ***250***.

```
switch(config)#ip arp inspection vlan 1-150,200-250
switch(config)#
```

Syslog for Invalid ARP Packets Dropped

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface
 Ethernet28/1 Vlan
2121 because invalid mac and ip binding. Received: 00:0a:00:bc:0
0:de/1.1.1.1.
```

Displaying ARP Inspection States

The command **show ip arp inspection vlan** displays the configuration and operation state of ARP inspection. For a VLAN range specified by **`show ip arp inspection vlan`** only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to **Active** when hardware is ready to trap ARP packets for inspection.

Example

This command displays the configuration and operation state of ARP inspection for VLANs ***1*** through ***150***.

```
switch(config)#show ip arp inspection vlan 1 - 150

VLAN 1
----------
Configuration
: Enabled
Operation State : Active
VLAN 2
----------
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration
: Enabled
Operation State : Active

switch(config)#
```

Displaying ARP Inspection Statistics

The command **show ip arp inspection statistics** displays the statistics of inspected ARP packets. For a VLAN specified by **show ip arp inspection vlan** only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command **clear arp inspection statistics** clears ARP inspection.

Examples

- This command displays ARP inspection statistics for ***VLAN 1***.

```
switch(config)#show ip arp inspection statistics vlan 2

Vlan : 2
------------
ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for ***Ethernet interface 3/1***.

```
switch(config)#show ip arp inspection statistics ethernet
 interface 3/1

Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
```

```
switch(config)#
```

Configure Trust Interface

By default, all interfaces are untrusted. The command **ip arp inspection trust** configures the trust state of an interface.

Examples

- This command configures the trust state of an interface.

```
switch(config)#ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)#no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)#default ip arp inspection trust
switch(config)#
```

Configure Rate Limit

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command **ip arp inspection logging** will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command **ip arp inspection limit** will error-disable interfaces.

Examples

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to ***2048*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***15*** seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst
 interval 15
switch(config)#
```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to ***512*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***11*** seconds.

```
switch(config)#ip arp inspection limit rate 512 burst interval
 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)#interface Ethernet 3 / 1
```

```
switch(config)#ip arp inspection limit rate 20 burst interval
 5
switch(config)#interface Ethernet 3 / 3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces

 Interface      Trust State  Rate (pps) Burst Interval
 -------------  -----------  ---------- --------------
 Et3/1          Untrusted    20         5
 Et3/3          Trusted      None       N/A

switch(config)#
```

Configure Errdisable Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command **`errdisable detect cause arp-inspection`** (e.g., after you perform a **`shutdown`** or **`no shutdown`** of the interface) or it automatically recovers after a certain time period. The command **`errdisable recovery cause arp-inspection`** will enable auto recovery. The command **`errdisable recovery interval`** will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter **Data Transfer Introduction** for information on all **`errdisable`** commands.

Examples:

- This command enables errdisable caused by an ARP inspection violation.

```
switch(config)#errdisable detect cause arp-inspection
switch(config)#
```

- This command disables errdisable caused by an ARP inspection violation.

```
switch(config)#no errdisable detect cause arp-inspection
switch(config)#
```

- This command enables auto recovery.

```
switch(config)#errdisable recovery cause arp-inspection
switch(config)#
```

- This command disables auto recovery.

```
switch(config)#no errdisable recovery cause arp-inspection
switch(config)#
```

- This command enables sharing the auto recovery interval of ***10*** seconds among all errdisable interfaces.

```
switch(config)#errdisable recovery interval 10
switch(config)#
```

- This command disables sharing the auto recovery interval of ***10*** seconds among all errdisable interfaces.

```
switch(config)#no errdisable recovery interval 10
switch(config)#
```

- This command displays the reason for a port entering the errdisable state.

```
switch(config)#show interfaces status errdisabled

Port          Name          Status       Reason
------------ ------------ ------------ ---------------
Et3/2                      errdisabled  arp-inspection

switch(config)#
```

Configure Static IP MAC Binding

The ARP inspection command **ip source binding** allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

Examples

- This command configures static IP-MAC binding for IP address ***127.0.0.1,*** MAC address ***0001.0001.0001***, ***VLAN 1***, and Ethernet interface ***slot 4*** and ***port 1***.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan
 1 interface
ethernet 4/1
switch(config)#
```

- This command configures static IP-MAC binding for IP address ***127.0.0.1***, MAC address ***0001.0001.0001***, ***VLAN 1***, and ***port-channel interface 20***.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan
 1 interface
port-channel 20
switch(config)#
```

- This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

```
switch(config)#show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1
interface port-channel 20

MacAddress      IpAddress   Lease(sec)  Type   VLAN  Interface
--------------- ----------- ----------- ------ ----- --------------
0001.0001.0001  127.0.0.1   infinite    static 1     Port-Channel20

switch(config)#
```

13.1.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet

layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- Enabling IPv4 Routing
- Static and Default IPv4 Routes
- Dynamic IPv4 Routes
- Viewing IPv4 Routes and Network Components

13.1.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **ip routing** command enables IPv4 routing.

Example

This command enables IP routing:

```
switch(config)#ip routing
switch(config)#
```

13.1.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The **ip route** command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of ***0***.

Example

This command creates a static route:

```
switch(config)#ip route 172.17.252.0/24 vlan 500
switch(config)#
```

Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is ***0.0.0.0/0*** and the next-hop is the default gateway.

Example

This command creates a default route and establishes ***192.14.0.4*** as the default gateway address:

```
switch(config)#ip route 0.0.0.0/0 192.14.0.4
switch(config)#
```

13.1.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- OSPFv2 Introduction
- Border Gateway Protocol (BGP)
- Routing Information Protocol (RIP)
- IS-IS

13.1.2.4 Viewing IPv4 Routes and Network Components

Displaying the FIB and Routing Table

The **show ip route** command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **`show running-config`** command displays configured commands not in the FIB. The **show ip route summary** command displays the number of routes, categorized by source, in the routing table.

Examples

- This command displays IP routes learned through BGP.

```
switch>show ip route bgp

Codes: C - connected, S - static, K - kernel,

switch>
```

Displaying the IP Route Age

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Example:

This command displays the amount of time since the last update to ip route ***172.17.0.0/20***.

```
switch>show ip route 172.17.0.0/20 age

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

 B E    172.17.0.0/20 via 172.25.0.1, age 3d01h

switch>
```

Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route in is ***0.0.0.0/0***.

The **show ip route gateway** command displays IP addresses of all gateways (next hops) used by active routes.

Example

This command displays next hops used by active routes.

```
switch>show ip route gateway

The following gateways are in use:
   172.25.0.1 Vlan101
   172.17.253.2 Vlan2000
   172.17.254.2 Vlan2201
   172.17.254.11 Vlan2302
   172.17.254.13 Vlan2302
   172.17.254.17 Vlan2303
   172.17.254.20 Vlan2303
   172.17.254.66 Vlan2418
   172.17.254.67 Vlan2418
   172.17.254.68 Vlan2768
   172.17.254.29 Vlan3020

switch>
```

Displaying Host Routes

The **show ip route host** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = ***255.255.255.255*** or prefix = ***/32***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

This command displays all host routes in the host forwarding table.

```
switch#show ip route host

R - receive B - broadcast F - FIB, A - attached

F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
R   172.17.254.1 to cpu
A   172.17.254.2 on Vlan2901
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
                via 172.17.254.67 on Vlan3008

```

```
F   172.26.0.31 via 172.17.254.33 on Vlan3911
F   172.26.0.32 via 172.17.254.105 on Vlan3912

switch#
```

13.1.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- Multicast Counters Hardware Overview
- Multicast Counters iBGP and eBGP Configuration
- Configuring IPv4 Multicast Counters

13.1.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- Platform Independent Requirements for Counters
- Policer Counter Overview
- BGP Functions Supported for Arista Switches
- Additional Requirements

13.1.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

13.1.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

[no] platform fm6000 [nat|acl|qos|multicast] policer banks <1|2>

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.

13.1.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

13.1.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:

- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

13.1.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.

- **Policer Usage**

13.1.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the Starter Group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, do not allocate a policer entry until a real route (G, S) is programmed into the Frame Filtering and Forwarding Unit (FFU).

13.1.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the FM6000 platform:

1. Execute the global configuration command:

   - **no** | **default** `ip multicast count` **bytes** | **packets**

   Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs of resources, specific creation has priority to preempt counters from wildcard creation. The **bytes** | **packets** optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

   - **no** | **default** `ip multicast count` ***<G> <S>***

   This is only takes affect when `ip multicast count` is enabled. Either ***<G> <S>*** or **bytes** | **packets** optional keyword is used. They can not be used concurrently.

No | default Commands: (default is same as no)

- **`no ip multicast count`** Deletes all multicast counters, including explicit ***<G> <S>*** routes
  - **`no ip multicast count`** ***<G> <S>*** Removes the config. Does not delete the counter because the wildcard is still active.
  - If no ***<G, S>*** is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If ***<G, S>*** is specified, only ***<G, S>*** will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This ***<G, S>*** configuration is applicable when the hardware runs out of resources. Specific ***<G, S>*** creation has priority to preempt counters from wildcard creation.

The ***byte*** | ***frame*** optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either ***<G, S>***, or ***byte*** | ***frame*** optional keywords are used but cannot be used together. All counters are ***byte*** | ***frame***. The ***byte*** | ***frame*** mode is global, and not applicable on a ***<G, S>*** basis.

2. Execute clear command:

```
clear ip multicast count <G> <S>
```

3. Execute show command:

```
show multicast fib ipv4 <G> count
```

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
switch>show multicast fib ipv4 count
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts is the sum of counts from all sources in that group.

The count value can be **N/A** if a mroute does not have an associated counter.

If the count value for any source in a ***G*** is **N/A**, then the total counts for ***G*** will be shown as **N/A**. However, the count values for other sources are still shown.

13.1.4 Route Management

When routing is enabled, the switch discovers the best route to a packet’s destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describes routing features that the switch supports:

- Route Redistribution
- Equal Cost Multipath Routing (ECMP) and Load Sharing
- Unicast Reverse Path Forwarding (uRPF)
- Routing Tables / Virtual Routing and Forwarding (VRF)
- RIB Route Control

13.1.4.1 Route Redistribution

Route redistribution is the advertisement, into a dynamic routing protocol's routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

13.1.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal Cost Multi-Path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

Configuring ECMP (IPv4)

All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

Example

This command sets the IPv4 load sharing hash seed to ***20***:

```
switch(config)#ip load-sharing fm6000 20
switch(config)#
```

Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the **multipath none** command or the no version of the **multipath deterministic** command.

Resilient ECMP

Resilient ECMP is used for those prefixes where it is not desirable for routes to be rehashed due to link flap, typically where ECMP is being used for load balancing. Resilient ECMP configures a fixed number of next-hop entries in the hardware ECMP table for all the routes within a specified IP address prefix. Implementing fixed table entries for a specified next-hop address allows data flows that are hashed to a valid next-hop number to remain intact even when some of the next hops go down or come back online.

Resilient ECMP is enabled for all routes within a specified prefix using the **ip hardware fib ecmp resilience** command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table can contain for the specified IP prefix, and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of next-hop addresses, the table space entries are filled by additional duplication of the nexthop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

Example

This command configures a hardware ECMP table space of 24 entries for the IP address ***10.14.2.2/24***. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24
 capacity 6 redundancy 4
switch(config)#
```

13.1.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet's source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware. Commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry will use for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface.

13.1.4.3.1 uRPF Operation

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet's source IP address. In strict mode, the uRPF also fails when the matching entry's outbound interface does not match the packet's ingress interface.

uRPF verification is not available for the following packets:

- DHCP (Source is ***0.0.0.0*** – Destination is ***255.255.255.255***).
- IPv6 link local (***FE80::/10***).
- Multicast packets.

ECMP uRPF

When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

Default Routes

uRPF strict mode provides an **`allow-default`** option that accepts default routes. On interfaces that enable allow-default and a default route is defined, uRPF strict mode validates a packet even when

the routing table does not contain an entry that matches the packet's source IP address. When allow-default is not enabled, uRPF does not consider the default route when verifying an inbound packet.

Null Routes

NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from a null route prefixes is dropped in strict and loose modes.

13.1.4.3.2 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the **ip verify** command.

Note: uRPF cannot be enabled on interfaces with ECMP member FECs.

Examples

- This command enables uRPF loose mode on ***interface vlan 17***.

```
switch(config)#interface vlan 17
switch(config-if-Vl17)#ip verify unicast source reachable-via
 any
switch(config-if-Vl17)#show active
 interface Vlan17
   ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on ***interface vlan 18***.

```
switch(config)#interface vlan 18
switch(config-if-Vl18)#ip verify unicast source reachable-via
 rx
switch(config-if-Vl18)#show active
 interface Vlan18
   ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

13.1.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a Routing Information Base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called "default" and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).

Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches.

VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a Route Distinguisher (RD) may be prepended to each address. RDs are defined in ***RFC 4364***.

13.1.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

13.1.4.4.2 User-Defined VRFs

A user-defined VRF is created with the **vrf instance** command. After its creation, a VRF may be assigned a route distinguisher (RD) with the **rd (VRF configuration mode)** command in the VRF submode of Router-BGP Configuration Mode.

Examples

- These commands create a VRF named ***purple***, place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as ***AS 530*** and assigning ***12*** as its local number.

```
switch(config)#vrf instance purple
switch(config-vrf-purple)#router bgp 50
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the **vrf (Interface mode)** command. Loopback, SVI, and routed ports can be added to a VRF.

  These commands add ***VLAN 20*** to the VRF named ***purple***.

```
switch(config)#interface VLAN 20
switch(config-if-Vl20)#vrf purple
switch(config-if-Vl20)#
```

- The **show vrf** command shows information about user-defined VRFs on the switch.

  This command displays information for the VRF named ***purple***.

```
switch>show vrf purple
Vrf     RD          Protocols  State       Interfaces
------- ----------- ---------- ----------- ------------
purple  64496:237   ipv4       no routing  Vlan42, Vlan43

switch>
```

13.1.4.4.2.1rd (VRF configuration mode)

The **rd** command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a Route Distinguisher (RD) for a VRF, use the **rd (VRF configuration mode)** command.

Note: Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in **show vrf** outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.

13.1.4.4.3 Context-Active VRF

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:

- clear arp-cache
- show ip
- show ip arp
- show ip route
- show ip route gateway
- show ip route host

The **cli vrf** command specifies the context-active VRF.

Example

This command specifies ***magenta*** as the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
Current VRF routing-context is magenta
```

The **show routing-context vrf** command displays the context-active VRF.

Example

This command displays the context-active VRF.

```
switch>show routing-context vrf
Current VRF routing-context is magenta

switch>
```

13.1.4.5 RIB Route Control

The Routing Information Base (RIB) is composed of the routing information learned by the routing protocols, including static routes. The Forwarding Information Base (FIB) is composed of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) makes IP destination prefix-based switching decisions. The FIB is similar to a routing table or information base. It maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information is updated, and those changes are reflected in the FIB.

13.1.4.5.1 Configuring FIB policy

The RIB calculates the best/winning routes to each destination and place these routes in the forwarding table. Based on the FIB policy configured the best routes are advertised.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from being advertised by a routing protocol, or to be redistributed into another routing domain, or to be used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

The **`rib ipv4 | ipv6 fib policy`** command is used to enable FIB policy for a particular VRF under router general configuration mode.

The following match statements are supported:

- **`match interface`**
- **`match`** [ip | ipv6] address *prefix-list*
- **`match`** [ip | ipv6] resolved-next-hop *prefix-list*
- **`match isis level`**
- **`match metric`**
- match source-protocol

Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, ***map1***.

```
switch(config)#router general
switch(config-router-general)#vrf default
switch(config-router-general-vrf-default)#rib ipv4 fib policy
 map1
```

13.1.4.5.2 Displaying FIB Information

Use the **`show rib route <ipv4|ipv6> fib policy exclude`** command to display the RIB information. The **fib policy excluded** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Example

The following example displays the routes filtered by FIB policy using the **fib policy excluded** option of the **`show rib route ip|ipv6`** command.

```
switch#show rib route ipv6 fib policy excluded
switch#show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
>B    10.1.0.0/24 [200/0]
```

```
          via 10.2.2.1 [115/20] type tunnel
             via 10.3.5.1, Ethernet1
          via 10.2.0.1 [115/20] type tunnel
             via 10.3.4.1, Ethernet2
             via 10.3.6.1, Ethernet3
```

13.1.4.5.3 Displaying RIB Route Information

Use the **show rib route ip** command to view the IPv4 RIB information.

Example:

This command displays IPv4 RIB static routes.

```
switch#show rib route ip static

VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S    10.80.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
>S    172.16.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected

switch#
```

13.1.5 IPv4 Route Scale

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths ***12***, ***16***, ***20***, ***24***, ***28***, and ***32***. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of ***32***.

Note: IPv4 Route Scale cannot be used with AlgoMatch.

The following sections describes IPv4 route scale configuration, show commands, and system log messages:

- Configuring IPv4 Route Scale
- IPv4 Routescale with 2-to-1 Compression
- Show Commands

13.1.5.1 Configuring IPv4 Route Scale

IPv4 route scale is enabled by the **ip hardware fib optimize** command for the configuration mode interface. The platform Layer 3 agent is restarted to ensure IPv4 routes are optimized with the **agent SandL3Unicast terminate** command for the configuration mode interface.

Example

This configuration command allows configuring prefix lengths ***12*** and ***32***.

```
switch(config)#ip hardware fib optimize exact-match prefix-length
 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Example

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

Example:

This configuration command allows configuring prefix lengths ***32*** and ***16***.

```
switch(config)#ip hardware fib optimize exact-match prefix-length
 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command allows configuring prefix length ***24***.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-
  length 24
  ```

```
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

In this instance, there is only one prefix-length, so a prefix-length of ***32*** is not required. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command allows configuring prefix length *32*.

  ```
  switch(config)#ip hardware fib optimize exact-match prefix-
  length 32
  ! Please restart layer 3 forwarding agent to ensure IPv4
   routes are optimized
  ```

  For this command to take effect, you must restart the platform Layer 3 agent.
- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command disables configuring prefix lengths ***12*** and ***32***.

  ```
  switch(config)#no ip hardware fib optimize exact-match prefix-
  length 12 32
  ! Please restart layer 3 forwarding agent to ensure IPv4
   routes are not optimized
  ```

One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

Examples

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are not optimized.

  ```
  switch(config)#agent SandL3Unicast terminate
  SandL3Unicast was terminated
  ```

  Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command attempts to configure prefix length ***20*** and ***28*** which triggers an error exception. One of the two prefixes in this command must be a prefix-length of ***32***, which is required in the instance where there are two prefixes.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 20 28
% One of the prefix lengths must be 32
```

IPv4 routes of certain prefix lengths can be optimized for enhanced route scale. The following command disable prefix optimization on the specified VRF(s) to provide more flexibility.

Examples

- This configuration command disables prefix optimization on the default VRF.

```
switch(config)#ip hardware fib optimize disable-vrf default
! Please restart layer 3 forwarding agent to ensure that the
 disable-vrf option change takes effect
```

- This configuration command disables prefix optimization on VRFs named *vrf1* and*vrf2*.

```
switch(config)#ip hardware fib optimize disable-vrf vrf1 vrf2
! Please restart layer 3 forwarding agent to ensure that the
 disable-vrf option change takes effect
```

- This configuration command restarts the platform Layer 3 agent to ensure disable-vrf configuration to take effect.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Starting from the *EOS Release 4.26.0F*, /32 prefix length optimization command is supported in the R3 series.

Examples

- This configuration command enables prefix optimization on the default VRF.

```
switch(config)#ip hardware fib optimize vrf default prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- This configuration command enables prefix optimization on VRFs named ***vrf1*** and ***vrf2***.

```
switch(config)#ip hardware fib optimize vrf vrf1 vrf2 prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- This configuration command disables optimization on ***vrf1*** and ***vrf2*** optimization configured in above example.

```
switch(config)#no ip hardware fib optimize vrf vrf1
```

```
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

The **platform trident forwarding-table partition flexible** command enables ALPM Mode in Flexible UFT mode using a subset of resources, so ALPM and Exact Match can coexist. Prior to this release, ALPM could only be programmed in mode 4 where all the UFT resources were used and in flexible partition mode, configuring ALPM was not supported. This limits the number of IP routes that can be supported.

Examples

- This configuration command sets up the flexible partition.

```
switch(config)#platform trident forwarding-table partition
 flexible ?
  alpm          Shared UFT bank entries for the ALPM table
  exact-match   Shared UFT bank entries for the exact-match
 table
  l2-shared     Shared UFT bank entries for the MAC table
  l3-shared     Shared UFT bank entries for the host table
```

- ALPM gives the route prefix in DEFIM (TCAM table for longest prefix matched (LPM) lookup) and ALPM tables.

```
switch(config)#platform trident forwarding-table partition
 flexible alpm ?
  184320  Upto 180K LPM routes
  368640  Upto 360K LPM routes
```

Note: The size parameter has following values:

- DCS-7300X3: 180k and 360k are accepted.
- CCS-720XP: 144k and 96k are accepted.
- Other sizes are invalid.

13.1.5.2 IPv4 Routescale with 2-to-1 Compression

The IPv4 routescale with 2-to-1 compression optimizes certain prefix lengths and enhances the route scale capabilities on 7500R, 7280R, 7500R2, and 7280R2 platforms. The compression is best suited to achieve route scale when route distribution has a large number of routes of one or two prefix lengths.

13.1.5.2.1 Configuring IPv4 Routescale 2-to-1 Compression

Use the **compress** command to increase the hardware resources available for the specified prefix length. This command allows configuring up to one compressed prefix length, and this command is supported only on 7500R, 7280R, 7500R2, and 7280R2 platforms.

Note: The **compress** command takes effect only when you restart the platform Layer3 agent on 7500R, 7280R, 7500R2, and 7280R2 platforms. Use command **agent SandL3Unicast terminate** to restart the platform Layer3 agent.

Examples

- In the following example we are configuring prefix length ***20*** and ***24***, expanding prefix length ***19*** and ***23***, and compressing prefix length ***25***.

```
switch(config)#ip hardware fib optimize prefix-length 20 24 expand 19
 23 compress 25
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- In the following example we are configuring prefix length ***20*** and ***23***, expanding prefix length ***19***, compressing prefix length ***24***.

```
switch(config)#ip hardware fib optimize prefix-length 20 23 expand 19
 compress 24
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

- Optionally, you can also use the **internet** profile to configure the IPv4 route scale compression.

```
switch(config)#ip hardware fib optimize prefixes profile internet
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes are
 optimized
```

Configure a new TCAM profile for the **`compress`** configuration to work, and disable a few features in the new TCAM profile to make space for the flex-route feature in the hardware. Features like **acl vlan ip** and the **mirror ip** have to be disabled, if you need any of these features or any other features to be enabled with flex-route feature, contact the Arista team.

The **internet** profile works differently based on whether the flex-route feature is enabled in the TCAM profile or not. If the flex-route feature is enabled, the **internet** profile behaves like **`ip hardware fib optimize prefix-length 20 23 expand 19 22 compress 24`**. If the flex-route feature is disabled, the **internet** profile behaves as **`ip hardware fib optimize prefix-length 20 24 expand 19 23`**.

Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile flex-route copy default
switch(config-hw-tcam-profile-flex-route)#feature flex-route copy system-
feature-source-profile
switch(config-hw-tcam-profile-flex-route-feature-flex-route)#exit
switch(config-hw-tcam-profile-flex-route)#no feature acl vlan ip
switch(config-hw-tcam-profile-flex-route)#no feature mirror ip
switch(config-hw-tcam-profile-flex-route)#exit
Saving new profile 'flex-route'
switch(config-hw-tcam)#system profile flex-route
```

13.1.5.2.2 Limitations

- A maximum of two prefix lengths can be optimized directly at any point of time, of which only one can be a non-nibble aligned prefix length. Additional prefix lengths can be optimized using the **expand** or the **compress** options.
- A maximum of 1-to-4 way expansion and 2-to-1 way compression into any optimized prefix length is supported. Multiple expansion prefix lengths can be programmed at any time, however, there can be just one compression prefix length programmed at any given point in time.
- A maximum of ***4096*** next-hops can be reliably pointed to by the compressed prefixes using 2-to-1 way compression.
- The 2-to-1 compression cannot be enabled along with unicast RPF. When both features are enabled together, unicast RPF functionality may not be correct.

- The flex-route feature in TCAM profiles based only on the default profile, while disabling the **acl vlan ip** and the **mirror ip** features. Contact the Arista team if any other feature, that is not available in the default TCAM profile, is required to be supported along with the flex-route feature, including support for Mirror to GRE tunnel or ACLs on SVI.
- VXLAN is not supported with the compress option of this feature. There is no Syslog or a warning message when VXLAN is configured along with the 2-to-1 way compression feature.

13.1.5.3 Show Commands

The IPv4 route scale summary is displayed by the **show platform arad ip route summary** command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the **show platform arad ip route** command for the configuration mode interface.

Examples

- This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary

Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

- This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources appear with an asterisk (*).

```
switch(config)#show platform arad ip route

Tunnel Type: M(mpls), G(gre)
* - Routes in LEM
-------------------------------------------------------------------------------------------------
|                              Routing Table                                      |             |

```

13.1.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks.

IP Source Guard (IPSG) filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

13.1.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the **ip verify source** command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therfore, source IP MAC binding entries should be configured on port channels using the **ip source binding** command. When

configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Examples

- These configuration commands exclude VLAN IDs ***1*** through ***3*** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs ***4*** through ***10*** on ***Ethernet 36*** will be filtered by IPSG, while those received on VLANs ***1*** through ***3*** are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

- This configuration command configures source IP-MAC binding entries to IP address ***10.1.1.1***, MAC address ***0000.aaaa.1111***, ***VLAN ID 4094***, and ***Ethernet interface 36***.

```
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan
 4094 interface ethernet 36
switch(config)#
```

13.1.6.2 DHCP Server Show Commands

Use the **`show dhcp server`** command to display DHCP server information.

- DHCPv4 display example:

```
switch#show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options       Data
```

```
---------------- -----------
      2            192.0.2.2
      3            “Foo”

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- For DHCPv6, there are two additional fields in subnet information output, **`Direct`** field and the **`Relay`** field. These two fields specify if the DHCP Server is accepting broadcast or relayed messages.

  The **`Direct`** field displays **`Active`** when the subnet matches the interface with DHCPv6 configured. This indicates the server is accepting broadcast messages.

  The **`Direct`** field displays **Inactive** when there is another existing subnet already matching the interface, or when the subnet matches more than one DHCP configured interface.

  Examples of outputs for the DHCPv6 **`show dhcp server`** command:

  In this example, DHCPv6 is configured with subnet ***fe80::/10*** while being enabled on ***Ethernet1*** with address ***fe80::1/64*** and on ***Ethernet3*** with address ***fe80::2/64***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:
```

```
   Interface    Status

--------------- ------

   Ethernet1    Active
   Ethernet3    Active

Subnet: fe80::/10

Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5

Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com
```

```
Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active

Subnet: fc00::/7

Subnet name: foo

Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/10
```

```
Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **`show dhcp server`** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch#show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.7 DHCP Server

The router with DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

The DHCP server is based on ISC Kea.

The router with an DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

DHCP Server support includes:

DHCPv4 support includes:

- Configurable on different interfaces: Routed, VLAN, LAG, Sub-interface, and LAG Sub-interface.
- Configurable lease time for allocated network addresses.
- Configurable DNS domain.
- Configurable DNS servers.
- Configurable subnets with parameters:
  - Default gateway
  - DNS servers
  - Ranges

- Lease time

Additional features for DHCPv4 include:

- Configurable TFTP server
- Configurable TFTP bootfile

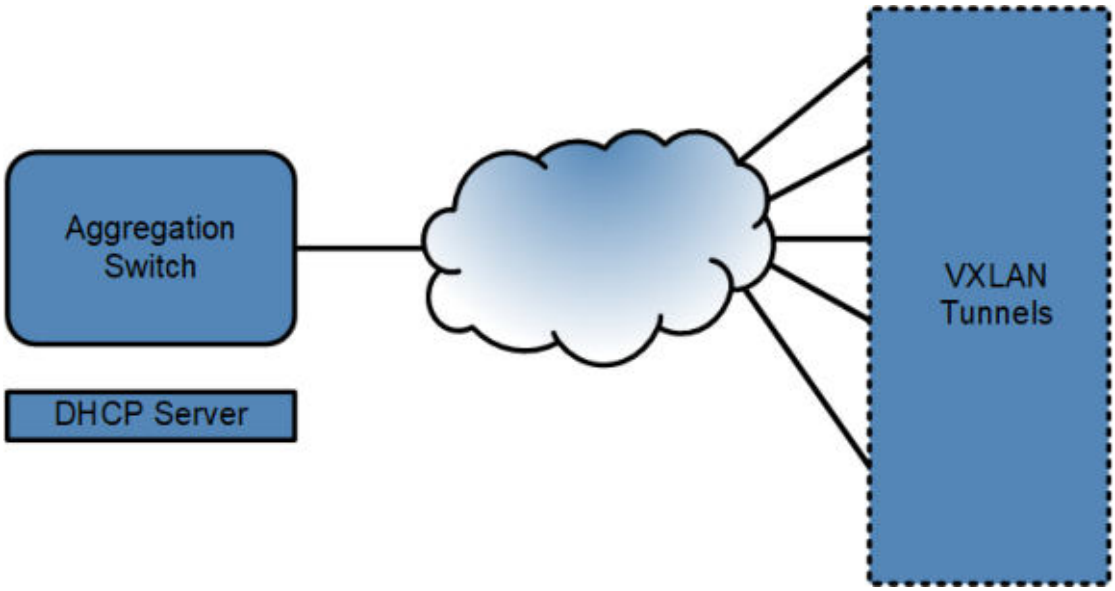
Additional features for DHCPv4 includes:

- Configurable Vendor options with sub options
- Configurable sub option types include: IPv4 address, array of IPv4 addresses, and string
- TFTP bootfile now supports an URI

Additional features for DHCPv4 include a configurable static IP address for exclusive use by a given client, based on the client's MAC address.

Example deployment:

DHCP Server on an aggregation switch, via VXLAN tunnels.



13.1.7.1 Configuring the DHCP Server

You can enable DHCP Server per interface with the IPv4 or IPv6 address family option.

Example

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#dhcp server ipv4

switch(config)#interface Ethernet2
switch(config-if-Et2)#dhcp server ipv6
```

For DHCPv4 to receive and reply to requests, minimum configurations of a valid subnet corresponding to the enabled interface with at least one valid range are required.

Example

```
switch(config)#interface Ethernet1
```

```
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#dhcp server ipv4
switch(config-if-Et1))#ip address 10.0.0.1/8
switch(config-if-Et1)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-if-Et1)#range 10.0.0.4 10.0.0.6
```

At least one non link-local address is required for DHCPv6.

Example

```
switch(config)#interface Vlan1409
switch(config-if-vlan1409)#dhcp server ipv6
switch(config-dhcp-server)#ipv6 address fe80::1/10

switch(config-if-vlan1409)#dhcp server
   subnet fe80::/10
      range fe80::4 fe80::6
```

To enter DHCP Server global configuration mode **(config-dhcp-server)**:

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#
```

To disable DHCP Server:

```
switch(config-dhcp-server)#disabled
switch(config)#
```

To set the lease time for allocated IP addresses. Lease time is configured globally and applied to all subnets. In the example, the lease time is set to 1 day.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#lease time (ipv4|ipv6) 1 days 0 hours 0
 minutes
```

To set the domain name for allocated IP addresses. In this example, the domain name is configured to ***aristanetworks.com***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#dns domain name (ipv4|ipv6) aristanetworks.com
```

To set the DNS servers. You can only configure up to two servers. In this example, ***10.2.2.2*** for ***DHCPv4*** and ***fe80::2*** for ***DHCPv6***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#dns server ipv4 10.2.2.2
switch(config-dhcp-server)#dns server ipv6 fe80::2
```

To set TFTP server. The server can be in the form of either an IP address or a fully qualified domain name. This is only available in DHCPv4. In this example, ***TFTP*** server ***10.0.0.2***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#tftp server option 66 ipv4 10.0.0.2
```

To set a list of TFTP servers. The server can only be in the form of an IP address. This is only available in DHCPv4. In this example, ***3.0.0.3*** and ***4.0.0.4*** TFTP servers are configured.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#tftp server option 150 ipv4 10.0.0.3 10.0.0.4
```

To set TFTP server boot file (such as DHCP option 67). This is only available in DHCPv4. In this example, TFTP boot `file bootfile.conf` is configurd.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#tftp server file ipv4 bootfile.conf
```

Or, a TFTP boot file URL **`//john.doe@www.example.com:123/example/one`**

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#tftp server file ipv4 https://john.
doe@www.example.com:123/example/one
```

To set a Vendor option, DHCP option 43, with sub options. Most of the time, different clients need different Vendor options. For this reason option 60, vendor class identifier, is used by the client to identify itself in order to request a specific Vendor option. To enter the Vendor option submode ***(config-dhcp-vendor)*** from ***(config-dhcp-server)*** config mode, specify a vendor class identifier. This is only available in DHCPv4.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)#
```

If **`default`** is specified, the configured Vendor option is sent to those clients requesting for a Vendor option whose vendor class identifier does not match any configured Vendor option. In this example, the default Vendor option for clients without a configured Vendor option.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 default
```

The Vendor option may contain ***0*** or more sub options. The resulting Vendor option is sent in hexadecimal format to the desired client. In theis example, the Vendor option holding a sub option with IPv4 address ***10.0.0.1***, for clients with vendor class identifier **`vendorClassIDA`**, resulting in Vendor option ***1:4:a:0:0:1***. The sub option number is ***1***. Length of the Data is ***4***. Data is ***a:0:0:1***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)#sub-option 1 type ipv4-address data 10.0.0.1
```

In this example, Vendor option holding a sub option with IPv4 addresses ***10.0.0.5*** and ***10.0.0.6***, for clients with vendor class identifier **vendorClassIDA**. Resulting in Vendor option ***fe:4:a:0:0:5:a:0:0:6***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 vendorClassIDA
switch(config-dhcp-vendor)#sub-option 254 type ipv4-address data 10.0.0.5
 10.0.0.6
```

In this example, Vendor option holding a sub option with a string ***FOO***, for all clients whose vendor class identifier does not match any configured Vendor option. Resulting in Vendor option ***1e:3:46:4f:4f***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 default
switch(config-dhcp-vendor-option-default)#sub-option 30 type string data
 "FOO"
```

In this example, Vendor option holding two sub options, where sub option 1 holds the IPv4 address ***10.0.0.1***, and sub option 2 holds a string ***FOO***, for all clients whose vendor class identifier does not match any configured Vendor option. Resulting in Vendor option ***1:4:a:0:0:1:2:3:46:4f:4f***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#vendor-option ipv4 default
switch(config-dhcp-vendor-option-default)#sub-option 1 type ipv4-address
 data 10.0.0.1
switch(config-dhcp-vendor-option-default)#sub-option 2 type string data
 "FOO"
```

Configuration options for subnets are configured under IPv4 or IPv6 address family specific subnet submode ***(config-dhcp-subnet)***. To enter the submode from ***(config-dhcp-server)*** config mode, specify a subnet mask. In this example, ***10.0.0.0/8*** for DHCPv4 and ***fe80::/10*** for DHCPv6.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server)#subnet fe80::/10
```

There can be multiple subnets configured, but they must not overlap. If this happens, all overlapping subnets are disabled.

For DHCPv6, a subnet may match only one interface and vice versa; otherwise no lease is assigned for that subnet.

In this example. the user enables DHCPv6 on ***Ethernet1*** (with address ***fe80::1/64***) and ***Ethernet3*** (with address ***fe80::2/64***), then configures a subnet ***fe80::/10*** for the DHCPv6:

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ipv6 address fe80::1/64
switch(config-if-Et1)#dhcp server ipv6

switch(config)#interface Ethernet3
switch(config-if-Et3)#no switchport
switch(config-if-Et3)#ipv6 address fe80::1/64
switch(config-if-Et3)#dhcp server ipv6

switch(config)#dhcp server
```

```
switch(config-dhcp-server)#subnet fe80::/1
```

To set default-gateway for a subnet. Only one default-gateway is allowed. This is only available in DHCPv4. In this example, ***10.0.0.3*** ia configured as the default gateway for subnet ***10.0.0.0/8***:

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)#default-gateway 10.0.0.3
```

To set the DNS servers for a subnet. In this example, ***10.1.1.1*** and ***10.2.2.2*** for DHCPv4 and ***fe80::1*** and ***fe80::2*** for DHCPv6. The number of DNS servers cannot exceed two (2).

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)#dns server 10.1.1.1 10.2.2.2
switch(config-dhcp-server-subnet-ipv4)#subnet fe80::/10
switch(config-dhcp-server-subnet-ipv6)#dns server fe80::1 fe80::2
```

To set the name of the subnet. In this example, the name ***foo*** for DHCPv4 and name ***bar*** for DHCPv6 are the selected names.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server-subnet-ipv4)#name foo
switch(config-dhcp-server-subnet-ipv4)#subnet fe80::/10
switch(config-dhcp-server-subnet-ipv6)#name bar
```

To set the range of IP addresses of the subnet. In this example, the IP address range for DHCPv4 is ***10.0.0.1*** to ***10.0.0.10*** and for DHCPv6 it is ***fe80::1 fe80::5***. The range must be within the subnet mask, otherwise the subnet is disabled.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server)#range 10.0.0.1 10.0.0.10
switch(config-dhcp-server)#subnet fe80::/10
switch(config-dhcp-server)#range fe80::1 fe80::5
```

To set TFTP server for a subnet. The server can be in the form of either an IP address or a fully qualified domain name. This is only available in DHCPv4. In this example, ***tftpserver.com*** is configured.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.8/24
switch(config-dhcp-server)#tftp server option 66 tftpserver.com
```

To set a list of TFTP servers. The server can only be in the form of an IP address. This is only available in DHCPv4. In this example, TFTP servers ***3.0.0.3 4.0.0.4*** are configured.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#10.0.0.0/8
switch(config-dhcp-server)#tftp server option 150 3.0.0.3 4.0.0.4
```

To set a TFTP boot file for a subnet. This is only available in DHCPv4. In this example, ***subnet-bootfile.conf*** is configurd.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server)#tftp server file subnet-bootfile.conf
```

To set a static IP address for exclusive use by a client, first enter the client's MAC address reservation submode.

To enter the MAC address reservation submode: ***(config-dhcp-mac-address-ipv4)*** from the ***(config-dhcp-reservations-ipv4)*** configuration mode, then specify the client's MAC address. This is only available in DHCPv4. In this example, we use the static IP address of ***10.0.0.1*** for a client with MAC address of ***1a1b.1c1d.1e1f***.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#subnet 10.0.0.0/8
switch(config-dhcp-server)#reservations
switch(config-dhcp-server)#mac-address 1a1b.1c1d.1e1f
switch(config-dhcp-server)#ipv4-address 10.0.0.1
```

To enable a debug log and save log to a file (this disables kea syslog messages). In this example, you enable **`/tmp/debug-dhcp.log`** as the debug log.

```
switch>config
switch(config)#dhcp server
switch(config-dhcp-server)#debug log file:/tmp/debug-dhcp.log
```

13.1.7.2 DHCP Server Limitations

The DHCP Server and DHCP Relay cannot be configured on the same router. The DHCP Relay has a higher precedence so the DHCP Server will be disabled when the DHCP Relay is configured.

If DHCPD is enabled on the router, configuring the EOS DHCP Server may cause DHCPD to crash or have unexpected behaviors.

During reload, the DHCP Server is not able to save its leases information. In a modular system, the second supervisor does not have an up-to-date lease database. The clients need to request for new leases. During the synchronizing phase for clients and server, duplicate IP addresses in the network may occur.

The DHCP Server is only supported on default VRF and it currently does not support legacy bootp requests.

All DHCP Server options must be less than 256 bytes in size, otherwise, the DHCP Server will not be able to send the affected option.

On certain platforms VXLAN Recirculation has to be enabled: VXLAN Routing Configuration.

13.1.7.3 DHCP Server Show Commands

Use the **`show dhcp server`** command to display DHCP server information.

- DHCPv4 display example:

```
switch#show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
```

```
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options       Data
---------------- -----------
      2            192.0.2.2
      3            "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- For DHCPv6, there are two additional fields in subnet information output, **`Direct`** field and the **`Relay`** field. These two fields specify if the DHCP Server is accepting broadcast or relayed messages.

  The **`Direct`** field displays **`Active`** when the subnet matches the interface with DHCPv6 configured. This indicates the server is accepting broadcast messages.

  The **`Direct`** field displays **Inactive** when there is another existing subnet already matching the interface, or when the subnet matches more than one DHCP configured interface.

  Examples of outputs for the DHCPv6 **`show dhcp server`** command:

  In this example, DHCPv6 is configured with subnet ***fe80::/10*** while being enabled on ***Ethernet1*** with address ***fe80::1/64*** and on ***Ethernet3*** with address ***fe80::2/64***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active
```

```
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active
   Ethernet3    Active

Subnet: fe80::/10

Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5
```

```
Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active

Subnet: fc00::/7

Subnet name: foo
```

```
Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/10

Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **`show dhcp server`** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
```

```
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch#show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.8 DHCP Relay Global Configuration Mode

The dhcp relay command is configured under the global configuration mode. When configured, it places the switch on DHCP relay mode and allows the user to configure DHCP relay specific configuration on several interfaces with a single command. Furthermore, configuration entered in the DHCP Relay global configuration mode can be overridden by equivalent interface specific commands.

Example

- The **dhcp relay** command places the switch in the DHCP relay configuration mode.

```
switch(config)#dhcp relay
switch(config-dhcp-relay)#
```

- It is possible to specify the IP address of the default DHCP or DHCPv6 Server. Multiple IP addresses can be specified and DHCP requests are forwarded to all specified helper addresses. This is equivalent to configuring **ip helper-address <IP_Address>** under each desired routing interface.
- Example to forward DHCP broadcast packets received on interface ***Ethernet1*** and ***Vlan2*** to DHCP servers at ***10.0.0.1***, ***10.0.0.2***, and to hostname ***DefaultDHCPHostname***:

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ip address 192.168.1.1/16

switch(config)#interface Vlan2
switch(config-if-Et1)#ip address 172.16.1.1/16

switch(config)# dhcp relay
switch(config-dhcp-relay)#server 10.0.0.1
switch(config-dhcp-relay)#server 10.0.0.2
switch(config-dhcp-relay)#server DefaultDHCPHostname
```

- Example to forward DHCPv6 broadcast packet received on interface ***Ethernet1*** to DHCPv6 Server at ***fc00::3***.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ipv6 address fc00::1/10

switch(config)#dhcp relay
switch(config-dhcp-relay)#server fc00::3
```

- This will point a routed interface to the specified DHCP and DHCPv6 server(s), if all the following criteria are met:
  - The routed interface is in the default VRF.
  - The interface has an IP address configured.
  - The interface is not a Management or Loopback.
- Example to remove the default DHCP or DHCPv6 Server.

```
switch(config)#dhcp relay
switch(config-dhcp-relay)#no server 10.0.0.1
switch(config-dhcp-relay)#no server 10.0.0.2
switch(config-dhcp-relay)#no server DefaultDHCPHostname
switch(config-dhcp-relay)#no server fc00::3
```

To override the default DHCP Server on an interface, **ip helper-address <IP_Address>** must be used.

-

Example to forward DHCP broadcast packet received on interface Ethernet1 to DHCP Servers at ***10.0.0.1***, ***10.0.0.2*** and hostname ***DefaultDHCPHostname***, but VLAN2s broadcast packets to DHCP Server at ***10.0.0.3*** only.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ip address 192.168.1.1/16

switch(config)#interface Vlan2
switch(config-if-Et1)#ip address 172.16.1.1/16
switch(config-if-Et1)#ip helper-address 11.0.0.3

switch(config)#dhcp relay
switch(config-dhcp-relay)#server 10.0.0.1
switch(config-dhcp-relay)#server 10.0.0.2
switch(config-dhcp-relay)#server DefaultDHCPHostname
```

To override the default DHCPv6 Server on an interface, **`ipv6 helper-address <IPv6_Address>`** must be used.

Example to forward DHCPv6 broadcast packet received on interface Ethernet1 to DHCPv6 Server at ***fc00::3***, but VLAN2s broadcast packets to DHCPv6 Server at ***fc00::4*** only.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no switchport
switch(config-if-Et1)#ipv6 address fc00::1/10

switch(config)#interface Vlan2
switch(config-if-Et1)#ipv6 address fc00::2/10
switch(config-if-Et1)#ipv6 helper-address fc00::4

switch(config)#dhcp relay
switch(config-dhcp-relay)#server fc00::3
```

You can disable DHCP or DHCPv6 Relay functionality from a specific interface. This will disable both DHCP Relay global and interface mode configurations.

- Example to disable DHCP Relay functionality only.

  ```
  switch(config)#interface Vlan3
  switch(config-if-Et1)#dhcp relay ipv4 disabled
  ```

- Example to disable DHCPv6 Relay functionality only.

  ```
  switch(config)#interface Vlan3
  switch(config-if-Et1)#dhcp relay ipv6 disabled
  ```

13.1.8.1 DHCP Relay Global Configuration Mode Limitations

The DHCP Relay global configuration mode's server commands do not apply to:

- Interfaces in non-default VRF.
- Interfaces without an IP address configured.
- Management and Loopback interfaces.

13.1.8.2 DHCP Relay Global Configuration Mode Show Command

Example

This command displays the VRF specifier for the server:

```
switch#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```

13.1.9 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- **Global Configuration**
- **DHCP Relay Global Configuration Mode Show Command**

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier:** The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

  Table 68: VPN Identifier

SubOpt	Len	ASCII VRF Identifier						
151	7	V	R	F	N	A	M	E

- **Link selection:** The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPaddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

  Table 69: Link Selection

SubOpt	Len	Subnet IP Address			
5	4	A1	A2	A3	A4

- **Server identifier override:** The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

  Table 70: Link Selection

SubOpt	Len	Overriding Server Identifier Address

11	4	B1	B2	B3	B4

- VSS control suboption as suboption 152: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

  Note: The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.

13.1.9.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The **ip helper-address** command enables DHCP relay on an interface; and relays DHCP messages to the specified IPv4 address.

Example

This command enables DHCP relay on the interface ***Ethernet 1/2***; and relays DHCP messages to the server at ***1.1.1.1***.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#ip helper-address 1.1.1.1
switch(config-if-Et1/2)#
```

The commands provided in examples below will turn on the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface are on the same VRF (default or non-default), then no VRF-related DHCP relay agent information option is inserted.

Examples

- This command configures the DHCP relay to add option 82 information.

```
switch(config)#ip dhcp relay information option
```

- These commands configures two new VRF instances and assign them Route Distinguishers (RDs).

```
switch(config)#vrf instance mtxxg-vrf
switch(config-vrf-mtxxg-vrf)#router bgp 50
switch(config-router-bgp)#vrf mtxxg-vrf
switch(config-router-bgp-vrf-mtxxg-vrf)#rd 5546:5546
switch(config)#vrf instance qchyh-vrf
switch(config-vrf-qchyh-vrf)#router bgp 50
switch(config-router-bgp)#vrf qchyh-vrf
switch(config-router-bgp-vrf-qchyh-vrf)#rd 218:218
```

- This command configures an interface connected to DHCP client in vrf ***mtxxg-vrf*** and assigns an IP address.

```
switch(config)#interface Ethernet 9
switch(config-if-Et9)#no switchport
```

- This command configures the DHCP client interface in VRF ***mtxxg-vrf***.

```
switch(config-if-Et9)#vrf mtxxg-vrf
switch(config-if-Et9)#ip address 10.10.0.1/16
```

- This command configures the server interface in VRF ***qchyh-vrf.***

```
switch(config-if-Et11)#vrf qchyh-vrf
switch(config-if-Et11)#ip address 10.40.0.1/16
```

- This command configures a helper address for a DHCP server in VRF ***qchyh-vrf***.

```
switch(config-if-Et11)#ip helper-address 10.40.2.3 vrf qchyh-
vrf
```

13.1.9.2 DHCP Relay Global Configuration Mode Show Command

Example

This command displays the VRF specifier for the server:

```
switch#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```

13.1.10 DHCP Relay in VXLAN EVPN

The ip dhcp relay information option (Global) command enables the configuration of the DHCP server to uniquely identify the origin of the request using a source-interface and the helper address. Source interface is configured with a routable address, which is used by the DHCP server to uniquely identify the DHCP relay agent which forwarded the client's request.

Configuring DHCP Relay in VXLAN EVPN (IPv4)

The following enables DHCP relay information option (***Option 82***) required to specify a source interface.

```
switch (config)#ip dhcp relay information option
```

The following configures a Loopback interface as the source interface.

```
switch (config)#interface Loopback1
switch (config-if-Lo1)#ip address 1.1.1.1/24
```

The following configures the Loopback interface as the specified source interface for the helper address.

```
switch (config)#interface Vlan100
switch (config-if-Vl100)#ip helper-address 10.1.1.4 source-interface
 Loopback1
```

The following configures the Loopback interface when the DHCP server is in a different VRF (***red***). The source interface must be configured in the DHCP server's VRF for the command to take effect.

```
switch (config)#interface Loopback3
switch (config-if-Lo3)#vrf red
switch (config-if-Lo3)#ip address 1.1.1.1/24

switch (config)#interface Vlan100
switch (config-if-Vl100)#ip helper-address 10.1.1.4 vrf red source-interf
ace Loopback3
```

The following disables the use of source interface along with the helper address.

```
switch (config)#interface Vlan100
switch (config-if-Vl100)#no ip helper-address 10.1.1.4 source-interface
 Loopback1
```

Configuring DHCP Relay in VXLAN EVPN (IPv6)

The following configures a local interface.

```
switch (config)#interface Loopback2
switch (config-if-Vl100)#ipv6 address 2001::10:20:30:1/128
```

The following configures the Loopback interface as the local interface for the helper address.

```
switch (config)#interface Vlan200
switch (config-if-Vl200)#ipv6 dhcp relay destination 2002::10:20:30:2
 local-interface Loopback2
```

The following configures the Loopback interface when the DHCP server is in a different VRF (***red***). The local interface must be configured in the DHCP server's VRF for the command to take effect.

```
switch (config)#interface Loopback4
switch (config-if-Lo4)#vrf red
switch (config-if-Lo4)#ipv6 address 2001::10:20:30:1/128

switch (config)#interface Vlan200
switch (config-if-Vl200)#ipv6 dhcp relay destination 2002::10:20:30:2 vrf
 red local-interface Loopback4
```

The following disables the use of local interface along with the helper address.

```
switch (config-if-Vl200)#no ipv6 dhcp relay destination 2002::10:20:30:2
 local-interface Loopback4
```

The following displays the status of DHCP relay option (***Option 82***) and lists the configured DHCP servers.

```
switch#show ip dhcp relay
DHCP Relay is active
```

```
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Vlan100
  Option 82 Circuit ID: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.1.1.4
Interface: Vlan200
  Option 82 Circuit ID: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 2002::10:20:30:2
```

Limitations

Client requests up to a rate of ***130*** packets/second are processed.

13.1.11 DHCP Snooping with Bridging

In this configuration, in addition to sending DHCP packets to relay (after adding information option), the packets will also be bridged within the VLAN. In the bridging mode, the switch intercepts DHCP packets, inserts option-82 if not already present, and bridges the packet within the VLAN. This mode of DHCP snooping can be configured without DHCP relay configuration.

13.1.11.1 Configuring DHCP Snooping with Bridging

Following are the steps to configure DHCP snooping with bridging:

1. Enable DHCP snooping feature using the ip dhcp snooping command.

```
switch#ip dhcp snooping
```

2. Enable the insertion of option-82 in DHCP request packets using the ip dhcp snooping information option command. By default, option-82 is not enabled and without this DHCP Snooping is not operational.

```
switch#ip dhcp snooping information option
```

3. Enable DHCP snooping on the corresponding VLANs using the ip dhcp snooping vlan command. By default, DHCP snooping is not enabled on any VLAN.

```
switch#ip dhcp snooping vlan
```

4. Set the circuit-id information that is sent in option-82. By default, Interface name and VLAN ID are sent. Remote circuit-id will always be the MAC address of the relay agent.

```
switch#ip dhcp snooping information option circuit-id type 2 format
%h:%p  Hostname and interface name
%p:%v  Interface name and VLAN ID
```

5. Enable bridging capabilities of DHCP snooping using the ip dhcp snooping bridging command. This command will enable DHCP snooping with or without DHCP relay configuration.

```
switch#ip dhcp snooping bridging
```

13.1.11.2 DHCP Snooping with Bridging Limitations

- DHCP snooping with bridging is supported only for IPv4.
- When DHCP snooping is configured without bridging configuration, packets with option-82 already present are dropped.

13.1.11.3 DHCP Snooping with Bridging Show Commands

The show ip dhcp snooping displays the DHCP snooping with bridging information.

```
switch#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 650
DHCP Snooping bridging is operational on following VLANs:
 650
Insertion of Option-82 is enabled
 Circuit-id sub-option Type: 0
 Circuit-id format: Interface name:Vlan ID
 Remote-id: 00:1c:73:8d:eb:67 (Switch MAC)
```

13.1.12 TCP MSS Clamping

TCP MSS clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

13.1.12.1 Cautions

This feature should be used with caution. When the TCP MSS clamping feature is enabled by issuing the **tcp mss ceiling** command on any routed interface, *all* routed IPv4 TCP SYN packets (TCP packets with the “SYN” flag set) are sent by default to the CPU and switched through software, even on interfaces where no TCP MSS ceiling has been configured, as long as TCP MSS clamping is enabled. This limits the number of TCP sessions that can be established through the switch per second, and, because throughput for software forwarding is limited, this feature can also cause packet loss if the rate at which TCP SYN packets are sent to the CPU exceeds the limits configured in the control-plane policy map.

Packet loss and TCP session reductions can be minimized by enabling TCP MSS clamping in hardware, but only SYN packets in which MSS is the first TCP option are clamped in the hardware data path; other TCP SYN packets are still switched through software.

To disable MSS clamping, the MSS ceiling must be removed from every interface on which it has been configured by issuing the **`no tcp mss ceiling`** command on each configured interface.

13.1.12.2 Enabling TCP MSS Clamping

There is no global configuration to enable TCP MSS clamping. It is enabled as soon as an MSS ceiling is configured on at least one interface.

13.1.12.3 Disabling TCP MSS Clamping

To disable TCP MSS clamping, the MSS ceiling configuration must be removed from every interface by using the **`no`** or **`default`** form of the **tcp mss ceiling** command on every interface where a ceiling has been configured.

13.1.12.4 Configuring the TCP MSS Ceiling on an Interface

The TCP MSS ceiling limit is set on an interface using the **tcp mss ceiling** command. This also enables TCP MSS clamping on the switch as a whole.

Note: Configuring a TCP MSS ceiling on any interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch; the configuration has no effect on GRE transit packets.
- The feature is supported only on IPv4 routed interfaces. It is not supported on L2 (switchport) interfaces or IPv6 routed interfaces.
- The feature is not supported for IPv6 packets even if they are going to be tunneled over an IPv4 GRE tunnel.
- The feature is not supported on VXLAN, loopback or management interfaces.
- The feature is only supported on IPv4 unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.

Example

- These commands configure ***Ethernet interface 5*** as a routed port, then specify a maximum MSS ceiling value of ***1458*** bytes for TCP SYN packets exiting that port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```

- These commands apply TCP MSS clamping at ***1436*** bytes in the egress direction for IPv6 packets:

```
switch(config)#interface ethernet 26
switch(config)#tcp mss ceiling ipv6 1436 egress
```

- These commands apply TCP MSS clamping at ***1476*** bytes for IPv4 packets and ***1436*** bytes for IPv6 packets in egress direction:

```
switch(config)#interface ethernet 27
switch(config)#tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

13.1.12.5 Verifying the TCP MSS Clamping

If TCP MSS ceiling is configured on an interface and if the command **show cpu counters queue | nz** is incrementing in **CoppSystemL3Ttl1IpOptUcast** field for Tcp packet with Syn flag, then TCP MSS clamping is being performed in Software.

```
switch#show cpu counters queue | nz
Fap0.1:
CoPP Class                    Queue    Pkts   Octets   DropPkts   DropOctets
Aggregate
-------------------------------------------------------------------------------
CoppSystemL3Ttl1IpOptUcast    TC0      1       82       0          0
```

13.1.12.6 Configuring TCP MSS Clamping

Interface Configuration

You can specify the TCP MSS value under the ***interface configuration mode***. The command syntax is shown below:

`tcp mss ceiling` [ipv4 | ipv6] *64-65515* egress

The keyword **egress** specifies that the MSS clamping is applied on packets transmitted out on the interface in egress direction.

The following example applies TCP MSS clamping at ***1436*** bytes in the egress direction for IPv4 packets:

```
switch(config)#interface ethernet 25
switch(config)#tcp mss ceiling ipv4 1436 egress
```

the following example applies TCP MSS clamping at ***1436*** bytes in the egress direction for IPv6 packets:

```
switch(config)#interface ethernet 26
switch(config)#tcp mss ceiling ipv6 1436 egress
```

The following example applies TCP MSS clamping at ***1476*** bytes for IPv4 packets and ***1436*** bytes for IPv6 packets in egress direction:

```
switch(config)#interface ethernet 27
switch(config)#tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

Hardware TCP MSS Clamping Configuration

Hardware MSS clamping requires the system TCAM profile to have TCP MSS clamping enabled. You can achieve this by creating a user defined TCAM profile as described below. The **User Defined PMF Profiles - TOI** provides general guidelines on how to create and configure TCAM profiles.

The system TCAM profile must have the feature **`tcp-mss-ceiling ip`** in it in order to use hardware MSS clamping. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

Step 1: Create the user defined TCAM profile

The following example demonstrates copying any source profile and adding the feature **`tcp-mss-ceiling ip`**:. In this example, the profile name is ***Pro1*** and the source profile name is ***Source1***.

```
(config)#hardware tcam
(config-hw-tcam)#profile Pro1 copy Source1
(config-hw-tcam-profile-Pro1)#feature tcp-mss-ceiling ip copy system-
feature-source-profile
```

TCP MSS clamping is supported only for IPv4 routed packets. Set the packet type for the feature as follows. This is optional when using **`copy system-feature-source-profile`**. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)#packet ipv4 forwarding
 routed
```

Set the key size limit to ***160***. This is also optional when the feature is copied from **`system-feature-source-profile`**. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)#key size limit 160
```

Removing unused features to ensure that the TCP MSS TCAM DB is allocated. In this example, the system profile name is ***Pro1*** and the feature name is ***Source1***.

```
(config-hw-tcam-profile-Pro1-feature-Source1)#exit
(config-hw-tcam-profile-Pro1)#no feature mirror ip
(config-hw-tcam-profile-Pro1)#no feature acl port mac
```

Step 2: Apply the user defined TCAM profile to the system.

The following example sets the profile as the system profile under the *hardware tcam* mode. In this example, the system profile name is ***red***.

```
(config-hw-tcam)#system profile red
```

When the system TCAM profile is changed, it is expected that some agents will restart. Also it might be necessary to remove some unused features from the TCAM profile to ensure that the TCP MSS feature gets allocated a TCAM DB. For more information about configuring TCAM profiles, refer to **User Defined PMF Profiles**.

Note: The hardware clamping only works for TCP packets with MSS as the first TCP option. Packets where MSS is not the first TCP option are still trapped to CPU for clamping in software even if the **`feature tcp-mss-ceiling`** is configured in the system TCAM profile.

Backward Compatibility

The **`tunnel mss ceiling`** command which provides the same functionality is deprecated with the introduction of **`tcp mss ceiling`** command. The configuration option **`tunnel mss ceiling`** was available only on GRE tunnel interfaces, while **`tcp mss ceiling`** is supported on other routed IPv4 interfaces as well.

13.1.12.7 TCP MSS Clamping Limitations

- The TCP-MSS Clamping is not supported on L2 (switchport) interfaces.
- The TCP-MSS Clamping is NOT supported on VXLAN, Loopback and Management interfaces.
- The TCP-MSS Clamping is supported only in the Egress direction.
- The TCP-MSS Clamping is only supported on unicast routed packets entering the switch. The configuration has no effect on GRE transit packets and GRE decap case, even if the Egress interface has TCP MSS ceiling configured.

Software TCP MSS Clamping Limitations

- Once the TCP-MSS Clamping is enabled, all routed TCP-SYN packets will be software switched, even on interfaces where there is no TCP-MSS ceiling configuration.
- TCP SYN packets could get dropped under high CPU usage conditions or due to DOS attack protection mechanisms such as PDP/CoPP. These factors could limit the TCP connection establishment rate, i.e new TCP sessions established per second through the switch.

Hardware MSS Clamping Limitations

- Hardware TCP-MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- TCP SYN packets where TCP-MSS is not the first TCP option are trapped to CPU for MSS adjustment even in hardware MSS clamping mode.

- Hardware TCP-MSS clamping is not supported for IPv6 packets.

13.1.12.8 Configuring Hardware Support for TCP MSS Clamping

TCP MSS clamping can be supported in hardware, but some packets are still routed through the software data path, and an MSS ceiling value must be configured on each interface where clamping is to be applied.

Hardware support for clamping is accomplished through the use of a user-defined TCAM profile. The TCAM profile can be created from scratch or copied from an existing profile, but in either case it must include the **`tcp-mss-ceiling ip`** feature.

Guidelines

- When the system TCAM profile is changed, some agents will restart.
- To ensure that the TCP MSS feature is allocated a TCAM DB, it may be necessary to remove some unused features from the TCAM profile.
- Hardware TCP MSS clamping only works for TCP packets with MSS as the first TCP option. Other TCP SYN packets are still trapped to the CPU for clamping in software.
- Hardware TCP MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- The maximum MSS ceiling limit with hardware MSS clamping is 32727 even though the CLI allows configuration of much larger values.
- For more information on the creation of user-defined TCAM profiles, see https://eos.arista.com/eos-4-20-5f/user-defined-pmf-profile/**.**

To configure hardware support for TCP MSS clamping, create a TCAM profile that includes the tcp mss ceiling feature, then apply it to the system.

13.1.12.8.1 Creating the TCAM Profile

A TCAM profile that supports TCP MSS clamping can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

Modifying a Copy of the Default TCAM Profile

The following commands create a copy of the default TCAM profile, name it **`tcp-mss-clamping`**, and configure it to enable MSS clamping in hardware, then remove some unused features included in the default profile to ensure that there are sufficient TCAM resources for the clamping feature.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tcp-mss-clamping copy default
switch(config-hw-tcam-profile-tcp-mss-clampingl)#feature tcp-mss-ceiling
 ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#key
size limit 160
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#packet
ipv4 forwarding routed
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#exit

switch(config-hw-tcam-profile-tcp-mss-clamping)#no feature mirror ip
switch(config-hw-tcam-profile-tcp-mss-clamping)#no feature acl port mac
switch(config-hw-tcam-profile-tcp-mss-clampingl)#exit
```

```
switch(config-hw-tcam)#exit

switch(config)#
```

13.1.12.8.2 Applying the TCAM Profile to the System

The following commands enter Hardware TCAM Configuration Mode and set the **tcp-mss-clamping** profile as the system profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tcp-mss-clamping
switch(config-hw-tcam)#
```

13.1.12.8.3 Verifying the TCAM Profile Configuration

The following command displays hardware TCAM profile information to verify that the user-defined TCAM profile has been applied correctly.

```
switch(config)#show hardware tcam profile

Configuration        Status
FixedSystem          tcp-mss-clamping         tcp-mss-clamping

switch(config)#
```

13.1.13 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

Note: The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

13.1.13.1 Configuring GRE Tunneling Interface

On a Local Arista Switch

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

On a Remote Arista Switch

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.2/24
switch(config-if-Tu10)#tunnel source 10.1.1.2
switch(config-if-Tu10)#tunnel destination 10.1.1.1
switch(config-if-Tu10)#tunnel path-mtu-discovery
```

```
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

Alternative Configuration for Tunnel Source IPv4 Address

```
switch(config)#interface Loopback 10
switch(config-if-Lo10)#ip add 10.1.1.1/32
switch(config-if-Lo10)#exit

switch(config)#conf terminal
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel source interface Loopback 10
```

Configuration for Adding an IPv4 Route over the GRE Tunnel Interface

```
switch(config)#ip route 192.168.100.0/24 Tunnel 10
```

Tunnel Mode

Tunnel Mode needs to be configured as gre, for GRE tunnel interface. Default value is **tunnel mode gre**.

IP Address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface's IPv4 address is assigned as the tunnel source IPv4 address.

Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

Tunnel Path Mtu Discovery

Specifies if the "Do not Fragment" flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

Tunnel TOS

Specifies the Tunnel Type of Service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of ***0*** will be assigned if tunnel TOS is not configured.

Tunnel TTL

Specifies the TTL value to the assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

13.1.13.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.

```
switch#show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
 Hardware is Tunnel, address is 0a01.0101.0800
 Internet address is 192.168.1.1/24
 Broadcast address is 255.255.255.255
 Tunnel source 10.1.1.1, destination 10.1.1.2
 Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
 Tunnel TTL 10, Hardware forwarding enabled
 Tunnel TOS 10
 Path MTU Discovery
 Tunnel transport MTU 1476 bytes
 Up 3 seconds
```

-
```
switch#show gre tunnel static

Name     Index  Source   Destination  Nexthop  Interface
-------- ------ -------- ------------ -------- -----------
Tunnel10 10     10.1.1.1 10.1.1.2     10.6.1.2 Ethernet6/1

switch#show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

- Use the **show platform fap tcam summary** command to verify if the TCAM bank is allocated for GRE packet termination lookup.

```
switch#show platform fap tcam summary

           Tcam Allocation (Jericho0)
Bank        Used By     Reserved By
---------- ------------ -----------
0          dbGreTunnel   -
```

- Use the **show ip route** command to verify if the routes over tunnel is setup properly.

```
switch#show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,

```

13.1.14 GRE Tunneling Support

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation. A maximum of 256 GRE-tunnel interfaces are supported.

Note: GRE keepalives are not supported.

To configure a local Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

To configure a remote Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.2/24
switch(config-if-Tu10)#tunnel source 10.1.1.2
switch(config-if-Tu10)#tunnel destination 10.1.1.1underlayVrf
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

To add a IPv4 route over the GRE-tunnel interface, configure simulare to the following.

```
switch(config)#ip route 192.168.100.0/24 Tunnel 10
```

Note: IPv6 GRE-Tunnels are not supported. This is only a data-plane limitation whereas IS-IS IPv6 (such as control-plane) can still work.

Use the **show interfaces Tunnel** command to display the interface tunnel.

```
switch(config)#show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show gre tunnel static** command to display a static interface tunnel.

```
switch(config)#show gre tunnel static
Name        Index      Source          Destination       Nexthop
 Interface
----------- -------    -----------     -------------     ----------
 ----------
Tunnel10    10         10.1.1.1        10.1.1.2          10.6.1.2
 Ethernet6/1
```

Use the **show tunnel fib static interface** command to display a fib static interface tunnel.

```
switch(config)#show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

Tunnel Mode

Tunnel mode is **GRE** for a GRE-tunnel interface which is also the default tunnel mode.

IP address

Use this IP address for routing over the GRE-tunnel interface. The configuration subnet is reachable over the GRE-tunnel interface, and the packets to the subnet is encapsulated with the GRE header.

Tunnel Source

Specifies the source IP address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel source IPv4 address is a valid local IPv4 address configured on the Arista switch. It uses any route interface on the Arista switch. The routed interfaces IPv4 address assigns the tunnel source IPv4 address. Maximum of 16 unique tunnel source IPv4 addresses are supported across all GRE-tunnel interfaces.

The following is an example of an interface as a Tunnel source.

```
switch(config)#interface Loopback 10
switch(config-if-Lo10)#ip add 10.1.1.1/32
switch(config-if-Lo10)#exit
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel source interface Loopback 10
```

Note: Coexistence of GRE-tunnel interfaces and Decap-Groups is not supported.

Note: Coexistence of GRE-tunnel interfaces and VxLan is not supported.

Note: GRE-tunnel is not supported with MLAG configuration.

Tunnel Destination

Specifies the destination IPv4 address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel destination IPv4 is reachable from the Arista switch.

Note: Multicast traffic over GRE-Tunnels is not supported.

Tunnel Path MTU Discovery

The tunnel path Maximum Transmition Unit (MTU) Discovery specifies if the Don't Fragment (DF) flag needs to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. MTU configuration on the GRE-tunnel interface is used by control plane protocols and not enforced in hardware for packets forwarded in data-plane. The MTU change on the tunnel interface does not take effect until the tunnel interface is flapped.

Tunnel TOS

The Tunnel TOS specifies the TOS value to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. The default value of ***0*** is assigned if tunnel TOS is not configured. Maximum of seven unique tunnel TOS values are supported across all GRE-tunnel interfaces.

Tunnel TTL

The Tunnel TTL specifies the TTL value to be set in the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel path MTU discovery to be configured. Maximum of four unique tunnel TTL values are supported across all GRE-tunnel interfaces.

VRF Forwarding (Overlay VRF)

The following configuration is an example of overlay VRF, for a GRE tunnel interface.

```
switch(config)#vrf instance overlayVrf
switch(config)#ip routing vrf overlayVrf
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#vrf overlayVrf
```

Note: Both the tunnels source and destination address must be in the underlay VRF. GRE key forwarding is not supported.

The following is an example of a static route configuration, with an overlay VRF.

```
switch(config)#ip route vrf overlayVrf 7.7.7.0/24 192.168.1.2
```

VRF Forwarding (Underlay VRF)

The following is an configuration example of a underlay VRF for a GRE tunnel interface.

```
switch(config)#vrf instance underlayVrf
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel underlay vrf underlayVrf
```

13.1.14.1 TCAM Bank Allocation

Note: Command to check if Ternary Content-Addressable Memory (TCAM) bank is allocated for GRE packet termination lookup.

```
switch(config)#show platform fap tcam summary

           Tcam Allocation (Jericho0)
Bank       Used By                    Reserved By
---------- -------------------------- -----------
0           dbGreTunnel                -
```

PBR is not supported on GRE terminated packets.

Verifing Tunnel Routes

Use the **show ip route** command to check if the routes over tunnel is setup correctly.

```
switch(config)#show ip route
VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set

 C      192.168.1.0/24 is directly connected, Tunnel10, Static Interface
 GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
 S      192.168.100.0/24 is directly connected, Tunnel10, Static
 Interface GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS
 10
```

Verifing Tunnel Encap

Use the **show platform fap eedb ip-tunnel gre interface Tunnel** command to check the tunnel encap programming on the GRE interface.

```
switch(config)#show platform fap eedb ip-tunnel gre interface Tunnel 10
 ------------------------------------------------------------------------------------------------------------------------
|                                                Jericho0                                                                |
|                                  GRE Tunnel Egress Encapsulation DB                                                    |
|-----------------------------------------------------------------------------------------------------------------------|
| Bank/   | OutLIF  | Next    | VSI   | Encap | TOS  | TTL  | Source   | Destination     | OamLIF | OutLIF  | Drop |
| Offset  |         | OutLIF  | LSB   | Mode  |      |      | IP       | IP              | Set    | Profile |      |

```

Verifying Tunnel VRF

Use the **show ip interface tunnel** command to check the overlay VRF.

```
switch(config)#show ip interface tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1476 bytes
  VPN Routing/Forwarding "overlayVrf"
switch(config)#show ip route vrf overlayVrf

VRF: overlayVrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

 C        1.1.1.0/24 is directly connected, Ethernet1
 S        7.7.7.0/24 [1/0] via 192.168.1.2, Tunnel10, Static Interface

 C        192.168.1.0/24 is directly connected, Tunnel10, Static
 Interface GRE-Tunnel index 10, dst 10.1.1.2, src 10.1.1.1
```

Tunnel underlay VRF Configuration

Use the **show interfaces Tunnel** command to check the underlay VRF.

```
switch(config)#show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
```

```
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show ip route vrf underlayVrf** command to check the IP route VFR underlayVRF.

```
switch(config)#show ip route vrf underlayVrf
VRF: underlayVrf
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked,

Gateway of last resort is not set

 C        10.1.1.0/24 is directly connected, Ethernet1
```

13.1.15 BfRuntime to use non-default VRFs

Use the following to configure the VRF for the BfRuntime connection for the management interface on the switches that support it. The management interface may be configured on a different VRF from the default one.

Configuring BfRuntime to use Non-default VRFs

The **platform barefoot bfrt vrf** command configures the forwarding plane agent to restart and listen on the configured VRFs for connections.

```
(config)#platform barefoot bfrt vrf <VRF name>
```

If left unconfigured, the default VRF is used for the IP and port for the the BfRuntime server.

The following shows a typical configuraiton.

```
(config)#vrf instance management
(config-vrf-management)#exit
(config)#platform barefoot bfrt 0.0.0.0 50052
(config)#platform barefoot bfrt vrf <VRF name>
(config)#int management1
(config-if-Ma1)#vrf management
```

Displaying BfRuntime Configuration

The **show platform barefoot bfrt** command displays the existing configuration for the BfRuntime server.

```
(switch)#show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.16 IPv4 Commands

IP Routing and Address Commands

- agent SandL3Unicast terminate
- clear arp inspection statistics
- compress
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- ipv4 routable 240.0.0.0/4
- rib fib policy
- show dhcp server
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route match tag
- show ip route summary
- show rib route ip
- show rib route [<ipv4 | ipv6>] fib policy excluded
- show rib route summary
- show routing-context vrf
- show vrf
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary
- tcp mss ceiling

IPv4 DHCP Relay

- clear ip dhcp relay counters
- dhcp relay
- ip dhcp relay all-subnets
- ip dhcp relay all-subnets default
- ip dhcp relay always-on

- ip dhcp snooping information option
- ip dhcp relay information option circuit-id
- ip helper-address
- show ip dhcp relay
- show ip dhcp relay counters

IPv4 DHCP Snooping

- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping bridging
- ip dhcp snooping information option
- ip dhcp snooping vlan
- show ip dhcp snooping
- show ip dhcp snooping counters
- show ip dhcp snooping hardware

IPv4 Multicast Counters

- clear ip multicast count
- ip multicast count

ARP Table

- arp
- arp aging timeout
- arp cache persistent
- arp gratuitous accept
- clear arp-cache
- clear arp
- ip local-proxy-arp
- ip proxy-arp
- show arp
- show ip arp

VRF Commands

- compress
- cli vrf
- description (VRF)
- platform barefoot bfrt vrf
- show platform barefoot bfrt
- show routing-context vrf
- show vrf
- vrf (Interface mode)
- vrf instance

Trident Forwarding Table Commands

- platform trident forwarding-table partition
- platform trident routing-table partition
- show platform trident forwarding-table partition

IPv4 GRE Tunneling Commands

- interface tunnel
- tunnel
- show interface tunnel
- show platform fap eedb ip-tunnel gre interface tunnel
- show tunnel fib static interface gre
- show platform fap tcam summary

13.1.16.1 agent SandL3Unicast terminate

The **agent SandL3Unicast terminate** command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

Command Mode

Global Configuration

Command Syntax

agent SandL3Unicast terminate

Related Commands

- **ip hardware fib optimize** enables IPv4 route scale.
- **show platform arad ip route** shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- **show platform arad ip route summary** shows hardware resource usage of IPv4 routes.

Example

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

13.1.16.2 arp aging timeout

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is *14400* seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

arp aging timeout *arp_time*

no arp aging timeout

default arp aging timeout

Parameters

arp_time ARP aging timeout period (seconds). Values range from **60** to **65535**. Default value is ***14400***.

Example

This command specifies an ARP cache duration of ***7200*** seconds (two hours) for dynamic addresses added to the ARP cache that were learned through ***VLAN 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
   arp aging timeout 7200
switch(config-if-Vl200)#
```

13.1.16.3 arp cache persistent

The **arp cache persistent** command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The **no arp cache persistent** and **default arp cache persistent** commands remove the ARP cache persistent configuration from the running-config.

Command Mode

Global Configuration

Command Syntax

arp cache persistent

no arp cache persistent

default arp cache persistent

Example

This command restores the ARP cache after reboot.

```
switch(config)#arp cache persistent
switch(config)#
```

13.1.16.4 arp gratuitous accept

The **arp gratuitous accept** command configures the configuration mode interface to accept gratuitous ARP request packets received on that interface. Accepted gratuitous ARP requests are then learned by the ARP table.

The no and **default** forms of the command prevent the interface from accepting gratuitous ARP requests. Configuring gratuitous ARP acceptance on an L2 interface has no effect.

Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Interface Port-channel Configuration

Command Syntax

arp gratuitous accept

no arp gratuitous accept

default arp gratuitous accept

Example

These commands configure ***Ethernet interface 2/1*** to accept gratuitous ARP request packets.

```
switch (config)#interface ethernet 2/1
switch (config-if-Et2/1)#arp gratuitous accept
switch (config-if-Et2/1)#
```

13.1.16.5 arp

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The **no arp** and **default arp** commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

Command Mode

Global Configuration

Command Syntax

arp [**VRF_INSTANCE**] *ipv4_addr mac_addr* **arpa**

no arp [**VRF_INSTANCE**] *ipv4_addr*

default arp [**VRF_INSTANCE**] *ipv4_addr*

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified user-defined VRF.
- ***ipv4_addr*** IPv4 address of ARP entry.
- ***mac_addr*** Local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

Examples

- This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

- This command adds the same static entry to the ARP cache in the VRF named ***purple***.

```
switch(config)#arp vrf purple 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

13.1.16.6 clear arp inspection statistics

The **clear arp inspection statistics** command clears ARP inspection statistics.

Command Mode

EXEC

Command Syntax

clear arp inspection statistics

Related Commands

- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan
- show ip arp inspection statistics

Example

This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
switch(config)#
```

13.1.16.7 clear arp

The **clear arp** command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

Command Mode

Privileged EXEC

Command Syntax

clear arp [**VRF_INSTANCE**] *ipv4_addr* **Parameters**

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is removed.
  - ***no parameter*** Specifies the context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- ***ipv4_addr*** IPv4 address of dynamic ARP entry.

Example

These commands display the ARP table before and after the removal of dynamic ARP entry for IP address ***172.22.30.52***.

```
switch#show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.52            0  0025.900e.c468  Management1
172.22.30.53            0  0025.900e.c63c  Management1
172.22.30.133           0  001c.7304.3906  Management1

switch#clear arp 172.22.30.52
switch#show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.53            0  0025.900e.c63c  Management1
172.22.30.133           0  001c.7304.3906  Management1

switch#
```

13.1.16.8 clear arp-cache

The **clear arp-cache** command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing **clear arp-cache** for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode

Privileged EXEC

Command Syntax

clear arp-cache [**VRF_INSTANCE**][**INTERFACE_NAME**]

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is refreshed.
  - ***no parameter*** Specifies the context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **INTERFACE_NAME** Interface upon which ARP cache entries are refreshed. Options include:
  - ***no parameter*** All ARP cache entries.
  - **interface ethernet *e_num*** ARP cache entries of specified Ethernet interface.
  - **interface loopback *l_num*** ARP cache entries of specified loopback interface.
  - **interface management *m_num*** ARP cache entries of specified management interface.
  - **interface port-channel *p_num*** ARP cache entries of specified port-channel Interface.
  - **interface vlan *v_num*** ARP cache entries of specified VLAN interface.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Related Commands

The cli vrf command specifies the context-active VRF.

Example

These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch#show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.118           0  001c.7301.6015  Management1

switch#clear arp-cache
switch#show arp

Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1

switch#
```

13.1.16.9 clear ip dhcp relay counters

The **clear ip dhcp relay counters** command resets the DHCP relay counters. The configuration mode determines which counters are reset:

Interface configuration: command clears the counter for the configuration mode interface.

Command Mode

Privileged EXEC

Command Syntax

clear ip dhcp relay counters [**INTERFACE_NAME**]

Parameters

INTERFACE_NAME Entity for which counters are cleared. Options include:

- ***no parameter*** Clears counters for the switch and for all interfaces.
- **interface ethernet *e_num*** Clears counters for the specified Ethernet interface.
- **interface loopback *l_num*** Clears counters for the specified loopback interface.
- **interface port-channel *p_num*** Clears counters for the specified port-channel Interface.
- **interface vlan *v_num*** Clears counters for the specified VLAN interface.

Examples

- These commands clear the DHCP relay counters for ***VLAN 1045*** and shows the counters before and after the **clear** command.

```
switch#show ip dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
 Vlan1001 |  207  148    0 | 4 days, 19:54:24 ago
 Vlan1045 |  376  277    0 | 4 days, 19:54:24 ago

switch#clear ip dhcp relay counters interface vlan 1045

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  380  380    0 | 4 days, 21:19:17 ago
 All Resp |  281  281    0 |
          |                |

```

13.1.16.10 clear ip dhcp snooping counters

The **clear ip dhcp snooping counters** command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

clear ip dhcp snooping counters [**COUNTER_TYPE**]

Parameters

COUNTER_TYPE The type of counter that the command resets. Options include:

- ***no parameter*** Counters for each VLAN.
- **debug** Aggregate counters and drop cause counters.

Examples

- This command clears the DHCP snooping counters for each VLAN.

```
switch#clear ip dhcp snooping counters
switch#show ip dhcp snooping counters

     | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|------ ----- ------|----- ---- ------|-------------
 100 |     0     0     0 |    0    0     0 |  0:00:10 ago

switch#
```

- This command clears the aggregate DHCP snooping counters.

```
switch#clear ip dhcp snooping counters debug
switch#show ip dhcp snooping counters debug

Counter                       Snooping to Relay Relay to Snooping
----------------------------- ----------------- -----------------

Dropped - Invalid Dhcp Optype                 0                 0
Dropped - Invalid Info Option                 0                 0
Dropped - Snooping disabled                   0                 0

Last Cleared:  0:00:08 ago

switch#
```

13.1.16.11 clear ip multicast count

The **clear ip multicast count** command clears all counters associated with the multicast traffic.

Command Mode

Gobal Configuration

Command Syntax

clear ip multicast count [*group_address* [*source_address*]]

Parameters

- ***no parameters*** Clears all counts of the multicast route traffic.
- ***group_address*** Clears the multicast traffic count of the specified group address.
  - ***source_address*** Clears the multicast traffic count of the specified group and source addresses.

Guidelines

This command functions only when the **ip multicast count** command is enabled.

Examples

- This command clears all counters associated with the multicast traffic.

```
switch(config)#clear ip multicast count
```

- This command clears the multicast traffic count of the specified group address.

```
switch(config)#clear ip multicast count 16.39.24.233
```

13.1.16.12 cli vrf

The **cli vrf** command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

Command Mode

Privileged EXEC

Command Syntax

cli vrf [**VRF_ID**]

Parameters

VRF_ID Name of VRF assigned as the current VRF scope. Options include:

- ***vrf_name*** Name of user-defined VRF.
- **default** System-default VRF.

Guidelines

VRF-context aware commands include:

clear arp-cache

show ip

show ip arp

show ip route

show ip route gateway

show ip route host

Related Commands

The **show routing-context vrf** command displays the context-active VRF.

Example

These commands specify ***magenta*** as the context-active VRF, then display the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
Current VRF routing-context is magenta
switch#
```

13.1.16.13 compress

The **compress** command increases the hardware resources available for the specified prefix lengths.

The **no compress** command removes the 2-to-1 compression configuraion from the ***running-config***.

Note: The **compress** command is supported only on 7500R, 7280R, 7500R2 and 7280R2 platforms.

Command Mode

Global Configuration

Command Syntax

ip hardware fib optimize prefix-length <*prefix-length*>expand <*prefix-length*> compress

no ip hardware fib optimize prefix-length <*prefix-length*>expand <*prefix-length*> compress

Parameters

compress Allows configuring up to one compressed prefix length.

Example

In the following example we are configuring prefix length ***20*** and ***24***, expanding prefix length ***19*** and ***23***, and compressing prefix length ***25***.

```
switch(config)#ip hardware fib optimize prefix-length 20 24
 expand 19 23 compress 25
 ! Please restart layer 3 forwarding agent to ensure IPv4 routes
 are optimized
```

13.1.16.14 description (VRF)

The **description** command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The **no description** and **default description** commands remove the text string from the configuration mode VRF by deleting the corresponding **description** command from ***running-config***.

Command Mode

VRF Configuration

Command Syntax

description *label_text*

no description

default description

Parameters

label_text Character string assigned to the VRF configuration.

Related Commands

The **vrf instance** command places the switch in VRF configuration mode.

Example

These commands add description text to the ***magenta*** VRF.

```
switch(config)#vrf instance magenta
switch(config-vrf-magenta)#description This is the first vrf
switch(config-vrf-magenta)#show active
 vrf instance magenta
   description This is the first vrf

switch(config-vrf-magenta)#
```

13.1.16.15 dhcp relay

The **dhcp relay** command places the switch in the DHCP relay mode. This command is executed under ***global configuration mode***.

The **no dhcp relay** command removes DHCP relay configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

dhcp relay

no dhcp relay

Example

The **dhcp relay** command places the switch in the DHCP relay configuration mode.

```
switch(config)#dhcp relay
switch(config-dhcp-relay)#
```

13.1.16.16 interface tunnel

The **interface tunnel** command places the switch in interface-tunnel configuration mode.

Interface-tunnel configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed.

The **no interface tunnel** command deletes the specified interface tunnel configuration.

The **exit** command returns the switch to the global configuration mode.

Command Mode

Global Configuration

Command Syntax

interface tunnel *number*

no interface tunnel *number*

Parameter

number Tunnel interface number. Values range from **0** to **255**.

Example

This command places the switch in interface-tunnel configuration mode for tunnel interface ***10***.

```
switch(config)#interface tunnel 10
switch(config-if-Tu10)#
```

13.1.16.17 ip arp inspection limit

The **ip arp inspection limit** command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

Command Mode

EXEC

Command Syntax

ip arp inspection limit [**RATE** *pps*] [**BURST_INTERVAL** *sec* | none]

no ip arp inspection limit [**RATE** *pps*] [**BURST_INTERVAL** *sec* | none]

default ip arp inspection limit [**RATE** *pps*] [**BURST_INTERVAL** *sec* | none]

Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - ***pps*** ARP inspection limit rate packets per second.
- **BURST_INTERVAL** Specifies the ARP inspection limit burst interval.
  - ***sec*** Burst interval second.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan

Examples

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to ***512*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***11*** seconds.

```
switch(config)#ip arp inspection limit rate 512 burst interval
 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)#interface Ethernet 3/1
switch(config)#ip arp inspection limit rate 20 burst interval
 5
switch(config)#interface Ethernet 3/3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces

 Interface      Trust State  Rate (pps) Burst Interval
 -------------  -----------  ---------- --------------
 Et3/1          Untrusted    20         5
 Et3/3          Trusted      None       N/A

switch(config)#
```

13.1.16.18 ip arp inspection logging

The **ip arp inspection logging** command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

Command Mode

EXEC

Command Syntax

ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

no ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

default ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - ***<pps>*** ARP inspection limit rate packets per second.
- **BURST_INTERVAL** Specifies the ARP inspection limit burst interval.
  - ***sec*** Burst interval second.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan
- show ip arp inspection vlan

Example

This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to ***2048*** (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to ***15*** seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst interval
 15
switch(config)#
```

13.1.16.19 ip arp inspection trust

The **ip arp inspection trust** command configures the trust state of an interface. By default, all interfaces are untrusted.

Command Mode

EXEC

Command Syntax

ip arp inspection trust

no ip arp inspection trust

default ip arp inspection trust

Related Commands

- ip arp inspection limit
- ip arp inspection logging
- show ip arp inspection vlan
- ip arp inspection vlan

Examples

- This command configures the trust state of an interface.

```
switch(config)#ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)#no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)#default ip arp inspection trust
switch(config)#
```

13.1.16.20 ip arp inspection vlan

The **ip arp inspection vlan** command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

Command Mode

EXEC

Command Syntax

ip arp inspection vlan [**LIST**]

Parameters

LIST Specifies the VLAN interface number.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan

Example

- This command enables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)#ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs ***1*** through ***150***.

```
switch(config)#no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs ***1*** through ***150***.

```
switch(config)#default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs 1 through ***150*** and ***200*** through ***250***.

```
switch(config)#ip arp inspection vlan 1-150,200-250
switch(config)#
```

13.1.16.21 ip dhcp relay all-subnets default

The **ip dhcp relay all-subnets default** command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an **ip dhcp relay all-subnets** statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The **no ip dhcp relay all-subnets default** and **default ip dhcp relay all-subnets default** commands restore the global DHCP smart relay default setting of disabled by removing the **ip dhcp relay all-subnets default** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay all-subnets default

no ip dhcp relay all-subnets default

default ip dhcp relay all-subnets default

Related Commands

- ip helper-address Enables the DHCP relay agent on a configuration mode interface.
- ip dhcp relay all-subnets Enables the DHCP smart relay agent on a configuration mode interface.

Example

This command configures the global DHCP smart relay setting to **enabled**.

```
switch(config)#ip dhcp relay all-subnets default
switch(config)#
```

13.1.16.22 ip dhcp relay all-subnets

The **ip dhcp relay all-subnets** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the **ip dhcp relay all-subnets default** command. The **ip dhcp relay all-subnets** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp relay all-subnets** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp relay all-subnets** command restores the interface's to the default DHCP smart relay setting, as configured by the **ip dhcp relay all-subnets default** command, by removing the corresponding **ip dhcp relay all-subnets** or **no ip dhcp relay all-subnets** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay all-subnets

no ip dhcp relay all-subnets

default ip dhcp relay all-subnets

Examples

- This command enables DHCP smart relay on VLAN interface ***100***.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#ip dhcp relay all-subnets
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command disables DHCP smart relay on VLAN interface ***100***.

```
switch(config-if-Vl100)#no ip dhcp relay all-subnets
switch(config-if-Vl100)#show active
 interface Vlan100
   no ip dhcp relay all-subnets
   ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command enables DHCP smart relay globally, configures VLAN interface ***100*** to use the global setting, then displays the DHCP relay status.

```
switch(config)#ip dhcp relay all-subnets default
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#default ip dhcp relay
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

13.1.16.23 ip dhcp relay always-on

The **ip dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an **ip helper-address** statement.

The **no ip dhcp relay always-on** and **default ip dhcp relay always-on** commands remove the **ip dhcp relay always-on** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay always-on

no ip dhcp relay always-on

default ip dhcp relay always-on

Related Commands

These commands implement DHCP relay agent.

- ip helper-address
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id

Example

This command enables the DHCP relay agent.

```
switch(config)#ip dhcp relay always-on
switch(config)#
```

13.1.16.24 ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by **ip helper-address** commands. The command specifies the tag contents for packets forwarded by the interface that it configures.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch's default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay information option

no ip dhcp relay information option

default ip dhcp relay information option

Related Commands

These commands implement DHCP relay agent.

- ip helper-address
- ip dhcp relay always-on
- ip dhcp relay information option circuit-id

Example

This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

```
switch(config)#ip dhcp relay information option
switch(config)#
```

13.1.16.25 ip dhcp relay information option circuit-id

The **ip dhcp relay information option circuit-id** command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by **ip helper-address** commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (**ip dhcp relay information option circuit-id**). The default value for each interface is the name and number of the interface.

The **no ip dhcp relay information option circuit-id** and **default ip dhcp relay information option circuit-id** commands restore the default content setting for the configuration mode interface by removing the corresponding command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay information option circuit-id *id_label*

no ip dhcp relay information option circuit-id

default ip dhcp relay information option circuit-id

Parameters

id_label Tag content. Format is alphanumeric characters (maximum 15 characters).

Related Commands

- ip helper-address
- ip dhcp relay always-on
- ip dhcp relay information option (Global)

Example

This command configures **x-1234** as the tag content for packets send from VLAN ***200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip dhcp relay information option circuit-
id x-1234
switch(config-if-Vl200)#
```

13.1.16.26 ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a set of Layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping

no ip dhcp snooping

default ip dhcp snooping

Related Commands

- ip dhcp snooping information option enables insertion of option-82 snooping data.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)#show ip dhcp snooping
DHCP Snooping is disabled
switch(config)#ip dhcp snooping
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```

13.1.16.27 ip dhcp snooping bridging

The **ip dhcp snooping bridging** command enables the DHCP snooping bridging configuration.

The **no ip dhcp snooping bridging** command removes the DHCP snooping bridging configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

ip dhcp snooping bridging

no ip dhcp snooping bridging

Example

This command configures the DHCP snooping bridging.

```
switch#configure
switch(config)#ip dhcp snooping bridging
```

13.1.16.28 ip dhcp snooping information option

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in ***running-config*** without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping information option

no ip dhcp snooping information option

default ip dhcp snooping information option

Related Commands

- ip dhcp snooping globally enables DHCP snooping.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

```
switch(config)#ip dhcp snooping information option
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

13.1.16.29 ip dhcp snooping vlan

The **ip dhcp snooping vlan** command enables DHCP snooping on specified VLANs. DHCP snooping is a Layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping vlan** command persists in ***running-config*** without any operational affect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable DHCP snooping operability by removing the **ip dhcp snooping information option** statement from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping vlan *v_range*

no ip dhcp snooping vlan *v_range*

default ip dhcp snooping vlan *v_range*

Parameters

- ***v_range*** VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.
- The **ip dhcp snooping** command globally enables DHCP snooping.
- The **ip dhcp snooping vlan** command enables insertion of option-82 snooping data.
- The **ip helper-address** command enables the DHCP relay agent on a configuration mode interface.

Example

These commands enable DHCP snooping globally, DHCP on VLAN interface ***100***, and DHCP snooping on ***VLAN 100***.

```
switch(config)#ip dhcp snooping
switch(config)#ip dhcp snooping information option
switch(config)#ip dhcp snooping vlan 100
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

13.1.16.30 ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from ***running-config*** .

Command Mode

Global Configuration

Command Syntax

ip hardware fib ecmp resilience *net_addr* capacity *nhop_max* redundancy **duplicates**

no ip hardware fib ecmp resilience *net_addr*

default ip hardware fib ecmp resilience *net_addr*

Parameters

- ***net_addr*** IP address prefix managed by command. (CIDR or address-mask).
- ***nhop_max*** Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: <**2** to **64**>
  - Trident: <**2** to **32**>
  - Trident II: <**2** to **64**>
- **duplicates** Specifies the redundancy factor. Value ranges from ***1*** to ***128***.

Example

This command configures a hardware ECMP table space of 24 entries for the IP address ***10.14.2.2/24***. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24
 capacity 6 redundancy 4
switch(config)#
```

13.1.16.31 ip hardware fib optimize

The **ip hardware fib optimize** command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the **agent SandL3Unicast terminate** command for the configuration mode interface.

Command Mode

Global Configuration

Command Syntax

ip hardware fib optimize exact-match prefix-length *prefix-length prefix-length*

ip hardware fib optimize exact-match prefix-length *prefix-length prefix-length*

Parameters

prefix-length The length of the prefix equal to ***12***, ***16***, ***20***, ***24***, ***28***, or ***32***. One additional prefix-length limited to the prefix-length of ***32*** is optional.

Related Commands

- The agent SandL3Unicast terminate command enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- The show platform arad ip route command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- The show platform arad ip route summary command shows hardware resource usage of IPv4 routes.

Examples

- This configuration command allows configuring prefix lengths ***12*** and ***32***.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.
  - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
  - This configuration command allows configuring prefix lengths ***32*** and ***16***.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
  - This configuration command allows configuring prefix length ***24***.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 24
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- In this instance, there is only one prefix-length, so a prefix-length of ***32*** is not required. For this command to take effect, the platform Layer 3 agent must be restarted.
  - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
  - This configuration command allows configuring prefix length ***32***.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are optimized
```

- For this command to take effect, the platform Layer 3 agent must be restarted.
  - This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
  - This configuration command disables configuring prefix lengths ***12*** and ***32***.

```
switch(config)#no ip hardware fib optimize exact-match
 prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4
 routes are not optimized
```

  - One of the two prefixes in this command is a prefix-length of ***32***, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

13.1.16.32 ip helper-address

The **ip helper-address** command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The **no ip helper-address** and **default ip helper-address** commands remove the corresponding **ip helper-address** command from ***running-config***. Commands that do not specify an IP helper-address remove all helper-addresses from the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip helper-address *ipv4_addr* [vrf *vrf_name*][source-address *ipv4_addr* | source-interface **INTERFACES**]

no ip helper-address [*ipv4_addr*]

default ip helper-address [*ipv4_addr*]

Parameters

- **vrf *vrf_name*** Specifies the user-defined VRF for DHCP server.
- ***ipv4_addr*** Specifies the DHCP server address accessed by interface.
- **source-address *ipv4_addr*** Specifies the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** Specifies the source interface to communicate with DHCP server. Options include:
  - **Ethernet *eth_num*** Specifies the Ethernet interface number.
  - **Loopback *lpbck_num*** Specifies the loopback interface number. Value ranges from **0** to **1000**.
  - **Management *mgmt_num*** Specifies the management interface number. Accepted values are ***1*** and ***2***.
  - **Port-Channel** {***int_num*** | ***sub_int_num***} Specifies the port-channel interface or subinterface number. Value of interface ranges from **1** to **2000**. Value of sub-interface ranges from **1** to **4094**.
  - **Tunnel *tnl_num*** Specifies the tunnel interface number. Value ranges from **0** to **255**.
  - **VLAN *vlan_num*** Specifies the Ethernet interface number. Value ranges from **1** to **4094**.

Related Commands

- ip dhcp relay always-on
- ip dhcp relay information option (Global)
- ip dhcp relay information option circuit-id

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Examples

- This command enables DHCP relay on the VLAN interface ***200***; and configure the switch to forward DHCP requests received on this interface to the server at ***10.10.41.15***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip helper-address 10.10.41.15
switch(config-if-Vl200)#show active
interface Vlan200
   ip helper-address 10.10.41.15
switch(config-if-Vl200)#
```

- This command enables DHCP relay on the interface Ethernet 1/2; and configures the switch to use ***2.2.2.2*** as the source IP address when relaying IPv4 DHCP messages to the server at ***1.1.1.1***.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#ip helper-address 1.1.1.1 source-
address 2.2.2.2
switch(config-if-Et1/2)#
```

13.1.16.33 ip icmp redirect

The **ip icmp redirect** command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The **no ip icmp redirect** disables the switch from sending ICMP redirect messages.

Command Mode

Global Configuration

Command Syntax

ip icmp redirect

no ip icmp redirect

default ip icmp redirect

Example

This command disables the redirect messages.

```
switch(config)#no ip icmp redirect
switch(config)#show running-config
              <-------OUTPUT OMITTED FROM EXAMPLE-------->
!
no ip icmp redirect
ip routing
!
               <-------OUTPUT OMITTED FROM EXAMPLE-------->
switch(config)#
```

13.1.16.34 ip load-sharing

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The **no ip load-sharing** and **default ip load-sharing** commands return the hash seed to the default value of zero by removing the **ip load-sharing** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip load-sharing **HARDWARE** *seed*

no ip load-sharing **HARDWARE**

default ip load-sharing **HARDWARE**

Parameters

- **HARDWARE** The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI ? command.
  - **arad**
  - **fm6000**
  - **petraA**
  - **trident**
- ***seed*** The hash seed. Value range varies by switch platform. The default value on all platforms is 0.
  - when **HARDWARE**=**arad** ***seed*** ranges from 0 to 2.
  - when **HARDWARE**=**fm6000** ***seed*** ranges from 0 to 39.
  - when **HARDWARE**=**petraA** ***seed*** ranges from 0 to 2.
  - when **HARDWARE**=**trident** ***seed*** ranges from 0 to 5.

Example

This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.

```
switch(config)#ip load-sharing fm6000 1
switch(config)#
```

13.1.16.35 ip local-proxy-arp

The **ip local-proxy-arp** command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The **no ip local-proxy-arp** and **default ip local-proxy-arp** commands disable local proxy ARP on the configuration mode interface by removing the corresponding **ip local-proxy-arp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip local-proxy-arp

no ip local-proxy-arp

default ip local-proxy-arp

Example

These commands enable local proxy ARP on VLAN interface ***140***.

```
switch(config)#interface vlan 140
switch(config-if-Vl140)#ip local-proxy-arp
switch(config-if-Vl140)#show active
interface Vlan140
   ip local-proxy-arp
switch(config-if-Vl140)#
```

13.1.16.36 ip multicast count

The **ip multicast count** command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The **no ip multicast count** command deletes all multicast counters including the routes of group and source addresses.

The **no ip multicast count *group_address source_address*** command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The **default ip multicast count** command reverts the current counter configuration of multicast route to the default state.

Command Mode

Global Configuration

Command Syntax

ip multicast count [*group_address* [*source_address*] | bytes | packets]

no ip multicast count [*group_address* [*source_address*] | bytes | packets]

default ip multicast count [*group_address* [*source_address*] | bytes | packets]

Parameters

- ***group_address*** Configures the multicast route traffic count of the specified group address.
  - ***source_address*** Configures the multicast route traffic count of the specified group and source addresses.
- **bytes** Configures the multicast route traffic count to bytes.
- **packets** Configures the multicast route traffic count to packets.

Guidelines

This command is supported on the FM6000 platform only.

Examples

- This command configures the multicast route traffic count to bytes.

```
switch(config)#ip multicast count bytes
```

- This command configures the multicast route traffic count of the specified group and source addresses.

```
switch(config)#ip multicast count 10.50.30.23 45.67.89.100
```

- This command deletes all multicast counters including the routes of group and source addresses.

```
switch(config)#no ip multicast count
```

- This command reverts the current multicast route configuration to the default state.

```
switch(config)#default ip multicast count
```

13.1.16.37 ip proxy-arp

The **ip proxy-arp** command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default.

The **no ip proxy-arp** and **default ip proxy-arp** commands disable proxy ARP on the configuration mode interface by removing the corresponding **ip proxy-arp** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip proxy-arp

no ip proxy-arp

default ip proxy-arp

Example

This command enables proxy ARP on Ethernet interface ***4***.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ip proxy-arp
switch(config-if-Et4)#
```

13.1.16.38 ip route

The **ip route** command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The **no ip route** and **default ip route** commands delete the specified static route by removing the corresponding **ip route** command from ***running-config***. Commands that do not list a nexthop address remove all **ip route** statements with the specified destination from ***running-config***. If an **ip route** statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

Command Mode

Global Configuration

Command Syntax

ip route [**VRF_INSTANCE**] *dest_net* **NEXTHOP** [**DISTANCE**][**TAG_OPTION**][**RT_NAME**]

no ip route [**VRF_INSTANCE**] *dest_net* [**NEXTHOP**][**DISTANCE**]

default ip route [**VRF_INSTANCE**] *dest_net* [**NEXTHOP**][**DISTANCE**]

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified VRF.
- ***dest_net*** Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP** Location or access method of next hop device. Options include:
  - ***ipv4_addr*** An IPv4 address.
  - **null0** Null0 interface.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **DISTANCE** Administrative distance assigned to route. Options include:
  - ***no parameter*** Route assigned default administrative distance of one.
  - **1-255** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
  - ***no parameter*** Assigns default static route tag of ***0***.
  - **tag *t_value*** Static route tag value. ***t_value*** ranges from **0** to **4294967295**.
- **RT_NAME** Associates descriptive text to the route. Options include:

- ***no parameter*** No text is associated with the route.
- **name *descriptive_text*** The specified text is assigned to the route.

Related Command

The **ip route nexthop-group** command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

Example

This command creates a static route in the default VRF.

```
switch(config)#ip route 172.17.252.0/24 vlan 2000
switch(config)#
```

13.1.16.39 ip routing

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from ***running-config***. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch's MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch's address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

ip routing [**VRF_INSTANCE**]

no ip routing [**DELETE_ROUTES**][**VRF_INSTANCE**

default ip routing [**DELETE_ROUTES**][**VRF_INSTANCE**]

Parameters

- **DELETE_ROUTES** Resolves routing table static entries when routing is disabled.
  - ***no parameter*** Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.
- **VRF_INSTANCE** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified user-defined VRF.

Example

This command enables IPv4 routing.

```
switch(config)#ip routing
switch(config)#
```

13.1.16.40 ip source binding

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Note: IP source bindings are also used by static ARP inspection.

The **no ip source binding** and **default ip source binding** commands exclude parameters from IPSG filtering, and set the default for **ip source binding**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ip source binding [*IP_ADDRESS*][*MAC_ADDRESS*] vlan [*VLAN_RANGE*] interface [*INTERFACE*]

no ip source binding [*IP_ADDRESS*][*MAC_ADDRESS*] vlan [*VLAN_RANGE*] interface [*INTERFACE*]

default ip source binding [*IP_ADDRESS*][*MAC_ADDRESS*] vlan [*VLAN_RANGE*] interface [*INTERFACE*]

Parameters

- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

Related Commands

- **ip verify source**
- **show ip verify source**

Example

This command configures source IP-MAC binding entries to IP address ***10.1.1.1***, MAC address ***0000.aaaa.1111***, VLAN ID ***4094,*** and ***Ethernet interface 36***.

```
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan
 4094 interface
ethernet 36
switch(config)#
```

13.1.16.41 ip verify source

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

ip verify source vlan [**VLAN_RANGE**]

no ip verify source [**VLAN_RANGE**]

default ip verify source

Parameters

VLAN_RANGE Specifies the VLAN ID range.

Related Commands

- **ip source binding**
- **show ip verify source**

Example

This command excludes VLAN IDs ***1*** through ***3*** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs ***4*** through ***10*** on ***Ethernet 36*** will be filtered by IPSG, while those received on VLANs ***1*** through ***3*** are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

13.1.16.42 ip verify

The **ip verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

The **no ip verify** and **default ip verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ip verify** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip verify unicast source reachable-via **RPF_MODE**

no ip verify unicast

default ip verify unicast

Parameters

RPF_MODE Specifies the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent **ip verify** commands on any interface do not disrupt IPv4 routing.

Examples

- This command enables uRPF loose mode on ***VLAN interface 17***.

```
switch(config)#interface vlan 17
switch(config-if-Vl17)#ip verify unicast source reachable-via
 any
switch(config-if-Vl17)#show active
 interface Vlan17
   ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on ***VLAN interface 18***.

```
switch(config)#interface vlan 18
switch(config-if-Vl18)#ip verify unicast source reachable-via
 rx
```

```
switch(config-if-Vl18)#show active
 interface Vlan18
   ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

13.1.16.43 ipv4 routable 240.0.0.0/4

The **ipv4 routable 240.0.0.0/4** command assignes an class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

The **no ipv4 routable 240.0.0.0/4** and **default ipv4 routable 240.0.0.0/4** commands disable IPv4 Class E routing by removing the **ipv4 routable 240.0.0.0/4** command from ***running-config***.

IPv4 routable ***240.0.0.0/4*** routing is disabled by default.

Command Mode

Router General Configuration

Command Syntax

ipv4 routable 240.0.0.0/4

no ipv4 routable 240.0.0.0/4

default ipv4 routable 240.0.0.0/4

Example

These commands configure an IPv4 Class E (***240/4***) address to an interface.

```
switch(config)#router general
switch(config-router-general)#ipv4 routable 240.0.0.0/4
```

13.1.16.44 platform barefoot bfrt vrf

The **platform barefoot bfrt vrf** command configures the forwarding plane agent on supported platforms to restart and listen on the configured VRF for connections. If left unconfigured, the default VRF is used for the IP and port for the the BfRuntime server.

Command Mode

Global Configuration

Command Syntax

platform barefoot bfrt vrf *VRF name*

Parameters

VRF name configured VRF for connections.

Example

These commands configure the forwarding plane agent to restart and listen on the configured VRF for connections.

```
switch(config)#vrf instance management
switch(config-vrf-management)#exit
switch(config)#platform barefoot bfrt 0.0.0.0 50052
switch(config)#platform barefoot bfrt vrf <VRF name>
switch(config)#int management1
switch(config-if-Ma1)#vrf management
```

13.1.16.45 platform trident forwarding-table partition

The **platform trident forwarding-table partition** command provides a shared table memory for L2, L3 and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

Note: Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident forwarding-table partition** and **default platform trident forwarding-table partition** commands remove the **platform trident forwarding-table partition** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

platform trident forwarding-table partition SIZE

no platform trident forwarding-table partition

default platform trident forwarding-table partition

Parameters

SIZE Size of partition. Options include:

- ***0*** 288k l2 entries, 16k host entries, 16k lpm entries.
- ***1*** 224k l2 entries, 80k host entries, 16k lpm entries.
- ***2*** 160k l2 entries, 144k host entries, 16k lpm entries.
- ***3*** 96k l2 entries, 208k host entries, 16k lpm entries.

The default value is ***2*** (160k l2 entries, 144k host entries, 16k lpm entries).

Examples

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

```
switch(config)#platform trident forwarding-table partition 2
switch(config)
```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

```
#switch(config)#platform trident forwarding-table partition 3

Warning: StrataAgent will restart immediately
```

13.1.16.46 platform trident routing-table partition

The **`platform trident routing-table partition`** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

Note: Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **`no platform trident routing-table partition`** and **`default platform trident routing-table partition`** commands restore the default partitions sizes by removing the **`platform trident routing-table partition`** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

`platform trident routing-table partition` **SIZE**

`no platform trident routing-table partition`

`default platform trident routing-table partition`

Parameters

SIZE Size of partition. Options include:

- ***1*** 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length).
- ***2*** 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).
- ***3*** 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length).

The default value is ***2*** (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).

Restrictions

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

Example

This command sets the shareable routing table to option ***1*** that supports ***6K*** prefixes equal to or shorter than ***/64*** and ***1K*** prefixes longer than ***/64***.

```
switch(config)#platform trident routing-table partition 1
switch(config)
```

13.1.16.47 rib fib policy

The **rib fib policy** command enables FIB policy for a particular VRF under router general configuration mode.The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The **no rib fib policy** and **default rib fib policy** commands restore the switch to its default state by removing the corresponding rib fib policy command from ***running-config*** .

Command Mode

Router General Configuration

Command Syntax

rib [*ipv4* | *ipv6*] fib policy *name*

no rib [*ipv4* | *ipv6*] fib policy *name*

default rib [*ipv4* | *ipv6*] fib policy *name*

Parameters

- ***ipv4*** IPv4 configuration commands.
- ***ipv6*** IPv6 configuration commands.
- ***name*** Route map name.

Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, ***map1***.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy
 map1
```

13.1.16.48 show arp

The **`show arp`** command displays all ARP tables. This command differs from the **show ip arp** command in that it shows MAC bindings for all protocols, whereas **show ip arp** only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the ***resolve*** argument.

Command Mode

EXEC

`show arp` [**VRF_INST**][**FORMAT**][**HOST_ADD**][**HOST_NAME**][**INTF**][**MAC_ADDR**][**DATA**]

Parameters

The **VRF_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.
- **FORMAT** Displays format of host address. Options include:
  - ***no parameter*** Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST_ADD** IPv4 address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host address.
  - ***ipv4_addr*** Table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host name.
  - **host *hostname*** Entries matching ***hostname*** (text).
- **INTF** Interfaces for which command displays status.
  - ***no parameter*** Routing table entries are not filtered by interface.
  - **interface ethernet *e_num*** Routed Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Routed loopback interface specified by ***l_num***.
  - **interface management *m_num*** Routed management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Routed port channel Interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by interface MAC address.
  - **mac_address *mac_address*** Entries matching ***mac_address*** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - ***no parameter*** Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Example

This command displays the ARP table.

```
switch>show arp
Address         Age (min)  Hardware Addr   Interface
172.22.30.1             0  001c.730b.1d15  Management1
172.22.30.133           0  001c.7304.3906  Management1
switch>
```

13.1.16.49 show dhcp server

Use the **show dhcp server** command to display DHCP server information.

Command Mode

EXEC

Command Syntax

show dhcp server [ipv4 | ipv6 [leases [**A.B.C.D**/**E** | **NAME**]]] | [leases [ipv4 | ipv6 | **NAME**]]

Parameters

- **ipv4** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **leases** Displays active leases.
  - **A.B.C.D**/**E** IPv4 subnet.
  - **NAME** Subnet name.

Examples

- DHCPv4 display example.

```
switch#show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
   Interface   Status
------------------------------------------------
   Ethernet1   Inactive (Could not determine VRF)
   Ethernet2   Inactive (Not in default VRF)
   Ethernet3   Inactive (Kernel interface not created yet)
   Ethernet4   Inactive (Not up)
   Ethernet5   Inactive (No IP address)
   Ethernet6   Active

Vendor information:
Vendor ID: default
  Sub-options         Data
---------------- ----------------
      1          192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options       Data
---------------- -----------
      2           192.0.2.2
      3           "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
```

```
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- In this example, DHCPv6 is configured with subnet ***fe80::/10*** while being enabled on ***Ethernet1*** with address ***fe80::1/64*** and on ***Ethernet3*** with address ***fe80::2/64***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

   Ethernet1    Active
   Ethernet3    Active

Subnet: fe80::/10
```

```
Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5

Direct: Inactive (Multiple interfaces match this subnet: Ethernet1
 Ethernet3)
Relay: Active

Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets ***fc00::/7*** and **fe80::/10** while being enabled on ***Ethernet1*** with address ***fe80::1/10*** and ***fc00::1/7***.

```
switch#show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s):  fc00::2

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

   Interface    Status

--------------- ------

```

```
   Ethernet1    Active
```

```
Subnet: fc00::/7

Subnet name: foo

Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
Subnet: fe80::/10

Subnet name: bar

Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
```

- When a subnet is disabled, the **show dhcp server** command displays the disable message with a reason. The number of active leases of the disabled subnets will be ***0***. In this example, there are overlapping subnets.

```
switch#show dhcp server
IPv4 DHCP Server is active
```

```
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet
 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet
 10.0.0.0/24)
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch#show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
   Interface   Status
-------------------------------------------------
   Ethernet1   Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12
 overlaps with an existing pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is
 reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch#show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
```

```
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

13.1.16.50 show interface tunnel

The **show interface tunnel** command displays the interface tunnel information.

Command Mode

EXEC

Command Syntax

show interface tunnel *number*

Parameter

number Specifies the tunnel interface number.

Example

This command displays tunnel interface configuration information for tunnel interface ***10***.

```
switch#show interface tunnel 10

Tunnel10 is up, line protocol is up (connected)
 Hardware is Tunnel, address is 0a01.0101.0800
 Internet address is 192.168.1.1/24
 Broadcast address is 255.255.255.255
 Tunnel source 10.1.1.1, destination 10.1.1.2
 Tunnel protocol/transport GRE/IP
   Key disabled, sequencing disabled
   Checksumming of packets disabled
 Tunnel TTL 10, Hardware forwarding enabled
 Tunnel TOS 10
 Path MTU Discovery
 Tunnel transport MTU 1476 bytes
 Up 3 seconds
```

13.1.16.51 show ip arp inspection statistics

The **show ip arp inspection statistics** command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

Command Mode

EXEC

Command Syntax

show ip arp inspection statistics [vlan [**VID**]|[**INTERFACE**] interface *intf_slot* | *intf_port*]

Parameters

- **VID** Specifies the VLAN interface ID.
- **INTERFACE** Specifies the interface (e.g., Ethernet).
  - ***intf_slot*** Interface slot.
  - ***intf_port*** Interface port.
- **INTF** Specifies the VLAN interface slot and port.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- ip arp inspection vlan

Examples

- This command display statistics of inspected ARP packets for VLAN ***10***.

```
switch(config)#show ip arp inspection statistics vlan 10

Vlan : 10
--------------
ARP
Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1
Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for Ethernet interface ***3/1***.

```
switch(config)#show ip arp inspection statistics ethernet
 interface 3/1
Interface : 3/1
--------
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
```

```
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

13.1.16.52 show ip arp inspection vlan

The **`show ip arp inspection vlan`** command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to ***Active*** when hardware is ready to trap ARP packets for inspection.

Command Mode

EXEC

Command Syntax

`show ip arp inspection vlan` [**LIST**]

Parameters

LIST Specifies the VLAN interface number.

Related Commands

- ip arp inspection limit
- ip arp inspection trust
- show ip arp inspection statistics

Example

This command displays the configuration and operation state of ARP inspection for VLANs ***1*** through ***150***.

```
switch(config)#show ip arp inspection vlan 1 - 150

VLAN 1
----------
Configuration
: Enabled
Operation State : Active
VLAN 2
----------
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
----------
Configuration
: Enabled
Operation State : Active

switch(config)#
```

13.1.16.53 show ip arp

The **`show ip arp`** command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the ***resolve*** argument.

Command Mode

EXEC

Command Syntax

`show ip arp` [**VRF_INST**][**FORMAT**][**HOST_ADD**][**HOST_NAME**][**INTF**][**MAC_ADDR**][**DATA**]

Parameters

The **VRF_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.
- **FORMAT** Displays format of host address. Options include:
  - ***no parameter*** Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host address.
  - ***ipv4_addr*** Table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by host name.
  - **host *hostname*** Entries matching ***hostname*** (text).
- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** Routing table entries are not filtered by interface.
  - **interface ethernet *e_num*** Routed Ethernet interface specified by ***e_num***.
  - **interface loopback *l_num*** Routed loopback interface specified by ***l_num***.
  - **interface management *m_num*** Routed management interface specified by ***m_num***.
  - **interface port-channel *p_num*** Routed port channel Interface specified by ***p_num***.
  - **interface vlan *v_num*** VLAN interface specified by ***v_num***.
  - **interface vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- MAC_ADDR MAC address by which routing table entries are filtered. Options include:
  - ***no parameter*** Routing table entries are not filtered by interface MAC address.
  - **mac_address *mac_address*** entries matching ***mac_address*** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - ***no parameter*** Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp

Address         Age (min)  Hardware Addr   Interface

switch>
```

13.1.16.54 show ip dhcp relay counters

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

show ip dhcp relay counters

Example

This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
 Vlan1000 |    0    0    0 | 4 days, 19:54:24 ago
 Vlan1036 |  376  277    0 | 4 days, 19:54:24 ago

switch>
```

13.1.16.55 show ip dhcp relay

The **show ip dhcp relay** command displays the DHCP relay agent configuration status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp relay

Example

This command displays the DHCP relay agent configuration status.

```
switch>show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch>
```

13.1.16.56 show ip dhcp snooping counters

The **show ip dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping counters [**COUNTER_TYPE**]

Parameters

COUNTER_TYPE The type of counter that the command resets. Formats include:

- ***no parameter*** Command displays counters for each VLAN.
- **debug** Command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch>show ip dhcp snooping counters

     | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|------ ----- ------|----- ---- ------|-------------
 100 |     0     0     0 |    0    0     0 |  0:35:39 ago

switch>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch>show ip dhcp snooping counters debug
Counter                       Snooping to Relay Relay to
 Snooping
------------------------------ ----------------- -------------

switch>
```

13.1.16.57 show ip dhcp snooping hardware

The **show ip dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping hardware

Example

This command DHCP snooping hardware status.

```
switch>show ip dhcp snooping hardware
DHCP Snooping is enabled
DHCP Snooping is enabled on following VLANs:
    None
    Vlans enabled per Slice
        Slice:  FixedSystem
        None
switch>
```

13.1.16.58 show ip dhcp snooping

The **show ip dhcp snooping** command displays the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping

Related Commands

- ip dhcp snooping globally enables DHCP snooping.
- ip dhcp snooping vlan enables DHCP snooping on specified VLANs.
- ip dhcp relay information option (Global) enables insertion of option-82 snooping data.
- ip helper-address enables the DHCP relay agent on a configuration mode interface.

Example

This command displays the switch's DHCP snooping configuration.

```
switch>show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
  100
DHCP Snooping is operational on following VLANs:
  100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch>
```

13.1.16.59 show ip interface brief

Use the **`show ip interface brief`** command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

Command Mode

EXEC

Command Syntax

`show ip interface` [**INTERFACE_NAME**][**VRF_INST**] brief

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** All routed interfaces.
  - ***ipv4_addr*** Neighbor IPv4 address.
  - **ethernet** ***e_range*** Routed Ethernet interfaces specified by ***e_range***.
  - **loopback** ***l_range*** Routed loopback interfaces specified by ***l_range***.
  - **management** ***m_range*** Routed management interfaces specified by ***m_range***.
  - **port-channel** ***p_range*** Routed port channel Interfaces specified by ***p_range***.
  - **vlan** ***v_range*** VLAN interfaces specified by ***v_range***.
  - **vxlan** ***vx_range*** VXLAN interface range specified by ***vx_range***.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf** ***vrf_name*** Specifies name of VRF instance. System default VRF is specified by **`default`**.

Example

This command displays the summary status of VLAN interfaces ***900-910***.

```
switch>show ip interface vlan 900-910 brief

! Some interfaces do not exist
Interface              IP Address         Status     Protocol
     MTU
Vlan901                170.33.254.1/30    up         up
    9212
Vlan902                170.33.254.14/29   up         up
    9212
Vlan905                170.33.254.17/29   up         up
    1500
Vlan907                170.33.254.67/29   up         up
    9212
Vlan910                170.33.254.30/30   up         up
    9212
```

13.1.16.60 show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

Command Mode

EXEC

Command Syntax

show ip interface [**INTERFACE_NAME**][**VRF_INST**]

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
  - ***no parameter*** All routed interfaces.
  - ***ipv4_addr*** Neighbor IPv4 address.
  - **ethernet *e_range*** Routed Ethernet interfaces specified by ***e_range***.
  - **loopback *l_range*** Routed loopback interfaces specified by ***l_range***.
  - **management *m_range*** Routed management interfaces specified by ***m_range***.
  - **port-channel *p_range*** Routed port channel Interfaces specified by ***p_range***.
  - **vlan *v_range*** VLAN interfaces specified by ***v_range***.
  - **vxlan *vx_range*** VXLAN interfaces specified by ***vx_range***.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

- This command displays IP status of configured VLAN interfaces numbered between ***900*** and ***910***.

```
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```

- This command displays the configured TCP Maximum Segment Size (MSS) ceiling value of ***1436*** bytes for an Ethernet interface ***25***.

```
switch>show ip interface ethernet 25
Ethernet25 is up, line protocol is up (connected)
  Internet address is 10.1.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1500 bytes
  IPv4 TCP MSS egress ceiling is 1436 bytes
```

13.1.16.61 show ip route age

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Command Mode

EXEC

Command Syntax

show ip route ADDRESS age

Parameters

ADDRESS Filters routes by IPv4 address or subnet.

- ***ipv4_addr*** Routing table entries matching specified address.
- ***ipv4_subnet*** Routing table entries matching specified subnet (CIDR or address-mask).

Example

This command shows the amount of time since the last update to ip route ***172.17.0.0/20***.

```
switch>show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

 B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
switch>
```

13.1.16.62 show ip route gateway

The **show ip route gateway** command displays IP addresses of all gateways (next hops) used by active routes.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] gateway

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Example

This command displays next hops used by active routes.

```
switch>show ip route gateway
The following gateways are in use:
   172.25.0.1 Vlan101
   172.17.253.2 Vlan3000
   172.17.254.2 Vlan3901
   172.17.254.11 Vlan3902
   172.17.254.13 Vlan3902
   172.17.254.17 Vlan3903
   172.17.254.20 Vlan3903
   172.17.254.66 Vlan3908
   172.17.254.67 Vlan3908
   172.17.254.68 Vlan3908
   172.17.254.29 Vlan3910
   172.17.254.33 Vlan3911
   172.17.254.35 Vlan3911
   172.17.254.105 Vlan3912
   172.17.254.86 Vlan3984
   172.17.254.98 Vlan3992
   172.17.254.99 Vlan3992
switch>
```

13.1.16.63 show ip route host

The **show ip route host** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = ***255.255.255.255*** or prefix = ***/32***). Each entry includes a code of the route's purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] host

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Example

This command displays all host routes in the host forwarding table.

```
switch>show ip route host
R - receive B - broadcast F - FIB, A - attached

F   127.0.0.1 to cpu
B   172.17.252.0 to cpu
A   172.17.253.2 on Vlan2000
R   172.17.253.3 to cpu
A   172.17.253.10 on Vlan2000
B   172.17.253.255 to cpu
B   172.17.254.0 to cpu
R   172.17.254.1 to cpu
B   172.17.254.3 to cpu
B   172.17.254.8 to cpu
A   172.17.254.11 on Vlan2902
R   172.17.254.12 to cpu

F   172.26.0.28 via 172.17.254.20 on Vlan3003
                via 172.17.254.67 on Vlan3008
                via 172.17.254.98 on Vlan3492
                via 172.17.254.2 on Vlan3601
                via 172.17.254.13 on Vlan3602
via 172.17.253.2 on Vlan3000
F   172.26.0.29 via 172.25.0.1 on Vlan101
F   172.26.0.30 via 172.17.254.29 on Vlan3910
F   172.26.0.32 via 172.17.254.105 on Vlan3912
switch>
```

13.1.16.64 show ip route match tag

The **show ip route match tag** command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] **ADDRESS** match tag

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Displays routes of specified IPv4 address or subnet.
  - ***ipv4_addr*** Routing table entries matching specified IPv4 address.
  - ***ipv4_subnet*** Routing table entries matching specified IPv4 subnet (CIDR or address-mask).

Example

This command displays the route tag for the specified subnet.

```
switch>show ip route 172.17.50.0/23 match tag
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
 Service,
       DH - DHCP client installed default route, M - Martian

 O E2   172.17.50.0/23 tag 0

switch>
```

13.1.16.65 show ip route summary

The **show ip route summary** command displays the number of routes, categorized by destination prefix, in the routing table.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**] summary **Parameters**

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- ***no parameter*** Context-active VRF.
- **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

This command displays a summary of the routing table contents.

```
switch>show ip route summary
Route Source         Number Of Routes
-------------------------------------
connected                    15
static                        0
ospf                         74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                           7
  External: 6 Internal: 1
internal                     45
attached                     18
aggregate                     0
switch>
```

13.1.16.66 show ip route

The **show ip route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays configured commands not in the FIB.

Command Mode

EXEC

Command Syntax

show ip route [**VRF_INSTANCE**][**ADDRESS**][**ROUTE_TYPE**][**INFO_LEVEL**][**PREFIX**]

Parameters

The **VRF_INSTANCE** and **ADDRESS** parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Filters routes by IPv4 address or subnet.
  - ***no parameter*** All routing table entries.
  - ***ipv4_addr*** Routing table entries matching specified address.
  - ***ipv4_subnet*** Routing table entries matching specified subnet (CIDR or address-mask).
- **ROUTE_TYPE** Filters routes by specified protocol or origin. Options include:
  - ***no parameter*** All routing table entries.
  - **aggregate** Entries for BGP aggregate routes.
  - **bgp** Entries added through BGP protocol.
  - **connected** Entries for routes to networks directly connected to the switch.
  - ***isis*** Entries added through ISIS protocol.
  - **kernel** Entries appearing in Linux kernel but not added by EOS software.
  - **ospf** Entries added through OSPF protocol.
  - **rip** Entries added through RIP protocol.
  - **static** Entries added through CLI commands.
  - **vrf** Displays routes in a VRF.
- **INFO_LEVEL** Filters entries by next hop connection. Options include:
  - ***no parameter*** Filters routes whose next hops are directly connected.
  - **detail** Displays all routes.
- **PREFIX** Filters routes by prefix.
  - ***no parameter*** Specific route entry that matches the ADDRESS parameter.
  - **longer-prefixes** All subnet route entries in range specified by ADDRESS parameter.

Related Commands

The **cli vrf** command specifies the context-active VRF.

Examples

- This command displays IPv4 routes learned through BGP.

```
switch>show ip route bgp
Codes: C - connected, S - static, K - kernel,
```

```
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type
 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type
 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, A - Aggregate

 B E    170.44.48.0/23 [20/0] via 170.44.254.78
 B E    170.44.50.0/23 [20/0] via 170.44.254.78
 B E    170.44.52.0/23 [20/0] via 170.44.254.78
 B E    170.44.54.0/23 [20/0] via 170.44.254.78

 Ethernet1
```

13.1.16.67 show ip verify source

The **show ip verify source** command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

Command Mode

EXEC

Command Syntax

show ip verify source [VLAN | DETAIL]

Parameters

- **VLAN** Displays all VLANs configured in **no ip verify source vlan**.
- **DETAIL** Displays all source IP-MAC binding entries configured for IPSG.

Related Commands

- ip source binding
- ip verify source

Examples

- This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface       Operational State
--------------- ------------------------
Ethernet1       IP source guard enabled
Ethernet2       IP source guard disabled
```

- This command displays all VLANs configured in **no ip verify source vlan**. Hardware programming errors, e.g.,VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANS: 1-2
VLAN            Operational State
--------------- ------------------------
1               IP source guard disabled
2               Error: vlan classification failed
```

- This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface      IP Address  MAC Address     VLAN  State
-------------- ----------- --------------- ----- ------------------------
Ethernet1      10.1.1.1    0000.aaaa.1111   5     active
Ethernet1      10.1.1.5    0000.aaaa.5555   1     IP source guard disabled
Port-Channel1  20.1.1.1    0000.bbbb.1111   4     Port-Channel down
```

13.1.16.68 show ip

The **show ip** command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

Command Mode

EXEC

Command Syntax

show ip

Example

This command displays IPv4 routing status.

```
switch>show ip

IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10

switch>
```

13.1.16.69 show platform arad ip route summary

The **show platform arad ip route summary** command shows hardware resource usage of IPv4 routes.

Command Mode

EXEC

Command Syntax

show platform arad ip route summary

Related Commands

- The **agent SandL3Unicast terminate** command enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- The **ip hardware fib optimize** command enables IPv4 route scale.
- The **show platform arad ip route** command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4

switch(config)#
```

13.1.16.70 show platform arad ip route

The **`show platform arad ip route`** command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Command Mode

EXEC

Command Syntax

`show platform arad ip route`

Examples

- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is ***4094*** by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is *2*.

```
switch#show platform arad ip route
 Tunnel Type: M(mpls), G(gre)

switch(config)#
```

13.1.16.71 show platform barefoot bfrt

The **show platform barefoot bfrt** command displays information about the current BfRuntime server configuration.

Command Mode

EXEC

Command Syntax

show platform barefoot bfrt

Parameters

no parameter state of the system.

Example

The following output is for a system where the BfRuntime server has been configured.

```
(switch)#show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.16.72 show platform fap eedb ip-tunnel gre interface tunnel

The **show platform fap eedb ip-tunnel gre interface tunnel** command verifies the tunnel encapsulation programming for the tunnel interface.

Command Mode

EXEC

Command Syntax

show platform fap eedb ip-tunnel gre interface tunnel *number*

Parameter

number Specifies the tunnel interface number.

Example

These commands verify the tunnel encapsulation programming for the ***tunnel interface 10***.

```
switch#show platform fap eedb ip-tunnel gre interface tunnel 10

13.1.16.73 show platform fap tcam summary

The **show platform fap tcam summary** command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

Command Mode

EXEC

Command Syntax

show platform fap tcam summary

Example

This command verifies if the TCAM bank is allocated for GRE packet termination lookup.

```
switch#show platform fap tcam summary

Tcam Allocation (Jericho0)
Bank        Used By                Reserved By
----------- ---------------------- -----------
0           dbGreTunnel             -
```

13.1.16.74 show platform trident forwarding-table partition

The **show platform trident forwarding-table partition** command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

Command Mode

Privileged EXEC

Command Syntax

show platform trident forwarding-table partition

show platform trident forwarding-table partition flexible

Example

The **show platform trident forwarding-table partition** command shows the Trident forwarding table information.

```
switch(config)#show platform trident forwarding-table partition
L2 Table Size: 96k
L3 Host Table Size: 208k
LPM Table Size: 16k
switch(config)#
```

The **show platform trident forwarding-table partition flexible**shows the banks allocated for ALPM as well.

```
switch(config)#show platform trident forwarding-table partition
 flexible
------------------------------------------------
Minimum L2 entries             = 32768
Minimum L3 entries             = 16384
Maximum L2 entries             = 262144
Maximum L3 entries             = 262144
Maximum Exact Match entries    = 131072
L2 entries per bucket          = 4
L3 entries per bucket          = 4
Exact Match entries per bucket = 2
Maximum entries per bucket     = 4
Maximum shared buckets         = 65536
Maximum entries per bank       = 32768
Maximum shared banks           = 8
ALPM entries per bank          = 46080
ALPM                           = Enabled

```

13.1.16.75 show rib route ip

The **show rib route ip** command displays a list of IPv4 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

show rib route ip [vrf *vrf_name*][**PREFIX**][**ROUTE TYPE**]

Parameters

- **vrf *vrf_name*** Displays RIB routes from the specified VRF.
- **PREFIX** dDisplays routes filtered by the specified IPv4 information. Options include:
  - ***ip_address*** Displays RIB routes filtered by the specified IPv4 address.
  - ***ip_subnet_mask*** Displays RIB routes filtered by the specified IPv4 address and subnet mask.
  - ***ip_prefix*** Displays RIB routes filtered by the specified IPv4 prefix.
- **ROUTE TYPE** Displays routes filtered by the specified route type. Options include:
  - **bgp** Displays RIB routes filtered by BGP.
  - **connected** Displays RIB routes filtered by connected routes.
  - **dynamicPolicy** Displays RIB routes filtered by dynamic policy routes.
  - **host** Displays RIB routes filtered by host routes.
  - **isis** Displays RIB routes filtered by ISIS routes.
  - **ospf** Displays RIB routes filtered by OSPF routes.
  - **ospf3** Displays RIB routes filtered by OSPF3 routes.
  - **reserved** Displays RIB routes filtered by reserved routes.
  - **route-input** Displays RIB routes filtered by route-input routes.
  - **static** Displays RIB routes filtered by static routes.
  - **vrf** Displays routes in a VRF.
  - **vrf-leak** Displays leaked routes in a VRF.

Examples

- This command displays IPv4 RIB static routes.

```
switch#show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S    10.80.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
>S    172.16.0.0/12 [1/0]
         via 172.30.149.129 [0/1]
            via Management1, directly connected
switch#
```

- This command displays IPv4 RIB connected routes.

```
switch#show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
```

```
       L - Part of a recursive route resolution loop
>C    10.1.0.0/24 [0/1]
         via 10.1.0.102, Ethernet1
>C    10.2.0.0/24 [0/1]
         via 10.2.0.102, Ethernet2
>C    10.3.0.0/24 [0/1]
         via 10.3.0.102, Ethernet3
switch#
```

- This command displays routes leaked through VRF leak agent.

```
switch#show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...
>VL    20.0.0.0/8 [1/0] source VRF: VRF1
          via 10.1.2.10 [0/0] type ipv4
             via 10.1.2.10, Ethernet1
```

13.1.16.76 show rib route [<ipv4 | ipv6>] fib policy excluded

The **show rib route <ipv4 | ipv6> fib policy excluded** command displays the RIB routes filtered by FIB policy. The **fib policy exclude** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Command Mode

EXEC

Command Syntax

show rib route [*ipv4* | *ipv6*] fib policy excluded

Example

The following example displays the RIB routes excluded by the FIB policy using the fib policy excluded option of the **show rib route** command.

```
Switch#show rib route ipv6 fib policy excluded
switch#show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
>B    10.1.0.0/24 [200/0]
         via 10.2.2.1 [115/20] type tunnel
            via 10.3.5.1, Ethernet1
         via 10.2.0.1 [115/20] type tunnel
            via 10.3.4.1, Ethernet2
            via 10.3.6.1, Ethernet3
```

13.1.16.77 show rib route summary

The **show rib route summary** command displays information about the routes present in the Routing Information Base.

Command Mode

EXEC

Command Syntax

show rib route summary [**INFO_LEVEL**]

Parameters

- **no parameter** variable displays data in one table with the summary of all routes in the RIB for default VRF.
- **brief** keyword displays one table with the summary of all routes across all configured VRFs.
- **ip** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **ipv6** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **vrf *vrf_Name*** keyword displays one table with the summary of all routes in the Routing Information Base for the specified VRF.
- **vrf all** keyword displays one table with the summary of all routes in the Routing Information Base for each configured VRF.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - **Display Values**
    - **VRF** VRF RIB displayed.
    - **Route Source** Source for the route.
    - **Number of Routes** Number of routes for each source.

Examples

- The following displays data in one table with the summary of all routes in the RIB for default VRF.

```
switch>show rib route summary
VRF: default
Route Source         Number Of Routes
-------------------- ----------------
BGP                                1
Connected                          4
Dynamic policy                     0
IS-IS                              0
OSPF                               0
OSPFv3                             0
RIP                                0
Route input                        2
Static                             0
VRF leak                           0
```

- The following displays data in one table with the summary of all routes across all configured VRFs.

```
switch>show rib route summary brief
Route Source         Number Of Routes
-------------------- ----------------
BGP                                2
Connected                          8
Dynamic policy                     0
IS-IS                              0
```

```
OSPF                                    0
OSPFv3                                  0
RIP                                     0
Route input                             4
Static                                  0
VRF leak                                0
```

- The following displays data in one table with the summary of all IPv4 routes in the RIB for default VRF.

```
switch>show rib route summary ip
VRF: default
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   1
Connected                             4
Dynamic policy                        0
IS-IS                                 0
OSPF                                  0
OSPFv3                                0
RIP                                   0
Route input                           2
Static                                0
VRF leak                              0
```

- The following displays data in one table with the summary of all IPv6 routes in the RIB for default VRF.

```
switch>show rib route summary ipv6
VRF: default
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   0
Connected                             0
Dynamic policy                        0
IS-IS                                 0
OSPF                                  0
OSPFv3                                0
RIP                                   0
Route input                           0
Static                                0
VRF leak                              0
```

- The following displays data in one table with the summary of all routes in the RIB for the VRF named ***red***.

```
switch>show rib route summary vrf red
VRF: red
Route Source          Number Of Routes
--------------------- ----------------
BGP                                   1

```

13.1.16.78 show routing-context vrf

The **show routing-context vrf** command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

Command Mode

EXEC

Command Syntax

show routing-context vrf

Related Commands

The **cli vrf** command specifies the context-active VRF.

Example

This command displays the context-active VRF.

```
switch>show routing-context vrf
Current VRF routing-context is PURPLE
switch>
```

13.1.16.79 show tunnel fib static interface gre

The **show tunnel fib static interface gre** command displays the Forwarding Information Base (FIB) information for a static interface GRE tunnel.

Command Mode

EXEC

Command Syntax

show tunnel fib static interface gre *number*

Parameter

number Specifies the tunnel index number.

Example

This command display the interface tunnel configuration with GRE configured.

```
switch#show tunnel fib static interface gre 10

Type 'Static Interface', index 10, forwarding Primary
   via 10.6.1.2, 'Ethernet6/1'
      GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

13.1.16.80 show vrf

The **show vrf** command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

Command Mode

EXEC

Command Syntax

show vrf [**VRF_INSTANCE**]

Parameters

VRF_INSTANCE Specifies the VRF instance to display.

- ***no parameter*** Information is displayed for all VRFs.
- **vrf *vrf_name*** Information is displayed for the specified user-defined VRF.

Example

This command displays information for the VRF named ***purple***.

```
switch>show vrf purple
Vrf      RD          Protocols  State       Interfaces
-------- ----------- ---------- ----------- --------------
purple   64496:237   ipv4       no routing  Vlan42, Vlan43

switch>
```

13.1.16.81 tcp mss ceiling

The **tcp mss ceiling** command configures the Maximum Segment Size (MSS) limit in the TCP header on the configuration mode interface and enables TCP MSS clamping.

The **no tcp mss ceiling** and the **default tcp mss ceiling** commands remove any MSS ceiling limit previously configured on the interface.

Note: Configuring a TCP MSS ceiling on any Ethernet or tunnel interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

Command Mode

Interface-Ethernet Configuration

Subinterface-Ethernet Configuration

Interface-Port-channel Configuration

Subinterface-Port-channel Configuration

Interface-Tunnel Configuration

Interface-VLAN Configuration

Command Syntax

tcp mss ceiling {ipv4 *segment size* | ipv6 *segment size*}{egress | ingress}

no tcp mss ceiling

default tcp mss ceiling

Parameters

- **ipv4** ***segment size*** The IPv4 segment size value in bytes. Values range from **64** to **65515**.
- **ipv6** ***segment size*** The IPv6 segment size value in bytes. Values range from **64** to **65495**. This option is not supported on Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+).
- **egress** The TCP SYN packets that are forwarded from the interface to the network.
- **ingress** The TCP SYN packets that are received from the network to the interface. Not supported on Sand platform switches.

Guidelines

- On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), this command works only for egress, and is supported only on IPv4 unicast packets entering the switch.
- Clamping can only be configured in one direction per interface and works only on egress on Sand platform switches.
- To configure ceilings for both IPv4 and IPv6 packets, both configurations must be included in a single command; re-issuing the command overwrites any previous settings.
- Clamping configuration has no effect on GRE transit packets.

Example

These commands configure ***interface ethernet 5*** as a routed port, then specify a maximum MSS ceiling value of ***1458*** bytes in TCP SYN packets exiting that port. This enables TCP MSS clamping on the switch.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
```

```
switch(config-if-Et5)#
```

13.1.16.82 tunnel

The **tunnel** command configures options for protocol-over-protocol tunneling. Because interface-tunnel configuration mode is not a group change mode, ***running-config*** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no tunnel** command deletes the specified tunnel configuration.

Command Mode

Interface-tunnel Configuration

Command Syntax

tunnel *options*

no tunnel *options*

Parameters

- ***options*** Specifies the various tunneling options as listed below.
  - **destination** Destination address of the tunnel.
  - **ipsec** Secures the tunnel with the IPsec address.
  - **key** Sets the tunnel key.
  - **mode** Tunnel encapsulation method.
  - **path-mtu-discovery** Enables the Path MTU discovery on tunnel.
  - **source** Source of the tunnel packets.
  - **tos** Sets the IP type of service value.
  - **ttl** Sets time to live value.
  - **underlay** Tunnel underlay.

Example

These commands place the switch in interface-tunnel configuration mode for ***interface Tunnel 10*** and with GRE tunnel configured on the interfaces specified.

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

13.1.16.83 vrf (Interface mode)

The **vrf** command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the vrf instance command.

The **no vrf** and **default vrf** commands remove the configuration mode interface from the specified VRF by deleting the corresponding **vrf** command from ***running-config***.

All forms of the **vrf** command remove all IP addresses associated with the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

vrf [*vrf_name*]

no vrf [*vrf_name*]

default vrf [*vrf_name*]

Parameters

vrf_name Name of configured VRF.

Examples

- These commands add the configuration mode interface (***vlan 20***) to the VRF named ***purple***.

```
switch(config)#interface vlan 20
switch(config-if-Vl20)#vrf purple
switch(config-if-Vl20)#
```

- These commands remove the configuration mode interface from VRF ***purple***.

```
switch(config)#interface vlan 20
switch(config-if-Vl20)#no vrf purple
switch(config-if-Vl20)#
```

13.1.16.84 vrf instance

The **vrf instance** command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the **vrf (Interface mode)** command.

The **no vrf instance** and **default vrf instance** commands delete the specified VRF instance by removing the corresponding **vrf instance** command from ***running-config***. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

vrf instance [*vrf_name*]

no vrf instance [*vrf_name*]

default vrf instance [*vrf_name*]

Parameters

vrf_name Name of VRF being created, deleted or configured. The names ***main*** and ***default*** are reserved.

Example

This command creates a VRF named ***purple*** and places the switch in VRF configuration mode for that VRF.

```
switch(config)#vrf instance purple
switch(config-vrf-purple)#
```

13.2 IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv6 and includes these topics:

- Introduction
- IPv6 Description
- Configuring IPv6
- IPv6 Commands

13.2.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP version 4 (IPv4) and IP version 6 (IPv6).

IPv6 is described by ***RFC 2460: Internet Protocol, Version 6 (IPv6) Specification***. ***RFC 2463*** describes ICMPv6 for IPv6. ICMPv6 is a core protocol of the Internet Protocol suite.

13.2.2 IPv6 Description

Internet Protocol version 6 is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

- IPv6 Address Format
- IPv6 DHCP Snooping
- Neighbor Discovery Protocol

13.2.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

Example

The following three IPv6 hexadecimal number representations refer to the same address:

```
d28e:0000:0000:0000:0234:812f:61ed:4419
d28e:0:0:0:234:812f:61ed:4419
d28e::234:812f:61ed:4419
```

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- A 64-bit network prefix that identifies the network segment.
- A 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address:

- Global address: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. The following figure depicts the switch's link local address derivation method.

Figure 28: Link Local Address Derivation

Multicast Addressing

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.

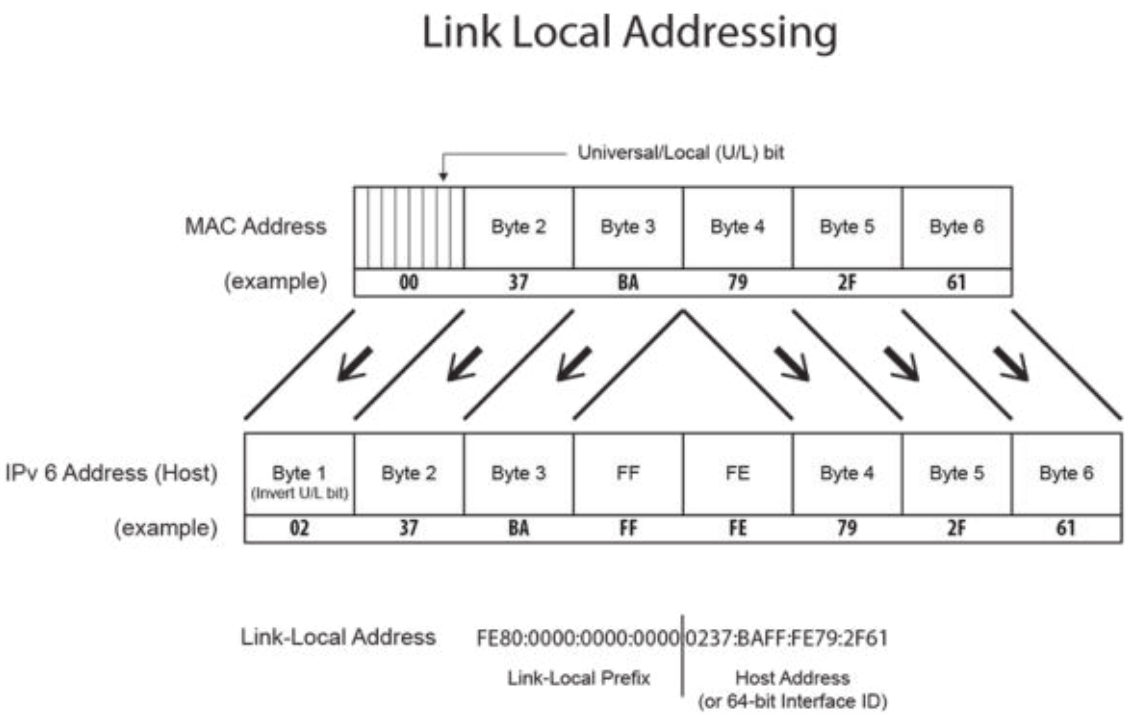

Figure 29: Link Local Address Derivation

A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain Layer 2 link-layer addresses of other nodes.

13.2.2.2 IPv6 DHCP Snooping

Dynamic Host Configuration Protocol (DHCP) snooping is a Layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-id information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-id) along with the physical interface name and VLAN number (remote-id) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

13.2.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (***RFC 4861***) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

13.2.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- Configuring IPv6 on the Switch
- Configuring IPv6 on an Interface
- Configuring IPv6 DHCP Snooping
- Viewing IPv6 Network Components
- DHCP Relay Agent for IPv6
- TCP MSS Clamping for IPv6

13.2.3.1 Configuring IPv6 on the Switch

13.2.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The **ipv6 unicast-routing** command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing
switch(config)#
```

13.2.3.1.2 Configuring Default and Static IPv6 Routes

The **ipv6 route** command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

Example

This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is ***::/0***. The default route destination is referred to as the default gateway.

Example

This command creates a default route and establishes ***fd7a:629f:52a4:fe61::2*** as the default gateway address.

```
switch(config)#ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```

13.2.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. **Equal Cost Multipath Routing (ECMP) and Load Sharing** describes resilient ECMP. The **ipv6 hardware fib ecmp resilience** command implements IPv6 resilient ECMP.

Example

This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address ***2001:db8:0::/64***. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity
 5
redundancy 3
switch(config)#
```

13.2.3.2 Configuring IPv6 on an Interface

13.2.3.2.1 Enabling IPv6 on an Interface

The **ipv6 enable** command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The no **ipv6 enable** command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

Example

This command enables IPv6 on ***VLAN interface 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```

13.2.3.2.2 Assigning an IPv6 Address to an Interface

The **ipv6 address** command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

Example

These commands configure an IPv6 address with subnet mask for ***VLAN 200***:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31::1:32:93/64
switch(config-if-Vl200)#
```

13.2.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:

- determine Layer 2 addresses for neighbors known to reside on attached links.
- detect changed Layer 2 addresses.
- purge invalid values from the neighbor cache table.
- (hosts) find neighboring routers to forward packets.
- track neighbor reachability status.

IPv6 Neighbor Discovery is defined by ***RFC 2461***. IPv6 Stateless Address Autoconfiguration is described by ***RFC 2462***.

The following sections describe Neighbor Discovery configuration tasks.

13.2.3.2.3.1Reachable Time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

Example

These commands configure the entry of ***25000*** (25 seconds) in the reachable time field of RAs sent from ***VLAN 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
switch(config-if-Vl200)#show active
   interface Vlan200
   ipv6 address fd7a:4321::1/64
   ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

13.2.3.2.3.2Router Advertisement Interval

The **ipv6 nd ra interval** command configures the interval between IPv6 RA transmissions from the configuration mode interface.

Example

These commands configure a RA transmission interval of ***60*** seconds on ***VLAN interface 200***, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
   ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.3.2.3.3Router Lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the ***router lifetime*** field of IPv6 RAs sent from the configuration mode interface.

If the value is set to ***0***, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than ***0*** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is ***0***, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

Example

This command configures the switch to enter ***2700*** in the router lifetime field of RAs transmitted from ***vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan200
   ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.3.2.3.4Router Advertisement Prefix

The **ipv6 nd prefix** command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface's RAs. The **ipv6 nd prefix** command with the **no-advertise** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration

includes at least one **ipv6 nd prefix** command that enables prefix advertising, RAs advertise only prefixes specified through **ipv6 nd prefix** commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are ***2,592,000*** (valid) and ***604,800*** (preferred) seconds.

Example

These commands enable neighbor discovery advertising for IPv6 address ***3012:D678::/64***, specifying a valid lifetime of ***1,296,000*** seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

13.2.3.2.3.5Router Advertisement Suppression

The **ipv6 nd ra disabled** command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example

This command suppresses all RAs on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.3.2.3.6Router Advertisement MTU Suppression

The **ipv6 nd ra mtu suppress** command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

Example

This command suppresses the MTU option on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.3.2.3.7Router Advertisement Flag Configuration

The following commands sets the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The **ipv6 nd managed-config-flag** command sets the **managed address configuration** flag. This bit instructs hosts to use stateful address autoconfiguration.
- The **ipv6 nd managed-config-flag** command sets the other **stateful configuration** flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the **managed address configuration** flag is set.
- These commands configure the switch to set the **managed address configuration** flag in advertisements sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
```

```
switch(config-if-Vl200)#
```

- These commands configure the switch to set the **other stateful configuration** flag in advertisements sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is **medium**.

Example

This command configures the switch as a medium preference router on RAs sent from ***vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

13.2.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. **Unicast Reverse Path Forwarding (uRPF)** describes uRPF. uRPF is enabled for IPv6 packets entering the configuration mode interface through the **ipv6 verify** command.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

Example

This command enables uRPF strict mode on ***interface vlan 100***. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx
 allow-default
switch(config-if-Vl100)#show active
 interface Vlan100
   ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.3.3 Configuring IPv6 DHCP Snooping

13.2.3.3.1 Enabling IPv6 DHCP Snooping on the Switch

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a Layer 2 feature that can be configured on LAN switches. The Arista switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

Note: DHCPv6 VLAN classification and DHCPv4 VLAN classification share same hardware resource.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)#ipv6 dhcp snooping
switch(config)#ipv6 dhcp snooping remote-id option
switch(config)#ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)#ipv6 dhcp snooping
switch(config)#show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.3.4 Viewing IPv6 Network Components

13.2.3.4.1 Displaying RIB Route Information

Use the **show rib route ipv6** command view the IPv6 Routing Information Base (RIB) information.

Example

This command displays IPv6 RIB BGP routes.

```
switch#show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
 B    2001:10:1::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100::/64 [200/200]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:1::/64 [200/0]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:2::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected

switch#
```

13.2.3.4.2 Displaying the FIB and Routing Table

The **show ipv6 route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

Example

This command displays a route table entry for a specific IPv6 route.

```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
     via f180::21c:73ff:fe00:1319, Vlan3601
     via f180::21c:73ff:fe00:1319, Vlan3602
     via f180::21c:73ff:fe00:1319, Vlan3608
     via f180::21c:73ff:fe0f:6a80, Vlan3610
     via f180::21c:73ff:fe00:1319, Vlan3611

switch>
```

13.2.3.4.3 Displaying the Route Age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

Example

This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

13.2.3.4.4 Displaying Host Routes

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = ***/128***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch#show ipv6 route host
R - receive F - FIB, A - attached

 F  ::1 to cpu
```

```
 A  fee7:48a2:0c11:1900:400::1 on Vlan102
 R  fee7:48a2:0c11:1900:400::2 to cpu
 F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
 R  fee7:48a2:0c11:1a00::17 to cpu
 F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
 F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                            via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch#
```

13.2.3.4.5 Displaying Route Summaries

The **show ipv6 route summary** command displays the current number of routes of the IPv6 routing table in summary format.

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source    Number Of Routes
----------------- ----------------
   connected                    2
   static                       0
   ospf                         5
   bgp                          7
   isis                         0
   internal                     1
   attached                     0
   aggregate                    2

   Total Routes                 17
switch>
```

13.2.3.5 DHCP Relay Agent for IPv6

13.2.3.5.1 Configuring IPv6 DHCP Relay

13.2.3.5.1.1Configuring the IPv6 DHCP Relay Agent (Global)

The **ipv6 dhcp relay always-on** command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status ond any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an **ipv6 dhcp relay destination** statement.

Example

This command enables the DHCP relay agent.

```
switch(config)#ipv6 dhcp relay always-on
switch(config)#
```

13.2.3.5.1.2Configuring DHCP for IPv6 Relay Agent

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

Example

This command enables the DHCPv6 relay agent function and sets the client message destination address to ***2001:0db8:0:1::1*** on Ethernet interface ***4***.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)
```

13.2.3.5.1.3Configuring the Client Link Layer Address for the IPv6 DHCP Relay Agent

The **ipv6 dhcp relay option link-layer address** command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode. The **no ipv6 dhcp relay option link-layer address** command disables the link layer address option (79) in the global configuration mode.

Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)#ipv6 dhcp relay option link-layer address
```

13.2.3.5.1.4Clearing IPv6 DHCP Relay Counters

The **clear ipv6 dhcp relay counters** command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- **Global configuration:** command clears the counters for the switch and for all interfaces.
- **Interface configuration:** command clears the counter for the configuration mode interface.

Examples

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)#exit
switch(config)#clear ipv6 dhcp relay counters
switch(config)#
```

- These commands clear the DHCP relay counters for ***interface ethernet 4***.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#clear ipv6 dhcp relay counters
switch(config)#
```

13.2.3.5.2 Viewing IPv6 DHCP Relay Information

13.2.3.5.2.1IPv6 DHCP Status

The **show ip dhcp relay** command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example

This command displays the DHCP Agent Relay parameter status.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
```

```
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet1/2
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et1/2)#
```

13.2.3.5.2.2IPv6 DHCP Relay Counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Example

This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters

           |  Dhcp Packets  |
Interface  | Rcvd Fwdd Drop |          Last Cleared
-----------|----- ---- -----|----------------------
  All Req  |  376  376    0 | 4 days, 19:55:12 ago
 All Resp  |  277  277    0 |
           |                |
Ethernet4  |  207  148    0 | 4 days, 19:54:24 ago

switch>
```

13.2.3.6 TCP MSS Clamping for IPv6

TCP MSS clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

13.2.3.6.1 Configuring the TCP MSS Ceiling on an IPv6 Interface

The TCP MSS ceiling limit is set on an interface using command **`tcp mss ceiling ipv6`**. This also enables TCP MSS clamping on the switch.

Note: Clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured without any hardware support. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On platform switches ***DCS-7280R3, DCS-7500R3 Line Cards and DCS-7800R3 Line Cards***, the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on unicast packets entering the switch; the configuration has no effect on GRE transit packets.

- It is not supported on L2 (switchport) interfaces.
- This is not supported on VXLAN, Loopback or management interfaces.
- This is only supported on unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.
- This cannot co-exist with Policy Based Routing (PBR) on switches running releases ***EOS-4.21.5F*** or older.
- Only hardware TCP MSS clamping is supported from release ***EOS-4.26.1F***.

Example

These commands configure ***interface ethernet 26*** as a routed port, then specify a maximum MSS ceiling value of ***1436*** bytes for TCP SYN packets exiting that port.

```
switch(config)#interface ethernet 26
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv6 1436 egress
switch(config-if-Et5)#
```

13.2.4 IPv6 Commands

Global Configuration Commands

- ipv6 dhcp relay always-on
- ipv6 dhcp relay option link-layer address
- ipv6 hardware fib aggregate-address
- ipv6 hardware fib ecmp resilience
- ipv6 hardware fib nexthop-index
- ipv6 neighbor
- ipv6 neighbor cache persistent
- ipv6 route
- ipv6 unicast-routing

Interface Configuration Commands

- ipv6 address
- ipv6 dhcp relay destination
- ipv6 dhcp snooping
- ipv6 enable
- ipv6 nd managed-config-flag
- ipv6 nd ns-interval
- ipv6 nd other-config-flag
- ipv6 nd prefix
- ipv6 nd ra dns-server
- ipv6 nd ra dns-servers lifetime
- ipv6 nd ra dns-suffix
- ipv6 nd ra dns-suffixes lifetime
- ipv6 nd ra hop-limit
- ipv6 nd ra interval
- ipv6 nd ra lifetime
- ipv6 nd ra mtu suppress
- ipv6 nd ra disabled
- ipv6 nd reachable-time
- ipv6 nd router-preference
- ipv6 verify
- pim ipv6 sparse-mode

Privileged EXEC Commands

- clear ipv6 dhcp relay counters
- clear ipv6 dhcp snooping counters
- clear ipv6 neighbors

EXEC Commands

- show ipv6 dhcp relay counters
- show ipv6 dhcp snooping
- show ipv6 dhcp snooping counters
- show ipv6 dhcp snooping hardware
- show ipv6 hardware fib aggregate-address
- show ipv6 interface

- show ipv6 nd ra internal state
- show ipv6 neighbors
- show ipv6 route
- show ipv6 route age
- show ipv6 route host
- show ipv6 route interface
- show ipv6 route match tag
- show ipv6 route summary
- show rib route ipv6

13.2.4.1 clear ipv6 dhcp relay counters

The **clear ipv6 dhcp relay counters** command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 dhcp relay counters [**PORT**]

Parameters

PORT Interface through which neighbor is accessed. Options include:

- ***no parameter*** all dynamic entries are removed.
- **interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **interface loopback *l_num*** Loopback interface specified by ***l_num***.
- **interface port-channel *p_num*** Port-channel interface specified by ***p_num p_num***.
- **interface vlan *v_num*** VLAN interface specified by ***v_num***.

Example

These commands clear the DHCP relay counters for ***interface ethernet 4*** and shows the counters before and after the **clear** command.

```
switch(config)#show ipv6 dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
Ethernet4 |  207  148    0 | 4 days, 19:54:24 ago

switch(config)#interface ethernet 4
switch(config-if-Et4)#clear ipv6 dhcp relay counters

          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  380  380    0 | 4 days, 21:19:17 ago
 All Resp |  281  281    0 |
          |                |
Ethernet4 |    0    0    0 |4 days, 21:18:30 ago
These commands clear all DHCP relay counters on the switch.
switch(config-if-Et4)#exit

switch(config)#clear ipv6 dhcp relay counters

switch(config)#show ipv6 dhcp relay counters
          |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop | Last Cleared
----------|----- ---- -----|-------------
  All Req |    0    0    0 |  0:00:03 ago
 All Resp |    0    0    0 |
          |                |
Ethernet4 |    0    0    0 | 0:00:03 ago
switch(config)#
```

13.2.4.2 clear ipv6 dhcp snooping counters

The **clear ipv6 dhcp snooping counters** command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 dhcp snooping counters [**COUNTER_TYPE**]

Parameters

- **COUNTER_TYPE** The type of counter that the command resets.
- ***no parameter*** command clears the counters for each VLAN.
- **debug** command clears aggregate counters and drop cause counters.

Examples

- This command clears the number of DHCP packets sent and received on each VLAN.

```
switch#clear ipv6 dhcp snooping counters
switch# show ipv6 dhcp snooping counters

     | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
Vlan |  Rcvd   Fwdd   Drop |  Rcvd  Fwdd  Drop | Last Cleared
-----|------ ------ -------|------ ----- ------|-------------
2789 |     1      1      0 |     1     1     0 |  0:03:09 ago
```

- This command clears the number of DHCP packets sent on the switch.

```
switch#clear ipv6 dhcp snooping counters debug
switch#show ipv6 dhcp snooping counters debug

Counter                        Snooping to Relay Relay to Snooping
------------------------------ ----------------- -----------------
Received                                       1                 1
Forwarded                                      1                 1
Dropped - Invalid VlanId                       0                 0
Dropped - Parse error                          0                 0
Dropped - Invalid Dhcp Optype                  0                 0
Dropped - Invalid Remote-ID Option             0                 0
Dropped - Snooping disabled                    0                 0

Last Cleared:  0:04:29 ago
```

13.2.4.3 clear ipv6 neighbors

The **clear ipv6 neighbors** command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

Command Mode

Privileged EXEC

Command Syntax

clear ipv6 neighbors [**PORT**][**DYNAMIC_IPV6**]

Parameters

- **PORT** Interface through which neighbor is accessed. Options include:
  - ***no parameter*** all dynamic entries are removed.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **DYNAMIC_IPV6** Address of entry removed by the command. Options include:
  - ***no parameter*** All dynamic entries for specified interface are removed.
  - ***ipv6_addr*** IPv6 address of entry.

Example

This command removes all dynamic neighbor entries for ***vlan 200***.

```
switch#clear ipv6 neighbors vlan 200
switch#
```

13.2.4.4 ipv6 address

The **ipv6 address** command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The **no ipv6 address** and **default ipv6 address** commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding **ipv6 address** command from ***running-config***. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an **ipv6 enable** command is configured on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 address [*ipv6_prefix*]

no ipv6 address [*ipv6_prefix*]

default ipv6 address [*ipv6_prefix*]

Parameter

ipv6_prefix address assigned to the interface (CIDR notation).

Guidelines

This command is supported on routable interfaces.

Example

These commands configure an IPv6 address and prefix length for ***vlan 200***:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/64
switch(config-if-Vl200)#
```

13.2.4.5 ipv6 dhcp relay always-on

The **iv6p dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an **ipv6 dhcp relay destination** statement.

The **no ipv6 dhcp relay always-on** and **default ipv6 dhcp relay always-on** commands remove the **ipv6 dhcp relay always-on** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp relay always-on

no ipv6 dhcp relay always-on

default ipv6 dhcp relay always-on

Example

This command enables the DHCP relay agent.

```
switch(config)#ipv6 dhcp relay always-on
switch(config)#
```

13.2.4.6 ipv6 dhcp relay destination

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **no ipv6 dhcp relay destination** and **default ipv6 dhcp relay destination** commands remove the corresponding **ipv6 dhcp relay destination** command from ***running-config***. When the commands do not list an IPv6 address, all **ipv6 dhcp relay destination** commands are removed from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 dhcp relay destination [*ipv6_addr*][*source-address ipv6_addr*]

no ipv6 dhcp relay destination [*ipv6_addr*]

default ipv6 dhcp relay destination [*ipv6_addr*]

Parameters

- ***ipv6_addr*** DCHP Server's IPv6 address.
- **source-address *ipv6_addr*** specify the source IPv6 address to communicate with DHCP server.

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Example

This command enables the DHCPv6 relay agent and sets the destination address to ***2001:0db8:0:1::1*** on ***interface ethernet 4***.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et4)#
```

13.2.4.7 ipv6 dhcp relay option link-layer address

The **ipv6 dhcp relay option link-layer address** command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The **no ipv6 dhcp relay option link-layer address** command disables the link layer address option (79) in the global configuration mode.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp relay option link-layer address

no ipv6 dhcp relay option link-layer address

default ipv6 dhcp relay option link-layer address

Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)#ipv6 dhcp relay option link-layer address
```

13.2.4.8 ipv6 enable

The **ipv6 enable** command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The **no ipv6 enable** and **default ipv6 enable** command remove the corresponding **ipv6 enable** command from ***running-config***. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 enable

no ipv6 enable

default ipv6 enable

Example

This command enables IPv6 on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```

13.2.4.9 ipv6 hardware fib aggregate-address

The **ipv6 hardware fib aggregate-address** command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The **no ipv6 hardware fib aggregate-address** and **default ipv6 hardware fib aggregate-address** commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding **ipv6 hardware fib aggregate-address** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib aggregate-address *ipv6_prefix* summary-only software-forward

no ipv6 hardware fib aggregate-address *ipv6_prefix*

default ipv6 hardware fib aggregate-address *ipv6_prefix*

Parameters

ipv6_prefix IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

Example

These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)#ipv6 hardware fib aggregate-address fd77:4890:531
3:ffed::/64
summary-only software-forward
switch(config)#show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:ffed::/64

switch(config)#
```

13.2.4.10 ipv6 hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib ecmp resilience *net_prfx* capacity *nhop_max* redundancy *duplicates*

no ipv6 hardware fib ecmp resilience *net_addr*

default ipv6 hardware fib ecmp resilience *net_addr*

Parameters

- ***net_prfx*** IPv6 address prefix managed by command.
- ***nhop_max*** Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: <**2** to **64**>
  - Trident: <**2** to **32**>
  - Trident II: <**2** to **64**>
- ***duplicates*** Specifies the redundancy factor. Value ranges from ***1*** to ***128***.

Example

This command configures a hardware ECMP table space of 15 entries for the IPv6 address ***2001:db8:0::/64***. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity
 5 redundancy 3
```

13.2.4.11 ipv6 hardware fib nexthop-index

The **ipv6 hardware fib nexthop-index** command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route's ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- **Next hop index:** specified in the command.
- **Prefix offset:** the least significant bits of the route's prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The **no ipv6 hardware fib nexthop-index** and **default ipv6 hardware fib nexthop-index** commands remove the specified nexthop used for ECMP routes by removing the **ipv6 hardware fib nexthop-index** command from ***running-config*** .

Command Mode

Global Configuration

Command Syntax

ipv6 hardware fib nexthop *nxthop_index* [**PREFIX**]

no ipv6 hardware fib nexthop

default ipv6 hardware fib nexthop

Parameters

- ***nxthop_index*** specifies the next hop index. Value ranges from ***0*** to ***32***.
- **PREFIX** Number of bits of the route's prefix to use as the prefix-offset. Value ranges from ***0*** to ***64***.
  - ***no parameter*** The prefix offset is set to zero.
  - **prefix-bits *0 to 64*** Specifies the number bits to use as the prefix-offset.

Example

This command specifies the next hop from the list of ECMP next hops for the route.

```
switch(config)#ipv6 hardware fib nexthop-index 5 prefix-bits 10
switch>show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10
switch>
```

13.2.4.12 ipv6 nd managed-config-flag

The **ipv6 nd managed-config-flag** command causes the **managed address configuration** flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The **no ipv6 nd managed-config-flag** and **default ipv6 nd managed-config-flag** commands restore the default setting where the **managed address configuration** flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding **ipv6 nd managed-config-flag** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd managed-config-flag

no ipv6 nd managed-config-flag

default ipv6 nd managed-config-flag

Example

These commands cause the managed address configuration flag to be set in IPv6 RA packets sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```

13.2.4.13 ipv6 nd ns-interval

The **ipv6 nd ns-interval** command configures the interval between IPv6 Neighbor Solicitation (NS) transmissions from the configuration mode interface.

The **no ipv6 nd ns-interval** and **default ipv6 nd ns-interval** commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of 1000 milliseconds by removing the corresponding **ipv6 nd ns-interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ns-interval *period* no ipv6 nd ns-interval

default ipv6 nd ns-interval

Parameter

period interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from ***1000*** to ***4294967295***. The default period is ***1000*** milliseconds.

Example

This command configures a neighbor solicitation transmission interval of ***30*** seconds on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ns-interval 30000
switch(config-if-Vl200)#
```

13.2.4.14 ipv6 nd other-config-flag

The **ipv6 nd other-config-flag** command configures the configuration mode interface to send IPv6 RAs with the **other stateful configuration** flag set.

The **no ipv6 nd other-config-flag** and **default ipv6 nd other-config-flag** commands restore the default setting by removing the corresponding **ipv6 nd other-config-flag** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd other-config-flag

no ipv6 nd other-config-flag

default ipv6 nd other-config-flag

Example

These commands configure the switch to set the other stateful configuration flag in advertisements sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.4.15 ipv6 nd prefix

The **ipv6 nd prefix** command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as **IPv6 addresses** are advertised in the interface's RAs. The **ipv6 nd prefix** command with the ***no-advertise*** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one **ipv6 nd prefix** command that enables prefix advertising, RAs advertise only prefixes specified through **ipv6 nd prefix** commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are ***2,592,000*** (valid) and ***604,800*** (preferred) seconds.

The **no ipv6 nd prefix** and **default ipv6 nd prefix** commands remove the corresponding **ipv6 nd prefix** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd prefix *ipv6_prefix* **LIFETIME** [**FLAGS**]

ipv6 nd prefix *ipv6_prefix* no-advertise

no ipv6 nd prefix *ipv6_prefix*

default ipv6 nd prefix *ipv6_prefix*

Parameters

- ***ipv6_prefix*** IPv6 prefix (CIDR notation).
- **no-advertise** Prevents advertising of the specified prefix.
- **LIFETIME** Period that the specified IPv6 prefix is advertised (seconds). Options include:
  - **valid preferred** Two values that set the *valid* and *preferred* lifetime periods.
  - **valid** One value that sets the *valid* lifetime. The *preferred* lifetime is set to the default value.
  - ***no parameter*** The *valid* and *preferred* lifetime periods are set to their default values.

Options for **valid**: **0 to 4294967295** and **infinite**. Default value is ***2592000*** Options for **preferred**: **0 to 4294967295** and **infinite**. The default value is ***604800***. The maximum value (***4294967295***) and **infinite** are equivalent settings.

- **FLAGS** **on-link** and **autonomous address-configuration** flag values in RAs.
  - ***no parameter*** both flags are set.
  - **no-autoconfig** **autonomous address-configuration** flag is reset.
  - **no-onlink** **on-link** flag is reset.
  - **no-autoconfig no-onlink** both flags are reset.
  - **no-onlink no-autoconfig** both flags are reset.

Example

These commands enable neighbor discovery advertising for IPv6 address ***3012:D678::/64***, on ***interface vlan 200***, specifying a valid lifetime of ***1,296,000*** seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
```

13.2.4.16 ipv6 nd ra disabled

The **ipv6 nd ra disabled** command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

The **no ipv6 nd ra disabled** and **default ipv6 nd ra disabled** commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding **ipv6 nd ra disabled** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra disabled [**SCOPE**]

no ipv6 nd ra disabled

default ipv6 nd ra disabled

Parameters

SCOPE specifies the RAs that are suppressed.

- ***no parameter*** Periodic unsolicited RAs are suppressed.
- **all** All RAs are suppressed.

Example

This command suppresses all RAs on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.4.17 ipv6 nd ra dns-server

The **ipv6 nd ra dns-server** command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the **ipv6 nd ra dns-servers lifetime** command.

The **no ipv6 nd ra dns-server** and **default ipv6 nd ra dns-server** commands remove the corresponding **ipv6 nd ra dns-server** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-server *ipv6_addr* **SERVER_LIFE**

no ipv6 nd ra dns-server *ipv6_addr*

default ipv6 nd ra dns-server *ipv6_addr*

Parameters

- ***ipv6_addr*** RDNSS address to be included in RAs from the command mode interface.
- **SERVER_LIFE** maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - ***no parameter*** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the **ipv6 nd ra interval** command.
  - **lifetime 0** the configured RDNSS is not to be used.
  - **lifetime *1 to 4294967295*** specifies the lifetime period for this RDNSS in seconds.

Example

This command configures the RDNSS at ***2001:0db8:0:1::1*** as a preferred RDNSS for ***interface vlan 200*** to include in its neighbor-discovery route advertisements, and sets its lifetime value to ***300*** seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime
 300
switch(config-if-Vl200)#
```

13.2.4.18 ipv6 nd ra dns-servers lifetime

The **ipv6 nd ra dns-servers lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The **no ipv6 nd ra dns-servers lifetime** and **default ipv6 nd ra dns-servers lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-servers lifetime** command from ***running-config***. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-servers lifetime *period*

no ipv6 nd ra dns-servers lifetime

default ipv6 nd ra dns-servers lifetime

Parameters

period the RDNSS lifetime value for the configuration mode interface. Options include:

- ***0*** any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
- ***1 to 4294967295*** maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-server** command. Should be between the router advertisement interval configured on the interface and two times that interval.

Example

This command sets the default RDNSS maximum lifetime value for ***vlan 200*** to ***350*** seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-servers lifetime 350
switch(config-if-Vl200)#
```

13.2.4.19 ipv6 nd ra dns-suffix

The **ipv6 nd ra dns-suffix** command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106 . The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the **ipv6 nd ra dns-suffixes lifetime** command.

The **no ipv6 nd ra dns-suffix** and **default ipv6 nd ra dns-suffix** commands remove the corresponding **ipv6 nd ra dns-suffix** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-suffix *domain* **SUFFIX_LIFE**

no ipv6 nd ra dns-suffix *ipv6_addr*

default ipv6 nd ra dns-suffix *ipv6_addr*

Parameters

- ***domain*** domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, "**.**" and "**-**" and must begin and end with an alphanumeric character.
- **SUFFIX_LIFE** maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - ***no parameter*** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the ipv6 nd ra interval command.
  - **lifetime 0** the configured domain suffix is not to be used.
  - **lifetime *1 to 4294967295*** specifies the lifetime period for this domain suffix in seconds.

Example

These commands create a DNSSL for ***interface vlan 200*** to include in its neighbor-discovery route advertisements, and set its lifetime value to ***300*** seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```

13.2.4.20 ipv6 nd ra dns-suffixes lifetime

The **ipv6 nd ra dns-suffixes lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The **no ipv6 nd ra dns-suffixes lifetime** and **default ipv6 nd ra dns-suffixes lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-suffixes lifetime** command from ***running-config***. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra dns-suffixes lifetime *period*

no ipv6 nd ra dns-suffixes lifetime

default ipv6 nd ra dns-suffixes lifetime

Parameters

period the DNSSL lifetime value for the configuration mode interface. Options include:

- ***0*** any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
- ***1 to 4294967295*** maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-suffix** command. Should be between the RA interval configured on the interface and two times that interval.

Example

This command sets the default DNSSL maximum lifetime value for ***interface vlan 200*** to ***350*** seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```

13.2.4.21 ipv6 nd ra hop-limit

The **ipv6 nd ra hop-limit** command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The **no ipv6 nd ra hop-limit** and **default ipv6 nd ra hop-limit** commands remove the corresponding **ipv6 nd ra hop-limit** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra hop-limit *quantity*

no ipv6 nd ra hop-limit lifetime

default ipv6 nd ra hop-limit lifetime

Parameters

quantity the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:

- ***0*** indicates that outgoing packets from attached hosts are to be immediately discarded.
- ***1 to 255*** number of hops. The default value is ***64***.

Example

These commands include a hop-limit value of ***100*** in RA packets sent by ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```

13.2.4.22 ipv6 nd ra interval

The **ipv6 nd ra interval** command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The **no ipv6 nd ra interval** and **default ipv6 nd ra interval** commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of ***200*** seconds by removing the corresponding **ipv6 nd ra interval** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra interval [**SCALE**] *ra_period* [*minimum_period*]

no ipv6 nd ra interval

default ipv6 nd ra interval

Parameters

- **SCALE** timescale in which command parameter values are expressed.
  - ***no parameter*** seconds.
  - **msec** milliseconds.
- ***ra_period*** maximum interval between successive IPv6 RA transmissions. The default period is ***200*** seconds.
  - ***4 - 1800*** valid range when **SCALE** is set to default value (seconds).
  - ***500 - 1800000*** valid range when **SCALE** is set to **msec**.
- ***minimum_period*** minimum interval between successive IPv6 RA transmissions. Must be smaller than ***ra_period***. By default, a minimum period is not defined.
  - ***no parameter*** Command does not specify a minimum period.
  - ***3 - 1799*** valid range when **scale** is set to default value (seconds).
  - ***375 - 1799999*** valid range when **scale** is set to **msec**.

Example

These commands configure a RA transmission interval of ***60*** seconds on VLAN interface ***interface vlan 200***, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
   ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.4.23 ipv6 nd ra lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the **router lifetime** field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to ***0***, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than ***0*** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is ***0***, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The **no ipv6 nd ra lifetime** and **default ipv6 nd ra lifetime** commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of ***1800*** seconds by removing the corresponding **ipv6 nd ra lifetime** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra lifetime *ra_lifetime*

no ipv6 nd ra lifetime

default ipv6 nd ra lifetime

Parameters

ra_lifetime router lifetime period (seconds). Default value is 1800. Options include:

- ***0*** Router should not be considered as a default router.
- ***1 - 65535*** Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the **ipv6 nd ra interval** command.

Example

This command configures the switch to enter ***2700*** in the router lifetime field of RAs transmitted from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan20
   ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.4.24 ipv6 nd ra mtu suppress

The **ipv6 nd ra mtu suppress** command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The **no ipv6 nd ra mtu suppress** and **default ipv6 nd ra mtu suppress** commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding **ipv6 nd ra mtu suppress** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd ra mtu suppress

no ipv6 nd ra mtu suppress

default ipv6 nd ra mtu suppress

Example

This command suppresses the MTU option on ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.4.25 ipv6 nd reachable-time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The **no ipv6 nd reachable-time** and **default ipv6 nd reachable-time** commands restore the entry of the default value (***0***) in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd reachable-time** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd reachable-time *period*

no ipv6 nd reachable-time

default ipv6 nd reachable-time

Parameter

period Reachable time value (milliseconds). Value ranges from ***0 to 4294967295***. Default is ***0***.

Example

These commands configure the entry of ***25000*** (25 seconds) in the reachable time field of RAs sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
interface Vlan200
   ipv6 address fd7a:4321::1/64
   ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

13.2.4.26 ipv6 nd router-preference

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is **medium**.

The **no ipv6 nd router-preference** and **default ipv6 nd router-preference** commands restore the switch to enter the default DRP field value of **medium** in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd router-preference** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 nd router-preference **RANK**

no ipv6 nd router-preference

default ipv6 nd router-preference

Parameters

RANK Router preference value. Options include:

- **high**
- **low**
- **medium**

Example

This command configures the switch as a medium preference router on RAs sent from ***interface vlan 200***.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

13.2.4.27 ipv6 neighbor cache persistent

The **ipv6 neighbor cache persistent** command restores the IPv6 neighbor cache after reboot.

The **no ipv6 neighbor cache persistent** and **default ipv6 neighbor cache persistent** commands remove the ARP cache persistant configuration from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 neighbor cache persistent

no ipv6 neighbor cache persistent

default ipv6 neighbor cache persistent

Example

This command restores the ipv6 neighbor cache after reboot.

```
switch(config)#ipv6 neighbor cache persistent
switch(config)#
```

13.2.4.28 ipv6 neighbor

The **ipv6 neighbor** command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The **no ipv6 neighbor** and **default ipv6 neighbor** commands remove the specified static entry from the IPV6 neighbor discovery cache and delete the corresponding **ipv6 neighbor** command from ***running-config***. These commands do not affect any dynamic entries in the cache.

Command Mode

Global Configuration

Command Syntax

ipv6 neighbor *ipv6_addr* **PORT** *mac_addr*

no ipv6 neighbor *ipv6_address* **PORT**

default ipv6 neighbor *ipv6_addr* **PORT**

Parameters

- ***ipv6_addr*** Neighbor's IPv6 address.
- **PORT** Interface through which the neighbor is accessed. Options include:
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
  - ***mac_addr*** Neighbor's data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

Example

This command will add a static entry to the neighbor discovery cache for the neighbor located at ***3100:4219::3EF2*** with hardware address ***0100.4EA1.B100*** and accessible through ***vlan 200***.

```
switch(config)#ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#
```

13.2.4.29 ipv6 route

The **ipv6 route** command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

The command provides these methods of designating the nexthop location:

- **null0:** Traffic to the specified destination is dropped.
- **IPv6 gateway:** Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface:** Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway:** Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The **no ipv6 route** and **default ipv6 route** commands delete static routes by removing the corresponding **ipv6 route** statements from ***running-config***. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

Command Mode

Global Configuration

Command Syntax

ipv6 route *dest_prefix* **NEXTHOP** [**DISTANCE**][**TAG_OPT**][**RT_NAME**]

no ipv6 route *dest_prefix* [*nexthop_addr*][**DISTANCE**]

default ipv6 route *dest_prefix* [*nexthop_addr*][**DISTANCE**]

Parameters

- ***dest_prefix*** Destination IPv6 prefix (CIDR notation).
- **NEXTHOP** Access method of next hop device. Options include:
  - **null0** Null0 interface – route is dropped.
  - ***nexthop_addr*** IPv6 address of nexthop device.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
  - **ethernet *e_num nexthop_addr*** Combination route (Ethernet interface and gateway).
  - **loopback *l_num nexthop_addr*** Combination route (loopback interface and gateway).
  - **management *m_num nexthop_addr*** Combination route (management interface and gateway).

    - **port-channel *p_num nexthop_addr*** Combination route (port channel interface and gateway).
    - **vlan *v_num nexthop_addr*** Combination route (VLAN interface and gateway).
    - **vxlan *vx_num nexthop_addr*** Combination route (VXLAN interface and gateway).
- **DISTANCE** administrative distance assigned to route. Options include:
    - ***no parameter*** route assigned default administrative distance of one.
    - ***1 to 255*** The administrative distance assigned to route.
- **TAG_OPT** static route tag. Options include:
    - ***no parameter*** assigns default static route tag of ***0***.
    - **tag *0 to 4294967295*** Static route tag value.
- **RT_NAME** Associates descriptive text to the route. Options include:
    - ***no parameter*** No text is associated with the route.
    - **name *descriptive_text*** The specified text is assigned to the route.

Example

This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```

13.2.4.30 ipv6 unicast-routing

The **ipv6 unicast-routing** command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The **no ipv6 unicast-routing** and default **ip ipv6 unicast-routing** commands disable IPv6 unicast routing by removing the **ipv6 unicast-routing** command from ***running-config***. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the **delete-static-routes** option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

ipv6 unicast-routing

no ipv6 unicast-routing [**DELETE_ROUTES**]

default ipv6 unicast-routing [**DELETE_ROUTES**]

Parameters

DELETE_ROUTES Resolves routing table static entries when routing is disabled.

- ***no parameter*** Routing table retains static entries.
- **delete-static-routes** Static entries are removed from the routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing
switch(config)#
```

13.2.4.31 ipv6 verify

The **ipv6 verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode**: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode**: uRPF validation does not consider the inbound packet's ingress interface.

The **no ipv6 verify** and **default ipv6 verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ipv6 verify** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 verify unicast source reachable-via **RPF_MODE**

no ipv6 verify unicast

default ipv6 verify unicast

Parameters

RPF_MODE Specifes the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent **ip verify** commands on any interface do not disable IPv6 routing.

Example

This command enables uRPF strict mode on ***interface vlan 100***. When a default route is configured on the interface, all inbound packets are checked as valid.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx
allow-default
switch(config-if-Vl100)#show active
 interface Vlan100
   ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.4.32 ipv6 dhcp snooping

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch.

The **no ipv6 dhcp snooping** and **default ipv6 dhcp snooping** commands disable global DHCP snooping by removing the ipv6 dhcp snooping command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

no ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

default ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]

Parameters

- **remote-id option** configures the remote ID option.
- **vlan** enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
- **$** end of range.
- **vlan-range** VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from ***1*** to ***4094***.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)#ipv6 dhcp snooping
switch(config)#ipv6 dhcp snooping remote-id option
switch(config)#ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)#ipv6 dhcp snooping
switch(config)# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.4.33 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Note: PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode** and **default pim ipv6 sparse-mode** commands restore the default PIM and IGMP (router mode) settings of ***disabled*** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel

Configuration Interface-VLAN Configuration

Command Syntax

pim ipv6 sparse-mode

no pim ipv6

no pim ipv6 sparse-mode

default pim ipv6

default pim ipv6 sparse-mode

Example

This command enables **pim ipv6 sparse-mode** on ***interface vlan 4*** interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv6 sparse-mode
switch(config-if-Vl4)#
```

13.2.4.34 show ipv6 dhcp relay counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp relay counters

Example

This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters
           |  Dhcp Packets  |
Interface | Rcvd Fwdd Drop |         Last Cleared
----------|----- ---- -----|---------------------
  All Req |  376  376    0 | 4 days, 19:55:12 ago
 All Resp |  277  277    0 |
          |                |
Ethernet4 |  207  148    0 | 4 days, 19:54:24 ago

switch>
```

13.2.4.35 show ipv6 dhcp snooping counters

The **show ipv6 dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping counters [**COUNTER_TYPE**]

Parameters

- **COUNTER_TYPE** The type of counter that the command displays.
- ***no parameter*** command displays counters for each VLAN.
- **debug** command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch#show ipv6 dhcp snooping counters

     | Dhcpv6 Request Pkts | Dhcpv6 Reply Pkts |
Vlan |  Rcvd   Fwdd   Drop |  Rcvd  Fwdd  Drop | Last Cleared
-----|------ ------ -------|------ ----- ------|-------------
2789 |     1      1      0 |     1     1     0 |  0:03:09 ago
```

- This command displays the number of DHCP packets sent on the switch.

```
switch#show ipv6 dhcp snooping counters debug

Counter                         Snooping to Relay Relay to Snooping
------------------------------ ----------------- -----------------
Received                                        1                 1
Forwarded                                       1                 1
Dropped - Invalid VlanId                        0                 0
Dropped - Parse error                           0                 0
Dropped - Invalid Dhcp Optype                   0                 0
Dropped - Invalid Remote-ID Option              0                 0
Dropped - Snooping disabled                     0                 0

Last Cleared:  0:04:29 ago
```

13.2.4.36 show ipv6 dhcp snooping hardware

The **show ipv6 dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping hardware

Example

This command displays DHCP snooping hardware status.

```
switch#show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
    2789
    Vlans enabled per Slice
        Slice:  Linecard0-0
        2789
        Slice:  Linecard0-1
        2789
        Slice:  Linecard0-2
        2789
        Slice:  Linecard0-3
        2789
```

13.2.4.37 show ipv6 dhcp snooping

The **show ipv6 dhcp snooping** command displays information about the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

show ipv6 dhcp snooping

Related Commands

- **ipv6 dhcp snooping**
- **show ipv6 dhcp snooping counters**
- **show ipv6 dhcp snooping hardware**
- **clear ipv6 dhcp snooping counters**

Example

This command displays the switch's DHCP snooping configuration.

```
switch#show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.4.38 show ipv6 hardware fib aggregate-address

The **show ipv6 hardware fib aggregate-address** command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The **ipv6 hardware fib aggregate-address** command configures IPv6 prefix restictions.

Command Mode

EXEC

Command Syntax

show ipv6 address fib aggregate-address [**ADDRESS**][**RESTRICTION**]

Parameters

- **ROUTE_FILTER** filters by IPv6 address. Options include:
  - ***no parameter*** Displays all routes.
  - ***ipv6_addr*** Command displays only specified address.
  - ***ipv6_prefix*** Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - ***no parameter*** displays routes restricted from the hardware routing table.
  - **software-forward** displays routes restricted from the hardware routing table.

Example

This command displays the routes that are restricted from the hardware routing table.

```
switch>show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S  fd77:4890:5313:aaed::/64
S  fd77:4890:5313:ffed::/64

switch>
```

13.2.4.39 show ipv6 interface

The **ipv6 interface** command displays the status of specified routed interfaces that are configured for IPv6.

Command Mode

EXEC

Command Syntax

show ipv6 interface [**INTERFACE_NAME**][**INFO_LEVEL**]

Parameters

- **INTERFACE_NAME** interfaces for which command displays status.
  - ***no parameter*** all routed interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays data block for each specified interface.
  - **brief** command displays table that summarizes IPv6 interface data.

Example

This command displays the status of ***interface vlan 903***.

```
switch>show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
  IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
  Global unicast address(es):
    fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
  Joined group address(es):
    ff02::1
    ff02::1:ff01:21e
    ff02::1:ff00:3
    ff01::2
switch>
```

13.2.4.40 show ipv6 nd ra internal state

The **ipv6 nd ra internal state** command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

Command Mode

EXEC

Command Syntax

show ipv6 nd ra internal state [**INTERFACE_NAME**]

Parameters

INTERFACE_NAME interfaces for which command displays status.

- ***no parameter*** all routed interfaces.
- **ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **loopback *l_num*** Loopback interface specified by ***l_num***.
- **management *m_num*** Management interface specified by ***m_num***.
- **port-channel *p_num*** Port-Channel Interface specified by ***p_num***.
- **vlan *v_num*** VLAN interface specified by ***v_num***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.

Example

This command displays the IPv6 RA daemon for ***vlan 1243***.

```
switch>show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
                                ifindex : 0x00000021
                                    mtu : 9212
                             numIpv6Addr : 2
                   numPrefixToAdvertise : 0
                    numPrefixToSuppress : 0
                              RaSuppress : 0
                           RsRspSuppress : 0
                      raIntervalMaxMsec : 200000
                      raIntervalMinMsec : 0
                      managedConfigFlag : 0
                        otherConfigFlag : 0
                          raMtuSuppress : 0
                             raLifetime : 1800
                         reacheableTime : 0
                       routerPreference : 0
                             lastRaTime : 2012-05-01 09:22:57.020634
                      lastRsRspSentTime :
                            nextTimeout : 171.474535 (sec)

                              numRaSent : 219
                              numRsRcvd : 0
                        numRsSuppressed : 0
                           numRsRspSent : 0
            numRsDroppedInvalidHopLimit : 0
            numPktDroppedUnexpectedType : 0
                            initialized : 1
switch>
```

13.2.4.41 show ipv6 neighbors

The **show ipv6 neighbors** command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

Command Mode

EXEC

Command Syntax

show ipv6 neighbors [**PORT**][**SOURCE**][**INFO_LEVEL**]

Parameters

- **PORT** Filters by interface through which neighbor is accessed. Options include:
  - ***no parameter*** all routed interfaces.
  - **ethernet *e_num*** Ethernet interface specified by ***e_num***.
  - **loopback *l_num*** Loopback interface specified by ***l_num***.
  - **management *m_num*** Management interface specified by ***m_num***.
  - **port-channel *p_num*** Port-channel interface specified by ***p_num***.
  - **vlan *v_num*** VLAN interface specified by ***v_num***.
  - **vxlan *vx_num*** VXLAN interface specified by ***vx_num***.
- **SOURCE** Filters by neighbor IPv6 address. Options include:
  - ***<no parameter>*** all IPv6 neighbors.
  - ***ipv6_addr*** IPv6 address of individual neighbor.
- **INFO_LEVEL** amount of information that is displayed. Options include:
  - ***no parameter*** command displays the discovery cache for the specified interfaces.
  - **summary** command displays summary information only.

Example

This command displays the IPv6 neighbor discovery cache for IPv6 address ***fe80::21c:73ff:fe01:5fe1***.

```
switch>show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address                              Age Hardware Addr    State Interface

13.2.4.42 show ipv6 route age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

Command Mode

EXEC

Command Syntax

show ipv6 route ADDRESS age

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- ***ipv6_address*** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

13.2.4.43 show ipv6 route host

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = */**128***). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **A** routes to any neighboring host for which the switch has an ARP entry.
- **R** routes defined because the IP address is an interface address.

Command Mode

EXEC

Command Syntax

show ipv6 route host

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch>show ipv6 route host
R - receive F - FIB, A - attached

 F  ::1 to cpu
 A  fee7:48a2:0c11:1900:400::1 on Vlan102
 R  fee7:48a2:0c11:1900:400::2 to cpu
 F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
 R  fee7:48a2:0c11:1a00::17 to cpu
 F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
 F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                            via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```

13.2.4.44 show ipv6 route interface

The **show ipv6 route interface** command displays routing table entries on a specified routed port.

Command Mode

EXEC

Command Syntax

show ipv6 route [**ADDRESS**] **interface** **PORT_NAME** [**INFO_LEVEL**]

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - ***no parameter*** all routing table entries.
  - ***ipv6_address*** routing table entries matching specified IPv6 address.
  - ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (CIDR notation).
- **PORT_NAME** interfaces for which command displays status.
  - **ethernet** ***e_num*** Ethernet interface specified by ***e_num***.
  - **loopback** ***l_num*** Loopback interface specified by ***l_num***.
  - **management** ***m_num*** Management interface specified by ***m_num***.
  - **port-channel** ***p_num*** Port-Channel Interface specified by ***p_num***.
  - **vlan** ***v_num*** VLAN interface specified by ***v_num***.
  - **vxlan** ***vx_num*** VXLAN interface specified by ***vx_num***.
- **INFO_LEVEL** Filters entries by next hop connection.
  - ***no parameter*** filters routes whose next hops are directly connected.
  - **detail** displays all routes.

Example

This command displays the IPv6 routes in ***interface ethernet 8***.

```
switch>show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:629f:63af:1232::/64 [150/11]

     via fe80::21c:73ff:fe00:3640, Ethernet8
C   fe80:0:40::/64 [0/1]
     via ::, Ethernet8
```

13.2.4.45 show ipv6 route match tag

The **show ipv6 route match tag** command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

show ipv6 route ADDRESS **match tag**

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- ***ipv6_address*** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route tag for the specified prefix.

```
switch>show ipv6 route 2001:0DB8::/64 match tag
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R -
 RIP, A B
- BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP,
 NG -
Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L -
 VRF Leaked

C   2001:0DB8::/64 tag 0

switch>
```

13.2.4.46 show ipv6 route summary

The **show ipv6 route summary** command displays the information about the IPv6 routing table.

Command Mode

EXEC

Command Syntax

show ipv6 route summary

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source    Number Of Routes
----------------- ----------------
   connected                    2
   static                       0
   ospf                         5
   bgp                          7
   isis                         0
   internal                     1
   attached                     0
   aggregate                    2

   Total Routes                 17
switch>
```

13.2.4.47 show ipv6 route

The **show ipv6 route** command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays all configured routes.

Command Mode

EXEC

Command Syntax

show ipv6 route [**ADDRESS**][**ROUTE_TYPE**][**INFO_LEVEL**]

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
  - ***no parameter*** all routing table entries.
  - ***ipv6_address*** routing table entries matching specified IPv6 address.
  - ***ipv6_prefix*** routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
  - ***no parameter*** all routing table entries.
  - **aggregate** entries for BGP aggregate routes.
  - **bgp** entries added through BGP protocol.
  - **connected** entries for routes to networks directly connected to the switch.
  - **kernel** entries appearing in Linux kernel but not added by EOS software.
  - **isis** entries added through IS-IS protocol.
  - **ospf** entries added through OSPF protocol.
  - ***static*** entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
  - ***no parameter*** filters routes whose next hops are directly connected.
  - **detail** displays all routes.

Example

This command displays a route table entry for a specific IPv6 route.

```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
 A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
     via fe80::21c:73ff:fe00:1319, Vlan3601
     via fe80::21c:73ff:fe00:1319, Vlan3602
     via fe80::21c:73ff:fe00:1319, Vlan3608
     via fe80::21c:73ff:fe0f:6a80, Vlan3610
     via fe80::21c:73ff:fe00:1319, Vlan3611

switch>
```

13.2.4.48 show platform fap mroute ipv6

The **show platform fap mroute ipv6** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Command Mode

EXEC

Command Syntax

show platform

Example

This command enables PIM sparse mode on ***VLAN 4*** interface.

```
switch#show platform fap mroute ipv6
Jericho0 Multicast Routes:
--------------------------

                                                                     Vlan1200(Et8/1) Vlan1223(Et2/1)
                                                                     Vlan1226(Et5/1) Vlan1232(Et3/1)
                                                                     Vlan1307(Et6/1) Vlan1337(Et4/1)
```

13.2.4.49 show rib route ipv6

The **show rib route ipv6** command displays a list of IPv6 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

show rib route ipv6 [vrf *vrf_name*] [**PREFIX**][**ROUTE TYPE**]

Parameters

- **vrf *vrf_name*** displays RIB routes from the specified VRF.
- **PREFIX** displays routes filtered by the specified IPv6 information. Options include:
  - ***ipv6_address*** displays RIB routes filtered by the specified IPv6 address.
  - ***ipv6_subnet_mask*** displays RIB routes filtered by the specified IPv6 address and subnet mask.
  - ***ipv6_prefix*** displays RIB routes filtered by the specified IPv6 prefix.
- **ROUTE TYPE** displays routes filtered by the specified route type. Options include:
  - **bgp** displays RIB routes filtered by BGP.
  - **connected** displays RIB routes filtered by connected routes.
  - **dynamicPolicy** displays RIB routes filtered by dynamic policy routes.
  - **host** displays RIB routes filtered by host routes.
  - **isis** displays RIB routes filtered by ISIS routes.
  - **ospf** displays RIB routes filtered by OSPF routes.
  - **ospf3** displays RIB routes filtered by OSPF3 routes.
  - **reserved** displays RIB routes filtered by reserved routes.
  - **route-input** displays RIB routes filtered by route-input routes.
  - **static** displays RIB routes filtered by static routes.

Examples

- This command displays IPv6 RIB BGP routes.

```
switch#show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
 B    2001:10:1::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100::/64 [200/200]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:1::/64 [200/0]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
>B    2001:10:100:2::/64 [200/42]
         via 2001:10:1::100 [0/1]
            via Ethernet1, directly connected
switch#
```

- This command displays IPv6 RIB connected routes.

```
switch#show rib route ipv6 connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
```

```
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>C    2001:10:1::/64 [0/1]
         via 2001:10:1::102, Ethernet1
>C    2001:10:2::/64 [0/1]
         via 2001:10:2::102, Ethernet2
>C    2001:10:3::/64 [0/1]
         via 2001:10:3::102, Ethernet3
switch#
```

13.3 Ingress and Egress Per-Port for IPv4 and IPv6 Counters

This feature provides support for per-interface ingress and egress packet and byte counters for both IPv4 and IPv6.

This section describes Ingress and Egress per-port for IPv4 and IPv6 counters, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Configuration
- Show Commands
- Dedicated ARP Entry for TX IPv4 and IPv6 Counters
- Limitations

13.3.1 Configuration

IPv4 and IPv6 ingress counters (count **bridged and routed** traffic, supported only on front-panel ports) can be enabled and disabled using the **`hardware counter feature ip in`** command:

```
[no] hardware counter feature ip in
```

For IPv4 and IPv6 ingress and egress counters that include only **routed** traffic (supported on Layer3 interfaces such as routed ports, L3 subinterfaces only):

On the DCS-7300X, DCS-7250X, DCS-7050X, and DCS-7060X platforms, IPv4 and IPv6 **packet** counters for only **routed** traffic do not require any configuration. They are collected by default. Other platforms (DCS-7280SR, DCS-7280CR and DCS-7500-R) need the feature enabled.

```
[no]hardware counter feature ip in layer3
```

```
[no]hardware counter feature ip out layer3
```

13.3.2 Show Commands

Use the **`show interfaces counters ip`** command to display IPv4, IPv6 packets, and octets.

```
switch#show interfaces counters ip
Interface   IPv4InOctets    IPv4InPkts     IPv6InOctets
 IPv6InPkts
Et1/1              0               0               0
 0
Et1/2              0               0               0
 0
Et1/3              0               0               0
 0
Et1/4              0               0               0
 0
...
Interface  IPv4OutOctets  IPv4OutPkts    IPv6OutOctets
 IPv6OutPkts
Et1/1              0               0               0
 0
Et1/2              0               0               0
 0
```

```
Et1/3             0                 0                 0
 0
Et1/4             0                 0                 0
 0
...
```

The output from the **show interfaces counters ip** can also be queried through SNMP via the ARISTA-IP-MIB.

To clear the the IPv4 or IPv6 counters, use the **clear counters** command

```
switch#clear counters
```

13.3.3 Dedicated ARP Entry for TX IPv4 and IPv6 Counters

IPv4/IPv6 egress Layer 3 (**hardware counter feature ip out layer3**) counting on DCS-7280SR, DCS-7280CR and DCS-7500-R platforms work, based on ARP entry of the nexthop. By default, IPv4 next hop and IPv6 next hop both resolve to the same MAC address and interface that have shared ARP entry. To differentiate the counters between IPv4 and IPv6, disable arp entry sharing with following command:

```
ip hardware fib next-hop arp dedicated
```

On the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms, this command is required for IPv4 and IPv6 egress counters to operate.

13.3.4 Limitations

- Packet sizes greater than 9236 bytes are not counted by per-port IPv4 and IPv6 counters.
- Only the DCS-7260X3, DCS-7368, DCS-7300, DCS-7050SX3, DCS-7050CX3, DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip in** command.
- Only the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip [in|out] layer3** command.

13.4 ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This section describes the construction of Access Control Lists (ACLs), prefix lists, and route maps.

This section includes the following topics:

- ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction
- Access Control Lists
- Service ACLs
- Sub-interface ACLs
- RACL Sharing on SVIs
- Route Maps
- Prefix Lists
- Port ACLs with User-Defined Fields
- ACL, Route Map, and Prefix List Commands

13.4.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access Control Lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An Access Control List (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL is an ACL applied by a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. The show commands are used to display the interface mapping, TCAM entries, and TCAM utilization information.

13.4.2 Access Control Lists

These sections describe access control lists:

- ACL Types
- ACL Configuration
- Applying ACLs

13.4.2.1 ACL Types

The switch supports the following ACL types:

- **IPv4** can match on IPv4 source or destination addresses, with L4 modifiers including protocol, port number, and DSCP value.
- **IPv6** can match on IPv6 source or destination addresses, with L4 modifiers including protocol, port number, etc.
- **Standard IPv4** can match only on source IPv4 address.
- **Standard IPv6** can match only on source IPv6 address.
- **MAC** can match on L2 source and destination addresses..

ACLs can also be made dynamic (not persisting in the EOS), and the **payload** keyword can be used to turn an ACL into a User-Defined Field (UDF) alias for use in other ACLs.

13.4.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data.

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

13.4.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

IPv4 ACL Rule Parameters

All rules in IPv4 ACLs include the following criteria:

- **Protocol**: The packet's IP protocol. Valid rule inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address**: The packet's source IPv4 address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all source addresses.
- **Destination Address**: The packet's destination IP address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs ***may*** include the following criteria:

- **Fragment**: Rules filter on the fragment bit.

- **Time-to-live**: Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
  - **Equal:** Packets match if packet value equals statement value.
  - **Greater than:** Packets match if packet value is greater than statement value.
  - **Less than:** Packets match if packet value is less than statement value.
  - **Not equal:** Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports** / **Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  - ***any*** denotes that the rule matches all ports.
  - A list of ports that matches the packet port. Maximum list size is 10 ports.
  - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  - Integer (lower bound): The rule matches any port with a number larger than the integer.
  - Integer (upper bound): The rule matches any port with a number smaller than the integer.
  - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits**: Rules filter TCP packets on flag bits.
- **Message type**: Rules filter ICMP type or code.
- **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

All rules in IPv6 ACLs include the following criteria:

- **Protocol**: All rules filter on the packet's IP protocol field. Rule input options include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address**: The packet's source IPv6 address. Valid rule inputs include:
  - An IPv6 prefix (CIDR). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - ***any*** to denote that the rule matches all addresses.
- **Destination Address**: The packet's destination IP address. Valid rule inputs include:
  - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - A host IP address (dotted decimal notation).
  - ***any*** to denote that the rule matches all addresses.

All rules in IPv6 ACLs ***may*** include the following criteria:

- **Fragment**: Rules filter on the fragment bit.
- ***HOP*** Compares the packet's hop-limit value to a specified value. Comparison options include:
  - **eq**: Packets match if hop-limit value equals statement value.
  - **gt**: Packets match if hop-limit value is greater than statement value.
  - **lt**: Packets match if hop-limit value is less than statement value.
  - **neq**: Packets match if hop-limit value is not equal to statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports** / **Destination Ports**: A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:

- ***any*** denotes that the rule matches all ports.
- A list of ports that matches the packet port. Maximum list size is 10 ports.
- Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
- Integer (lower bound): The rule matches any port with a number larger than the integer.
- Integer (upper bound): The rule matches any port with a number smaller than the integer.
- Range integers: The rule matches any port whose number is between the integers.

- **Flag bits**: Rules filter TCP packets on flag bits.
- **Message type**: Rules filter ICMP type or code.
- **Tracked**: Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

Standard IPv4 and IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

MAC ACL Rule Parameters

MAC ACLs filter traffic on a packet's layer 2 header. Criteria that MAC ACLs use to filter packets include:

- **Source Address** and **Mask**: The packet's source MAC address. Valid rule inputs include:
  - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  - ***any*** to denote that the rule matches all source addresses.
- - **Destination Address** and **Mask**: The packet's destination MAC address. Valid rule inputs include:
    - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
    - ***any*** to denote that the rule matches all destination addresses.
  - **Protocol**: The packet's protocol as specified by its EtherType field contents. Valid inputs include:
    - Protocol name for a limited set of common protocols.
    - Assigned protocol number for all protocols.

13.4.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule's placement in a list. New rules are inserted into a list according to their sequence numbers. A rule's sequence number can be referenced when deleting it from a list.

ACL Configuration describes procedures for configuring ACLs.

13.4.2.1.4 Implementing Access Control Lists

An Access Control List (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement. Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

Applying ACLs describes procedures for applying ACLs to interfaces or the control plane.

13.4.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- **ACL logging**: A syslog entry is logged when a packet matches specified ACL rules.
- **ACL counters**: ACL counters increment when a packet matches a rule in specified ACLs.

ACL Logging

ACL rules provide a **log** option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

ACL Rule Tracking Configuration describes procedures for configuring and enabling ACL logging.

ACL Counters

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list's counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in a non-counting state, the counter does not increment. A list's counter state applies to all rules in the ACL. The default state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands.

ACL Rule Tracking Configuration describes procedures for configuring and enabling ACL counters.

13.4.2.1.6 Egress ACL Counters

Egress ACL counters count the number of packets hitting rules associated with egress ACLs applied to various interfaces in a switch.

13.4.2.1.6.1Configuring Egress ACL Counters

To enable egress ACL counters for a specific ACL, use the counter per-entry command in the configuration mode for the ACL.

Example

In the following example, configure the **counters per-entry** command in the ACL configuration mode.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#counters per-entry
```

Enabling Egress Counters Globally

Both IPv4 and IPv6 egress ACL counters are enabled in the global configuration mode by using the **hardware counter feature acl out** command.

Example

The following example, shows how to enable IPv4 egress ACL counters.

```
switch(config)#hardware counter feature acl out ipv4
switch(config)#
```

The following example, shows how to enable IPv6 egress ACL counters.

```
switch(config)#hardware counter feature acl out ipv6
switch(config)#
```

Disabling Egress Counters Globally

Both IPv4 and IPv6 egress ACL counters are also disabled in the global configuration mode by using the **hardware counter feature acl out** command.

The following example, shows how to disable IPv4 egress ACL counters.

```
switch(config)#no hardware counter feature acl out ipv4
switch(config)#
```

The following example, shows how to disable IPv6 egress ACL counters.

```
switch(config)#no hardware counter feature acl out ipv6
switch(config)#
```

Egress Counter Roll Over in the Global Mode

The counters roll over when the counter value for an ACL rule exceeds ***2^64***. IPv4 egress ACL counters are enabled by default, but IPv6 egress ACL counters require explicit configuration.

Example

In the following example, the **hardware counter feature acl ipv6 out** command is configured using units and packets.

```
switch(config)#hardware counter feature acl ipv6 out units packets
switch(config)#
```

The **clear ip access-lists counters** command clears the counters for all of the IPv4 ACLs or a specific IPv4 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named ***red*** is selected.

```
switch(config)#clear ip access-list counters red session
switch(config)#
```

The IPv6 egress ACL counters do not work in unshared mode.

Example

Use the **`hardware access-lists resource sharing vlan ipv6 out`** command to enable egress IPv6 ACL sharing.

```
switch(config)#hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

The **`clear ipv6 access-list counters`** command clears the counters for all of the IPv6 ACLs or a specific IPv6 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named ***green*** is selected.

```
switch(config)#clear ipv6 access-list counters green session
switch(config)#
```

13.4.2.1.6.2Displaying Egress ACL Counters

Use the following show commands to display Egress ACL Counters information.

Use the **`show ip access-lists`** command to display all the IPv4 ACLs, or a specific IPv4 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)#show ip access-list acl1
IP Access List acl1
        counter per-entry
        10 deny ip 11.1.1.0/24 any dscp af11
        20 deny ip any any [match 39080716, 0:00:00 ago]
```

Use the **`show ipv6 access-lists`** command to display all the IPv6 ACLs or a specific IPv6 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)#show ipv6 access-list acl1
IPV6 Access List acl1
        counter per-entry
        10 permit ipv6 any any [match 3450000, 0:00:10 ago]
        20 deny ipv6 any any
```

The counter name **`EgressAclDropCounter`** in the output of this show command signifies the aggregate counter value for the remaining egress IPv4 ACL. In this example the deny rules, whose per rule counters, are not allocated. The per rule counters is not allocated when the user does not configure the ***counter per-entry*** parameter for the respective ACL.

```
switch(config)#show hardware counter drop
Summary:
Total Adverse (A) Drops: 0
Total Congestion (C) Drops: 0
Total Packet Processor (P) Drops: 250
```

```
Type Chip CounterName : Count : First Occurrence : Last Occurrence
------------------------------------------------------------------------
------------
P Fap0 EgressAclDropCounter : 250 : 2015-11-11 22:39:02 : 2015-11-11
 22:51:44
```

13.4.2.1.7 AlgoMatch

AlgoMatch enables more flexible and scalable solutions for access control, telemetry, and enforcement networking whether the requirements are an on-premises or hybrid cloud model. By combining power-efficient and low-cost general purpose memory technology with advanced software algorithms, AlgoMatch provides greater scale, performance, and efficiency compared to common standard implementations with merchant silicon systems and TCAM.

In a typical TCAM solution, as additional lookup capacity is added, the power increases in-line with the scale. AlgoMatch utilizes power-efficient searching, only checking locations needed, and as a result lowers power draw by as much as half compared to TCAMs.

AlgoMatch utilizes a flexible and efficient packet matching algorithm with variable lookup sizes, rather than a fixed size lookup with TCAM. This enables full flow matching against source and destination criteria, or parts of the mask, and allows for multiple actions to be performed on a single packet or flow, with user defined filters for packet classification and custom actions in a single pass. A policy with multiple actions is not typically possible with a TCAM solution without using recirculation of chained lookups. However, with AlgoMatch, multiple actions can be applied in a single pass (For example, access control, telemetry, and counters) without losing either features or performance.

AlgoMatch Benefits

- **Improved power efficiency**: 50 percentage lower.
- **Efficient Layer 4 rules**: allows enhanced security policy.
- **Counters**: provide better visibility and flow filtering.

Note: AlgoMatch configuration and show commands are no different from security ACLs. For more information on ACL commands refer to **ACL, Route Map, and Prefix List Commands**.

13.4.2.2 ACL Configuration

Access control lists are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
- **Std-IPv6-ACL configuration mode** for Standard IPv6 access control lists.
- **MAC-ACL configuration mode** for MAC access control lists.

These sections describe the creation and modification of ACLs:

- Managing ACLs
- Modifying an ACL
- ACL Rule Tracking Configuration
- Displaying ACLs
- Configuring Per-Port Per-VLAN QoS
- Displaying Per-Port Per-VLAN QoS
- Configuring Mirror Access Control Lists

13.4.2.2.1 Managing ACLs

Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- **ip access-list** for IPv4 ACLs.
- **ipv6 access-list** for IPv6 ACLs.
- **ip access-list standard** for standard IPv4 ACLs.
- **ipv6 access-list standard** for standard IPv6 ACLs.
- **mac access-list** for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see **Modifying an ACL** for additional information).

Examples

- This command places the switch in ***ACL*** configuration mode to create an ACL named ***test1***.

```
switch(config)#ip access-list test1
switch(config-acl-test1)#
```

- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named ***stest1***.

```
switch(config)#ip access-list standard stest1
switch(config-std-acl-stest1)#
```

- This command places the switch in ***MAC-ACL*** configuration mode to create an MAC ACL named ***mtest1***.

```
switch(config)#mac access-list mtest1
switch(config-mac-acl-mtest1)#
```

Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode. To exit the group-change mode, changes can also be discarded using the `abort` command instead of exit.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)#permit ip 10.10.10.0/24 any
switch(config-acl-test1)#permit ip any host 10.20.10.1
switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Because the changes were not yet saved, the ACL remains empty, as shown by **show ip access-lists**.

```
switch(config-acl-test1)#show ip access-lists test1
switch(config-acl-test1)#
```

To save all current changes to the ACL and exit ACL configuration mode, type **exit**.

```
switch(config-acl-test1)#exit
switch(config)#show ip access-lists test1
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Discarding List Changes

The **abort** command exits ACL configuration mode without saving pending changes.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)#permit ip 10.10.10.0/24 any
switch(config-acl-test1)#permit ip any host 10.20.10.1
switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

To discard the changes, enter **abort**. If the ACL existed before entering ACL-configuration mode, **abort** restores the version that existed before entering ACL-configuration mode. Otherwise, **show ip access-lists** shows the ACL was not created.

```
switch(config-acl-test1)#abort
switch(config)#
```

13.4.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in **Creating and Opening a List**. By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

Permit All Traffic During ACL Update

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the **hardware access-list update default-result permit** command.

These commands add deny rules to the appropriate ACL:

- **deny (IPv4 ACL)** adds a deny rule to an IPv4 ACL.
- **deny (IPv6 ACL)** adds a deny rule to an IPv6 ACL.
- **deny (Standard IPv4 ACL)** adds a deny rule to an IPv4 standard ACL.
- **deny (Standard IPv6 ACL)** adds a deny rule to an IPv6 standard ACL.
- **deny (MAC ACL)** adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- **permit (IPv4 ACL)** adds a permit rule to an IPv4 ACL.
- **permit (IPv6 ACL)** adds a permit rule to an IPv6 ACL.
- **permit (Standard IPv4 ACL)** adds a permit rule to an IPv4 standard ACL.
- **permit (Standard IPv6 ACL)** adds a permit rule to an IPv6 standard ACL.
- **permit (MAC ACL)** adds a permit rule to a MAC ACL.

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule's sequence number is derived by adding ***10*** to the last rule's sequence number.

Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

```
switch(config)#hardware access-list update default-result permit
```

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)#permit ip 10.10.10.0/24 any
switch(config-acl-test1)#permit ip any host 10.20.10.1
switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule's sequence number is ***40***.

```
switch(config-acl-test1)#permit ip any any
switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules' numbers.

Example

This command inserts a rule between the first two rules by assigning it the sequence number ***15***.

```
Switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1
Switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        15 permit ip 10.30.10.0/24 host 10.20.10.1
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule be deleted.
- Enter **default**, followed by the rule to be deleted.

Examples

- These equivalent commands remove rule ***20*** from the list.

```
switch(config-acl-test1)#no 20
switch(config-acl-test1)#no permit ip any host 10.20.10.1
switch(config-acl-test1)#default permit ip any host 10.20.10.1
```

- This ACL results from entering one of the preceding commands.

```
switch(config-acl-test1)#show
ip access list test1
        10 permit ip 10.10.10.0/24 any
        15 permit ip 10.30.10.0/24 host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
```

Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The **resequence (ACLs)** command adjusts the sequence numbers of ACL rules.

Example

The **resequence (ACLs)** command renumbers rules in the test1 ACL. The sequence number of the first rule is ***100***; subsequent rules numbers are incremented by ***20***.

```
switch(config-acl-test1)#show
IP Access List test1
        10 permit ip 10.10.10.0/24 any
        25 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        50 permit ip any any
        90 remark end of list
switch(config-acl-test1)#resequence 100 20
switch(config-acl-test1)#show
```

```
IP Access List test1
        100 permit ip 10.10.10.0/24 any
        120 permit ip any host 10.20.10.1
        140 deny ip host 10.10.10.1 host 10.20.10.1
        160 permit ip any any
        180 remark end of list
```

13.4.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a **log** option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and on 7100 series switches. On 7100 series switches, matches are logged only on ingress, not on egress.

Example

This command creates an ACL rule with logging enabled.

```
switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1 log
switch(config-acl-test1)#
```

The format of the generated Syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:

  IPACCESS: list *acl intf filter protocol src-ip*(*src_port*) **->** *dst-ip*(*dst_port*)
- Messages generated by ICMP packets matching an IP ACL use this format:

  IPACCESS: list *acl intf filter* **icmp** *src-ip*(*src-port*) **->** *dst-ip*(*dst-port*) **type=** *n* **code=** *m*
- Messages generated by all other IP packets matching an IP ACL use this format:

  IPACCESS: list *acl intf filter protocol src-ip* **->** *dst-ip*
- Messages generated by packets matching a MAC ACL use this format:

  MACACCESS: list *acl intf filter vlan ether src_mac* **->** *dst_mac*
- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:

  MACACCESS: list *acl intf filter vlan ether ip-prt src-mac src-ip* **:** *src-prt* **->** *dst-mac dst-ip* **:** *dst-prt*
- Messages generated by any other IP packet matching a MAC ACL use this format:

  MACACCESS: list *acl intf filter vlan ether src_mac src_ip* **->** *dst_mac dst_ip*

Variables in the Syslog messages display the following values:

- **acl** Name of ACL.
- **intf** Name of interface that received the packet.
- **filter** Action triggered by ACL (**denied** or **permitted**).
- **protocol** IP protocol specified by packet.
- **vlan** Number of VLAN receiving packet.
- **ether** EtherType protocol specified by packet.
- **src-ip** and **dst-ip** source and destination IP addresses.
- **src-prt** and **dst-prt** source and destination ports.
- **src-mac** and **dst-mac** source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The **counters per-entry (ACL configuration modes)** command places the ACL in counting mode.

This command places the configuration mode ACL in counting mode.

```
switch(config-acl-test1)#counters per-entry
switch(config-acl-test1)#exit
switch(config-acl-test1)#show ip access-list test1
IP Access List test1
        counters per-entry
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        50 remark end of list
```

The **clear ip access-lists counters** and **clear ipv6 access-lists counters** commands set the IP access list counters to zero for the specified IP access list.

This command clears the ACL counter for the test1 ACL.

```
switch(config)#clear ip access-lists counters test1
switch(config)#
```

13.4.2.2.4 Displaying ACLs

ACLs can be displayed by a **show running-config** command. The **show ip access-lists** also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the **show (ACL configuration modes)** command displays the current or pending list, as specified by command parameters.

Displaying a List of ACLs

To display the roster of ACLs on the switch, enter **show ip access-lists** with the **summary** option.

Example

This command lists the available access control lists.

```
switch(config)#show ip access-list summary
IPV4 ACL default-control-plane-acl
        Total rules configured: 12
        Configured on: control-plane
        Active on    : control-plane

IPV4 ACL list2
        Total rules configured: 3

IPV4 ACL test1
        Total rules configured: 6

IPV4 ACL test_1
        Total rules configured: 1

IPV4 ACL test_3
        Total rules configured: 0
switch(config)#
```

Displaying Contents of an ACL

These commands display ACL contents.

- **show ip access-lists**

- **show ipv6 access-lists**
- **show mac access-lists**

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter **show ip access-lists** followed by the name of the ACL.
- To display the contents of all ACLs on the switch, enter the command without any options.

ACLs that are in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

Examples

- This command displays the rules in the **default-control-plane-acl** ACL.

```
switch#show ip access-lists default-control-plane-acl
IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any
        20 permit ip any any tracked [match 1725, 0:00:00 ago]
        30 permit ospf any any
        40 permit tcp any any eq ssh telnet www snmp bgp https
        50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29
 ago]
        60 permit tcp any any eq mlag ttl eq 255
        70 permit udp any any eq mlag ttl eq 255
        80 permit vrrp any any
        90 permit ahp any any
        100 permit pim any any
        110 permit igmp any any [match 1316, 0:00:23 ago]
        120 permit tcp any any range 5900 5910
```

- This command displays the rules in all ACLs on the switch.

```
switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
        counters per-entry
        10 permit icmp any any
        20 permit ip any any tracked [match 1371, 0:00:00 ago]
        30 permit ospf any any
        40 permit tcp any any eq ssh telnet www snmp bgp https
        50 permit udp any any eq bootps bootpc snmp
        60 permit tcp any any eq mlag ttl eq 255
        70 permit udp any any eq mlag ttl eq 255
        80 permit vrrp any any
        90 permit ahp any any
        100 permit pim any any
        110 permit igmp any any [match 1316, 0:00:23 ago]
        120 permit tcp any any range 5900 5910

IP Access List list2
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.30.10.0/24 host 10.20.10.1
        30 permit ip any host 10.20.10.1
        40 deny ip host 10.10.10.1 host 10.20.10.1
        50 permit ip any any

IP Access List test1
Switch(config)#
```

Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the **show (ACL configuration modes)** command provides options for displaying ACL contents.

- To display the list, as modified in ACL configuration mode, enter **show** or **show pending**.
- To display the list, as stored in ***running-config***, enter **show active**.
- To display differences between the pending list and the stored list, enter **show diff**.

Examples

The examples in this section assume these ACL commands were previously entered.

These commands are stored in the configuration:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to ***running-config***:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to ***running-config***:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

This command displays the pending ACL, as modified in ***ACL*** configuration mode.

```
switch(config-acl-test_1)#show pending
IP Access List test_1
        10 permit ip 10.10.10.0/24 any
        20 permit ip 10.10.0.0/16 any
        25 permit tcp 10.10.20.0/24 any
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        45 deny pim 239.24.124.0/24 10.5.8.4/30
        50 remark end of list
```

This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.21.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
        40 permit ip any any
        50 remark end of list
```

This command displays the difference between the saved and modified ACLs.

- Rules added to the pending list are denoted with a plus sign (+).
- Rules removed from the saved list are denoted with a minus sign (-).

```
switch(config-acl-test_1)#show diff
---
+++
```

```
@@ -1,7 +1,9 @@

13.4.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas. Per-port per-VLAN works with QoS-based class-maps only.

To configure per-port per-VLAN QoS on DCS-7280(R) and DCS-7500(R), change the TCAM profile to QoS as shown below.

1. Change the TCAM profile to QoS.

```
switch#config
switch(config)#hardware tcam profile qos
```

2. Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 100 0xfff ip any any
switch(config-acl-acl1)#exit
```

3. Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)#class-map match-any class1
switch(config-cmap-qos-class1)#match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)#exit
```

13.4.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

The **show policy-map** command displays the policy-map information of the configured policy-map.

Examples

- ```
  switch#show policy-map policy1
  Service-policy policy1
  Class-map: class1 (match-any)
  Match: ip access-group name acl1
  Police cir 512000 bps bc 96000 bytes
  Class-map: class-default (match-any)
  ```
- The **show policy-map interface** command displays the policy-map configured on an interface.

  ```
  switch#show policy-map interface ethernet 1
  Service-policy input: p1
  Hardware programming status: Successful
  ```
  ```

```
Class-map: c2001 (match-any)
Match: vlan 2001 0xfff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xfff
set dscp 8
Class-map: c2003 (match-any)
Match: vlan 2003 0xfff
set dscp 12
```

13.4.2.2.7 Configuring Mirror Access Control Lists

Access Control Lists (ACLs) are configured to permit or deny traffic between source and destination ports on Strata-based platforms. Mirror ACLs are used in mirroring traffic by matching VLAN ID of the configured ACLs. Mirror ACLs are applied for IPv4, IPv6, and MAC ACLs.

Note: Mirror ACLs work in receiving direction only.

Examples

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
```

- These commands configure monitor session ***sess1*** with ***Ethernet 1*** as source port and ***Ethernet 2*** as destination port for an ingress ip ***acl_1***.

```
switch(config)#monitor session sess1 source ethernet 1 rx ip access-
group acl1
switch(config)#monitor session sess1 destination ethernet 2
```

13.4.2.3 Applying ACLs

Access Control Lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.

- The **ip access-group** command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.
- The **ip access-group** command applies the specified IP or standard IP ACL to the conntrol-plane traffic.
- The **mac access-group** command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This result in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.

Examples

- These commands assign ***test1*** ACL to ***interface ethernet 3***, then verify the assignment.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test1 in
switch(config-if-Et3)#show running-config interfaces ethernet 3
interface Ethernet3
   ip access-group test1 in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and applies the ACL assignment to the control-plane traffic.

```
switch(config)#control-plane
switch(config-cp)#ip access-group test_cp in
```

- This command enables shared ACLs.

```
switch(config)#hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- This command disables shared ACLs.

```
switch(config)#no hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- These commands apply an IPv4 ACL named ***test_ACL*** to ingress traffic on ***interface ethernet 5.1***.

```
switch(config)#interface ethernet 5.1
switch(config-if-Et5.1)#ipv4 access-group test_ACL in
switch(config-if-Et5.1)#
```

Removing an ACL from an Interface

The **`no ip access-group`** command removes an IP ACL assignment statement from ***running-config*** for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The **`no mac ip access-group`** command removes a MAC ACL assignment statement from ***running-config*** for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the **`no ip access-group`** command in control plane configuration mode. Removing the control plane ACL command from ***running-config*** reinstates **default-control-plane-acl** as the control plane ACL.

Examples

- These commands remove the assigned IPv4 ACL from ***interface ethernet 3***.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#no ip access-group test in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and remove the ACL assignment from ***running-config***, restoring **default-control-plane-acl** as the control plane ACL.

```
switch(config)#control-plane
switch(config-cp)#no ip access-group test_cp in
switch(config-cp)#
```

13.4.3 Service ACLs

These sections describe Service ACLs:

- **Service ACL Description**
- **Configuring Service ACLs and Displaying Status and Counters**

13.4.3.1 Service ACL Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable Access Control List (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

13.4.3.2 Configuring Service ACLs and Displaying Status and Counters

13.4.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands in ***mgt-ssh*** configuration mode as shown below.

```
switch(config)#management ssh
switch(config-mgmt-ssh)#ip access-group <acl_name> [vrf
 <vrf_name>] inswitch(config-mgmt-ssh)#ipv6 access-group <acl_name> [vrf
 <vrf_name>] in
```

In ***Release EOS-4.19.0***, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
switch>show management ssh ip access-list
switch>show management ssh ipv6 access-list
```

13.4.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the **snmp-server community** command as shown below.

snmp-server community *community-name* [view *viewname*] [ro | rw] *acl_name*

snmp-server community *community-name* [view *viewname*] [ro | rw] ipv6 *ipv6_acl_name*

13.4.3.2.3 EAPI

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#vrf <vrf_name>
switch(config-mgmt-api-http-cmds-vrf-<vrf>)#ip access-group <acl_name>
switch(config-mgmt-api-http-cmds-vrf-<vrf>)#ipv6 access-group
 <ipv6_acl_name>
```

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
switch>show management api http-commands ip access-list
switch>show management api http-commands ipv6 access-list
```

13.4.3.2.4 BGP

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#router bgp <asn>
switch(config-router-bgp)#ip access-group <acl_name>
switch(config-router-bgp)#ipv6 access-group <ipv6_acl_name>
switch(config-router-bgp)#vrf <vrf_name>
switch(config-router-bgp-vrf-<vrf>)#ip access-group <acl_name>
switch(config-router-bgp-vrf-<vrf>)#ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
switch>show bgp ipv4 access-list
switch>show bgp ipv6 access-list
```

13.4.3.2.5 UCMP auto adjust for BGP

UnequalCcost Multi-Path (UCMP) for BGP forwards traffic based on weight assignments for next hops of routes of ECMP traffic. The weights are programmed in the FIB. By disseminating BGP link-bandwidth extended community attribute information with BGP routes, the receiver device of all routes, programs the next hops in the FIB using the received link-bandwidth values. The percentage of interface speed is appended to the received link bandwidth extended community value of the route. The weight ratio of the traffic sent over egress ports is adjusted to forward more traffic towards the peer with higher interface speed.

Configuring UCMP auto adjust for BGP

The following command enables the weight adjustment.

This command configures the adjust auto to ***62.3*** percent.

```
switch(config-router-bgp)#neighbor group1 link-bandwidth adjust
 auto percent 62.3
```

PERCENT is a float value between ***0.0*** to ***100.0*** and is optional.

13.4.3.2.6 OSPF

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#router ospf <id>
switch(config-router-ospf)#ip access-group <acl_name>
switch(config-router-ospf)#ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
switch>show ospf ipv4 access-list
switch>show ospf ipv6 access-list
```

13.4.3.2.7 PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the **access-group** command as shown below.

```
switch(config)#router pim
switch(config-router-pim)#ipv4
switch(config-router-pim-ipv4)#access-group <acl_name>
switch(config-router-pim-ipv4)#vrf <vrf_name>
switch(config-router-pim-vrf-<vrf>)#ipv4
switch(config-router-pim-vrf-<vrf>-ipv4)#access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
switch>show ip pim access-list
```

13.4.3.2.8 IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the **ip igmp access-group** command as shown below.

```
switch(config)#router igmp
switch(config-router-igmp)#ip igmp access-group <acl_name>
switch(config-router-igmp)#vrf <vrf_name>
switch(config-router-igmp-vrf-<vrf>)#ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
switch>show ip igmp access-list
```

13.4.3.2.9 DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the **ip dhcp relay access-group** and **ipv6 dhcp relay access-group** commands as shown below.

```
switch(config)#ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
switch(config)#ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
switch>show ip dhcp relay access-list
switch>show ipv6 dhcp relay access-list
```

13.4.3.2.10 LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the command as shown below.

ip access-group (Service ACLs)

```
switch(config)#mpls ldp
switch(config-mpls-ldp)#ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch>show mpls ldp access-list
```

13.4.3.2.11 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#ip access-group <acl_name>
switch(config-qm-streaming)#ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch>show queue-monitor streaming access-lists
```

13.4.3.2.12 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#mpls ping
switch(config-mpls-ping)#ip access-group <acl_name> [vrf <vrf_name>]
switch(config-mpls-ping)#ipv6 access-group <ipv6_acl_name> [vrf
 <vrf_name>]
```

13.4.3.2.13 Telnet Server

To apply Service ACLs to the Telnet server, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#ip access-group <acl_name> [vrf <vrf_name>] in
switch(config-mgmt-telnet)#ipv6 access-group <ipv6_acl_name> [vrf
 <vrf_name>] in
```

In ***EOS 4.19.0***, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
switch>show management telnet ip access-list
switch>show management telnet ipv6 access-list
```

13.4.4 Sub-interface ACLs

This Sub-interface ACLs feature enables ACL functionality on subinterfaces.

13.4.4.1 Configuring Sub-interface ACLs

Configure the ACLs on subinterfaces, use the following command:

ip|ipv6 access-group *acl-name* in | out

To unconfigure the ACLs on subinterfaces, use the following command:

no ip|ipv6 access-group in | out

13.4.4.2 Sub-interface ACLs Limitations

The sub-interface ACLs feature contains the following limitations:

- Egress IPv4 ACLs on subinterfaces are not supported when sharing mode is disabled for Egress IPv4 RACLs.
- Egress IPv6 ACL deny logging is not supported on subinterfaces.
- Blocking traffic while modifying ACLs is not supported on Egress IPv4 ACLs on subinterfaces.

13.4.4.3 Sub-interface ACLs Show Commands

The **show ip|ipv6 access-lists** displays the summary of a configured ACL including the subinterface on which the ACL is configured and active.

show ip|ipv6 access-lists *acl-name* summary

Examples

```
switch(config)#show ip access-lists acl1 summary
IPV4 ACL acl1
 Total rules configured: 1
 Configured on Ingress: Et5.1
 Active on Ingress: Et5.1
```

```
switch(config)#show ipv6 access-lists acl1 summary
IPV6 ACL acl1
 Total rules configured: 1
 Configured on Egress: Et5.1
 Active on Egress: Et5.1
```

13.4.5 RACL Sharing on SVIs

13.4.5.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple

VLANs and an ingress sharing is applied on all VLANs, it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use **`no hardware access-list resource sharing vlan in`** command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The **no** form of the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use **`show platform trident`** command on the switch.

13.4.5.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs, and when Egress Sharing is applied on all VLANs it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switche, the IPv4 Egress Sharing must me disabled using the **`no hardware access-list resource sharing vlan ipv4 out`** command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use **hardware access-list resource sharing vlan ipv4 out** command. Note, enabling or disabling the IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following **`show`** commands can be used to verify the IPv4 Egress Sharing information on the switch.

- **show ip access-lists**
- **show vlan**
- **show platform arad acl tcam**
- **show ip route**
- **show platform arad ip route**

13.4.5.3 Configuring IPv4 Egress Sharing

Use **`hardware access-list resource sharing vlan ipv4 out`** command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switche.The **no** form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.

13.4.5.4 Displaying IPv4 Egress Sharing Information

Examples

- The **show ip access-lists** command displays the list of all the configured IPv4 ACLs.

```
switch#show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
 Total rules configured: 17
 Configured on Ingress: control-plane(default VRF)
 Active on Ingress: control-plane(default VRF)
```

```
IPV4 ACL ipAclLimitTest
 Total rules configured: 0
 Configured on Egress: Vl2148,2700
 Active on Egress: Vl2148,2700
```

- The **`show vlan`** command displays the list of all the member interfaces under each SVI.

```
switch#show vlan
VLAN  Name            Status    Ports
----- --------------- --------- -----------------
1     default         active
2148  VLAN2148        active    Cpu, Et1, Et26
2700  VLAN2700        active    Cpu, Et18
```

- The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
 direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
Bank Offset Entries
0         0       1
Fap: Arad1, Shared: true, Interfaces: Vl2148
Bank Offset Entries
0         0       1

Switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=======================================================
Arad0:
=======================================================
 Bank   Used                  Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=======================================================
Arad1:
=======================================================
 Bank   Used                   Used %             Used By
    0      1                        0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
```

- The **`show ip route`** command displays the unicast ip routes installed in the system.

```
switch#show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
 O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

13.4.6 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

13.4.6.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

Route Map Statements

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- ***name*** identifies the route map to which the statement belongs.
- ***sequence number*** designates the statement's placement within the route map.
- **filter type** specifies the route resolution. Valid types are **permit** and **deny**.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **`match`** command, the statement passes all routes.
- When a statement contains a single **`match`** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **`match`** command that lists multiple objects, the statements passes routes whose parameters match at least one object.
- When a statement contains multiple **`match`** commands, the statement passes routes whose parameters match all match commands.

`Set` commands modify parameters for redistributed routes. **`Set`** commands are valid in permit statements.

Example

The following route map statement is named ***MAP_1*** with sequence number ***10***. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to ***100***. Routes that do not match the statement are evaluated against the next statement in the route map.

```
switch#route-map MAP_1 permit 10
   match as 10
   set local-preference 100
```

Route Maps with Multiple Statements

A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statements passes a route, the

redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

Example

The following route map is named ***MAP_1*** with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

```
switch#route-map MAP_1 permit 10
   match as 10
   set local-preference 100
!
switch#route-map MAP_1 permit 20
   match metric-type type-1
   match as 100
```

Route Map Configuration describes route map configuration procedures.

Route Maps with Multiple Statements and Continue Commands

Route map statements that contain a **continue (route map)** command support additional route map evaluation of routes whose parameters meet the statement's match commands. Routes that match a statement containing a **`continue`** command are evaluated against the statement specified by the **`continue`** command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The **`set`** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statements containing them.

Example

The following route map is named ***MAP_1*** with a permit statement and a deny statement. The permit statement contains a continue command. Routes that match statement 10 are evaluated against statement 20.

```
route-map MAP_2 permit 10
   match as 10
   continue 20
   set local-preference 100
!
route-map MAP_2 deny 20
   match metric-type type-1
   match as 100
```

The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The **`continue`** command guarantees the evaluation of all routes against both statements.

13.4.6.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- **Route Map Creation and Editing**
- **Modifying Route Map Components**

13.4.6.2.1 Route Map Creation and Editing

Creating a Route Map Statement

To create a route map, enter **route-map** followed by the map name and filter type (**deny** or **permit**). The default sequence number is assigned to the statement if the command does not include a number.

Example

This command places the switch in ***route map*** configuration mode to create a route map statement named *map1* with a sequence number of ***50***.

```
switch(config)#route-map map1 permit 50
switch(config-route-map-map1)#
```

Editing a Route Map Statement

To edit an existing route map statement, enter **route-map** with the map's name and statement's number. The switch enters route map configuration mode for the statement. Subsequent **match (route-map)** and **set (route-map)** commands add the corresponding commands to the statement.

The **show** command displays contents of the existing route map.

Example

This command places the switch in route map configuration mode to edit an existing route map statement. The **show** command displays contents of all statements in the route map.

```
switch(config)#route-map MAP2
switch(config-route-map-MAP2)#show
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
switch(config-route-map-MAP2)#
```

Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit **exit** command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

Example

The first command creates the ***map1*** statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the **show** command.

```
switch(config)#route-map map1 permit
switch(config-route-map-map1)#match as 100
switch(config-route-map-map1)#show
switch(config-route-map-map1)#
```

The **exit** command saves the **match** command.

```
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Match clauses:
```

```
    match as 100
  Set clauses:
switch(config)#
```

Discarding Route Map Modifications

The **abort** command discards all pending changes and exits route map configuration mode.

Example

The **abort** command discards the pending **match** command and restores the original route map.

```
switch(config)#route-map map1 permit
switch(config-route-map-map1)#match as 100
switch(config-route-map-map1)#abort
switch(config)#show route-map map1
switch(config)#
```

13.4.6.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:

- **match (route-map)** adds a match rule to a route map.
- **set (route-map)** adds a set rule to a route map.

Inserting a Statement

To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

Example

This command adds statement 50 to the ***Map1*** route map, then displays the new route map.

```
switch(config)#route-map Map1 permit 50
switch(config-route-map-Map1)#match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
route-map Map1 deny 10
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
route-map Map1 permit 50
  Match clauses:
    match as 150
  Set clauses:
switch(config)#
```

Deleting Route Map Components

To remove a component from a route map, perform one of the following:

- To remove a command from a statement, enter **no**, followed by the command to be removed.
- To remove a statement, enter no, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter **no** followed by the route map without a sequence number.

13.4.6.3 Using Route Maps

Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

Example

This command uses ***Map1*** route map to select OSPFv2 routes for redistribution into BGP AS1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute ospf route-map Map1
switch(config-router-bgp)#exit
switch(config)#
```

13.4.7 Prefix Lists

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rules consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.

- **Prefix List Configuration** describes the prefix list configuration process.
- **Using Prefix Lists** describes the use of prefix lists.
- **Static Routes Redistribution into IGPs** describes redistribution of routes whose configured next-hops satisfy the route-map policy.

13.4.7.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include a alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

13.4.7.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The **ip prefix-list** command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the **ip prefix-list** command, followed by the name of the list. The switch enters ***IPv4 prefix-list*** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Examples

- This command places the switch in ***IPv4 prefix list*** configuration mode to create an IPv4 prefix list named route-one.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named ***route-one***.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```

To view the list, save the rules by exiting the ***Prefix-list*** command mode, then re-enter the configuration mode and type **show active**.

```
switch(config-ip-pfx)#exit
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#show active
ip prefix-list route-one
```

```
   seq 10 deny 10.1.1.0/24
   seq 20 deny 10.1.0.0/16
   seq 30 permit 12.15.4.9/32
   seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#ip prefix-list route-one
```

IPv4 prefix lists are referenced in **match (route-map)** command.

13.4.7.1.2 IPv6 Prefix Lists

Creating an IPv6 Prefix List

The switch provides ***IPv6 prefix-list*** configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.

To create an IP ACL, enter the **ipv6 prefix-list** command, followed by the name of the list. The switch enters ***IPv6 prefix-list*** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Example

This command places the switch in ***IPv6 prefix list*** configuration mode to create an IPv6 prefix list named *map1*.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ***Prefix-List*** configuration mode for the list. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

Example

These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)#permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)#permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the ***prefix-list*** command mode, then re-enter the configuration mode and type **`show active`**.

```
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
   seq 10 permit 3:4e96:8ca1:33cf::/64
   seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule's sequence number is ***30***.

```
switch(config-ipv6-pfx)#permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
   seq 10 permit 3:4e96:8ca1:33cf::/64
```

```
   seq 20 permit 3:11b1:8fe4:1aac::/64
   seq 30 permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#
```

Inserting a Rule

To insert a rule into a prefix list, use the **seq (IPv6 Prefix Lists)** command to enter a rule with a sequence number that is between numbers of two existing rules.

Example

This command inserts a rule between the first two rules by assigning it the sequence number ***15***.

```
switch(config-ipv6-pfx)#seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

Deleting a Rule

To remove a rule from the configuration mode prefix list, enter **no seq** (see **seq (IPv6 Prefix Lists)**), followed by the sequence number of the rule to be removed.

Example

These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

13.4.7.2 Using Prefix Lists

Route map match commands include an option that matches a specified prefix list.

Example

The ***MAP_1*** route map uses a match command that references the ***PL_1*** prefix list.

```
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
```

13.4.7.3 Static Routes Redistribution into IGPs

Use **match ip next-hop** route-map, while redistributing static routes into IGPs to redistribute the static routes whose **configured** next-hops satisfies the route-map policy.

The following example applies match ip next-hop clause for static routes redistributed into IGPs for multi-agent mode as well. The following configures a static route.

```
switch(config)# ip route 10.20.30.0/24 1.2.3.4
```

The following configures a prefix-list.

```
switch (config)#ip prefix-list prefixListName
switch(config-ip-pfx)#permit 1.2.3.4/32
```

1.2.3.4 is a **configured** next-hop for static route ***10.20.30.0/24***.

The following configures a route map.

```
switch(config)#route-map routeMapName
switch(config-route-map-routeMapName)#match ip next-hop prefix-list
 prefixListName
```

To redistribute static routes with ‘match ip next-hop’ route-map clause in IS-IS.

```
switch(config-router-isis)#redistribute static route-map routeMapName
```

Redistributed routes can be seen using the following show commands. If routes are redistributed into IS-IS then **`show isis database detail`**If routes are redistributed into OSPFv2 then **`show ip ospf database detail`**.

```
switch#show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

13.4.8 Port ACLs with User-Defined Fields

Describes the support for specifying User-Defined Fields (UDF) in Port ACLs including IPv4, IPv6, and MAC ACLs. The purpose of the User-Defined Fields feature is to permit or deny packets based on custom offset pattern matching.

User-Defined Fields, or UDFs, are defined as part of an access-list filter and are comprised of an offset, length, pattern match and mask. This describes a single portion of any incoming packet to match the provided value upon.

UDFs may also be defined via aliases. Aliases are a way to save a UDF configuration for reuse in multiple access-lists and or access-list rules. An alias may substitute for a fully defined UDF including the offset, pattern and mask. The pattern or mask may be overridden when the alias is used in an access-list rule.

The behavior, CLI syntax and configuration of UDFs are identical to Traffic Steering UDF and Mirroring ACL UDF.

This section describes port ACLs with user-defined fields, including configuration instructions. Topics covered by this section include:

- Configuring Port ACLs with User-Defined Fields
- Port ACLs with User-Defined Fields Limitations

13.4.8.1 Configuring Port ACLs with User-Defined Fields

User-Defined Fields are specified as part of an access-list. The type of access-list however, dictates the base position of the UDF and the options available. In addition, a TCAM profile must be configured to include UDFs as part of the Port ACL feature's key.

13.4.8.1.1 TCAM Profile

User-Defined Fields are defined as additional fields in the Port ACL feature's key. By default, UDFs are not included in the keys for the Port ACL features. Adding a UDF to the key requires removal of different key fields to fit within the TCAM width restrictions.

Note: Each UDF is either 16 bits wide or 32 bits wide.

Below are example configurations of the TCAM profile.

13.4.8.1.1.1IPv4 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the Layer 4 port key fields with 1 16-bit UDF and 1 32-bit UDF.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile ipv4Udf copy default
switch(config-hw-tcam-profile-ipv4Udf)#feature acl port ip
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#no key field
 l4-ops
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#no key field
 l4-src-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#no key field
 l4-dst-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#key field
 udf-16b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#key field
 udf-32b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)#exit
switch(config-hw-tcam-profile-ipv4Udf)#exit
```

```
switch(config-hw-tcam)#system profile ipv4Udf
```

Example-16-bit IPv4 Header Match

The following configurations match IPv4 packets based on the Identification(ID) field. Packets ingressing into ***Ethernet Interface 7*** with an ID equal to ***1000*** is forwarded. Packets with an ID different than ***1000*** is dropped.

```
(config)#ip access-list udfAcl
(config-acl-udfAcl)#permit ip any any payload header start offset 1
 pattern 0x03E80000 mask 0x0000FFFF
(config-acl-udfAcl)#deny ip any any
(config-acl-udfAcl)#exit
(config)#interface ethernet 7
(config-if-Et7)#
```

13.4.8.1.1.2IPv6 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the destination IPv6 address key field with 2 32-bit UDFs.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile ipv6Udf copy default
switch(config-hw-tcam-profile-ipv6Udf)#feature acl port ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)#no key field
 dst-ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)#key field
 udf-32b-1
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)#key field
 udf-32b-2
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)#exit
switch(config-hw-tcam-profile-ipv6Udf)#exit
switch(config-hw-tcam)#system profile ipv6Udf
```

Example-32-bit IPv6 Payload Match

The following configurations match IPv6 UDP packets based on the first 32 bits of the packet payload. UDP packets ingressing into ***Ethernet Interface 7*** that starts with ***0x1234567X*** (where X can be any valid hexadecimal) in the payload are forwarded. Any other packets are dropped. The offset is set to 2 (2 x 4-byte words) to skip the UDP header.

```
(config)#ipv6 access-list udfAcl
(config-ipv6-acl-udfAcl)#permit udp any any payload offset 2 pattern
 0x12345670 mask 0x0000000f
(config-ipv6-acl-udfAcl)#deny ipv6 any any
(config-ipv6-acl-udfAcl)#exit
(config)#interface ethernet 7
(config-if-Et7)#ipv6 access-group udfAcl in
```

13.4.8.2 Port ACLs with User-Defined Fields Limitations

User-defined fields consume a limited set of copy resources. For each unique offset, if a pattern is specified that is masked to be > 16 bits wide, then a 32-bit resource is used. If no 32-bit resource is available, then two 16-bit resources are used, if available. Copy resources are dependent upon the number of UDF key fields added to the feature key. Each UDF key field maps to one copy resource. Using the above TCAM profile configurations:

- IPv4: 1 x 16-bit pattern + 1 x 32-bit pattern.
- IPv6: 2 x 32-bit pattern.
- MAC: 1 x 16-bit pattern + 1 x 32-bit pattern.

Other limitations include:

- Maximum offset value is 31, which is 31 4-byte words, or 124 bytes.
- UDFs only work on ingress Port ACLs.

13.4.9 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

ACL Creation and Access Commands

- hardware access-list resource sharing vlan in
- hardware access-list resource sharing vlan ipv4 out
- ip access-list
- ip access-list standard
- ipv6 access-list
- ipv6 access-list standard
- mac access-list
- system profile

ACL Implementation Commands

- ip access-group
- ipv6 access-group
- mac access-group

Service ACL Implementation Commands

- ip access-group (Service ACLs)
- ipv6 access-group (Service ACLs)

ACL Edit Commands

- counters per-entry (ACL configuration modes)
- hardware access-list update default-result permit
- no <sequence number> (ACLs)
- resequence (ACLs)
- show (ACL configuration modes)

ACL Rule Commands

- deny (IPv4 ACL)
- deny (IPv6 ACL)
- deny (MAC ACL)
- deny (Standard IPv4 ACL)
- deny (Standard IPv6 ACL)
- permit (IPv4 ACL)
- permit (IPv6 ACL)
- permit (MAC ACL)
- permit (Standard IPv4 ACL)
- permit (Standard IPv6 ACL)
- remark

ACL List Counter Commands

- clear ip access-lists counters
- clear ipv6 access-lists counters
- hardware counter feature acl out

ACL Display Commands

- show ip access-lists
- show ipv6 access-lists
- show mac access-lists

Prefix List Creation and Access Commands

- ip prefix-list
- ipv6 prefix-list

Prefix List Edit Commands

- deny (IPv6 Prefix List)
- permit (IPv6 Prefix List)
- seq (IPv6 Prefix Lists)

Prefix List Display Commands

- show hardware tcam profile
- show ip prefix-list
- show ipv6 prefix-list
- show platform trident tcam
- show platform fap acl
- show platform fap acl tcam
- show platform fap acl tcam hw
- show platform fap acl tcam summary
- show platform arad acl tcam
- show platform arad acl tcam summary
- show platform arad mapping
- show platform fap acl tcam hw

Route Map Creation and Access Command

- route-map

Route Map Edit Commands

- continue (route map)
- description (route map)
- match (route-map)
- set (route-map)
- set as-path prepend
- set as-path match
- set community (route-map)
- set extcommunity (route-map)

Route Map Display Commands

- show route-map

13.4.9.1 clear ip access-lists counters

The **clear ip access-lists counters** command sets ACL counters to zero for the specified IPv4 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

clear ip access-lists counters [**ACL_NAME**][**SCOPE**]

Parameters

- **ACL_NAME** Name of ACL. Options include:
  - ***no parameter*** all ACLs.
  - ***access_list*** name of ACL.
- **SCOPE** Session affected by command. Options include:
  - ***no parameter*** command affects counters on all CLI sessions.
  - **session** affects only current CLI session.

Example

This command resets all IPv4 ACL counters.

```
switch(config)#clear ip access-lists counters
switch(config)#
```

13.4.9.2 clear ipv6 access-lists counters

The **`clear ipv6 access-lists counters`** command sets ACL counters to zero for the specified IPv6 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

`clear ipv6 access-lists counters` [**ACL_NAME**][**SCOPE**]

Parameters

- **ACL_NAME** name of ACL. Options include:
  - ***no parameter*** all IPv6 ACLs.
  - ***access_list*** name of IPv6 ACL.
- **SCOPE** Session affected by command. Options include:
  - ***no parameter*** command affects counters on all CLI sessions.
  - **session** affects only current CLI session.

Example

This command resets all IPv6 ACL counters.

```
switch(config)#clear ipv6 access-lists counters
switch(config)#
```

13.4.9.3 continue (route map)

The **continue** command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement's matching criteria.

A statement typically contains a **match (route-map)** and a **set (route-map)** command. The evaluation of routes whose settings are the same as **match** command parameters normally ends and the statement's **set** commands are applied to the route. Routes that match a statement containing a **continue** command are evaluated against the statement specified by the continue command.

When a route matches multiple route map commands, the filter action (**deny** or **permit**) is determined by the last statement that the route matches. The **set** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The **no continue** and **default continue** commands remove the corresponding **continue** command from the configuration mode *route map* statement by deleting the corresponding command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

continue NEXT_SEQ

no continue NEXT_SEQ

default continue NEXT_SEQ

Parameters

NEXT_SEQ Specifies next statement for evaluating matching routes. Options include:

- ***no parameter*** Next statement in the route map, as determined by sequence number.
- ***seq_number*** Specifies the number of the next statement. Values range from ***1*** to ***16777215***.

Restrictions

A **continue** command cannot specify a sequence number smaller than the sequence number of its route map statement.

Related Command

route-map command enters ***route map*** configuration mode.

Example

This command creates route map map1, statement 40 with a match command, a set command, and a continue command. Routes that match the statement are subsequently evaluated against statement 100. The **set local-preference** command is applied to matching routes regardless of subsequent matching operations.

```
switch(config)#route-map map1 deny 40
switch(config-route-map-map1)#match as 15
switch(config-route-map-map1)#continue 100
switch(config-route-map-map1)#set local-preference 50
switch(config-route-map-map1)#
```

13.4.9.4 counters per-entry (ACL configuration modes)

The **counters per-entry** command places the ACL in counting mode. An ACL in counting mode displays the number of instances each rule in the list matches an inbound packet and the elapsed time since the last match. The show access list commands display the statistics next to each rule in the ACL.

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The **no counters per-entry** and **default counters per-entry** commands place the ACL in non-counting mode.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

counters per-entry

no counters per-entry

default counters per-entry

Examples

- This command places the test1 ACL in counting mode.

```
switch(config)#ip access-list test1
switch(config-acl-test1)#counters per-entry
switch(config-acl-test1)#
```

- This command displays the ACL, with counter information, for an ACL in counting mode.

```
switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 12041, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https [match 11,
 1:41:07 ago]
  50 permit udp any any eq bootps bootpc snmp rip [match 78, 0:00:27
 ago]
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 14, 0:23:27 ago]
  120 permit tcp any any range 5900 5910
  130 permit tcp any any range 50000 50100
  140 permit udp any any range 51000 51100
```

13.4.9.5 deny (IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny PROTOCOL SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

no deny PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**][**FLAGS**] [**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

default deny PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][**fragments**][**tracked**][**DSCP_FILTER**][**TTL_FILTER**][log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding 10 to the number of the ACL's last rule.
  - ***14294967295*** Number assigned to entry.
- **PROTOCOL** protocol field filter. Values include:
  - **ahp** Authentication Header Protocol (51).
  - **icmp** Internet Control Message Protocol (1).
  - **igmp** Internet Group Management Protocol (2).
  - **ip** Internet Protocol v4 (4).
  - **ospf** Open Shortest Path First (89).
  - **pim** Protocol Independent Multicast (103).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User datagram protocol (17).
  - **vrrp** Virtual Router Redundancy Protocol (112).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0*** to ***255***.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***network_addr*** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
  - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
  - **gt *port*** The set of ports with larger numbers than the listed port.
  - **lt *port*** The set of ports with smaller numbers than the listed port.

    - **range** ***port_1 port_2*** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - **dscp** ***dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
    - **ttl eq** ***ttl_value*** Packets match if **ttl** in packet is equal to ***ttl_value***.
    - **ttl gt** ***ttl_value*** Packets match if **ttl** in packet is greater than ***ttl_value***.
    - **ttl lt** ***ttl_value*** Packets match if **ttl** in packet is less than ***ttl_value***.
    - **ttl neq** ***ttl_value*** Packets match if **ttl** in packet is not equal to ***ttl_value***.
        - Valid in ACLs applied to the control plane.
        - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from ***10.10.1.1/24*** to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#deny ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.

```
switch(config-acl-text1)#65 deny pim any any
switch(config-acl-text1)#
```

13.4.9.6 deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny PROT SRC_ADDR** [**SRC_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**] [**MSG**][**hop**] [**tracked**][**DSCP_FILTER**] [log]

no deny PROT SRC_ADDR [**SOURCE_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**][**hop**][**tracked**] [**DSCP_FILTER**][log]

default deny PROT SRC_ADDR [**SOURCE_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**] [**hop**] [**tracked**][**DSCP_FILTER**][log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **PROT** Protocol field filter. Values include:
  - **icmpv6** Internet Control Message Protocol for version 6 (58).
  - **ipv6** Internet Protocol IPv6 (41).
  - **ospf** Open Shortest Path First (89).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User Datagram Protocol (17).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0*** to ***255***.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
  - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
  - **gt *port*** The set of ports with larger numbers than the listed port.
  - **lt *port*** The set of ports with smaller numbers than the listed port.
  - **range *port_1 port_2*** The set of ports whose numbers are between the range.
- **HOP** Filters by packet's hop-limit value. Options include:
  - ***no parameter*** Rule does not use hop limit to filter packets.
  - **hop-limit eq *hop_value*** Packets match if **hop-limit** value in packet equals ***hop_value***.
  - **hop-limit gt *hop_value*** Packets match if **hop-limit** in packet is greater than ***hop_value***.

    - **hop-limit lt *hop_value*** Packets match if **hop-limit** in packet is less than ***hop_value***.
    - **hop-limit neq *hop_value*** Packets match if **hop-limit** in packet is not equal to ***hop_value***.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - **dscp *dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from ***3710:249a:c643:ef11::/64*** to any host.

```
switch(config)#ipv6 access-list text1
switch(config-acl-text1)#deny ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

13.4.9.7 deny (IPv6 Prefix List)

The **deny** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a **deny** statement specifies.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode prefix list. The **no** **seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[**SEQUENCE**] **deny** *ipv6_prefix* [**MASK**]

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the list's last rule.
  - **seq *seq_num*** Number is specified by ***seq_num***. Value ranges from ***0 to 65535***.
- ***ipv6_prefix*** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq *mask_e*** Prefix length is equal to ***mask_e***.
  - **ge *mask_g*** Range is from ***mask_g*** to ***128***.
  - **le *mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge *mask_l* le *mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_land***, and ***mask_g*** range from ***1 to 128***.
  - When **le** and **ge** are specified, ***subnet*** mask ***mask_g mask_l***.

Example

This command appends a **deny** statement at the end of the text1 prefix list. The **deny** statement denies redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#deny 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.8 deny (MAC ACL)

The **deny** command adds a deny rule to the configuration mode MAC Access Control List (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

no deny SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

default deny SOURCE_ADDR DEST_ADDR [**PROTOCOL**][log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***mac_address mac_mask*** MAC address and mask.
  - **any** Packets from all addresses are filtered.
  - ***mac_address*** specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***mac_mask*** specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***0*** bits require an exact match to filter.
  - ***1*** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
  - **aarp** Appletalk Address Resolution Protocol (0x80f3).
  - **appletalk** Appletalk (0x809b).
  - **arp** Address Resolution Protocol (0x806).
  - **ip** Internet Protocol Version 4 (0x800).
  - **ipx** Internet Packet Exchange (0x8137).
  - **lldp** LLDP (0x88cc).
  - **novell** Novell (0x8138).
  - **rarp** Reverse Address Resolution Protocol (0x8035).
  - ***protocol_num*** Integer corresponding to a MAC protocol. Values range from ***0 to 65535***.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from ***10.1000.0000*** through ***10.1000.FFFF*** to any host.

```
switch(config)#mac access-list text1
switch(config-mac-acl-text1)#deny 10.1000.0000 0.0.FFFF any aarp
```

- This command inserts a permit statement with the sequence number ***25***. The deny statement drops all packets through the interface.

```
switch(config-mac-acl-text1)#25 deny any any
```

13.4.9.9 deny (Standard IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR** [log]

no deny SOURCE_ADDR [log]

default deny SOURCE_ADDR [log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - **network_addr** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

  Subnet addresses support discontiguous masks.
- **log** Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from ***10.10.1.1/24***.

```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#deny 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.10 deny (Standard IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv6 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **deny SOURCE_ADDR**

no deny SOURCE_ADDR

default deny SOURCE_ADDR

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from ***2103::/64***.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#deny 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.11 description (route map)

The **description** command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The **no description** and **default description** commands remove the text string from the configuration mode route map by deleting the corresponding **description** command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

description *label_text*

no description

default description

Parameters

label_text Character string assigned to the route map configuration.

Related Command

route-map.

Example

These commands add description text to the ***XYZ-1*** route map.

```
switch(config)#route-map XYZ-1
switch(config-route-map-XYZ-1)#description This is the first map.
switch(config-route-map-XYZ-1)#exit
switch(config)#show route-map XYZ-1
route-map XYZ-1 permit 10
  Description:
    description This is the first map.
  Match clauses:
  Set clauses:
switch(config)#
```

13.4.9.12 hardware access-list resource sharing vlan in

The **hardware access-list resource sharing vlan in** command enables the IPv4 Ingress Sharing of hardware resources on the switch same ACL is applied on different VLANs.

The **no hardware access-list resource sharing vlan in** command disables the IPv4 Ingress Sharing of hardware resources on the switch.

Command Mode

Global Configuration

Command Syntax

```
hardware access-list resource sharing vlan in

no hardware access-list resource sharing vlan in
```

Guidelines

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.

Use the **show platform trident** command to verify the Ingress IPv4 Sharing information.

13.4.9.13 hardware access-list resource sharing vlan ipv4 out

The **hardware access-list resource sharing vlan ipv4 out** command enables the IPv4 Egress RACL TCAM sharing on the switch.

The **no hardware access-list resource sharing vlan ipv4 out** command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

Command Mode

Global Configuration

Command Syntax

hardware access-list resource sharing vlan ipv4 out

no hardware access-list resource sharing vlan ipv4 out

Guidelines

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use the **show running-config all | include sharing** command to verify whether or not sharing for egress IPv4 RACLs is enabled.

Example

This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch#show running-config all | include sharing

hardware access-list resource sharing vlan ipv4 out
                          ---->It returns the following output if IPv4 RACL
 sharing is enabled.
```

13.4.9.14 hardware access-list update default-result permit

The **hardware access-list update default-result permit** command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the **ip access-list** commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The **no hardware access-list update default-result permit** and **default hardware access-list update default-result permit** commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding **hardware access-list update default-result permit** command from the ***running-config***.

Command Mode

Global Configuration

Command Syntax

hardware access-list update default-result permit

no hardware access-list update default-result permit

default hardware access-list update default-result permit

Restrictions

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

This command does not support egress ACLs.

While this command is enabled, static NAT, and ACL-based mirroring are affected during ACL updates.

Example

This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

```
switch(config)#hardware access-list update default-result permit
switch(config)#
```

13.4.9.15 hardware counter feature acl out

The **hardware counter feature acl out** command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The **no hardware counter feature acl out** and **default hardware counter feature acl out** commands disable or return the egress ACL hardware counters to the default state.

Command Mode

Global Configuration

Command Syntax

hardware counter feature acl out [**OPTIONS**]

no hardware counter feature acl out [**OPTIONS**]

default hardware counter feature acl out [**OPTIONS**]

Parameters

- **OPTIONS** ACL hardware counter options include:
  - **ipv4** Address family IPv4.
  - **ipv6** Address family IPv6.

Examples

- This command enables IPv4 egress ACL hardware counters.

```
switch(config)#hardware counter feature acl out ipv4
switch(config)#
```

- This command disables IPv4 egress ACL hardware counters.

```
switch(config)#no hardware counter feature acl out ipv4
switch(config)#
```

13.4.9.16 ip access-group (Service ACLs)

The **ip access-group (Service ACLs)** command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The **no ip access-group (Service ACLs)** and **default ip access-group (Service ACLs)** commands remove the corresponding **ip access-group (Service ACLs)** command from ***running-config***.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

Router-IGMP Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

ip access-group *acl_name* [vrf*vrf_name*][in]

no ip access-group *acl_name* [vrf*vrf_name*][in]

default ip access-group *acl_name* [vrf*vrf_name*][in]

Parameters

Parameters vary by process.

- ***acl_name*** Name of the Service ACL assigned to control-plane service.
- **vrf *vrf_name*** Specifies the VRF in which the Service ACL is to be applied.
- **in** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the Service ACL ***bgpacl*** to the BGP routing protocol in VRF ***purple***.

```
(config)#router bgp 5
(config-router-bgp)#vrf purple
(config-router-bgp-vrf-purple)#ip access-group bgpacl
```

For additional configuration examples, see **Configuring Service ACLs and Displaying Status and Counters**.

13.4.9.17 ip access-group

The **ip access-group** command applies an IPv4 or standard IPv4 access control list (ACL) to the configuration mode interface or subinterface.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip access-group *list_name* **DIRECTION**

no ip access-group *list_name* **DIRECTION**

default ip access-group *list_name* **DIRECTION**

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Iinbound packets.
  - **out** Outbound packets.

Restrictions

Filtering of outbound packets by ACLs is not supported on Petra platform switches.

Filtering of outbound packets by ACLs on FM6000 switches is supported on physical interfaces only (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

Example

These commands apply the IPv4 ACL named ***test2*** to ***interface ethernet 3***.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test2 in
switch(config-if-Et3)#
```

13.4.9.18 ip access-list standard

The **ip access-list standard** command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list standard** and **default ip access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

ip access-list standard *list_name*

no ip access-list standard *list_name*

default ip access-list standard *list_name*

Parameters

list_name Name of standard ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-ACL configuration mode:

- **deny (Standard IPv4 ACL)**
- **no <sequence number> (ACLs)**
- **permit (Standard IPv4 ACL)**
- **remark**
- **resequence (ACLs)**
- **show (ACL configuration modes)**

Related Commands

- **ip access-list** Enters ACL configuration mode for editing IPv4 ACLs.
- **show ip access-lists** Displays IPv4 and standard IPv4 ACLs.

Examples

- This command places the switch in std-ACL configuration mode to modify the ***filter2*** IPv4 ACL.

```
switch(config)#ip access-list standard filter2
switch(config-std-acl-filter2)#
```

- This command saves changes to ***filter2*** ACL, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)#exit
switch(config)#
```

- This command discards changes to ***filter2***, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)#abort
switch(config)#
```

13.4.9.19 ip access-list

The **ip access-list** command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list** and **default ip access-list** commands delete the specified IPv4 ACL.

Command Mode

Global Configuration

Command Syntax

ip access-list *list_name*

no ip access-list *list_name*

default ip access-list *list_name*

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in ACL configuration mode:

- **deny (IPv4 ACL)**
- **no <sequence number> (ACLs)**
- **permit (IPv4 ACL)**
- **remark**
- **resequence (ACLs)**
- **show (ACL configuration modes)**

Related Commands:

- **ip access-list standard** Enters ***std-acl*** configuration mode for editing standard IP ACLs.
- **show ip access-lists** Displays IP and standard ACLs.

Examples

- This command places the switch in ACL configuration mode to modify the ***filter1*** IPv4 ACL.

```
switch(config)#ip access-list filter1
switch(config-acl-filter1)#
```

- This command saves changes to ***filter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)#exit
switch(config)#
```

- This command discards changes to ***filter1***, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)#abort
switch(config)#
```

13.4.9.20 ip prefix-list

The **ip prefix-list** command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the match command is evaluating.

The **no ip prefix-list** and **default ip prefix-list** commands delete the specified prefix list entry by removing the corresponding **ip prefix-list** statement from ***running-config***. If the **no** or **default ip prefix-list** command does not list a sequence number, the command deletes all entries of the prefix list.

Command Mode

Global Configuration

Command Syntax

ip prefix-list *list_name* [**SEQUENCE**] **FILTER_TYPE** *network_addr* [**MASK**]

no ip prefix-list *list_name* [**SEQUENCE**]

default ip prefix-list *list_name* [**SEQUENCE**]

Parameters

- ***list_name*** The label that identifies the prefix list.
- **SEQUENCE** Sequence number of the prefix list entry. Options include:
  - ***no parameter*** Entry's number is ten plus highest sequence number in current list.
  - **seq** ***seq_num*** Number assigned to entry. Value ranges from ***0*** to ***65535***.
- **FILTER_TYPE** Specifies route access when it matches IP prefix list. Options include:
  - **permit** Routes are permitted access when they match the specified subnet.
  - **deny** Routes are denied access when they match the specified subnet.
- ***network_addr*** Subnet upon which command filters routes. Format is CIDR or address-mask.
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq** ***mask_e*** Prefix length is equal to ***mask_e***.
  - **ge** ***mask_g*** Range is from ***1*** to ***32***.
  - **le** ***mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge** ***mask_l*** **le** ***mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_l***, and ***mask_g*** range from ***1*** to ***32***. When **le** and **ge** are specified, ***subnet*** **mask** ***mask_g***>***mask_l***.

Example

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named ***route-one***.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named ***route-one***.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```

13.4.9.21 ipv6 access-group (Service ACLs)

The **`ipv6 access-group (Service ACLs)`** command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The **`no ipv6 access-group (Service ACLs)`** and **`default ipv6 access-group (Service ACLs)`** commands remove the corresponding **`ipv6 access-group (Service ACLs)`** command from ***running-config***.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

`ipv6 access-group` *ipv6_acl_name* [vrf*vrf_name*][in]

`no ipv6 access-group` [*ipv6_acl_name*][vrf*vrf_name*][in]

`default ipv6 access-group` *ipv6_acl_name* [vrf *vrf_name*][in]

Parameters

Parameters vary by process.

- ***ipv6_acl_name*** Name of the IPv6 Service ACL assigned to control-plane service.
- **vrf *vrf_name*** Specifies the VRF in which the Service ACL is to be applied.
- **in** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the IPv6 Service ACL ***bgpacl*** to the BGP routing protocol in VRF ***purple***.

```
(config)#router bgp 5
(config-router-bgp)#vrf purple
(config-router-bgp-vrf-purple)#ipv6 access-group bgpacl
```

For additional configuration examples, see **Configuring Service ACLs and Displaying Status and Counters**.

13.4.9.22 ipv6 access-group

The **ipv6 access-group** command applies an IPv6 or standard IPv6 Access Control List (ACL) to the configuration mode interface.

The **no ipv6 access-group** and **default ipv6 access-group** commands remove the corresponding **ipv6 access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ipv6 access-group *list_name* **DIRECTION**

no ipv6 access-group *list_name* **DIRECTION**

default ipv6 access-group *list_name* **DIRECTION**

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Inbound packets.
  - **out** Outbound packets.

Examples

These commands assign the IPv6 ACL named ***test2*** to the ***interface ethernet 3***.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ipv6 access-group test2 in
switch(config-if-Et3)#
```

13.4.9.23 ipv6 access-list standard

The **ipv6 access-list standard** command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list standard** and **default ipv6 access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

ipv6 access-list standard *list_name*

no ipv6 access-list standard *list_name*

default ipv6 access-list standard *list_name*

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-IPv6-ACL configuration mode:

- **deny (Standard IPv6 ACL)**
- **no <sequence number> (ACLs)**
- **permit (Standard IPv6 ACL)**
- **remark**
- **resequence (ACLs)**
- show (ACL configuration modes)

Related Commands

- **ipv6 access-list** Enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- **show ipv6 access-lists** Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in Std-IPv6 ACL configuration mode to modify the ***filter2*** ACL.

```
switch(config)#ipv6 access-list standard filter2
switch(config-std-ipv6-acl-filter2)#
```

- This command saves changes to ***filter2*** ACL, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)#exit
switch(config)#
```

- This command discards changes to ***filter2***, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)#abort
switch(config)#
```

13.4.9.24 ipv6 access-list

The **ipv6 access-list** command places the switch in ***IPv6-ACL*** configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list** and **default ipv6 access-list** commands delete the specified IPv6 ACL.

Command Mode

Global Configuration

Command Syntax

ipv6 access-list *list_name*

no ipv6 access-list *list_name*

default ipv6 access-list *list_name*

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-ACL configuration mode:

- **deny (IPv6 ACL)**
- **no <sequence number> (ACLs)**
- **permit (IPv6 ACL)**
- **remark**
- **resequence (ACLs)**
- **show (ACL configuration modes)**

Related Commands

- **ipv6 access-list standard** Enters ***std-ipv6-acl*** configuration mode for editing standard IPv6 ACLs.
- **show ipv6 access-lists** Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in IPv6-ACL configuration mode to modify the ***filter1*** IPv6 ACL.

```
switch(config)#ipv6 access-list filter1
switch(config-ipv6-acl-filter1)#
```

- This command saves changes to ***filter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)#exit
switch(config)#
```

- This command discards changes to ***filter1***, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)#abort
switch(config)#
```

13.4.9.25 ipv6 prefix-list

The **`ip prefix-list`** command places the switch in ***IPv6 prefix-list*** configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **`exit`** command saves pending prefix list changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **`abort`** command discards pending changes, returning the switch to global configuration mode.

The **`no ipv6 prefix-list`** and **`default ipv6 prefix-list`** commands delete the specified IPv6 prefix list.

Command Mode

Global Configuration

Command Syntax

`ipv6 prefix-list` *list_name*

`no ipv6 prefix-list` *list_name*

`default ipv6 prefix-list` *list_name*

Parameter

list_name Name of prefix list. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-pfx configuration mode:

- **deny (IPv6 Prefix List)**
- **permit (IPv6 Prefix List)**
- **seq (IPv6 Prefix Lists)**

Examples

- This command places the switch in ***IPv6 prefix-list*** configuration mode to modify the ***route-five*** prefix list.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#
```

- This command saves changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)#exit
switch(config)#
```

- This command saves changes to the prefix list, then places the switch in ***interface-ethernet*** mode.

```
switch(config-ipv6-pfx)#interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)#abort
switch(config)#
```

13.4.9.26 mac access-group

The **mac access-group** command applies a MAC Access Control List (MAC ACL) to the configuration mode interface.

The **no mac access-group** and **default mac access-group** commands remove the specified **mac access-group** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

mac access-group *list_name* **DIRECTION**

no mac access-group *list_name* **DIRECTION**

default mac access-group *list_name* **DIRECTION**

Parameters

- ***list_name*** Name of MAC ACL.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
  - **in** Inbound packets.
  - **out** Outbound packets.

Restrictions

Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident II platform switches.

Example

These commands assign the MAC ACL named ***mtest2*** to ***interface ethernet 3*** to filter inbound packets.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#mac access-group mtest2 in
switch(config-if-Et3)#
```

13.4.9.27 mac access-list

The **mac access-list** command places the switch in ***MAC-ACL*** configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no mac access-list** and **default mac access-list** commands delete the specified list.

Command Mode

Global Configuration

Command Syntax

mac access-list *list_name*

no mac access-list *list_name*

default mac access-list *list_name*

Parameters

list_name Name of MAC ACL. Names must begin with an alphabetic character and cannot contain a space or quotation mark.

Commands Available in MAC-ACL configuration mode:

- **deny (MAC ACL)**
- **no <sequence number> (ACLs)**
- **permit (MAC ACL)**
- **remark**
- **resequence (ACLs)**
- **show (ACL configuration modes)**

Examples

- This command places the switch in ***MAC-ACL*** configuration mode to modify the ***mfilter1*** MAC ACL.

```
switch(config)#mac access-list mfilter1
switch(config-mac-acl-mfilter1)#
```

- This command saves changes to ***mfilter1*** ACL, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)#exit
switch(config)#
```

- This command saves changes to ***mfilter1*** ACL, then places the switch in ***interface-etherne***t mode.

```
switch(config-mac-acl-mfilter1)#interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to ***mfilter1***, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)#abort
switch(config)#
```

13.4.9.28 match (route-map)

The **match** command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each **match** command. When a route properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The **no match** and **default match** commands remove the **match** command from the configuration mode route map statement by deleting the corresponding command from ***running-config***.

Note: The route map configuration supports only standard ACL.

Command Mode

Route-Map Configuration

Command Syntax

match CONDITION

no match CONDITION

default match CONDITION

Parameters

- **CONDITION** Specifies criteria for evaluating a route. Options include:
  - **aggregate-role** Role in BGP contributor-aggregate relation. Options include:
    - **contributor** BGP aggregate's contributor.
    - **aggregate-attributes** Route map to apply against the aggregate route.
  - **as *1*** to ***4294967295*** BGP Autonomous System number.
  - **as-path *path_name*** BGP Autonomous System path access list.
  - **community NAME** BGP community. Options for **NAME** include:
    - **listname** BGP community.
    - ***listname* exact-match** BGP community; list must match set that is present.
  - **extcommunity *listname*** BGP extended community. Options for **NAME** include:
    - ***listname*** BGP community.
    - ***listname* exact-match** BGP community; list must match set that is present.
  - ***interface* INTF_NAME** Specifies an interface. Options for **INTF_NAME** include:
    - **ethernet *e_num*** Ethernet interface.
    - **loopback *l_num*** Loopback interface.
    - **port-channel *p_num*** Port channel interface.
    - **vlan *v_num*** VLAN interface.

    invert-result Invert sub route map result.
  - **ip address LIST** IPv4 address filtered by an ACL or prefix list. **LIST** options include:
    - ***access-list acl_name*** IPv4 address filtered by access control list (ACL).
    - **prefix-list *plv4_name*** IPv4 address filtered by IP prefix list.
  - **ip next-hop prefix-list *plv4_name*** IPv4 next-hop filtered by IP prefix list.
  - **ip resolved-next-hop prefix-list *plv4_name*** IPv4 resolved nexthop filtered by IP prefix list.
  - **ipv6 address prefix-list *plv6_name*** IPv6 address filtered by IPv6 prefix list.
  - **ipv6 next-hop prefix-list *plv6_name*** IPv6 next-hop filtered by IPv6 prefix list.
  - **ipv6 resolved-next-hop prefix-list *plv6_name*** IPv6 resolved nexthop filtered by IPv6 prefix list.

- **local-preference** ***1*** to ***4294967295*** BGP local preference metric.
- **metric** ***1*** to ***4294967295*** Route metric.
- **metric-type OSPF_TYPE** OSPF metric type. Options include:
  - **type-1** OSPF type 1 metric.
  - **type-2** OSPF type 2 metric.
- **source-protocol** ***protocol_type*** Routing protocol of route's source. Options include:
  - **bgp**
  - **connected**
  - **ospf**
  - **rip**
  - **static**
- **tag** ***1*** to ***4294967295*** Route tag.

Related Command

route-map.

Example

This command creates a ***route map*** match rule that filters routes from BGP ***AS 15***.

```
switch(config)#route-map map1
switch(config-route-map-map1)#match as 15
switch(config-route-map-map1)#
```

13.4.9.29 no <sequence number> (ACLs)

The **no <sequence number>** command removes the rule with the specified sequence number from the ACL. The **default <sequence number>** command also removes the specified rule.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

no *line_num*

default *line_num*

Parameters

line_num Sequence number of rule to be deleted. Values range from ***1 - 4294967295***.

Example

This command removes statement 30 from the list.

```
switch(config-acl-test1)#show IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
switch(config-acl-test1)#no 30
switch(config-acl-test1)#show IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

13.4.9.30 permit (IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit PROTOCOL SOURCE_ADDR** [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][fragments][tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

no permit PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**][**FLAGS** [**MESSAGE**] [fragments] [tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

default permit PROTOCOL SOURCE_ADDR [**SOURCE_PORT**] **DEST_ADDR** [**DEST_PORT**] [**FLAGS**][**MESSAGE**][fragments][tracked][**DSCP_FILTER**][**TTL_FILTER**][log]

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **PROTOCOL** Protocol field filter. Values include:
  - **ahp** Authentication Header Protocol (51).
  - **gre** Generic Routing Encapsulation.
  - **gtp** GPRS Tunneling Protocol.
  - **icmp** Internet Control Message Protocol (1).
  - **igmp** Internet Group Management Protocol (2).
  - **ip** Any Internet Protocol v4 (4).
  - **ospf** Open Shortest Path First (89).
  - **pim** Protocol Independent Multicast (103).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User datagram protocol (17).
  - **vlan** Enter VLAN number. Value ranges from ***1 to 4094***.
  - **vrrp** Virtual Router Redundancy Protocol (112).
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0 to 255***.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***network_addr*** subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

    Source and destination subnet addresses support discontiguous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1 port-2*** ... ***port-n*** A list of ports. Maximum list size is 10 ports.

    - **neq** ***port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
    - **gt** ***port*** The set of ports with larger numbers than the listed port.
    - **lt** ***port*** The set of ports with smaller numbers than the listed port.
    - **range** ***port_1 port_2*** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flags bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - ***dscp dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
    - **ttl eq** ***ttl_value*** Packets match if **ttl** in packet is equal to ***ttl_value***.
    - **ttl gt** ***ttl_value*** Packets match if **ttl** in packet is greater than ***ttl_value***.
    - **ttl lt** ***ttl_value*** Packets match if **ttl** in packet is less than ***ttl_value***.
    - **ttl neq** ***ttl_value*** Packets match if **ttl** in packet is not equal to ***ttl_value***.
        - Valid in ACLs applied to the control plane.
        - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all OSPF packets from ***10.10.1.1/24*** to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#permit ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number ***25***. The **permit** statement passes all PIM packets through the interface.

```
switch(config-acl-text1)#25 permit pim any any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
```

13.4.9.31 permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit PROT SRC_ADDR** [**SRC_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**] [**MSG**] [**HOP**] [tracked] [**DSCP_FILTER**] [log]

no permit PROT SRC_ADDR [**SRC_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**] [**HOP**][tracked] [**DSCP_FILTER**][log]

default permit PROT SRC_ADDR [**SRC_PT**] **DEST_ADDR** [**DEST_PT**][**FLAG**][**MSG**] [**HOP**] [tracked][**DSCP_FILTER**][log]

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **PROT** Protocol field filter. Values include:
  - **icmpv6** Internet Control Message Protocol for v6 (58).
  - **ipv6** Internet Protocol IPv6 (41).
  - **ospf** Open Shortest Path First (89).
  - **tcp** Transmission Control Protocol (6).
  - **udp** User Datagram Protocol (17).
  - **vlan** Enter VLAN number. Value ranges from ***1 to 4094***.
  - ***protocol_num*** Integer corresponding to an IP protocol. Values range from ***0 to 255***.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host *ipv6_addr*** IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
  - **any** All ports.
  - **eq *port-1*** **port-2** ... ***port-n*** A list of ports. Maximum list size is 10 ports.
  - **neq *port-1 port-2*** ... ***port-n*** The set of all ports not listed. Maximum list size is 10 ports.
  - **gt *port*** The set of ports with larger numbers than the listed port.
  - **lt *port*** The set of ports with smaller numbers than the listed port.
  - **range *port_1 port_2*** The set of ports whose numbers are between the range.
- **HOP** Filters by packet's hop-limit value. Options include:
  - ***no parameter*** Rule does not use hop limit to filter packets.

    - **hop-limit eq *hop_value*** Packets match if **hop-limit** value in packet equals ***hop_value***.
    - **hop-limit gt *hop_value*** Packets match if **hop-limit** in packet is greater than ***hop_value***.
    - **hop-limit lt *hop_value*** Packets match if **hop-limit** in packet is less than ***hop_value***.
    - **hop-limit neq *hop_value*** Packets match if **hop-limit** in packet is not equal to ***hop_value***.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
    - ***no parameter*** Rule does not use DSCP to filter packets.
    - **dscp *dscp_value*** Packets match if DSCP field in packet is equal to ***dscp_value***.
- **log** Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address ***3710:249a:c643:ef11::/64*** and with any destination address.

```
switch(config)#ipv6 access-list text1
switch(config-acl-text1)#permit ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit ipv6 vlan 1234 0x0 ip any any
```

13.4.9.32 permit (IPv6 Prefix List)

The **permit** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a **permit** statement specifies.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode prefix list. The **no** **seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[**SEQUENCE**] **permit** *ipv6_prefix* [**MASK**]

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding 10 to the number of the list's last rule.
  - **seq *seq_num*** Number is specified by ***seq_num***. Value ranges from ***0 to 65535***.
- ***ipv6_prefix*** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
  - ***no parameter*** Exact match with the subnet mask is required.
  - **eq *mask_e*** Prefix length is equal to ***mask_e***.
  - **ge *mask_g*** Range is from ***mask_g*** to ***128***.
  - **le *mask_l*** Range is from ***subnet*** mask length to ***mask_l***.
  - **ge *mask_l* le *mask_g*** Range is from ***mask_g*** to ***mask_l***.
  - ***mask_e***, ***mask_l*** and ***mask_g*** range from ***1 to 128***.
  - When **le** and **ge** are specified, the prefix list size ***mask_g mask_l***.

Example

This command appends a **permit** statement at the end of the text1 prefix list. The **permit** statement allows redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#permit 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.33 permit (MAC ACL)

The **permit** command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit** **SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

no permit **SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

default permit **SOURCE_ADDR DEST_ADDR** [**PROTOCOL**][log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
  - ***mac_address mac_mask*** MAC address and mask.
  - **any** Packets from all addresses are filtered.
  - ***mac_address*** Specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - **mac_mask** Specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - ***0*** bits require an exact match to filter.
  - ***1*** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
  - **aarp** Appletalk Address Resolution Protocol (0x80f3).
  - **appletalk** Appletalk (0x809b).
  - **arp** Address Resolution Protocol (0x806).
  - **ip** Internet Protocol Version 4 (0x800).
  - **ipx** Internet Packet Exchange (0x8137).
  - **lldp** LLDP (0x88cc).
  - **novell** Novell (0x8138).
  - **rarp** Reverse Address Resolution Protocol (0x8035).
  - ***protocol_num*** Integer corresponding to a MAC protocol. Values range from ***0 to 65535***.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all aarp packets from ***10.1000.0000*** through ***10.1000.FFFF*** to any host.

```
switch(config)#mac access-list text1
switch(config-mac-acl-text1)#permit 10.1000.0000 0.0.FFFF any aarp
switch(config-mac-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number ***25***. The **permit** statement passes all packets through the interface.

```
switch(config-mac-acl-text1)#25 permit any any
```

```
switch(config-mac-acl-text1)#
```

13.4.9.34 permit (Standard IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding ***10*** to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit SOURCE_ADDR** [log]

no permit SOURCE_ADDR [log]

default permit SOURCE_ADDR [log]

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***network_addr*** Subnet address (CIDR or address-mask).
  - **any** Packets from all addresses are filtered.
  - **host *ip_addr*** IP address (dotted decimal notation).

    Subnet addresses support discontiguous masks.
- **log** Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all packets with a source address of ***10.10.1.1/24***.

```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#permit 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.35 permit (Standard IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

[**SEQ_NUM**] **permit** **SOURCE_ADDR**

no permit **SOURCE_ADDR**

default permit **SOURCE_ADDR**

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
  - ***no parameter*** Number is derived by adding ***10*** to the number of the ACL's last rule.
  - ***1 - 4294967295*** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
  - ***ipv6_prefix*** IPv6 address with prefix length (CIDR notation).
  - **any** Packets from all addresses are filtered.
  - **host** ***ipv6_addr*** IPv6 host address.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement drops packets with a source address of ***2103::/64***.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.36 remark

The **remark** command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The **default remark** command removes the comment statement from the ACL.

The **no remark** command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

remark *text*

line_num remark [*text*]

no remark *text*

default remark *text*

Parameters

- ***text*** The comment text.
- ***line_num*** Sequence number assigned to the remark statement. Value ranges from ***1 - 4294967295***.

Example

This command appends a comment to the list.

```
switch(config-acl-test1)#remark end of list
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

13.4.9.37 resequence (ACLs)

The **resequence** command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is ***4294967295***.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

resequence [*start_num* [*inc_num*]]

Parameters

- ***start_num*** Sequence number assigned to the first rule. Default is ***10***.
- ***inc_num*** Numeric interval between consecutive rules. Default is ***10***.

Example

The **resequence** command renumbers the list, starting the first command at number ***100*** and incrementing subsequent lines by ***20***.

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
switch(config-acl-test1)#resequence 100 20
switch(config-acl-test1)#show
IP Access List test1
  100 permit ip 10.10.10.0/24 any
  120 permit ip any host 10.20.10.1
  140 deny ip host 10.10.10.1 host 10.20.10.1
  160 permit ip any any
  180 remark end of list
```

13.4.9.38 route-map

The **route-map** command places the switch in ***route map*** configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (**permit** or **deny**), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The **exit** command saves pending route map statement changes to ***running-config***, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no route-map** and **default route-map** commands delete the specified route map statement from ***running-config***.

Note: The route map configuration supports only standard ACL.

Command Mode

Global Configuration

Command Syntax

route-map *map_name* [**FILTER_TYPE**] [*sequence_number*]

no route-map *map_name* [**FILTER_TYPE**] [*sequence_number*]

default route-map *map_name* [**FILTER_TYPE**][*sequence_number*]

Parameters

- ***map_name*** Label assigned to route map. Protocols reference this label to access the route map.
- **FILTER_TYPE** Disposition of routes matching commands specified by route map statement.
  - **permit** Routes are redistributed when they match route map statement.
  - **deny** Routes are not redistributed when they match route map statement.
  - ***no parameter*** Sssigns **permit** as the **FILTER_TYPE**.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

- ***sequence_number*** The route map position relative to other statements with the same name.
  - ***no parameter*** Sequence number of 10 (default) is assigned to the route map.
  - ***1-16777215*** Specifies sequence number assigned to route map.

Commands Available in route map configuration mode:

- **continue (route map)**
- **match (route-map)**
- **set (route-map)**

Examples

- This command creates the route map named ***map1*** and places the switch in route map configuration mode. The route map is configured as a permit map.

```
switch(config)#route-map map1 permit 20
```

```
switch(config-route-map-map1)#
```

- This command saves changes to ***map1*** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)#exit
switch(config)#
```

- This command saves changes to ***map1*** route map, then places the switch in interface-Ethernet mode.

```
switch(config-route-map-map1)#interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to ***map1*** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)#abort
switch(config)#
```

13.4.9.39 seq (IPv6 Prefix Lists)

The **no seq** command removes the rule with the specified sequence number from the ACL. The **default seq** command also removes the specified rule.

The **seq** keyword is a command option used at the beginning of **deny (IPv6 Prefix List)** and **permit (IPv6 Prefix List)** commands that places a new rule between two existing rules.

Command Mode

IPv6-pfx Configuration

Command Syntax

no seq *line_num*

default seq *line_num*

Parameters

line_num Sequence number of rule to be deleted. Valid rule numbers range from ***0*** to ***65535***.

Example

These commands remove rule 20 from the ***map1*** prefix list, then displays the resultant list.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```

13.4.9.40 set (route-map)

The **set** command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The **no set** and **default set** commands remove the specified **set** command from the configuration mode route map statement by deleting the corresponding **set** command from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

set CONDITION

no set CONDITION

default set CONDITION

Parameters

- **CONDITION** Specifies the route modification parameter and value. Options include:
  - **as-path prepend** BGP AS number that is prepended to as-path. For details, see the set as-path prepend command.
    - ***1 - 4294967295*** BGP AS number to prepend.
    - **auto** Use peer AS number for inbound and local AS for outbound to prepend.
  - **distance** ***1 - 255*** Protocol independent administrative distance.
  - **ip next-hop** ***ipv4_address*** Next hop IPv4 address.
  - **ip next-hop peer-address** Use BGP peering address as next hop IPv4 address.
  - **ipv6 next-hop** ***ipv6_address*** Next hop IPv6 address.
  - **ipv6 next-hop peer-address** Use BGP peering address as next hop IPv6 address.
  - **local-preference** ***1 - 4294967295*** BGP local preference metric.
  - **metric** ***1 - 4294967295*** Route metric.
  - **metric +** ***1 - 4294967295*** Add specified value to current route metric.
  - **metric -** ***1 - 4294967295*** Subtract specified value to current route metric.
  - **metric-type OSPF_TYPE** OSPF metric type. Options include:
    - **type-1** OSPF type 1 metric.
    - **type-2** OSPF type 2 metric.
  - **origin O_TYPE** BGP origin attribute. Options for **O_TYPE** include:
    - **egp** Exterior BGP route.
    - **igp** Interior BGP route.
    - **incomplete** BGP route of unknown origin.
  - **tag** ***1 - 4294967295*** Route tag.
  - **weight** ***1 - 65535*** BGP weight parameter.

Related Commands

- **route-map** enters ***route-map*** configuration mode.
- **set (route-map)** specifies community modifications for the redistributed routes.
- **set community (route-map)** specifies extended community modifications for the redistributed routes.

Example

This command creates a route map entry that sets the local preference metric to ***100*** on redistributed routes.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set local-preference 100
switch(config-route-map-map1)#
```

13.4.9.41 set as-path match

The **set as-path match** command configures the **AS_PATH** attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode.

The **no set as-path match** command removes the AS path specified for the BGP prefix.

Command Mode

Route-Map Configuration

Command Syntax

set as-path match all replacement [[none | auto] *as_path*]

no set as-path match all replacement [[none | auto] *as_path*]

Parameters

- **none** Replaces the ***AS-Path*** of the matching routes with a null or an empty ***AS-Path***.
- **auto** iF the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the **AS_PATH** of the prefixes received from this neighbor with the neighbor's AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the **AS_PATH** of the prefixes advertised to this neighbor with the locally configured AS number.
- ***as_path*** Replaces the AS-Path of the matching routes with an arbitrary ***AS-Path***.

Examples

- This command replaces the AS-Path with the **none** option.

```
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200

 * > 202.202.1.0/24 80.80.1.1 - - - 200 200 500 600 i
```

The AS-Path of matching prefixes are replaced with the locally configured AS ***200*** and ***500 600***.

-

13.4.9.42 set as-path prepend

The **set as-path prepend** command adds a **set** statement to a route map to prepend one or more Autonomous System (AS) numbers to the **AS_PATH** attribute of a BGP route.

The **no set as-path prepend** and **default set as-path prepend** commands remove the specified set statements from the route map and update all corresponding routes.

Command Mode

Route-Map Configuration

Command Syntax

set as-path prepend {{auto | *as_number...* [auto | *as_number*]} | last-as *count*}

no set as-path prepend {{auto | *as_number...* [auto | *as_number*]} | last-as *count*}

default set as-path prepend {{auto | *as_number...* [auto | *as_number*]} | last-as *count*}

Parameters

- **auto** Prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- ***as_number*** Prepends the specified AS number. Can be entered in plain notation (values range from ***1-4294967295***) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from ***1-65535*** are entered in plain notation, and AS numbers from ***65536 to 4294967295*** are entered as two values separated by a dot. The first value is high-order and represents a multiple of ***65536***; the second value is low-order and represents a decimal integer. For example, AS number ***65552*** can be entered as either ***65552*** or 1.16 (i.e., 1*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in **show** outputs.
- **last-as *count*** Prepends the last AS number in the AS path *count* times. Values range from ***1 to 15***. This is mutually exclusive with the use of the **auto** keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

Examples

- These commands create a route-map entry that prepends AS number ***64496*** and prepends either the peer or local AS number twice.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set as-path prepend 64496 auto auto
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 auto auto
switch(config)#
```

- The commands create a route-map entry that prepends AS numbers ***64496***, ***64498***, and ***65552***.

```
switch(config)#route-map map2
switch(config-route-map-map2)#set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)#exit
switch(config)#show route-map map2
route-map map2 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 64498 65552
```

```
switch(config)#
```

- These commands create a route map entry that prepends the last AS number ***12*** times.

```
switch(config)#route-map map3
switch(config-route-map-map3)#set as-path prepend last-as 12
switch(config-route-map-map3)#exit
switch(config)#show route-map map3
route-map map3 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
switch(config)#
```

13.4.9.43 set community (route-map)

The **set community** command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set community none** command removes community attributes from the route.

The **no set community** and **default set community** commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the ***running config***.

Command Mode

Route-Map Configuration

Command Syntax

set community [**GSHUT** | *aa:nn* | *community-list* | internet | local-as | no-advertise | no-export | none | *number*]

no set community [**GSHUT** | *aa:nn* | additive | *community-list* | delete | internet | local-as | no-advertise | no-export | none | *number*]

default set community [**GSHUT** | *aa:nn* | additive | *community-list* | delete | internet | local-as | no-advertise | no-export | none | *number*]

Parameters

- **GSHUT** Configures a graceful shutdown in BGP.
- ***aa:nn*** Configures the community AS and network number, separated by colon. Value ranges from ***0:0 to 65535:65535***.
- ***community-list*** A label for community list.
- **internet** Advertises route to the Internet community.
- **local-as** Advertises route only to local peers.
- **no-advertise** Does not advertise route to any peer.
- **no-export** Advertises route only within BGP AS boundary.
- **none** Does not provide any community attributes.
- ***number*** Configures the community number. Value ranges from ***1*** to ***4294967040***.
- **additive** Adds specified attributes to the current community.
- **delete** Removes specified attributes from the current community.

Related Commands

- **ip community-list**
- **route-map**
- **set (route-map)**
- **set community (route-map)**

Guideline

EOS does not support disabling the process of graceful shutdown community.

Example

This command advertises routes only to local peers.

```
switch(config-route-map-map1)#show active
route-map map1 permit 10
   match community instances <= 50
   set community 0:456 0:2345
switch(config-route-map-map1)#set community local-as
switch(config-route-map-map1)#ip community-list 345 permit 23
switch(config)#route-map map1
switch(config-route-map-map1)#show active
```

```
route-map map1 permit 10
   match community instances <= 50
   set community 0:456 0:2345 local-as
switch(config-route-map-map1)#
```

13.4.9.44 set extcommunity (route-map)

The **set extcommunity** command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set extcommunity none** command removes extended community attributes from the route.

The **no set extcommunity** and **default set extcommunity** commands remove the specified **set extcommunity** command from the configuration mode route map statement by deleting the corresponding statement from ***running-config***.

Command Mode

Route-Map Configuration

Command Syntax

set extcommunity COND_X [**COND_2**][**COND_N**][**MOD_TYPE**]

set extcommunity none

no set extcommunityCOND_X[**COND_2**][**COND_N**][**MOD_TYPE**]

no set extcommunity none

default set extcommunity COND_X [**COND_2**][**COND_N**][**MOD_TYPE**]

default set extcommunity none

Parameters

- **COND_X** Specifies extended community route map modification. Command may contain multiple attributes. Options include:
  - **rt *ASN:nn*** Route target attribute (AS:network number).
  - **rt *IP-address:nn*** Route target attribute (IP address: network number).
  - **soo *ASN:nn*** Site of origin attribute (AS:network number).
  - **soo *IP-address:nn*** Site of origin attribute (IP address: network number).
- **MOD_TYPE** Specifies route map modification method. Options include:
  - ***no parameter*** Command replaces existing route map with specified parameters.
  - **additive** Command adds specified parameters to existing route map.
  - **delete** Command removes specified parameters from existing route map.

Related Commands

- **route-map** enters route map configuration mode.
- **set (route-map)** specifies attribute modifications for the redistributed routes.
- **set (route-map)** specifies community modifications for the redistributed routes.

Example

This command creates a route map entry in ***map1*** that sets the route target extended community attribute.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set extcommunity rt 10.13.2.4:100
switch(config-route-map-map1)#
```

13.4.9.45 show (ACL configuration modes)

The **show** command displays the contents of an Access Control List (ACL).

- **show** or **show pending** displays the list as modified in ACL configuration mode.
- **show active** displays the list as stored in running-config.
- **show comment** displays the comment stored with the list.
- **show diff** displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to ***running-config***.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

show

show active

show comment

show diff

show pending

Examples

The examples in this section assume these ACL commands are entered as specified.

These commands are stored in **none**:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to **none**:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to **none**:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.21.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  50 remark end of list
```

- This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)#show pending
IP Access List test_1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.10.0.0/16 any
  25 permit tcp 10.10.20.0/24 any
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
  45 deny pim 239.24.124.0/24 10.5.8.4/30
  50 remark end of list
```

- This command displays the difference between the saved and modified ACLs.
  - Rules added to the pending list are denoted with a plus sign (+).
  - Rules removed from the saved list are denoted with a minus sign (-)

```
switch(config-acl-test_1)#show diff

13.4.9.46 show hardware tcam profile

The **show hardware tcam profile** command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable to DCS-7280(E/R) and DCS-7500(E/R) series switches only.

Command Mode

EXEC

Command Syntax

show hardware tcam profile

Parameters

- ***tcam*** Specifies the TCAM information.
- ***profile*** Specifies the TCAM profile information.

Example

This command displays the current operational TCAM profile details.

```
switch#show hardware tcam profile
Configuration        Status
FixedSystem          default              default
```

13.4.9.47 show ip access-lists

The **show ip access-list** command displays the contents of IPv4 and standard IPv4 Access Control List (ACLs) on the switch. Use the **summary** option to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show ip access-list [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** All IPv4 ACLs are displayed.
  - ***list_name*** Specified IPv4 ACL is displayed.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** All rules in the specified lists are displayed.
  - **summary** The number of rules in the specified lists are displayed.

Examples

- This command displays all rules in ***test1*** IPv4 ACL.

```
switch#show ip access-list list2
IP Access List list2
        10 permit ip 10.10.10.0/24 any
        20 permit ip any host 10.20.10.1
        30 deny ip host 10.10.10.1 host 10.20.10.1
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch#show ip access-list summary
IPV4 ACL default-control-plane-acl
        Total rules configured: 12
        Configured on: control-plane
        Active on    : control-plane

IPV4 ACL list2
        Total rules configured: 3

IPV4 ACL test1
        Total rules configured: 6

Standard IPV4 ACL test_1
        Total rules configured: 1

IPV4 ACL test_3
        Total rules configured: 0

switch#
```

- This command displays the summary and lists all the configured IPv4 ACLs.

```
switch #show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
 Total rules configured: 17
 Configured on Ingress: control-plane(default VRF)
 Active on Ingress: control-plane(default VRF)
```

```
IPV4 ACL ipAclLimitTest
 Total rules configured: 0
 Configured on Egress: Vl2148,2700
 Active on Egress: Vl2148,2700
```

13.4.9.48 show ip prefix-list

The **show ip prefix-list** command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

show ip prefix-list [**DISPLAY_ITEMS**]

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- ***no parameter*** All IPv4 prefix list rules are displayed.
- ***list_name*** Specifies the IPv4 prefix list for which rules are displayed.

Example

This command displays all rules in the route-one IPv4 prefix list.

```
switch(config-ip-pfx)#show ip prefix-list
ip prefix-list route-one
    seq 10 deny 10.1.1.0/24
    seq 20 deny 10.1.0.0/16
    seq 30 permit 12.15.4.9/32
    seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#
```

13.4.9.49 show ipv6 access-lists

The **show ipv6 access-list** command displays the contents of all IPv6 Access Control List (ACLs) on the switch. Use the **summary** option to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show ipv6 access-list [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** All IPv6 ACLs are displayed.
  - ***list_name*** Specified IPv6 ACL is displayed.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** All rules in the specified lists are displayed.
  - **summary** The number of rules in the specified lists are displayed.

Examples

- This command displays all rules in test1 IPv6 ACL.

```
switch#show ipv6 access-list list2
IP Access List list2
        10 permit ipv6 3891:3c58:6300::/64 any
        20 permit ipv6 any host 2fe1:b468:024a::
        30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de:::
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch#show ipv6 access-list summary
IPV6 ACL list2
        Total rules configured: 3

IPV6 ACL test1
        Total rules configured: 6

IPV6 ACL test_1
        Total rules configured: 1

Standard IPV6 ACL test_3
        Total rules configured: 0
switch#
```

13.4.9.50 show ipv6 prefix-list

The **show ipv6 prefix-list** command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

show ipv6 prefix-list [**DISPLAY_ITEMS**]

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- ***no parameter*** All IPv6 prefix lists are displayed.
- ***list_name*** Specifies the IPv6 prefix list for which rules are displayed.

Examples

- This command displays all rules in the map1 IPv6 prefix list:

```
switch>show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch>
```

- This command displays all prefix lists:

```
switch>show ipv6 prefix-list
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
ipv6 prefix-list FREDD
ipv6 prefix-list route-five
ipv6 prefix-list map2
seq 10 deny 10:1:1:1::/64 ge 72 le 80
seq 20 deny 10:1::/32
switch>
```

13.4.9.51 show mac access-lists

The **show mac access-list** command displays the contents of all MAC Access Control List (ACLs) on the switch. Use the summary to display only the name of the lists and the number of lines in each list.

Command Mode

Privileged EXEC

Command Syntax

show mac access-lists [**LIST**][**SCOPE**]

Parameters

- **LIST** Name of lists to be displayed. Selection options include:
  - ***no parameter*** Command displays all ACLs.
  - ***list_name*** Command displays ACL specified by parameter.
- **SCOPE** Information displayed. Selection options include:
  - ***no parameter*** Command displays all rules in specified lists.
  - **summary** Command displays the number of rules in specified lists.

Examples

- This command displays all rules in ***mtest2*** MAC ACL.

```
switch#show mac access-list mlist2
IP Access List mlist2
        10 permit 1024.4510.F125 0.0.0 any aarp
        20 permit any 4100.4500.0000 0.FF.FFFF novell
        30 deny any any
switch#
```

- This command displays the number of rules in each MAC ACL on the switch.

```
switch#show mac access-list summary
MAC ACL mlist1
        Total rules configured: 6

MAC ACL mlist2
        Total rules configured: 3

MAC ACL mlist3
        Total rules configured: 1

MAC ACL mlist4
        Total rules configured: 0
switch#
```

13.4.9.52 show platform arad acl tcam summary

The **show platform arad tcam summary** command displays the percentage of TCAM utilization per forwarding ASIC.

Command Mode

EXEC

Command Syntax

show platform arad acl tcam *summary*

Parameter

summary Displays the ACL TCAM summary.

Example

This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

=======================================================
Arad3/0:
=======================================================
 Bank      Used           Used %                Used By
    1         4                0               IP RACLs
Total Number of TCAM lines used is: 4

=======================================================
Arad3/4:
=======================================================
 Bank      Used           Used %                Used By
    1         2                0               IP RACLs
Total Number of TCAM lines used is: 2
```

13.4.9.53 show platform arad acl tcam

The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

Command Mode

EXEC

Command Syntax

show platform arad acl tcam [*scope*]

Parameters

scope Specifies the information displayed. Options include:

- **detail** Displays the ACL TCAM details.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays the ACL entries from hardware.
- **shadow** Displays the ACL entries from shadow.
- **summary** Displays the ACL TCAM summary.

Examples

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on 2 VLANs (***Vl2148*** and ***Vl2700***) but number of TCAM entries occupied is only 1.

```
switch#show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
 direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
Bank Offset Entries
0         0       1
Fap: Arad1, Shared: true, Interfaces: Vl2148
Bank Offset Entries
0         0       1
```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=======================================================
Arad0:
=======================================================
 Bank   Used                  Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=======================================================
Arad1:
=======================================================
 Bank   Used                   Used %             Used By
    0      1                       0   IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
```

13.4.9.54 show platform arad mapping

The **show platform arad mapping** command displays the mapping between the interfaces and the forwarding ASICs.

Command Mode

EXEC

Command Syntax

show platform arad *chip_name* **mapping**

Parameter

chip_name Specifies the Arad chip name.

Example

This command displays the mapping between the interfaces and the forwarding ASICs on the Arad3/0 chip.

```
switch#show platform arad arad3/0 mapping
Arad3/0  Port                      SysPhyPort    Voq   ( Fap,FapPort)    Xlge     Serdes
-------------------------------------------------------------------------------
         Ethernet3/1/1                    34    288        (0  ,  2)     n/a        (20)
.................................................................................
```

13.4.9.55 show platform fap acl

The **show platform fap acl** command displays the ACL information of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]

Parameters

- **ipkgv** Displays the ACL Ingress Interface Specification (IPKGV) information.
- **l4ops** Displays the ACL Layer 4 Options (L4OPS) information.
- **mirroring** Displays the mirroring ACL information.
- **opkgv** Displays the ACL Egress Interface Specification (OPKGV) information.
- **pmf** Displays the Pmf.
- **tcam** Displays the ACL TCAM information.
- **udf** Displays the ACL UDF information.
- **vsicfg** Displays the ACL Virtual Switch Instance (VSI) CONFIG information.

Guidelines

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

Example

This command displays the brief information of all installed mirroring ACLs.

```
switch(config)#show platform fap acl mirroring

==============
 Aggregate ACLs
==============

  (list2:0->2) type=2; version=0
   - list2 [ prio 0 ] => session 2

  (list1:10->1,list3:20->3) type=0; version=13
   - list3 [ prio 20 ] => session 3
   - list1 [ prio 10 ] => session 1

======================
 Interface-ACL Mapping
======================

   Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
   Ethernet33 => (list2:0->2) [ mac ]
```

13.4.9.56 show platform fap acl tcam

The **show platform fap tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

show platform fap acl tcam [detail | diff | hw | shadow | summary]

Parameter

- **detail** Displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays ACL entries from hardware.
- **shadow** Displays ACL entries from shadow.
- **summary** Displays the percentage of TCAM utilization per forwarding ASIC.

Example

This command displays the number of TCAM entries and other ACL TCAM detail.

```
switch#show platform fap acl tcam detail
ip access-list ipAcl0000 (RACL, 1 rules, 2 entries, direction in, state
 success)
 Shared: false
 Interface: Vlan0002
 -------------------
 Fap: Arad3/0
 Bank Offset Entries
 1         0       2
 Interface: Vlan0003
 -------------------
 Fap: Arad3/0
 Bank Offset Entries
 1         2       2
 Fap: Arad3/4
 Bank Offset Entries
 1         0       2
```

13.4.9.57 show platform fap acl tcam hw

The **show platform fap acl tcam hw** command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

Command Mode

EXEC

Command Syntax

show platform fap *fap_name* **acl tcam hw**

Parameters

- ***fap_name*** Specifies the switch chip-set name.
- **acl** Specifies the Arad ACL information.
- **tcam** Specifies the Arad TCAM information.
- **hw** Specifies the ACL entries for hardware.

Example

This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch#show platform fap Arad1 acl tcam hw
================================================================================

<-------OUTPUT OMITTED FROM EXAMPLE-------->
```

13.4.9.58 show platform fap acl tcam summary

The **show platform fap acl tcam summary** command displays for each forwarding ASIC, the number of TCAM entries consumed per ACL type, and in which TCAM bank the entries are installed. A mirroring ACL does not consume TCAM resources unless attached to a mirroring source interface, and a mirroring destination is configured. If the mirroring destination is a GRE tunnel, at least one nexthop entry for the tunnel destination must be resolved before a TCAM entry is installed.

Command Mode

EXEC

Command Syntax

show platform fap acl tcam summary

Example

This command displays the number of TCAM entries consumed per ACL type, the bank installed, and ASIC. Three TCAM entries are consumed across two forwarding ASICs, two for IP ACLs, and one for MAC ACLs.

```
switch#show platform fap acl tcam summary
=========================================================
 Arad0:
=========================================================
    Bank   Used Used %    Used By
    0, 1      2      0    IP Mirroring
 Total Number of TCAM lines used is: 4
=========================================================
 Arad1:
=========================================================
   Bank   Used            Used %                 Used By
      2      1                 0           Mac Mirroring
```

13.4.9.59 show platform trident tcam

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

Command Mode

EXEC

Command Syntax

show platform trident tcam [acl | cpu-bound | **detail** | entry | mirror | pbr | pipe | qos | shared | summary]

Parameters

- ***no parameters*** Displays TCAM entries for each TCAM group.
- **acl** Displays the trident ACL information.
- **cpu-bound** Displays the trident cpu-bound information.
- **detail** Lists all TCAM entries.
- **entry** Displays the TCAM entry information.
- **mirror** Displays the trident Mirroring ACL information.
- **pbr** Displays the trident PBR ACL information.
- **pipe** Allows to specify a pipe for filtering.
- **qos** Displays the trident QOS information.
- **shared** Displays the ACL Sharing information.
- **summary** Displays the TCAM allocation information.

Guidelines

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

Examples

- This command displays the Trident mirroring ACL information.

```
switch(config)#show platform trident tcam mirror
=== Mirroring ACLs on switch Linecard0/0 ===

Session: mir-sess2

INGRESS ACL mirAcl2* uses 2 entries
 Assigned to ports: Ethernet32/1
```

- This command displays detailed information for the TCAM group.

```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
 Mlag control traffic uses 4 entries.
    589826               0 hits - MLAG - SrcPort UDP Entry
    589827               0 hits - MLAG - DstPort UDP Entry
    589828               0 hits - MLAG - SrcPort TCP Entry
    589829               0 hits - MLAG - DstPort TCP Entry
 CVX traffic reserves 6 entries (0 used).
 L3 Control Priority uses 23 entries.
    589836               0 hits - URM - SelfIp UDP Entry
    589837               0 hits - URM - SelfIp TCP Entry
589848               0 hits - OSPF - unicast
    589849           71196 hits - OSPFv2 - Multicast
    589850               0 hits - OSPFv3 - Multicast
    589851               0 hits - OSPF Auth ESP - Multicast
    589852               0 hits - OSPF Auth ESP - Unicast
    589853               0 hits - IP packets with GRE type and ISIS protocol

<-------OUTPUT OMITTED FROM EXAMPLE-------->

ck338.22:14:38(config-pmap-qos-policy1)#
```

13.4.9.60 show route-map

The **show route-map** command displays the contents of configured route maps.

Command Mode

EXEC

Command Syntax

show route-map [*map_name*]

Parameters

- ***no parameter*** Displays the content of all configured route maps.
- ***map_name*** Displays the content of the specified route map.

Examples

- This command displays the ***map1*** route map.

```
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
    set as-path prepend auto auto
```

- This command displays the ***map*** route map.

```
switch>show route-map map
route-map map permit 5
  Match clauses:
    match as 456
Set clauses:
route-map map permit 10
  Match clauses:
match ip next-hop 2.3.4.5
    match as-path path_2
  Set clauses:
    set local-preference 100
```

13.4.9.61 system profile

The **system profile** command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The **default system profile** and **no system profile** commands delete non-default TCAM profiles from the running configuration.

Command Mode

Hardware TCAM

Command Syntax

system profile [*profile_name*| default | mirroring-acl | pbr-match-nexthop-group | qos | tap-aggregation-default | tap-aggregation-extended | tc-counters]

default system profile

no system profile

Parameters

- ***profile_name*** Creates a profile with the specified name.
- **default** Creates a default profile.
- **mirroring-acl** Creates a mirroring-ACL profile.
- **pbr-match-nexthop-group** Creates a pbr-match-nexthop-group profile.
- **qos** Creates a Quality of Service (QoS) profile.
- **tap-aggregation-default** Creates a tap-aggregation-default profile.
- **tap-aggregation-extended** Creates a tap-aggregation-extended profile.
- **tc-counters** Creates a tc-counters profile.

Guideline

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

Examples

- These commands create a mirroring-ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
                     Configuration        Status
FixedSystem          mirroring-acl        mirroring-acl
switch(config-hw-tcam)#
```

- These commands delete non-default TCAM profiles.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#show hardware tcam profile
                     Configuration        Status
Linecard9            mirroring-acl        mirroring-acl
Linecard8            mirroring-acl        mirroring-acl
Linecard3            mirroring-acl        mirroring-acl
Linecard4            mirroring-acl        mirroring-acl
Linecard6            mirroring-acl        mirroring-acl
switch(config-hw-tcam)#default system profile
switch(config-hw-tcam)#show hardware tcam profile
                     Configuration        Status
Linecard9            default              default
Linecard8            default              default
Linecard3            default              default
Linecard4            default              default
Linecard6            default              default
```

```
switch(config-hw-tcam)#
```

- These commands delete TCAM profiles.

```
switch(config-hw-tcam)#show hardware tcam profile
                    Configuration        Status
Linecard9           tc-counters          tc-counters
Linecard8           tc-counters          tc-counters
Linecard3           tc-counters          tc-counters
Linecard4           tc-counters          tc-counters
Linecard6           tc-counters          tc-counters
switch(config-hw-tcam)#no system profile
switch(config-hw-tcam)#show hardware tcam profile
                    Configuration        Status
Linecard9           default              default
Linecard8           default              default
Linecard3           default              default
Linecard4           default              default
Linecard6           default              default
switch(config-hw-tcam)#
```

13.5 VARP

Virtual-ARP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When ip routing is enabled, packets to the virtual MAC address are routed to the next hop destination.

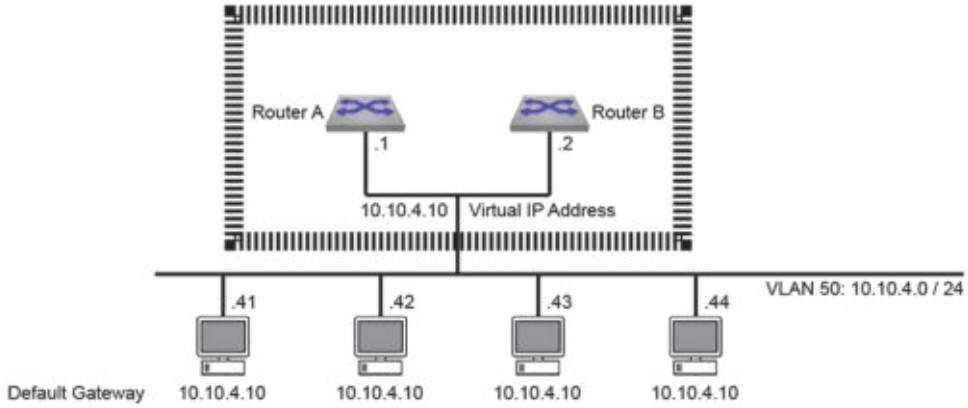

Figure 30: VARP Configuration

The following sections are included in this chapter:

- **VRRP and VARP Conceptual Overview**
- **VRRP and VARP Implementation Procedures**
- **VRRP and VARP Implementation Examples**
- **VRRP and VARP Configuration Commands**

13.5.1 VRRP and VARP Conceptual Overview

This section review the following topics:

- **VRRPv2**
- **VRRPv3**
- **VARP**

13.5.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a Virtual Router Identifier (VRID) and a virtual IP address. A virtual routers mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual routers scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN

and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role. A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

On 7280R3, 7500R3 and 7800R3 series, maximally 14 unique VRRP groups can be configured along with VARP and MLAG Peer gateway virtual MAC capabilities.

13.5.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in ***RFC 3768***.

13.5.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- **VRRP Configuration for IPv4**
- **VRRP Configuration for IPv6**
- **VARP Configuration**

13.5.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from ***running-config***.

13.5.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

Example

This command causes VLAN 20 to use VRRP version 3.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Master and Backup Router

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from ***254*** (highest priority) to ***1*** (lowest priority). Priority is either set by a CLI command or is assigned the default value of ***100***. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The **vrrp tracked-object** command configures the VRRP client process to track an object created by the **track** command and react if its status changes to ***down***.

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The **vrrp priority-level** command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of ***250*** for the virtual router with ***VRID 15*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

The **vrrp preempt** command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Examples

- This command disables preempt mode for the virtual router ***15*** on ***VLAN 20***.

  ```
  switch(config-if-vl20)#no vrrp 15 preempt
  switch(config-if-vl20)#
  ```

- This command enables preempt mode for the virtual router ***30*** on ***VLAN 20***.

  ```
  switch(config-if-vl20)#vrrp 30 preempt
  switch(config-if-vl20)#
  ```

The **vrrp preempt delay** command configures a period between an event that elevates a switch to master VRRP router status and the switch's assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

Advertisement Interval

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The **vrrp advertisement interval** command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

Example

This command sets the advertisement interval of ***10*** seconds for virtual router ***35*** on ***VLAN 100***.

```
switch(config-if-vl100)#vrrp 35 advertisement interval 10
switch(config-if-vl100)#
```

Description

The **vrrp session description** command associates a text string to the specified virtual router. The maximum string length is ***80*** characters. The string has no functional impact on the virtual router.

Example

This command associates the text string ***Laboratory Router*** to virtual router ***15*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The **vrrp peer authentication** command configures virtual router authentication parameters for the specified virtual router.

Example

This command implements plain-text authentication, using ***12345*** as the key, for virtual router ***40*** on ***VLAN 100***.

```
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

Secondary Addresses

The **vrrp ipv4 secondary** command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual routers configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the **vrrp ipv4** command (Virtual Router Enabling and the Primary IP address).

Example

This command assigns the IP address of ***10.2.4.5*** as the secondary IP address for the virtual router ***15*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

13.5.2.1.2 Virtual Router Enabling and the Primary IP address

The **vrrp ipv4** command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interfaces IP address subnet. A virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands reassign the virtual routers primary IP address.

Example

This command enables virtual router group ***15*** (VRID) on ***VLAN 20*** and assigns ***10.1.1.5*** as the virtual routers primary address.

```
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.1.3 Disabling VRRP

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The **no vrrp disabled** command changes the switchs virtual router state to **backup** or **master** if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the **vrrp tracked-object** command changes to **down**.

Examples

- This command places the switch in stopped mode for virtual router ***24*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router ***24*** on ***VLAN 20***.

```
switch(config-if-vl20)#no vrrp 24 disabled
switch(config-if-vl20)#
```

- This command configures the switch to enter stopped mode for virtual router ***24*** on ***VLAN 20*** if the status of ***tracked-object interfaceE6/48*** changes to **down**.

```
switch(config-if-vl20)#vrrp 24 tracked-object interfaceE6/48 shutdown
switch(config-if-vl20)#
```

The **no vrrp** and **no vrrp ipv4** commands delete the specified virtual IP address from the interface. Additionally, the **no vrrp** command removes all residual VRRP commands for the virtual router.

Examples

- This command removes all VRRP configuration commands for virtual router ***10*** on ***VLAN 15***.

```
switch(config-if-vl15)#no vrrp 10
switch(config-if-vl15)#
```

- This command disables virtual router ***25*** on ***VLAN 20*** and removes the primary IP address from its configuration.

```
switch(config-if-vl20)#no vrrp 25 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The **no vrrp** command removes all VRRP commands for the specified virtual router from ***running-config.***

13.5.2.2.1 Configuring VRRP for IPv6

Specify the VRRP Version

The **vrrp ipv4 version** command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

Example

This command causes ***VLAN 20*** to use VRRP version 3.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Create a VRRP Group and Configure a Virtual IPv6 Address

The **vrrp ipv6** command assigns an IPv6 address to the interface being configured and creates a VRRP group.

Example

These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the ***VLAN 20*** interface.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

Configure Tracking

The **vrrp tracked-object** command configures the VRRP client process to track an object created by the **track** command and react if its status changes to ***down***.

Example

This command causes interface ***VLAN 20*** to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-vl20)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

Configure the Priority Level

The **vrrp priority-level** command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of ***250*** for the virtual router with ***VRID 15*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

Configure the Preemption Mode

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become

the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The **vrrp preempt** command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Example

This command enables preempt mode for the virtual router ***30*** on ***VLAN 20***.

```
switch(config-if-vl20)#vrrp 30 preempt
```

Configure the VRRP Advertisement Interval

The **ip virtual-router mac-address advertisement-interval** command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

Example

This command configures a MAC address advertisement interval of one minute (***60*** seconds).

```
switch(config)#interface vlan 20
switch(config-if-vl20)#ip virtual-router mac-address advertisement-
interval 60
switch(config-if-vl20)#
```

13.5.2.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

Show VRRP Group

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

Example

This command displays a table of information for VRRP groups on the switch.

```
switch#show vrrp interface vlan 3060 brief
Interface Id  Ver Pri Time  State   VrIps
Vlan3060  1   3   100 3609  Master  2001::2
                                    2001::3
Vlan3060  2   3   100 3609  Master  2002::2
                                    2002::3
switch#
```

13.5.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

Virtual IP Addresses

The **ip virtual-router address** command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request will use the virtual IPv4 address as the source IP address

and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for ***VLAN 10***.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#ipv6 address 2001::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001::2
switch(config-if-Vl10)#exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for ***VLAN 10***. A static route is added to indicate that the virtual subnet is reachable through ***VLAN 10***.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
switch(config)#
```

Virtual MAC Address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either though static configuration or learned through a dynamic routing protocol.

Example

This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

Show Virtual MAC Address

To display the virtual router MAC and IP addresses, enter the **show ip virtual-router** command.

Example

This command displays the virtual router addresses assigned on the switch.

```
switch#show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address         Virtual IP Address   Status
 Protocol
Vlan15     10.1.1.3/24        10.1.1.15            up                  up
Vlan15     10.1.1.3/24        10.1.1.16            up                  up
Vlan15     10.1.1.3/24        10.1.1.17            up                  up
Vlan20     10.12.1.6/24       10.1.1.51            up                  up
Vlan20     10.12.1.6/24       10.1.1.53            up                  up
Vlan20     10.12.1.6/24       10.1.1.55            up                  up
switch#
```

Show IPv6 Virtual-Router

The **show ipv6 virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch#show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- **VRRP Examples**
- **VARP Example**

13.5.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

13.5.3.1.1 VRRP Example 1: One Virtual Router on One LAN

The network diagram displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

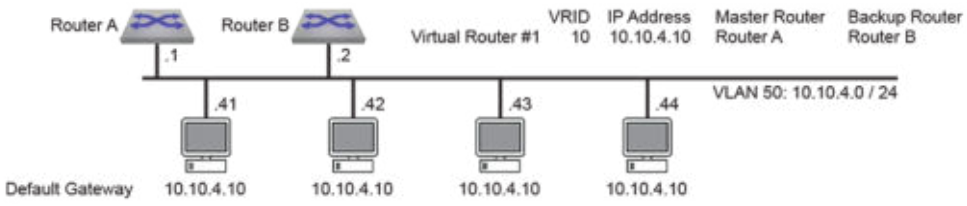

Figure 31: VRRP Example 1 Network Diagram

The following code configures the first switch (***Router A***) as the master router and the second switch (***Router B***) as a backup router for virtual router ***10*** on ***VLAN 50***. ***Router A*** becomes the Master virtual router by setting its priority at ***200***; ***Router B*** maintains the default priority of ***100***. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#exit
```

13.5.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

The nnetwork diagram displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

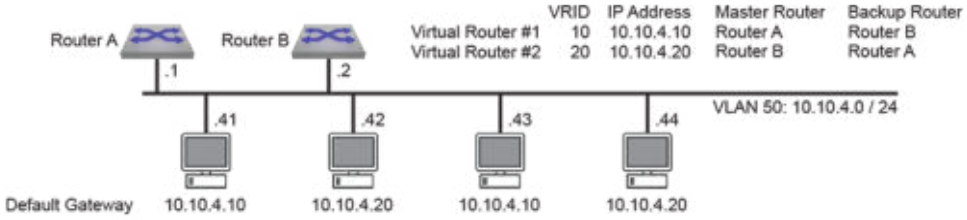

Figure 32: VRRP Example 2 Network Diagram

The following code configures two switches as a master and a backup router for two virtual routers on ***VLAN 50***.

- ***Router A*** is the master for virtual router ***10*** and backup for virtual router ***20***.
- ***Router B*** is the master for virtual router ***20*** and backup for virtual router ***10***.
- VRRP advertisement interval is ***3*** seconds on virtual router ***10*** and ***5*** seconds on virtual router ***20***.
- Priority preemption is enabled by default for both virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#no vrrp 20
switch-A(config-if-vl50)#vrrp 20 advertisement interval 5
switch-A(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)#exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#no vrrp 20
switch-B(config-if-vl50)#vrrp 20 priority 200
switch-B(config-if-vl50)#vrrp 20 advertisement interval 5
switch-B(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)#exit
```

13.5.3.1.3 VRRP Example 3: Two Virtual Routers on Two LANs

The network diagram displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups two groups on each of two LANs.

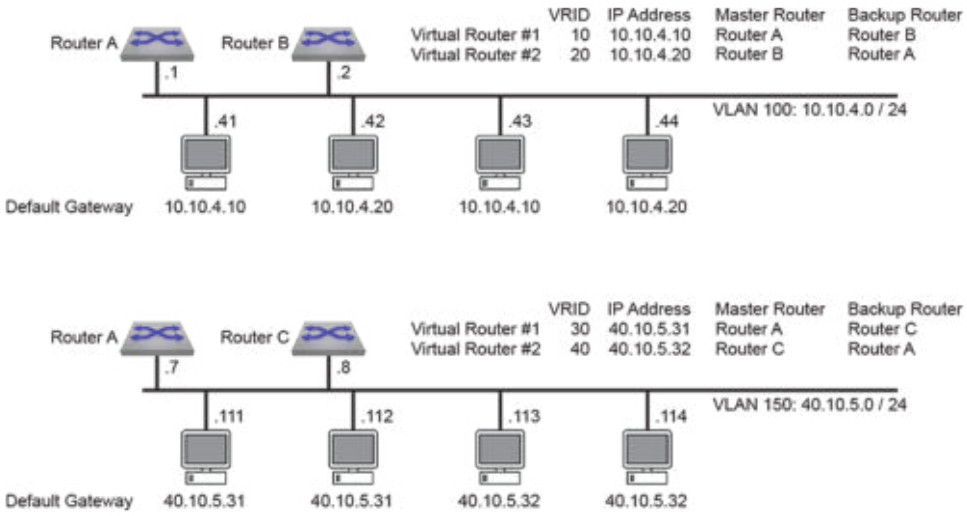

Figure 33: VRRP Example 3 Network Diagram

The following code configures the three switches as follows:

- ***Router A*** is the master for virtual router ***10*** and backup for virtual router ***20*** on ***VLAN 100***.
- ***Router A*** is the master for virtual router ***30*** and backup for virtual router ***40*** on ***VLAN 150***.
- ***Router B*** is the master for virtual router ***20*** and backup for virtual router ***10*** on ***VLAN 100***.
- ***Router C*** is the master for virtual router ***40*** and backup for virtual router ***30*** on ***VLAN 150***.
- VRRP advertisement interval is set to one second on all virtual routers.
- Priority preemption is disabled on all virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)#interface vlan 100
switch-A(config-if-vl100)#ip address 10.10.4.1/24
switch-A(config-if-vl100)#no vrrp 10
switch-A(config-if-vl100)#vrrp 10 priority 200
switch-A(config-if-vl100)#no vrrp 10 preempt
switch-A(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)#vrrp 10 advertisement interval 1
switch-A(config-if-vl100)#no vrrp 20
switch-A(config-if-vl100)#no vrrp 20 preempt
switch-A(config-if-vl100)#vrrp 20 ip 10.10.4.20
```

```
switch-A(config-if-vl100)#interface vlan 150
switch-A(config-if-vl150)#ip address 40.10.5.7/24
switch-A(config-if-vl150)#no vrrp 30
switch-A(config-if-vl150)#vrrp 30 priority 200
switch-A(config-if-vl150)#no vrrp 30 preempt
switch-A(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-A(config-if-vl100)#vrrp 30 advertisement interval 1
switch-A(config-if-vl150)#no vrrp 40
switch-A(config-if-vl150)#no vrrp 40 preempt
switch-A(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)#exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)#interface vlan 100
switch-B(config-if-vl100)#ip address 10.10.4.2/24
switch-B(config-if-vl100)#no vrrp 10
switch-B(config-if-vl100)#no vrrp 10 preempt
switch-B(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)#no vrrp 20
switch-B(config-if-vl100)#vrrp 20 priority 200
switch-B(config-if-vl100)#no vrrp 20 preempt
switch-B(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)#vrrp 20 advertisement interval 1
switch-B(config-if-vl100)#exit
```

Switch Code that Implements Router C on the Third Switch

```
switch-C(config)#interface vlan 150
switch-C(config-if-vl150)#ip address 40.10.5.8/24
switch-C(config-if-vl150)#no vrrp 30
switch-C(config-if-vl150)#no vrrp 30 preempt
switch-C(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)#no vrrp 40
switch-C(config-if-vl150)#vrrp 40 priority 200
switch-C(config-if-vl150)#no vrrp 40 preempt
switch-C(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl100)#vrrp 40 advertisement interval 1
switch-C(config-if-vl150)#exit
```

13.5.3.2 VARP Example

This section provides code that implements a VARP configuration. The network diagram displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures ***10.10.4.10*** as the virtual IP address for ***VLAN 50***, ***10.24.4.1*** as the virtual IP address for ***VLAN 70***, and ***001c.7300.0999*** as the virtual MAC address on both switches.

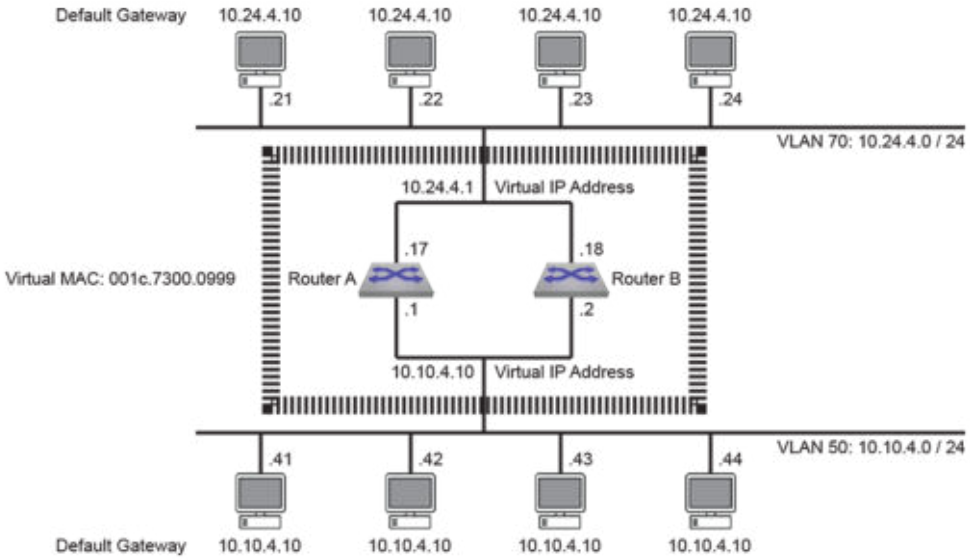

Figure 34: VARP Example Network Diagram

Switch Code that Implements VARP on the First Switch

```
switch-A(config)#ip virtual-router mac-address 001c.7300.0999
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-A(config-if-vl50)#interface vlan 70
switch-A(config-if-vl70)#ip address 10.24.4.17/24
switch-A(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)#exit
```

Switch Code that Implements VARP on the Second Switch

```
switch-B(config)#ip virtual-router mac-address 001c.7300.0999
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)#interface vlan 70
switch-B(config-if-vl70)#ip address 10.24.4.18/24
switch-B(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)#exit
```

13.5.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

Global Configuration Commands

- ip fhrp accept-mode
- ip virtual-router mac-address
- ip virtual-router mac-address advertisement-interval

Interface Configuration Commands Ethernet, Port Channel, and VLAN Interfaces

- ip virtual-router address
- ipv6 virtual-router address
- no vrrp
- vrrp advertisement interval
- vrrp disabled
- vrrp ipv4
- vrrp ipv4 checksum pseudo-header exclude
-
- vrrp ipv4 secondary
- vrrp ipv4 version
- vrrp ipv6
- vrrp mac-address advertisement-interval
- vrrp peer authentication
- vrrp preempt
- vrrp preempt delay
- vrrp priority-level
- vrrp session description
- vrrp timers delay reload
- vrrp tracked-object

Privileged EXEC Commands

- show ip virtual-router
- show ipv6 virtual-router
- show vrrp

13.5.4.1 ip fhrp accept-mode

The **ip fhrp accept-mode** command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The **no ip fhrp accept-mode** and **default ip fhrp accept-mode** commands restores the default SSH access availability by removing the **ip fhrp accept-mode** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip fhrp accept-mode

no ip fhrp accept-mode

default ip fhrp accept-mode

Example

This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

```
switch(config)#ip fhrp accept-mode
switch(config)#show running-config

!
ip fhrp accept-mode
!

switch(config)#
```

13.5.4.2 ip virtual-router address

The **ip virtual-router address** command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the **ipv6 virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of ***500*** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ip virtual-router address** and **default ip virtual-router address** commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding **ip virtual-router address** command from ***running-config***. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

ip virtual-router address *ipv4_addr*

no ip virtual-router address [*ipv4_addr*]

default ip virtual-router address [*ipv4_addr*]

Parameter

ipv4_addr IP address of router. Dotted decimal notation.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for ***VLAN 10***.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#exit
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for ***VLAN 10***. A static route is added to indicate that the virtual subnet is reachable through ***VLAN 10***.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
```

13.5.4.3 ip virtual-router mac-address advertisement-interval

The **ip virtual-router mac-address advertisement interval** command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is ***30*** seconds.

The **no ip virtual-router mac-address advertisement-interval** command restores the default period of ***30*** seconds by removing the **ip virtual-router mac-address advertisement-interval** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip virtual-router mac-address advertisement-interval *period*

no ip virtual-router mac-address advertisement-interval

default ip virtual-router mac-address advertisement-interval

Parameter

period advertisement interval (seconds). Values range from ***0 to 86400***. Default is ***30***.

Example

This command configures a MAC address advertisement interval of one minute (***60*** seconds).

```
switch(config)#ip virtual-router mac-address advertisement-interval 60
switch(config)#
```

13.5.4.4 ip virtual-router mac-address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either though static configuration or learned through a dynamic routing protocol.

The **no ip virtual-router mac-address** command removes a virtual MAC address from the interface by deleting the corresponding **ip virtual-router mac-address** command from ***running-config***.

Command Mode

Global Configuration

Command Syntax

ip virtual-router mac-address *mac_addr*

no ip virtual-router mac address [*mac_addr*]

Parameter

mac_addr MAC IP address (dotted hex notation). Select an address that will not otherwise appear on the switch.

Example

This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

13.5.4.5 ipv6 virtual-router address

The **ipv6 virtual-router address** command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the **ip virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of ***500*** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ipv6 virtual-router address** and **default ipv6 virtual-router address** commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding **ipv6 virtual-router address** command from ***running-config***. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

ipv6 virtual-router address *net_addr*

no ipv6 virtual-router address [*net_addr*]

default ipv6 virtual-router address [*net_addr*]

Parameter

net_addr network IPv6 address.

Example

These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for ***VLAN 10***.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)#exit
```

13.5.4.6 no vrrp

The **no vrrp** command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The **default vrrp** command also reverts VRRP configuration parameters to default settings by removing the corresponding **vrrp** commands.

Commands removed by the **no vrrp** command include:

- **vrrp advertisement interval**
- **vrrp disabled**
- **vrrp ipv4**
- **vrrp ipv4 secondary**
- **vrrp peer authentication**
- **vrrp preempt**
- **vrrp preempt delay**
- **vrrp priority-level**
- **vrrp session description**

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

no vrrp *group*

default vrrp*group*

Parameter

group Virtual Router Identifier (VRID). Values range from ***1 to 255***.

Example

This command removes all VRRP configuration commands for virtual router ***group 10*** on ***VLAN 15***.

```
switch(config)#interface vlan 15
switch(config-if-vl15)#no vrrp 10
switch(config-if-vl15)#
```

13.5.4.7 show ip virtual-router

The **show ip virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

show ip virtual-router

Messages

- **IP virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IP address** no virtual IP addresses are assigned to any VLAN interfaces.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch#show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address        Virtual IP Address   Status
 Protocol
Vlan15     10.1.1.3/24       10.1.1.15            up                up
Vlan15     10.1.1.3/24       10.1.1.16            up                up
Vlan15     10.1.1.3/24       10.1.1.17            up                up
Vlan20     10.12.1.6/24      10.1.1.51            up                up
Vlan20     10.12.1.6/24      10.1.1.53            up                up
Vlan20     10.12.1.6/24      10.1.1.55            up                up
switch#
```

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

```
switch#show ip virtual-router
IP virtual router is not configured
switch#
```

13.5.4.8 show ipv6 virtual-router

The **show ipv6 virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

show ipv6 virtual-router

Messages

- **IPv6 virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IPv6 address** no virtual IPv6 addresses are assigned to any VLAN interfaces.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch#show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.4.9 show vrrp

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

Command Mode

Privileged EXEC

Command Syntax

show vrrp [**INFO_LEVEL**] [**STATES**]

show vrrp INTF GROUP_NUM [**INFO_LEVEL**] [**STATES**]

show vrrp GROUP_NUM INTF_GROUP [**INFO_LEVEL**] [**STATES**]

Parameters

- **INTF** specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the STATES parameter.
  - ***no parameter*** specified groups on all interfaces.
  - **interface ethernet *e_num*** specified groups on Ethernet interface.
  - **interface loopback** *l_num* specified groups on loopback interface.
  - **interface management *m_num*** specified groups on management interface.
  - **interface port-channel *p_num*** specified groups on port channel interface.
  - **interface vlan *v_num*** specified groups on VLAN interface.
  - **interface vxlan *vx_num*** specified groups on VXLAN interface.
- **GROUP_NUM** the VRRP ID number of the group for which the command displays status.
  - ***no parameter*** all groups on specified interface.
  - ***vrid_num*** Virtual Router Identifier (VRID). Value ranges from ***1*** to ***255***.
- **INFO_LEVEL** Specifies format and amount of displayed information. Options include:
  - ***no parameter*** displays a block of data for each VRRP group.
  - **brief** displays a single table that lists information for all VRRP groups.
- **STATES** Specifies the groups, by VRRP router state, that are displayed. Options include:
  - ***no parameter*** displays data for groups in the **master** or **backup** states.
  - **all** displays all groups, including groups in the **stopped** and **interface down** states.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch#show vrrp brief
Interface Id  Ver Pri Time  State   VrIps
Vlan1006  3   2   100 3609  Master  127.38.10.2
Vlan1006  4   3   100 3609  Master  127.38.10.10
Vlan1010  1   2   100 3609  Master  128.44.5.3
Vlan1014  2   2   100 3609  Master  127.16.14.2
switch>
```

- This command displays data blocks for all VRRP groups on ***VLAN 46***, regardless of the VRRP state.

```
switch#show vrrp interface vlan 1006 all
Vlan1010 - Group 1
  VRRP Version 2
  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
```

```
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 0.0.0.0
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch#
```

- This command displays data for all VRRP group ***2*** on ***VLAN 1014***.

```
switch#show vrrp interface vlan 1014 group 2
Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch#
```

13.5.4.10 vrrp advertisement interval

The **vrrp advertisement interval** command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the groups Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The **no vrrp advertisement interval** and **default vrrp advertisement interval** commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding **vrrp advertisement interval** command from ***running-config***. The **no vrrp** command also removes the **vrrp advertisement interval** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **advertisement interval** *adv_time*

no vrrp *group* **advertisement interval**

default vrrp *group* **advertisement interval**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***adv_time*** advertisement interval (seconds). Values range from ***1 to 255***. Default value is ***1***.

Example

This command sets the advertisement interval of five seconds for the virtual router ***35*** on ***VLAN 100***.

```
switch(config)#interface vlan 100
switch(config-if-vl100)#vrrp 35 advertisement interval 5
switch(config-if-vl100)#
```

13.5.4.11 vrrp disabled

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a ***master*** or ***backup*** router for the virtual router group.

The **no vrrp disabled** and **default vrrp disabled** commands remove the corresponding **vrrp disabled** command from ***running-config***. This changes the switchs virtual router state to ***backup*** or ***master*** if the virtual router is properly configured.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **disabled**

no vrrp *group* **disabled**

default vrrp *group* **disabled**

Parameter

group Virtual Router Identifier (VRID). Values range from ***1 to 255***.

Examples

- These commands place the switch in stopped mode for virtual router ***24*** on ***VLAN 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router ***24*** on ***VLAN 20***.

```
switch(config-if-vl20)#no vrrp 24 disabled
switch(config-if-vl20)#
```

13.5.4.12 vrrp ipv4 checksum pseudo-header exclude

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group on the configuration mode interface of the switch and supports IPv4 VRRPv3 interoperability.

The **no** form of the command deletes the **`vrrp ipv4 checksum pseudo-header exclude`** configuration from the Ethernet interface on the switch.

The **`exit`** command returns the switch to global configuration mode.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`vrrp` *group* **`ipv4 checksum pseudo-header exclude`**

`no vrrp` *group* **`ipv4 checksum pseudo-header exclude`**

Parameter

group Virtual Router Identifier (VRID). Values range from ***1 to 255***.

Example

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on VRRP ***group 1*** on ***interface ethernet 1***.

```
switch(config-if-Et1)#vrrp 1 ipv4 checksum pseudo-header exclude
```

13.5.4.13 vrrp ipv4 secondary

The **vrrp ipv4 secondary** command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the **vrrp ipv4** command.

The **no vrrp ipv4 secondary** and **default vrrp ipv4 secondary** commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding **vrrp ipv4 secondary** statement from running-config. The **no vrrp** command also removes all **vrrp ipv4 secondary** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **ipv4***ipv4_addr* **secondary**

no vrrp *group* **ipv4***ipv4_addr* **secondary**

default vrrp *group* **ipv4***ipv4_addr* **secondary**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***ipv4_addr*** secondary IPv4 address of the virtual router.

Related Command

vrrp ipv4

Example

This command assigns the IP address of ***10.2.4.5*** as the secondary IP address for the virtual router with VRID of ***15*** on ***VLAN 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

13.5.4.14 vrrp ipv4 version

The **vrrp ipv4 version** command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The **no vrrp ipv4 version** and **default vrrp ipv4 version** commands restore the default VRRP version to VRRPv2 by removing the corresponding **vrrp ipv4** version statement from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **ipv4 version VERSION_NUMBER**

no vrrp *group* **ipv4 version**

default vrrp *group* **ipv4 version**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- **VERSION_NUMBER** Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2) Options include:
  - **2** VRRP v2 supports IPv4 environment.
  - **3** VRRP v3 supports IPv4 and IPv6 environment.

Examples

- This command enables VRRPv3 for IPv6 on ***interface ethernet 3***.

```
switch#(config)#interface ethernet 3
switch#(config-if-Et3)#vrrp 1 ipv4 version 3
```

- This command removes VRRPv3 from ***interface ethernet 3*** and reverts to the default VRRPv2.

```
switch#(config)#interface ethernet 3
switch#(config-if-Et3)#no vrrp 1 ipv4 version
```

13.5.4.15 vrrp ipv4

The **vrrp ipv4** command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet. A VRRP virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands replace the existing primary address assignment.

The **vrrp ipv4 secondary** command assigns a secondary IP address to the VRRP virtual router.

The **no vrrp ipv4**and **default vrrp ipv4** commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding **vrrp ipv4** statement from ***running-config.*** The **no vrrp** command also removes the **vrrp ipv4** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **ipv4** *ipv4_address*

no vrrp *group* **ipv4** *ipv4_address*

default vrrp *group* **ipv4** *ipv4_address*

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***ipv4_address*** IPv4 address of the virtual router.

Related Command

vrrp ipv4 secondary

Example

This command enables virtual router ***15*** on ***VLAN 20*** and designates ***10.1.1.5*** as the virtual routers primary address.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.4.16 vrrp ipv6

The **vrrp ipv6** command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet.

The **no vrrp ipv6** and **default vrrp ipv6** commands disable the VRRP virtual router and deletes the IPv6 address by removing the corresponding **vrrp ipv6** statement from ***running-config.*** The **no vrrp** command also removes the **vrrp ipv6** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **ip** *ipv6_address*

no vrrp *group* **ip** *ipv6_address*

default vrrp *group* **ip** *ipv6_address*

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1*** to ***255***.
- ***ipv6_address*** IPv6 address of the virtual router.

Examples

- This command enables address ***2001:db8:0:1::1*** for IPv6 VRRP on ***VLAN 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

- This command disables VRRPv3 on ***vlan 20*** from virtual router ***3***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#no vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

13.5.4.17 vrrp mac-address advertisement-interval

The **vrrp mac-address advertisement-interval** command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The **vrrp mac-address advertisement-interval 0**, **no vrrp mac-address advertisement-interval** and **default vrrp mac-address advertisement-interval** commands disable the feature by removing the **vrrp mac-address advertisement-interval** command from ***running-config.***

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **mac-address advertisement-interval** *period*

no vrrp *group* **mac-address**

default vrrp *group* **mac-address**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***period*** interval in which the master router sends advertisement packets (seconds). Value ranges from ***0 to 3600***. Selecting ***0*** as the interval disables this feature.

Examples

- This command specifies the interval between advertisement packets sent to the members of VRRP group ***3*** on ***VLAN 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 mac-address advertisement-interval 60
switch(config-if-vl20)#
```

- This command disables the feature on ***vlan 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#no vrrp 3 mac-address advertisement-interval
switch(config-if-vl20)#
```

13.5.4.18 vrrp peer authentication

The **vrrp peer authentication** command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The **no vrrp peer authentication** and **default vrrp peer authentication** commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding **vrrp peer authentication** command from ***running-config*** . The **no vrrp** command also removes the **vrrp peer authentication** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **peer authentication** **AUTH_PARAMETER**

no vrrp *group* **peer authentication**

default vrrp *group* **peer authentication**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- **AUTH_PARAMETER** encryption level and authentication key used by router. Options include:
  - **text** ***text_key*** plain-text authentication, ***text_key*** is text.
  - ***text_key*** plain-text authentication, ***text_key*** is text.
  - **ietf-md5 key-string 0** ***text_key*** IP authentication of MD5 key hash, ***text_key*** is text.
  - **ietf-md5 key-string** ***text_key*** IP authentication of MD5 key hash, ***text_key*** is text.
  - **ietf-md5 key-string 7** ***coded_key*** IP authentication of MD5 key hash, ***coded_key*** is MD5 hash.

Guidelines

This command is applicable to VRRPv2 which supports IPv4 addresses only.

Examples

- This command implements plain-text authentication, using ***12345*** as the key, for virtual router ***40*** on ***VLAN 100***.

```
switch(config)#interface vlan 100
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using ***12345*** as the key.

```
switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string
 0 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using ***12345*** as the key. The key is entered as the MD5 hash equivalent of the text string.

```
switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string
 7
EA3TUPxdddFCLYT8mb+kxw==
switch(config-if-vl100)#
```

13.5.4.19 vrrp preempt delay

The **vrrp preempt delay** command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The **vrrp preempt** command enables preemption for a specified virtual router.

The command configures two delay periods:

- **minimum** time delays master VRRP takeover when VRRP is fully implemented.
- **reload** time delays master VRRP takeover after VRRP is initialized following a switch reload (boot). The switch bypasses the reload time to become the VRRP master immediately if it senses there are no other active switches in the virtual router group.

Running-config maintains separate delay statements for **minimum** and **reload** parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from ***0 to 3600*** seconds (one hour). The default delay is zero seconds for both parameters.

The **no vrrp preempt delay** and **default vrrp preempt delay** commands reset the specified delay to the default of zero seconds. Commands that do no list either parameter resets both periods to zero. The **no vrrp** command also removes all **vrrp preempt delay** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **preempt delay** [**MINIMUM_INTERVAL**] [**RELOAD_INTERVAL**]

no vrrp *group* **preempt delay** [**DELAY_TYPE**]

default vrrp *group* **preempt delay** [**DELAY_TYPE**]

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- **MINIMUM_INTERVAL** period between preempt event and takeover of master VRRP router role.
  - ***no parameter*** minimum delay is not altered by command.
  - **minimum** ***min_time*** delay during normal operation (seconds). Values range from ***0 to 3600***.
- **RELOAD_INTERVAL** period after reboot-VRRP initialization and takeover of master VRRP router role.
  - ***no parameter*** reload delay is not altered by command.
  - **reload** ***reload_time*** delay after reboot (seconds). Values range from ***0 to 3600***.
- **DELAY_TYPE** delay type that is reset to default value.
  - ***no parameter*** reload and minimum delays are reset to default.
  - **minimum** minimum delay is reset to default.
  - **reload** reload delay is reset to default.

(**DELAY_TYPE** parameter is only used in **no vrrp preempt delay** and **default vrrp preempt delay** commands).

Related Command

vrrp preempt

Examples

- This command sets the minimum preempt time of ***90*** seconds for virtual router ***20*** on ***VLAN 40***.

```
switch(config)#interface vlan 40
switch(config-if-vl40)#vrrp 20 preempt delay minimum 90
switch(config-if-vl40)#
```

- This command sets the minimum and reload preempt time to ***0*** for virtual router ***20*** on ***VLAN 40***.

```
switch(config-if-vl40)#no vrrp 20 preempt delay
switch(config-if-vl40)#
```

13.5.4.20 vrrp preempt

The **vrrp preempt** command controls a virtual routers preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The **no vrrp preempt**cand **default vrrp preempt**ccommands disable preempt mode for the specified virtual router; the **default vrrp preempt** command stores a corresponding **no vrrp preempt** statement in ***running-config***. The **vrrp preempt** command enables preempt mode by removing the corresponding **no vrrp preempt** statement from running-config.

The **no vrrp** command also enables preempt mode by removing the **no vrrp preempt** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **preempt**

no vrrp *group* **preempt**

default vrrp *group* **preempt**

Parameter

group Virtual Router Identifier (VRID). Values range from ***1 to 255***.

Related Command

vrrp preempt delay

Examples

- This command disables preempt mode for virtual router ***20*** on ***VLAN 40***.

```
switch(config)#interface vlan 40
switch(config-if-vl40)#no vrrp 20 preempt
switch(config-if-vl40)#
```

- This command enables preempt mode for virtual router ***20*** on ***VLAN 40***.

```
switch(config-if-vl40)#vrrp 20 preempt
switch(config-if-vl40)#
```

13.5.4.21 vrrp priority-level

The **vrrp priority-level** command configures the switchs priority setting for a VRRP virtual router. Priority values range from ***1*** to ***254***. The default value is ***100***.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The **vrrp preempt** command controls the time when a switch can become the master virtual router.

The **no vrrp priority-level** and **default vrrp priority-level** commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding **vrrp priority-level** command from ***running-config***. The **no vrrp** command also removes the **vrrp priority-level** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **priority-level** *level*

no vrrp *group* **priority-level** *level*

default vrrp *group* **priority-level** *level*

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***level*** priority setting for the specified virtual router. Values range from ***1 to 254***.

Example

This command sets the virtual router priority value of ***250*** for virtual router ***group 45*** on ***vlan 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 45 priority-level 250
switch(config-if-vl20)#
```

13.5.4.22 vrrp session description

The **vrrp session description** command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is ***80*** characters.

The **no vrrp session description** and **default vrrp session description** commands remove the text string association from the VRRP virtual router by deleting the corresponding **vrrp session description** command from ***running-config***. The **no vrrp** command also removes the **vrrp session description** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **session description** *label_text*

no vrrp *group* **session description**

default vrrp *group* **session description**

Parameters

- ***group*** Virtual Router Identifier (VRID). Values range from ***1 to 255***.
- ***label_text*** text that describes the virtual router. Maximum string length is ***80*** characters.

Example

This command associates the text string ***Laboratory Router*** to virtual router ***15*** on ***vlan 20***.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

13.5.4.23 vrrp timers delay reload

The **vrrp timers delay reload** command delays the time for VRRP initialization after a system reboot.

The **no vrrp timers delay reload** and **default vrrp timers delay reload** commands restore the default value of ***0*** by deleting the **vrrp timers delay reload** statement from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **timers delay reload** [**INTERVAL**]

no vrrp *group* **timers delay reload**

default vrrp *group* **timers delay reload**

Parameters

INTERVAL The number of seconds for the delay (seconds). Options include:

- ***no parameter*** Default value of ***0*** seconds.
- ***0 to 3600*** seconds. Ranges between ***0 to 60*** minutes.

Examples

- These commands configure the VRRP reload delay interval to ***15*** minutes.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#vrrp 2 timers delay reload 900
switch(config-if-Vl100)#
```

- These commands removes the VRRP reload delay interval.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#no vrrp 2 timers delay reload
switch(config-if-Vl100)#
```

13.5.4.24 vrrp tracked-object

The **vrrp tracked-object** command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to **down**. The tracked object is created by the **track** command.

The **no vrrp tracked-object** and **default vrrp tracked-object** commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding **vrrp tracked-object** command from ***running-config***.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

vrrp *group* **tracked-object** *object_name* **ACTION** *amount*

no vrrp *group* **tracked-object** *object_name* **ACTION**

default vrrp *group* **tracked-object** *object_name* **ACTION**

Parameters

- ***group*** virtual router identifier (VRID). Values range from ***1*** to ***255***.
- ***object_name*** name of tracked object.
- ***amount*** amount to decrement VRRP priority level. Values range from ***1*** to ***254***.
- **ACTION** The action that VRRP is to take when the tracked objects status changes to **down**. Options include:
  - **decrement** decrease VRRP priority level by *amount*.
  - **shutdown** shut down VRRP on the configuration mode interface.
  - If both **decrement** and **shutdown** are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

Related Commands

track

Example

This command causes ***interface ethernet 5*** to disable VRRP when tracked object ***ETH8*** changes state.

```
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

13.6 OpenFlow

This section describes Arista's OpenFlow implementation. Topics in this section include:

- OpenFlow Introduction
- OpenFlow Description
- OpenFlow Configuration
- OpenFlow Commands

13.6.1 OpenFlow Introduction

Arista EOS supports OpenFlow 1.0 controlled by OpenFlow controllers for filtering and redirecting traffic.

13.6.2 OpenFlow Description

OpenFlow is a programmable network protocol that manages and directs traffic among Ethernet switches, routers, and wireless access points over the network in support of Software-Defined Networking (SDN) applications.

OpenFlow can be used for traffic flow management in metro, WAN, and data center networks, and also security management in enterprise and campus data center applications, and other applications with the appropriate use of OpenFlow controllers.

13.6.2.1 OpenFlow Controller

The Arista device supports an active controller connection for which the Arista device will initiate (seek) the TCP connection to a given OpenFlow Controller address.

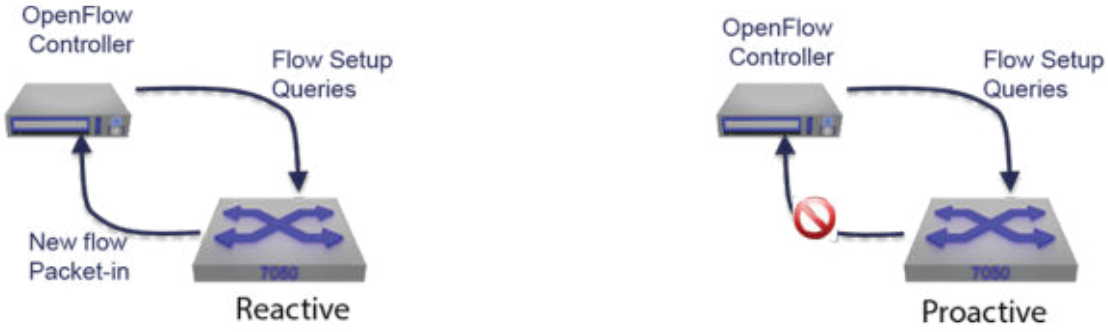

Figure 35: Reactive and proactive modes

The controller can be any standard OpenFlow controller.

Switch consists of three parts:

- A flow table, to tell the switch how to process the flow.
- A channel that connects the switch to a remote controller, allowing commands and packets to be sent between a controller and the switch.
- The OpenFlow Protocol, which provides a way for a controller to communicate with a switch.

An OpenFlow-enabled device supports an OpenFlow Client (control plane software), which communicates with an OpenFlow Controller using the OpenFlow protocol. The OpenFlow Controller runs on a server or a server cluster. OpenFlow-enabled devices support the abstraction of a flow table, which is manipulated by the OpenFlow Controller. A flow is a collection of packets where some selected header fields match particular values for those fields. The flow table is sorted by flow priority, which is defined by the controller.

Flow Table

Forwarding decisions for incoming packets are decided by a simple lookup on its flow-table entries. Packets that dont match any flow entry are dropped by default. Every flow entry in the flow-table contains:

- Header fields to match against packets: Each entry contains a specific value, or ANY, which matches any value.

Ingress Port	Ether Source	Ether Dst	Ether Type	VLAN Id	IP Proto	Src Port	Dst Port

- Counters to update for matching packet: These counters are used for statistics purposes, in order to keep track of the number of packets and bytes for each flow and the time that has elapsed since the flow initiation.
- Actions to apply to matching packets: The action specifies the way in which the packets of a flow will be processed. An action can be one of the following:

1. forward the packet to a given port or ports, after optionally rewriting some header fields,
2. ,
3. forward the packet to the controller.

Channel

The channel is the interface that connects each OpenFlow switch to a controller. Through this interface the controller exchanges messages with the switches in order to configure and manage them

13.6.2.2 OpenFlow Modes

Bind Modes

The switch can be configured to divide traffic entering the switch in either of two ways:

- By interface, so that only packets arriving on certain interfaces are processed by OpenFlow (interface bind mode, the default).
- By VLAN, so that only packets associated with certain VLAN IDs are processed by OpenFlow (VLAN bind mode).

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

Note: The hybrid mode of operation is experimental.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

Interface Bind Mode

When the switch is configured in interface bind mode, the ingress interface of a packet is processed according to entries in the OpenFlow table.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the **show openflow ports** command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

- In OpenFlow configuration mode, use the **bind mode (OpenFlow)** command to select interface bind mode.
- In the OpenFlow configuration mode, use the bind interface command to bind one or more interfaces to OpenFlow.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

VLAN Bind Mode

When a packet arrives at a switch interface, the switch assigns it a VLAN for internal processing, based on the switchport configuration of the ingress interface and on the packet's VLAN tag (if any). If the switch is configured in VLAN bind mode, the internal VLAN determines whether the packet is processed according to entries in the OpenFlow table and whether the packet is matched by a given entry in the OpenFlow table. After the switch has processed the packet, the switchport configuration of each potential egress interface controls whether the packet is transmitted tagged with the internal VLAN ID, transmitted untagged, or filtered.

Several configuration commands affect whether packets received on a given interface are processed by OpenFlow, and whether packets directed to an interface via an OpenFlow output action are transmitted or filtered:

Use the VLAN configuration mode command to create the VLANs to be accepted by the switch and processed by OpenFlow.

In the interface configuration mode, use switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the VLAN to an OpenFlow VLAN; for a trunk port, configure which OpenFlow VLANs are allowed.

In OpenFlow configuration mode, use the **bind mode (OpenFlow)** command to select VLAN bind mode, and use the **bind vlan (OpenFlow)** command to bind one or more VLANs to OpenFlow.

Untagged Packet Processing in VLAN Bind Mode

The OpenFlow protocol also allows a flow table entry to explicitly match untagged packets, or to strip the VLAN tag from matched packets. Since the switch actually assigns a VLAN internally to packets received without a tag, the OpenFlow function on the switch must be configured with a single "native" VLAN ID in order to make sense of such flow entries. When an OpenFlow native VLAN is configured:

- A flow table entry defined to match untagged packets actually matches packets whose internal VLAN is the OpenFlow native VLAN.
- A flow table entry with a strip VLAN tag action actually sets the packet's internal VLAN to the OpenFlow native VLAN.
- Packets sent to the controller via a packet-in message are sent untagged if they are assigned to the native VLAN, and tagged otherwise.
- Untagged packets received from the controller via a packet-out message are assigned to the native VLAN.

In contrast, when no OpenFlow native VLAN is configured:

- Flow table entries defined to match untagged packets or with a strip VLAN tag action are rejected.
- All packets sent to the controller via a packet-in message are sent tagged.
- Untagged packets received from the controller via a packet-out message are dropped.

There is no explicit command to configure the OpenFlow native VLAN. To configure a VLAN as the OpenFlow native VLAN:

- Use the VLAN configuration mode command.
- Every interface handling the OpenFlow traffic, in interface configuration mode, uses switchport commands to configure the interface as either an access port or a trunk port. For an access port,

set the access VLAN to N; for a trunk port, either set the native VLAN to N or configure the interface to drop untagged frames.
- In OpenFlow configuration mode, use the **bind vlan (OpenFlow)** command to assign VLAN N to OpenFlow.

Configuring two interfaces as access ports with different OpenFlow-bound VLANs, or as trunk ports with different native OpenFlow-bound VLANs, violates these constraints and causes the OpenFlow function to behave as no OpenFlow native VLAN is configured.

Use the **show openflow** command to see whether an OpenFlow native VLAN has been configured.

Spanning Tree Protocol in VLAN Bind Mode

STP can operate on OpenFlow-bound VLANs. The switch default STP configuration is one multiple spanning tree (MST) instance containing all VLANs, including OpenFlow-bound VLANs. When STP is configured on OpenFlow-bound VLANs, packets received from or sent to blocked ports are dropped, regardless of the rules defined in the OpenFlow flow table.

For some applications, you may want to disable STP on OpenFlow-bound VLANs. Before doing so, be sure that the OpenFlow controller and application is configured properly to manage multiple redundant paths through the network without allowing traffic to loop.

To ensure proper operation of STP on the switch and to support OpenFlow applications that inter-operate with STP, OpenFlow forwards inbound STP packets both to the spanning tree agent on the switch and to the OpenFlow controller as packet-in messages. This behavior overrides any flow table entries that might otherwise match STP packets, and is not configurable.

Monitor Bind Mode

Unlike interface and VLAN bind modes, monitor bind mode is tailored for specific applications. The switch both forwards traffic normally and selectively mirrors packets under OpenFlow control.

When the switch is configured in monitor bind mode, all traffic entering the switch is forwarded normally, regardless of ingress interface or internal VLAN. All Ethernet and Port-Channel interfaces are mapped to OpenFlow ports and exposed to the controller (except LAG members and mirror destination ports). In this mode, the entire switch is bound to OpenFlow, and OpenFlow processing is applied to packets in addition to the normal forwarding behavior.

Currently the only actions that can be performed on packets in monitor bind mode are:

- Output normally.
- Copy to mirror destination port.

In monitor bind mode, the default action taken on packets that are not matched by any flow table entry is output normally. The switch rejects flow entries not conforming to these restrictions.

Routing Between the OpenFlow and Non-OpenFlow Domain

The switch can be configured to perform standard IP routing of traffic processed by OpenFlow. From the controller's point of view, the switch appears to have a virtual port ***40000*** (OpenFlowRouter) in addition to the physical ports.

Packets sent out the OpenFlowRouter port can undergo standard IP routing into a different IP subnet. After routing, those packets can either exit the switch or be processed by OpenFlow again.

13.6.2.2.1 Port Mapping

For switches that support QSFP+ modules, a 40G interface can be configured as four 10G ports. These Ethernet interfaces are mapped to OpenFlow ports according to the formula port = M * 200 + N for EthernetM/N. For example, interface ***Ethernet1/1*** is mapped to OpenFlow port ***201***; ***Ethernet1/2*** to

OpenFlow port ***202***, ***Ethernet16/1*** to OpenFlow port ***3201***, ***Ethernet16/2*** to OpenFlow port ***3202***, and so on.

When IP routing is configured, the OpenFlow Router interface is mapped to OpenFlow port ***40000***.

Port-Channel (LAG) interfaces are mapped to OpenFlow ports according to the formula port = 40000 + N for Port-ChannelN. For example, interface ***Port-Channel23*** is mapped to OpenFlow port ***40023***.

The OpenFlow virtual ports all and flood refer to all Ethernet interfaces on the switch, but normal VLAN egress policies apply: a packet tagged with a given OpenFlow-bound VLAN (or untagged, if a native OpenFlow VLAN is configured) will egress a given interface only if the interface is configured to handle traffic for that VLAN. If an interface is not configured to handle traffic for any OpenFlow-bound VLAN, then no packets sent to all or flood will egress on that interface.

13.6.2.2.2 Queue Mapping

All multicast transmit queues that are configured to be mapped from a QoS traffic class are mapped to OpenFlow. OpenFlow-mapped queues can be used by the enqueue action in flow table entries and are included in queue stats reply messages. By default, all the multicast queues ***0*** to ***3*** are mapped.

Use the **`show qos maps`** command to view the current mapping of traffic class to multicast transmit queue, and use the **`qos map traffic-class to mc-tx-queue`** configuration command to modify it. If no traffic class is mapped to a given multicast transmit queue, the queue will not be mapped to OpenFlow and will be unavailable for use by the enqueue action.

13.6.2.2.3 Table Size

The switch supports one flow table. OpenFlow packet processing is performed in hardware; software forwarding (via the switch CPU) is not supported.

The switch advertises the table size for the l2-match profile. This should be taken as an approximation, as other switch features such as ACLs can consume hardware resources shared with OpenFlow. If the controller attempts to add a flow entry but there are insufficient resources to implement it in hardware, the switch returns an error message.

13.6.2.2.4 Match Fields

A flow table entry can specify an exact value or wildcard for any of the following fields:

- L2 source and destination addresses
- VLAN ID (and untagged packets, if the native OpenFlow VLAN is configured)
- VLAN priority
- L2 frame type
- IPv4 source and destination addresses with subnet masking
- IPv4 TOS/DSCP field
- IPv4 protocol
- TCP/UDP source and destination port numbers

Matching the IPv4 source or destination address within an ARP message is not supported, nor is matching the ARP opcode.

13.6.2.2.5 Actions

In VLAN and interface bind modes, the following flow entry actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Set L2 source and destination addresses
- Strip VLAN tag (if the native OpenFlow VLAN is configured)
- Set VLAN ID

- Set VLAN priority
- Set IPv4 TOS/DSCP
- Output or enqueue to physical port (see **OpenFlow Limitations** for restrictions on multiple output actions)
- Output or enqueue to all or flood (see **OpenFlow Limitations**)
- Output to controller (buffering not supported; entire packet contents are always sent)
- Drop (no action)
- Copy packet on egress to a mirror destination port (vendor-specific extension)

In monitor bind mode, only the following actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Output per normal forwarding (this action is required in every flow entry)
- Copy packet on egress to a mirror destination port (vendor-specific extension)

13.6.2.3 OpenFlow Limitations

Consider the following when using OpenFlow:

- OpenFlow is supported on both the 7050 and 7050X series of switches.
- OpenFlow Hybrid mode is not supported.
- Output to an ingress port is silently dropped. Flow table entries with an output to ingress port action are accepted by the switch, but matching packets are not actually forwarded via the ingress port. (But for packet-out, the output to ingress port action is supported.)
- Output/enqueue actions must follow modify actions. The switch will return an error if a modify action follows an output/enqueue action.
- Each action can be performed at most once. The switch will return an error if the same action appears more than once. Output and enqueue actions may appear at most once per port.
- Support output to only one queue. The switch will return an error if multiple enqueue actions appear with different queue ids, or if both enqueue and output actions appear.
- Packet is sent at most once per port even if there are overlapping output or enqueue actions. For example, the switch will accept a rule with actions output to all ports and output to a specific port ***12***, but will transmit the packet on port ***12*** only once even though it is contained in both actions.
- Flow entry priority is always respected, even for exact-match flow entries. The switch does not force exact-match flow entries to be processed at the highest priority.
- For packet-out messages, only output actions are supported (to a physical port, or to all, flood, or ingress port). The switch will return an error if a packet-out message is received with any other action.
- The switch-to-controller connection is plain TCP. The switch does not support encrypted TLS connections to the controller.
- Matching source and destination IP and operation code in ARP packets is not supported. Flow entries with matching the ARP Ethernet type are accepted by the switch, but the source and destination IP and protocol (opcode) match field values are ignored (i.e. the fields are wildcarded).
- A flow mod message with **modify** or **modify_strict** command does not modify the cookie value of existing flow entries. If the modify is treated as an add, however, the new entry will be assigned the specified cookie value.
- Matching all 802.3 packets without SNAP headers is not supported. The switch does not treat a ***dl_type*** value of 0x5ff as special.
- The ***port_mod*** message is not supported. It is not possible to modify the behavior of physical ports via the ***port_mod*** message. In particular, the ***no_flood port_config*** bit cannot be used to exclude ports from the flood virtual output port set.
- Changing the list of controllers causes the current controller connection to be dropped. When the OpenFlow feature is enabled and the list of controllers is changed in any fashion (e.g. by adding or deleting a controller), the current controller connection will be dropped.

- When adding a large number of flow table entries, add higher-priority entries before lower-priority entries. Due to hardware limitations, the switch will take much longer to add a new flow entry if the table already contains many entries with lower priority.

13.6.3 OpenFlow Configuration

By default, the OpenFlow feature is disabled on Arista devices. You must first enable the OpenFlow feature on the device.These sections describe OpenFlow configuration tasks:

- **Configuration Procedures**
- **Enabling Basic OpenFlow**
- **Optional OpenFlow Commands**
- **Displaying OpenFlow Configurations**

13.6.3.1 Configuration Procedures

Use the OpenFlow configuration mode commands to configure the following basic parameters:

- **openflow** : places the switch in OpenFlow configuration mode.
- **controller (OpenFlow)** : set the controller IP address and port.
- **bind interface (OpenFlow)** : bind interfaces to OpenFlow.
- **shutdown (Openflow)** : enable or disable OpenFlow.

13.6.3.2 Enabling Basic OpenFlow

Configure the management interface. Assign an IP address to the interface and set the default gateway IP address, allowing the OpenFlow function on the switch establish a TCP connection with the OpenFlow controller.

The following commands turn on OpenFlow pointing to a controller, ready to receive flow setup messages to be programmed in hardware for all traffic.

- The **openflow** command places the switch in OpenFlow configuration mode.

```
switch(config)#openflow
switch(config-OpenFlow)#
```

- The **controller (OpenFlow)** command points to the primary OpenFlow controller. Others can be configured as a standby list.

```
switch(config)#OpenFlow
switch(config-OpenFlow)#controller tcp:15.16.15.16:6633
switch(config-OpenFlow)#
```

- The **bind vlan (OpenFlow)** command dictates what VLAN or interfaces are tied to OpenFlow. Since hybrid mode is not supported, Arista recommends binding all VLANs or all interfaces to OpenFlow.

```
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```

- The **shutdown (Openflow)** command determines if the configuration takes effect or not. The following command enables OpenFlow on the switch.

```
switch(config-OpenFlow)#no shutdown
switch(config-OpenFlow)#
```

13.6.3.3 Optional OpenFlow Commands

Keepalive

The **keepalive (OpenFlow)** command allows you to set the interval for switch to controller keepalives (default of ***10*** seconds scales best for large scale multi-node OpenFlow switch networks). After three consecutive reply (from the controller) misses, the switch will try to connect to the second configured controller, if configured.

```
switch(config-OpenFlow)#keepalive
switch(config-OpenFlow)#
```

Profile

The **profile (OpenFlow)** command determines the type of flows. To double flow table size (in case all flows are L2 only), setting a profile of l2-match is best suited. Default is full-match (includes L3/4 field match).

```
switch(config-OpenFlow)#profile l2-match
switch(config-OpenFlow)#
```

Default-action

The **default-action (OpenFlow)** command tells the Arista OpenFlow agent the action that needs to be taken for packets (drop or send-to-controller) that dont match any existing flows programmed locally on the hardware.

```
switch(config-OpenFlow)#default-action drop
switch(config-OpenFlow)#
```

13.6.3.4 Displaying OpenFlow Configurations

Show commands display the state of OpenFlow running on the Arista switch.

- The **show openflow** command displays the configuration state of the OpenFlow feature and the flows that are actively installed in the hardware of the Arista switch.

```
switch(config)#show openflow
OpenFlow configuration: Enabled
DPID: 0x0000001c73111a92
Description: sw3-Arista
Controllers:
  configured: tcp:172.22.28.228:6633
  connected: tcp:172.22.28.228:6633
  connection count: 3
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: VLAN
  VLANs: 1-2
  native VLAN: 1
IP routing state: Disabled
Shell command execution: Disabled
Total matched: 7977645 packets
```

- The **show openflow flows** command show the default flow that is installed when OpenFlow is enabled.

```
switch(config)#show OpenFlow flows
```

```
Flow flow00000000000000000005:
  priority: 100
  cookie: 45035996453121666 (0xa000000ab1ae82)
  match:
    ingress interface: Ethernet3
    Ethernet type: IPv4
    source IPv4 address: 10.0.0.0/255.255.255.0
  actions:
    output interfaces: Ethernet11
  matched: 0 packets, 0 bytes
Flow __default__:
  priority: -1
  cookie: 0 (0x0)
  match:
  actions:
    output to controller
  matched: 5519922 packets, 433188045 bytes
```

13.6.4 OpenFlow Commands

OpenFlow Global Configuration Mode

- openflow

Openflow Configuration Commands

- bind interface (OpenFlow)
- bind mode (OpenFlow)
- bind vlan (OpenFlow)
- controller (OpenFlow)
- default-action (OpenFlow)
- description (OpenFlow)
- keepalive (OpenFlow)
- profile (OpenFlow)
- routing recirculation-interface (OpenFlow)
- routing vlan (OpenFlow)
- shell-command allowed (OpenFlow)
- shutdown (Openflow)

OpenFlow Display and Clear Commands

- clear openflow statistics
- show openflow
- show openflow flows
- show openflow ports
- show openflow profiles
- show openflow queues
- show openflow statistics

13.6.4.1 bind interface (OpenFlow)

When the switch is configured in interface bind mode, the ingress interface of a packet determines whether the packet is processed according to entries in the OpenFlow table or forwarded normally by the switch.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the **`show openflow ports`** command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

In the OpenFlow configuration mode, use the **`bind mode interface`** command to select the interface bind mode.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including Spanning Tree Protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

The **`no bind interface`** and **`default bind interface`** commands revert the specified list configuration to its default by removing the corresponding **`bind interface`** command from ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

`bind interface` **INTF**

`no bind interface [`**INTF**]

`default bind interface [`**INTF**]

Parameters

INTF Interface that are tied to OpenFlow. Options include:

- **ethernet *e_range*** Ethernet interfaces specified by ***e_range*** .
- **port-channel *p_range*** port channel interfaces specified by ***p_range***.

Valid ***e_range*** and ***p_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command binds ***ethernet 1*** to OpenFlow.

```
switch(config)# openflow
switch(config-openflow)#bind interface ethernet 1
```

13.6.4.2 bind mode (OpenFlow)

The **`bind mode`** command controls the way packets are divided on ingress between OpenFlow processing and normal switch processing.

The switch can be configured to divide traffic entering the switch in the following ways:

- **Interface bind mode**: Packets entering the switch from certain interfaces are only processed by OpenFlow according to flow table entries; packets entering from other interfaces are forwarded normally. (interface bind mode is the default).
- **VLAN bind mode**: Only packets associated with certain VLAN IDs are processed by OpenFlow.
- **Monitor bind mode**: All packets are forwarded normally, and are also processed by OpenFlow; a restricted set of actions are applied to packets matching a flow table entry.

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

The **`no bind mode`** and **`default bind mode`** commands revert the specified list configuration to its default by removing the corresponding **`bind mode`** command from ***running-config***.

Command Mode

Open flow Configuration

Command Syntax

`bind mode` **METHOD**

`no bind mode`

`default bind mode`

Parameters

METHOD bind interfaces to OpenFlow. Options include:

- **interface** Only packets arriving on certain interfaces are processed by OpenFlow.
- **monitor** All packets are forwarded normally, and are also processed by OpenFlow.
- **vlan** Only packets associated with certain VLAN IDs are processed by OpenFlow.

Example

In this example, packets received without VLAN tags are assigned to the default ***vlan 1*** upon entering the switch and are processed by OpenFlow. All VLAN-tagged packets are dropped.

```
switch#enable
switch#configure
switch(config)#interface et1-48
switch(config-if-Et1-48)#switchport mode access
switch(config-if-Et1-48)#switchport access vlan 1
switch(config-if-Et1-48)#exit
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```

13.6.4.3 bind vlan (OpenFlow)

The **bind vlan** command adds one or more VLAN IDs to the set of VLANs that are processed by OpenFlow in VLAN bind mode. The VLANs must be created separately using the VLAN configuration mode commands.

If you specify a nonexistent VLAN with the **bind vlan** command, the binding will be stored in the running configuration but will not take effect until the VLAN is created.

A range of VLANs may be passed to the **bind vlan** command to add more than one at a time.

The number of VLANs that may be bound to OpenFlow depends on available hardware resources, which are shared with other features including IP routing and ACLs. On the 7050 Series switches the maximum number is ***1024***.

Use the **show openflow** command to verify which VLANs are bound to OpenFlow; this command reflects the actual hardware state rather than the configuration.

The **no bind vlan** and **default bind vlan** commands removes one or more VLANs from the set of VLANs that are processed by OpenFlow in VLAN bind mode.

Command Mode

OpenFlow Configuration

Command Syntax

bind vlan [*v_range*]

no bind vlan [*v_range*]

default bind vlan [*v_range*]

Parameter

v_range VLAN list. VLAN numbers range from ***1*** to ***4094***.

Example

These command bind VLANs ***1*** and ***2*** to OpenFlow.

```
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1,2
```

13.6.4.4 clear openflow statistics

The **clear openflow statistics** command resets the flow statistics for OpenFlow.

Command Mode

Privileged EXEC

Command Syntax

clear openflow statistics

Example

This command resets the OpenFlow counters.

```
switch #clear openflow statistics
switch#
```

13.6.4.5 controller (OpenFlow)

The **controller** command adds the address of an OpenFlow controller to which the switch should connect. The parameter must take the form ***tcp:1.2.3.4:6633*** where ***1.2.3.4*** is the IP address of the controller and ***6633*** is the TCP port number.

The **controller** command may be used multiple times to add multiple controllers. The switch will attempt to connect to the first controller in the list of controllers. If the connection attempt fails, or the current connection terminates, the switch will try the next controller in that list, and so on. If the switch cannot connect to the last controller in the list, it will retry with the first controller in the list.

The order in which controllers are added is the order that the switch uses to establish controller connections. This ordering can be seen in the output of the **show openflow** command.

The **no controller** command either removes the specified controller from the list of controllers if a controller address is given as a parameter, or removes all controllers from the list of controllers if **no** parameter is given. If there are no controllers remaining after this command is executed, the OpenFlow function is effectively disabled.

Note: Adding or removing a controller will cause the current controller connection to be dropped. The switch will then attempt to connect to the first controller in the list of controllers, then second controller, and so on.

The **no controller** and **default controller** commands delete s the **controller** statement from ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

controller tcp:*ip_address* : *tcp_port*

no controller tcp:*ipaddress* : *tcp_port*

default controller tcp:*ipaddress* : *tcp_port*

Parameters

- ***ip_address*** ip address used for OpenFlow. Dotted decimal location.
- ***tcp_port*** name of the TCP port used for OpenFlow. Value ranges from ***0 to 65535***.

Example

These commands enable OpenFlow and sets the controller for an OpenFlow instance.

```
switch(config)#openflow
switch(config-OpenFlow)#controller tcp:1.2.3.4:6633
```

13.6.4.6 default-action (OpenFlow)

The **default-action** command sets the action for the default flow table entry. This entry is automatically added by the switch. It has the lowest priority, and matches packets that are not matched by any other entry.

Use **default-action drop** to change the default entry's action to drop packets instead of sending them to the controller. (Note: In this mode, the switch deviates from the OpenFlow specification.)

The **no default-action** command restores the default entry's action to send packets to the controller.

Command Mode

OpenFlow Configuration

Command Syntax

default-action **ACTION_TYPE**

no default-action

default default-action

Parameters

ACTION_TYPE Action for the default flow table entry. Options include:

- **controller** Sets the default entry's action to send packets to the controller.
- **drop** Changes the default entry's action to drop packets instead of sending them to the controller.

Example

This command sets the default entry's action to drop packets instead of sending them to the controller.

```
switch(config)#openflow
switch(config-OpenFlow)#default-action drop
```

13.6.4.7 description (OpenFlow)

The **description** command allows overriding the switch description string (normally the switch hostname) sent to the controller.

The **no description** and **default description** commands remove the description text for the switch hostname from ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

description *label_text*

no description

default description

Parameter

label_text character string up to ***256*** characters assigned to describe the switch.

Example

These commands add the description test to the switch.

```
switch(config-openflow)#description test
switch(config-openflow)#
```

13.6.4.8 keepalive (OpenFlow)

The **keepalive** command alters how often the switch sends an OpenFlow echo request to the currently connected controller (every ***10*** seconds by default). If an echo reply is not received after three successive echo requests, the switch disconnects from the controller. It then attempts to establish a new controller connection depending on the controller configuration.

The **no keepalive** command restores the default keepalive period by removing the **keepalive** command from the ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

keepalive *keep_alive_time*

no keepalive

default keepalive

Parameter

keep_alive_time keepalive period, in seconds. Value ranges from ***1 to 100000***. Default value is ***10*** seconds.

Example

This command sets the keepalive time for OpenFlow to ***30*** seconds.

```
switch(config)#openflow
switch(config-openflow)#keepalive 30
switch(config-openflow)#
```

13.6.4.9 openflow

The **openflow** command places the switch in OpenFlow configuration mode.

The **no openflow** and **default openflow** commands delete the openflow configuration mode statements from ***running-config***.

OpenFlow configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect ***running-config***. The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

openflow

no openflow

default openflow

Commands Available in OpenFlow Configuration Mode

- bind interface (OpenFlow)
- bind mode (OpenFlow)
- bind vlan (OpenFlow)
- controller (OpenFlow)
- default-action (OpenFlow)
- description (OpenFlow)
- keepalive (OpenFlow)
- profile (OpenFlow)
- routing recirculation-interface (OpenFlow)
- routing vlan (OpenFlow)
- shell-command allowed (OpenFlow)
- shutdown (Openflow)

Examples

- This command places the switch in ***OpenFlow*** configuration mode:

```
switch(config)#openflow
switch(config-openflow)#
```

- This command returns the switch to global management mode:

```
switch(config-openflow)#exit
switch(config)#
```

13.6.4.10 profile (OpenFlow)

The **`profile`** command sets an alternate flow table profile. Use the **show openflow profiles** command to see the flow table profiles supported by the switch.

The **`no profile`** and **`default profile`** commands restores the default flow table profile by removing the profile command from the from ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

`profile` **FIELD_TYPE**

`no profile`

`default profile`

Parameters

FIELD_TYPE Profiles supported by the switch for the active bind mode. Options include:

- **full-match** Supports matching the full set of OpenFlow match fields.
- **l2-match** Supports matching only a subset but with a larger maximum number of flow table entries.

Example

This command advertises the table size for the full-match flow table profile.

```
switch#(config-openflow)#profile full-match
switch#(config-openflow)#
```

13.6.4.11 routing recirculation-interface (OpenFlow)

The **routing recirculation-interface**command designates a switch interface to recirculate routed OpenFlow traffic for a second pass of processing. Exactly one recirculation interface must be configured to use routing, regardless of the number of VLANs being routed.

Any Ethernet or Port-Channel interface can be used for OpenFlow routing recirculation.

When an interface is configured for OpenFlow routing recirculation:

- The switch programs the hardware into a special MAC loopback mode, so the interface cannot be used to carry normal traffic.
- The link LED turns green and the recirculation function works even if a transceiver is not present or a cable is not inserted.
- The link speed is forced to the maximum.
- Interface configuration commands such as switchport and shutdown are ineffective, although they are preserved in the running configuration and become effective again when the interface is no longer configured for OpenFlow routing recirculation.

The **routing recirculation-interface** and **default routing recirculation-interface** commands revert the t configuration to its default by removing the corresponding **routing recirculation-interface** command from ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

bind interface **INTF**

no bind interface [**INTF**]

default bind interface [**INTF**]

Parameters

INTF Options include:

- **ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **port-channel *p_range*** port channel interfaces specified by ***p_range***.

Valid ***e_range*** and ***p_range*** formats include number, range, or comma-delimited list of numbers and ranges.

Example

This command recirculates traffic routed to and from ***vlan 1*** using the routed transit ***vlan 401***.

```
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
switch(config-openflow)#routing recirculation-interface et48
switch(config-openflow)#routing vlan 1 routed-vlan 401
switch(config-openflow)#enable
```

13.6.4.12 routing vlan (OpenFlow)

The **routing vlan** command enables IP routing of traffic processed by OpenFlow for a specific VLAN.

The **no routing vlan** and **default routing vlan** command disables IP routing of traffic processed by OpenFlow for a VLAN.

Command Mode

OpenFlow Configuration

Command Syntax

routing vlan VLAN_ID routed-vlan*vlan_transit*

no routing vlan VLAN_ID

default routing vlan VLAN_ID

Parameters

VLAN_ID Options include:

- ***v_num*** The full form of the command is **routing vlan 123 routed-vlan 456**, where ***123*** is the VLAN of the OpenFlow traffic to be routed, and ***456*** is a (non-OpenFlow-bound) VLAN configured for standard IP routing.
- **untagged** To route untagged OpenFlow traffic. use the command **routing vlan untagged routed-vlan 456**.

Example

This command associates the VLAN with an untagged ***vlan 22*** to match during the OpenFlow pass.

```
switch(config-openflow#routing vlan untagged routed-vlan 22
```

13.6.4.13 shell-command allowed (OpenFlow)

The **shell-command allowed** command allows the controller to run shell or CLI vendor extension commands on the switch.

When this extension is enabled, the switch will execute any CLI command sent by the controller, bypassing normal access controls, so enable it only if the controller is trusted.

The **no shell-command allowed** and **default shell-command allowed** commands disables the corresponding **shell-command allowed** from the ***running-config***.

Command Mode

OpenFlow Configuration

Command Syntax

shell-command allowed

no shell-command allowed

default shell-command allowed

Example

This command allows the controller to run arbitrary CLI commands on the switch.

```
switch(config)#openflow
switch(config-openflow)#shell-command allowed
switch(config-openflow)#
```

13.6.4.14 show openflow flows

The **show openflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, packet counters, and timeouts.

The default flow table entry is automatically created by the switch. It always has the lowest priority, and matches packets that are not matched by any other entry. The default entry's action is to send the packet to the controller.

Command Mode

EXEC

Command Syntax

show openflow flows

Example

This command displays the contents of the flow table.

```
switch#show openflow flows
Flow flow00000000000000000002:
priority: 0
cookie: 0 (0x0)
idle timeout: 60.0 sec
match:
ingress interface: Ethernet2
source Ethernet address: 00:a9:87:65:43:21
destination Ethernet address: 00:12:34:56:78:9a
untagged/native VLAN ID
VLAN PCP: 0
Ethernet type: IPv4
source IPv4 address: 10.0.1.1
destination IPv4 address: 10.0.1.2
IPv4 TOS: 0
IPv4 protocol: ICMP
source TCP/UDP port or ICMP type: 8
destination TCP/UDP port or ICMP code: 0
actions:
output interfaces: OpenFlowRouter
matched: 4 packets, 408 bytes
Flow __default__:
priority: -1
cookie: 0 (0x0)
match:
actions:
output to controller
switch#
```

13.6.4.15 show openflow ports

The **show openflow ports** command displays the mapping between OpenFlow port number and switch interface.

In interface bind mode, all OpenFlow-bound interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

In VLAN bind mode, Ethernet and Port-Channel interfaces (except routed ports and LAG members) configured to carry traffic for one or more OpenFlow-bound VLANs are mapped to OpenFlow ports and exposed to the controller.

In monitor bind mode, all Ethernet and Port-Channel interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

Command Mode

EXEC

Command Syntax

show openflow ports

Example

This command displays which interfaces the switch maps to OpenFlow ports.

```
switch#show openflow ports
Port 1: Ethernet1
Port 15: Ethernet15
switch#
```

13.6.4.16 show openflow profiles

The **`show openflow profiles`** command displays the flow table profiles supported by the switch for the active bind mode. For each profile, it shows:

- Which fields can be matched by a flow table entry and which can be wildcarded.
- Which actions are supported for matched packets (in monitor bind mode, only normal and mirror actions are supported).
- The maximum number of entries that can be added to the flow table.

The hardware resources available to OpenFlow are shared with other switch features like ACLs, so the actual maximum number of flow entries may be lower than the number shown by **show openflow profiles** command.

On Series 7050 switches, two profiles are available: the full-match profile supports matching the full set of OpenFlow match fields with a maximum of ***750*** flow table entries, while the l2-match profile supports matching only a subset but with a larger maximum number of flow table entries (***1500***).

Command Mode

EXEC

Command Syntax

`show openflow profiles`

Example

This command displays the flow table profiles.

```
switch#show openflow profiles
full-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
  Table size: 750 entries max
```

```
l2-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
  Table size: 1500 entries max
switch#
```

13.6.4.17 show openflow queues

The **show openflow queues** command displays the queues exposed to the OpenFlow controller for each switch interface, and packet and byte counters for each queue.

Command Mode

EXEC

Command Syntax

show openflow queues

Example

This command displays the packet and byte counters for each queue on the active OpenFlow interfaces.

```
switch#show openflow queues
Port 1 (Ethernet1):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
Port 15 (Ethernet15):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
switch#
```

13.6.4.18 show openflow statistics

The **show openflow statistics** command displays statistics sampled every ***5*** seconds over the past ***5*** minutes:

- Number of entries in the flow table.
- Number of ***flow_mod***, ***packet_out*** and ***packet_in*** messages processed in the ***5***-second interval.
- Number of ***packet_out*** messages dropped in the ***5***-second interval (the OpenFlow agent starts dropping ***packet_out*** messages when the transmit queue of the controller TCP connection exceeds ***50%*** of capacity).

Command Mode

EXEC

Command Syntax

show openflow statistics

Example

This command displays statistics sampled every ***5*** seconds.

```
switch#show openflow statistics
                      table       messages processed last 5 sec     dropped
                    entries   (flow_mod)(packet_out) (packet_in) last 5 sec
2013-08-16 14:48:06       4           0            0           0           0
2013-08-16 14:48:01       4           2            2           2           0
2013-08-16 14:47:56       0           0            2           2           0
2013-08-16 14:47:51       4           0            0           0           0
2013-08-16 14:47:46       4           0            0           0           0
2013-08-16 14:47:41       4           0            0           0           0
2013-08-16 14:47:36       4           0            0           0           0
2013-08-16 14:47:31       4           2            2           2           0
2013-08-16 14:47:26       0           0            0           0           0
2013-08-16 14:47:21       4           0            0           0           0
2013-08-16 14:47:16       4           0            0           0           0
2013-08-16 14:47:11       4           0            0           0           0
2013-08-16 14:47:06       4           0            0           0           0
2013-08-16 14:47:01       4           2            2           2           0
2013-08-16 14:46:56       4           2            2           2           0
2013-08-16 14:46:51       4           0            0           0           0
2013-08-16 14:46:46       0           0            0           0           0
2013-08-16 14:46:41       4           0            2           2           0
2013-08-16 14:46:36       4           0            2           2           0
2013-08-16 14:46:31       4           0            0           0           0
2013-08-16 14:46:26       4           0            0           0           0
2013-08-16 14:46:21       4           2            2           2           0
2013-08-16 14:46:16       4           2            2           2           0
2013-08-16 14:46:11       4           0            2           2           0
2013-08-16 14:46:06       0           0            0           0           0
2013-08-16 14:46:01       0           0            0           0           0
2013-08-16 14:45:56       0           0            0           0           0
2013-08-16 14:45:51       0           0            0           0           0
2013-08-16 14:45:46       0           0            0           0           0
2013-08-16 14:45:41       0           0            0           0           0
2013-08-16 14:45:36       0           0            0           0           0
2013-08-16 14:45:31       0           0            0           0           0
2013-08-16 14:45:26       0           0            0           0           0
2013-08-16 14:45:21       4           0            0           0           0
switch#
```

13.6.4.19 show openflow

The **show openflow** command shows the effective OpenFlow configuration parameters.

Command Mode

EXEC

Command Syntax

show openflow

Example

This command displays the actual hardware state of OpenFlow.

```
switch#show openflow
OpenFlow configuration: Enabled
DPID: 0x000000123456789a
Description: My awesome OpenFlow switch
Controllers:
configured: tcp:1.2.3.4:6633 tcp:5.6.7.8:6633
connected: tcp:1.2.3.4:6633
attempted connection count: 24
successful connection count: 1
keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: interface
interfaces: Ethernet2, Ethernet4, Ethernet6, Ethernet8
IP routing state: Enabled
recirculation interface: Ethernet44
VLAN untagged: routed to/from VLAN 3636
Shell command execution: Disabled
Total matched: 4601 packets
switch#
```

13.6.4.20 shutdown (Openflow)

The **shutdown** command, in OpenFlow mode, disables OpenFlow on the switch. OpenFlow is disabled by default.

The **no shutdown** and **default shutdown** commands re-enable OpenFlow by removing the **shutdown** command from ***running-config***.

Command Mode

Openflow Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands enable OpenFlow on the switch.

```
switch(config)#openflow
switch(config-openflow)#no shutdown
switch(config-openflow)#
```

- This command disables OpenFlow.

```
switch(config-openflow)#shutdown
```

13.7 DirectFlow

This section describes Arista's DirectFlow implementation. Topics in this section include:

- **Introduction**
- **DirectFlow Configuration**
- **DirectFlow Feature Interactions**
- **DirectFlow Commands**

13.7.1 Introduction

Like OpenFlow, DirectFlow exposes the underlying forwarding ASICs capabilities through a programmable interface like EAPI or the standard CLI.

Unlike OpenFlow, DirectFlow works in conjunction with all other aspects of standard L2/L3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

This feature enables you to configure flows that consist of a matching criteria and actions, and to modify how traffic is processed (for example, by overriding the L2 lookup decision or rewriting a mac address or VLAN).

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS and other features are all respected by DirectFlow. Traffic that doesn't match any programmed flow is processed normally while traffic that matches programmed flows is now subject to the actions specified in the flows.

DirectFlow and OpenFlow are mutually exclusive and you can run only one of the two at any given time.

How DirectFlow is Different from OpenFlow

There is no default flow matching all traffic, so traffic not matched by other rules is forwarded as normal. This means the configuration/ controller/ application doesnt consume TCAM space programming flows for normal forwarding.

DirectFlow works with other features and so the user can use ACL, rate limiting, STP etc. in their network as normal and not build all of that into the application used to inject flows.

DirectFlow flows can be configured from the CLI or using EAPI, giving users the option of using flow based forwarding without an external controller. This is especially useful where the number of flows is small and static, for example, to process a small subset of the traffic in a different manner to the normal L2/L3 pipeline.

Unlike OpenFlow which requires the switch support OUTPUT NORMAL or re-circulate a packet in order to send a packet from the OpenFlow domain to non-OpenFlow domain, there is just one domain with DirectFlow.

13.7.1.1 DirectFlow Flows

Similar to OpenFlow, you can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- **DirectFlow Non-persistent Flows**
- **Supported Matches**

- **Supported Actions**

13.7.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for ***5*** minutes, the agent can program a non-persistent flow that expires after a hard timeout of ***300*** seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

Note: By default, all DirectFlow flows are persistent. You must use the no **persistent** command to configure a non-persistent flow.

13.7.1.1.2 Supported Matches

DirectFlow supports all matches supported on EOS with OpenFlow 1.0.

This includes matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:

- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

13.7.1.1.3 Supported Actions

DirectFlow supports all actions supported on EOS with OpenFlow 1.0, including:

- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror)
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent.

13.7.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect ONLY after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators i.e. they must ***all*** match for the condition to be true and action to be taken.

- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

13.7.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Note: ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow Configuration Mode

The **directflow** command places the switch in DirectFlow configuration mode.

```
switch(config)#directflow
switch(config-directflow)#
```

Enable DirectFlow

The **shutdown (DirectFlow)** command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)#no shutdown
```

Create the Flow

The **flow (DirectFlow)** command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)#flow Test-1
switch(config-directflow-Test-1)#
```

Create the DirectFlow Match Criteria

The **match (DirectFlow-flow mode)** command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1)#match ethertype ip
switch(config-directflow-Test-1)#match source ip 10.10.10.10
```

Action Set

The **action set (DirectFlow-flow mode)** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1)#action egress mirror ethernet 7
```

```
switch(config-directflow-Test-1)#action set destination mac 0000.aaaa.bbb
b
```

Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the **exit** command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1)#exit
switch(config-directflow)#
```

Redirect to CPU

The **action output interface cpu (DirectFlow-flow mode)** command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config)#directflow
switch(config-directflow)#flow redirect-http-cpu
switch(config-directflow-redirect-http=cpu)#match ip protocol tcp
switch(config-directflow-redirect-http-cpu)#match destination port 80
switch(config-directflow-redirect-http-cpu)#action output interface cpu
```

Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the **no persistent** command to configure non-persistent flows.

```
switch config)#directflow
switch(config-directflow)#flow example-non-persistent
switch(config-directflow-example-non-persistent)#match input interface
 ethernet
25
switch(config-directflow-example-non-persistent)#action drop
switch(config-directflow-example-non-persistent)#no persistent
switch(config-directflow-example-non-persistent)#timeout hard 300
```

Display Details for Configured Flows

The **detail** option of the **show directflow flows** command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.

The initial use of the command displays the flow configuration (before the timeout expires).

```
switch(config-directflow)#show directflow flows example-non-persistent
 detail
Flow example-non-persistent: (Flow programmed)
 persistent: False
 priority: 0
 hard timeout: 300
 idle timeout: 0
 match:
  ingress interface:
      Et25
 actions:
  drop
```

```
 matched: 0 packets, 0 bytes
```

The second use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```
switch(config-directflow)#show directflow flows example-non-persistent
 detail
Flow example-non-persistent: (Flow not programmed)
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
  ingress interface:
      Et25
actions:
  drop
matched: 0 packets, 0 bytes
```

13.7.3 DirectFlow Feature Interactions

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

Bridging Features

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- **Q-in-Q:** Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- **Counters:** All packets that match DirectFlow entries cause interface counters to increment as usual.

Spanning Tree

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

LLDP, LAGs, and LACP

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

sFlow

sFlow is unaffected by DirectFlow.

IGMP Snooping

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.

Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

ACLs

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a **permit** action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

13.7.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

Unicast Routing

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

Multicast Routing

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry.

The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.

13.7.3.2 Displaying DirectFlow Configurations

To **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

```
switch(config-directflow)#show directflow flows
Flow Test1:
priority: 0
match:
ingress interface: Ethernet1
   ethertype ip
source ip address: 10.10.10.10
actions:
output mirror: Ethernet2
matched: 0 packets, 0 bytes
switch(config-directflow)#
```

- This example shows the status of a non-persistent flow. The flow will be deleted once ***5*** minutes have elapsed.

```
switch(config-directflow)#show directflow flows example-non-persistent
Flow example-non-persistent:
 persistent: False
 priority: 0
 hard timeout: 300
 idle timeout: 0
 match:
   ingress interface:
       Et25
 actions:
   drop
 matched: 0 packets, 0 bytes
```

13.7.4 DirectFlow Commands

DirectFlow Global Configuration Mode

- directflow

DirectFlow Configuration Commands

- action drop (DirectFlow-flow mode)
- action mirror (DirectFlow-flow mode)
- action output (DirectFlow-flow mode)
- action output interface cpu (DirectFlow-flow mode)
- action set (DirectFlow-flow mode)
- flow (DirectFlow)
- match (DirectFlow-flow mode)
- persistent
- priority (DirectFlow-flow mode)
- shutdown (DirectFlow)
- timeout (DirectFlow-flow mode)

DirectFlow and Clear Commands

- show directflow
- show directflow flows

13.7.4.1 action drop (DirectFlow-flow mode)

The **`action drop`** command configures packets that match an entry to be dropped.

The **`no action drop`** and **`default action drop`** commands remove the statement from the DirectFlow ***configuration mode***

Command Mode

Directflow-flow Configuration

Command Syntax

`action drop`

`no action drop`

`default action drop`

Example

This command sets the action for packets from ***Test-1*** to be dropped.

```
switch(config-directflow-Test-1)#action drop
switch#
```

13.7.4.2 action mirror (DirectFlow-flow mode)

The **`action mirror`** command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The **`no action mirror`** and **`default action mirror`** commands remove the statement from DirectFlow ***configuration mode.***

Command Mode

Directflow-flow Configuration

Command Syntax

`action` **DIRECTION** **`mirror`** **INT_NAME**

`no action` **DIRECTION** **`mirror`****INT_NAME**

`default action` **DIRECTION** **`mirror`** **INT_NAME**

Parameters

- **DIRECTION** transmission direction of traffic to be mirrored.
  - **ingress** mirrors before any rewrites.
  - **egress** mirrors after rewrites.
- ***INT_NAME*** Source interface for the mirroring session.
  - **ethernet** ***e_range*** Ethernet interfaces specified by ***e_range***.
  - **port-channel** ***p_range*** Port channel interfaces specified by ***p_range***.

Example

This command configures mirror traffic to ***ethernet 2***.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
switch(config-directflow-Test1)#action egress mirror ethernet 2
switch(config-directflow-Test1)#
```

13.7.4.3 action output (DirectFlow-flow mode)

The **`action output`** command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The **`no action output`** and **`default action output`**commands remove the statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

`action output` **DESTINATION**

`no action output` **DESTINATION**

`default action output` **DESTINATION**

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface ethernet *e_range*** Ethernet interfaces specified by ***e_range***.
- **interface port-channel *p_range*** Port channel interfaces specified by ***p_range***.
- **nexthop vrf *vrf_name ip_addr***. If the next hop is reachable in the default VRF, the default VRF does not need to be specfied.

Examples

- This command configures ***interface ethernet 7*** as the output for the mirroring session.

```
switch(config-directflow-Test1)#action output interface
 ethernet 7
switch(config-directflow-Test1)#
```

- The following commands configure a flow redirecting all traffic from ***10.10.1.2*** to ***e_range*** next hop assuming an appropriately configured TCAM profile.

```
switch(config-directflow)#flow flow-sip-10_10_1_2-redirect-
to-10_30_1_2
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.1.2
switch(config-directflow-Test1)#action output nexthop
 10.30.1.2
switch(config-directflow-Test1)#
```

13.7.4.4 action output interface cpu (DirectFlow-flow mode)

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

action output **DESTINATION**

no action output **DESTINATION**

default action output **DESTINATION**

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface cpu** Ethernet interfaces specified by ***e_range***.

Examples

- This command configures ***interface ethernet 7*** as the output for the mirroring session.

```
switch(config-directflow-Test1)#action output interface
 ethernet 7
switch(config-directflow-Test1)#
```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.

```
switch (config)#directflow
switch(config-directflow)#flow redirect-http-cpu
switch(config-directflow-redirect-http=cpu)#match ip protocol
 tcp
switch{config-directflow-redirect-http-cpu)#match destination
 port 80
switch(config-directflow-redirect-http-cpu)#action output
 interface cpu
```

13.7.4.5 action set (DirectFlow-flow mode)

The **`action set`** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The **`no action set`** and **`default action set`** commands remove **action set** statement from ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

`action set` **CONDITION**

`no action set` **CONDITION**

`default action set` **CONDITION**

Parameters

CONDITION specifies parameter and value. Options include:

- **cos *0 to 7*** Cost of service.
- **destination mac *mac_addr*** Dotted hex notation.
- **ip tos *0 to 255*** Type of service.
- **source mac *mac_addr*** Dotted hex notation.
- **traffic-class *0 to 7*** Dotted hex notation.
- **vlan *0 to 4094*** Number of VLAN.

The **`no action set`** and **`default action set`** commands require only the CONDITION type without a specific condition value.

Example

These commands change the destination MAC of the frame.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#action egress mirror ethernet 7
switch(config-directflow-Test1)#action set destination mac
 0000.aaaa.bbbb
```

13.7.4.6 directflow

The **directflow** command places the switch in DirectFlow configuration mode.

The **no directflow** and **default directflow** commands delete the DirectFlow configuration mode statements from ***running-config***.

DirectFlow configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect ***running-config***. The **exit** command returns the switch to ***global configuration mode***.

Command Mode

Global Configuration

Command Syntax

directflow

no directflow

default directflow

Commands Available in DirectFlow-Flow configuration mode:

- **flow (DirectFlow)**
- **shutdown (DirectFlow)**

Examples

- This command places the switch in ***DirectFlow*** configuration mode:

```
switch(config)#directflow
switch(config-directflow)#
```

- This command returns the switch to ***global management*** mode:

```
switch(config-directflow)#exit
switch(config)#
```

13.7.4.7 flow (DirectFlow)

The **`flow`** command places the switch in ***flow*** configuration mode.

The **`flow`** command specifies the name of the flow that subsequent commands modify and creates a newflow definition if it references a nonexistent flow. All changes in a ***flow*** configuration mode edit session are pending until the session ends:

- The **`exit`** command saves pending changes to ***running-config*** and returns the switch to ***DirectFlow*** configuration mode. Changes are also saved by entering a different configuration mode.
- The **`abort`** command discards pending changes, returning the switch to ***DirectFlow*** configuration mode.

The **`no flow`** and **`default flow`** commands delete the specified role by removing the role and its statements from ***running-config***.

Command Mode

DirectFlow Configuration

Command Syntax

`flow` *flow_name*

`no flow` *flow_name*

`default flow` *flow_name*

Parameters

flow_name Name of flow.

Commands Available in DirectFlow-Flow configuration mode:

- **action drop (DirectFlow-flow mode)**
- **action mirror (DirectFlow-flow mode)**
- **action output (DirectFlow-flow mode)**
- **action set (DirectFlow-flow mode)**
- **match (DirectFlow-flow mode)**

13.7.4.8 match (DirectFlow-flow mode)

The **match** command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The **no match** and **default match** commands remove the **match** statement from the configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

match CONDITION

no match CONDITION

default match CONDITION

Parameters

CONDITION specifies criteria for evaluating a route. Options include:

- **cos *0 to 7*** cost of service.
- **destination ip *ipv4_sub*** destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
- **destination mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **destination mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **destination port *0 to 65535*** Fields accepted only if protocol is TCP|UDP.
- **ethertype *0 to 65535*** Layer 4 destination port.
- **ethertype ARP** Layer 4 destination port.
- **ethertype IP** Layer 4 destination port.
- **icmp code *0 to 255*** Fields accepted only if protocol is ICMP.
- **icmp type *0 to 255*** Fields accepted only if protocol is ICMP.
- **input interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **input interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **ip protocol *0 to 255*** Type of service.
- **ip protocol icmp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol tcp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol udp** L3 fields valid only if ethertype is IP (0x0800).
- **ip tos *0 to 255*** L3 fields valid only if ethertype is IP (0x0800).
- **source ip *ipv4_subnet*** L3 fields valid only if ethertype is IP (0x0800).
- **source mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **source mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **source port *0 to 65535*** Fields accepted only if protocol is TCP| UDP.
- **tcp flag ack** Layer 4 destination port.
- **tcp flag fin** Layer 4 destination port.
- **tcp flag psh** Layer 4 destination port.
- **tcp flag rst** Layer 4 destination port.
- **tcp flag syn** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **vlan *1 to 4094* mask *1 to 4095*** Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

Example

This command creates the rules to match on Ethertype IP and Source IP ***10.10.10.10***.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#persistent
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
```

13.7.4.9 persistent

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to ***startup config*** they will persist over a reboot. The **no** form of the **`persistent`** command prevents the flow from showing up in ***running config***, ensuring that it will not persist over a reboot.

Command Mode

Directflow-flow Configuration

Command Syntax

```
persistent
```

```
no persistent
```

Example

These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)#directflow
switch(config-directflow)#flow example-non-persistent
switch(config-directflow-example-non-persistent)#match input
 interface ethernet
25
switch(config-directflow-example-non-persistent)#action drop
switch(config-directflow-example-non-persistent)#no persistent
switch(config-directflow-example-non-persistent)#timeout hard 300
switch(config-directflow-example-non-persistent)#exit
switch(config-directflow)#
```

13.7.4.10 priority (DirectFlow-flow mode)

The **priority** command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from ***0 to 65535***. The default is ***0***. The higher priority rules match first.

The **no priority** and **default priority** commands remove **priority** statement from the ***DirectFlow*** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

priority *priority_value*

no priority

default priority

Parameter

priority_value priority ***xxx***. Value ranges from ***0 to 65535.*** Default is ***0***.

Example

These commands assign the priority of ***150*** to flow ***Test-1***.

```
switch(config-directflow-Test-1)#priority 150
switch(config-directflow-Test-1)#
```

13.7.4.11 show directflow flows

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

Command Mode

EXEC

Command Syntax

show directflow flows [*flow_name* [counters | detail]]

Parameters

- ***flow_name*** name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- **counters** displays DirectFlow counters for the specified flow.
- **detail** displays detailed information for the specified flow.

Examples

- This command displays the contents of the flow table.

```
switch# show directflow flows
Flow test3:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::/ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
        Et32
  source: config
  matched: 0 packets, 0 bytes
Flow test2:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
        Et3/1
  source: config
  matched: 0 packets, 0 bytes
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
```

```
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch>
```

- This command displays information about flow ***test-1***.

```
switch#show directflow flows test-1
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch>
```

- This command displays detailed information for flow ***test-1***.

```
switch#show directflow flows test-1 detail
switch>show directflow flows test1 detail
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch>
```

- This command displays counters for flow ***test-1***.

```
switch#show directflow flows test-1 counters
Flow Name     Source      Matched packets    Matched bytes
---------     ------      ---------------    -------------
test1         config      0                  0
switch>
```

13.7.4.12 show directflow

The **show directflow** command displays summary information for DirectFlow. With the **counters** or **details** options, it displays counters or details for all flows configured on the switch.

Command Mode

EXEC

Command Syntax

show directflow [counters | details]

Examples

- This command displays summary information for DirectFlow.

```
switch#show directflow
DirectFlow configuration: Enabled
Total matched: 0 packets
Total programmed flows: 3 flows
switch#
```

- This command displays counters for all DirectFlow flows configured on the switch.

```
switch#show directflow counters
Flow Name      Source      Matched packets      Matched bytes
---------      ------      ---------------      -------------
test3          config      0                     0
test2          config      0                     0
test1          config      0                     0

Total matched packets: 0
switch>
```

- This command displays details for all DirectFlow flows configured on the switch.

```
switch#show directflow detail
Flow test3: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::/ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
        Et32
  source: config
  matched: 0 packets, 0 bytes
Flow test2: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
```

```
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
        Et3/1
  source: config
  matched: 0 packets, 0 bytes
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
        Et1/1
  actions:
    output interfaces:
        Et2/1
  source: config
  matched: 0 packets, 0 bytes
Flows: 3 programmed, 0 rejected
switch#
```

13.7.4.13 shutdown (DirectFlow)

The **shutdown** command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The **no shutdown** command re-enables DirectFlow.

Command Mode

Directflow Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- These commands enable DirectFlow on the switch.

```
switch(config)#directflow
switch(config-directflow)#no shutdown
switch(config-directflow)#
```

- This command disables DirectFlow Flow.

```
switch(config-directflow-Test1)#shutdown
```

13.7.4.14 timeout (DirectFlow-flow mode)

The **timeout** command, in ***DirectFlow*** mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a users most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

Command Mode

Directflow-flow Configuration

Command Syntax

no timeout *hard*

no timeout *idle*

Parameters

- ***idle*** session idle timeout length.
  - ***0*** Automatic connection timeout is disabled.
  - ***1-4294967295*** Automatic timeout period (seconds).
- ***hard*** session hard timeout length.
  - ***0*** Automatic connection timeout is disabled.
  - ***1-4294967295***

Example

- These commands enable a hard timeout period of ***5*** seconds on the switch.

```
switch(config)#directflow
switch(config-directflow-Test1)#timeout hard 5
switch(config-directflow-Test1)#
```

- These commands enable DirectFlow on the switch.

```
switch(config)#directflow
switch(config-directflow-Test1)#no timeout hard
switch(config-directflow-Test1)#
```

13.8 Decap Groups

These sections describe the Decap groups:

- **Decap Groups Description**
- **Decap Groups Configuration**
- **Decap Commands**

13.8.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

The decap capabilities are further enhanced to support the Generic UDP Encapsulation (GUE). GUE is a general method for encapsulating packets of random IP protocols within a UDP tunnel. GUE provides an extensible header format with optional data.

The switch identifies a GUE packet based on the outer UDP destination port. Then it terminates the tunnel based on the outer destination IP and removes the outer IP/UDP encapsulation. The outer UDP destination port is also used to determine if the inner payload is IP or MPLS. For IP payloads, the first nibble of the inner payload is used to distinguish between IPv4 vs IPv6. The decapsulated packet is then either IP or MPLS forwarded based on the inner payload.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are not processed through their ingress interface and VLAN.
- During a tunnel termination, ingress ACL filter each decap group packet's inner header.
- Packet counters are not available.
- VRF is not supported.

The decap support over GUE has the following limitaions:

- Outer UDP checksum validation is not supported.
- Outer IP options handling is not supported.
- Outer IP TTL check is not performed.
- No exception handling on inner IP packet. Specifically, packets with inner IP TTL=1 or IP options will simply be attempted to be forwarded in HW.
- VXLAN is not supported along with GUE decap option on DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series.
- When GUE is enabled with outer IP hashing, inner IP fields are not included in the load balance key of MPLS over GRE packets in tc-counters TCAM profile on DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

13.8.1.1 Decap Groups Configuration

Decap groups are configured in ***decap-group*** configuration mode. The ***decap-group*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. However, when exiting, the ***decap-group*** configuration mode does not affect running-config. The **`exit`** command returns the switch to ***global*** configuration mode.

- The static CLI entry for the incoming label is specified by the **mpls static** command.
- The tunnel type is specified by the **tunnel type (Decap Group)** command.
- The Decap IP address is specified by the **tunnel decap-ip (Decap Group)** command.
- The locally configured IP addresses are added to the Layer 3 interfaces using the **tunnel decap-interface (Decap Group)** command for a specified decap group.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain multiple **tunnel decap-ip** statements.

Examples

- This command defines a static CLI entry for the incoming-label.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3
 10.14.4.4 pop payload-type ipv4
```

- This command creates a decap group named ***DC-1*** and configures the group to terminate packets from GRE tunnel packets with the destination IP address of ***10.14.3.2***.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
 ip decap-group DC-1
   tunnel type gre
   tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#end
switch(config)#
```

13.8.1.2 Generic UDP Encapsulation (GUE) Decap Configuration

The **ip decap-group** configuration is used to specify GUE tunnel termination as follows:

```
switch(config)#ip decap-group test
switch(config-dg-test)#tunnel type UDP
switch(config-dg-test)#tunnel decap-ip 2.2.2.2
switch(config-dg-test)#tunnel decap-interface et1
```

The global UDP destination port to payload type mapping is configured as follows:

```
switch(config)#ip decap-group type udp destination port 6080 payload ip
switch(config)#ip decap-group type udp destination port 5555 payload mpls
```

Note: Note that each payload type can be mapped to only one UDP port. Otherwise, the following error will be shown:

```
switch(config)#ip decap-group type udp destination port 6081 payload
 ip
% There can be only one UDP destination port per payload type
```

MPLSoverGUE Decap-group Configuration

The MPLSoGUE decap-group requires the following platform configurations. First, the **mpls-over-gre** must be enabled since this supports the mpls-over-gre support in hardware:

```
switch(config)#platform fap mpls-over-gre
```

Second, outer IP hashing must be enabled as follows:

```
(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile default
! profile default is a reserved profile
! profile default is the current global profile
```

```
switch(config-sand-load-balance-profile-default)#packet-type gue outer-ip
```

Note: The above platform configurations are not required on DCS-7280R3, DCS-7500R3, and DCS-7800R3.

13.8.1.3 Decap Commands

Decap Configuration Commands

- ip decap-group
- tunnel decap-interface (Decap Group)
- tunnel decap-ip (Decap Group)
- tunnel type (Decap Group)

Decap Show Command

- show ip decap-group

13.8.1.3.1 ip decap-group

The **ip decap-group** command places the switch in ***decap-group*** configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

The ***decap-group*** configuration mode is not a group change mode; the ***running-config*** is changed immediately upon entering commands. Exiting the ***decap-group*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to ***global*** configuration mode.

The **no ip decap-group** and **default ip decap-group** commands delete previously configured commands in the specified **decap-group** mode.

Command Mode

Global Configuration

Command Syntax

ip decap-group *group_name*

no ip decap-group *group_name*

default ip decap-group *group_name*

Parameters

group_name Decap group name.

Commands Available in Decap-group Configuration Mode

- **tunnel decap-ip (Decap Group)** Specifies the IP address of packets handled by the decap group.
- **tunnel type (Decap Group)** Specifies the tunnel protocol for extracting payload.
- **show ip decap-group**

Examples

- This command creates a decap group named ***DC-1***.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#
```

- This command exits the ***decap-group*** mode for the ***DC-1*** decap group.

```
switch(config-dg-DC-1)#exit
switch(config)#
```

- This command delete the decap group named ***DC-1***.

```
switch(config)#no ip decap-group DC-1
switch(config)#
```

13.8.1.3.2 show ip decap-group

The **show ip decap-group** command displays the IP decap groups that are available in the switch.

Command Mode

Global Configuration

Command Syntax

show ip decap-group [**decap-group name** | **dynamic**]

Parameters

- ***decap-group name*** The decap group name.
- **dynamic** Displays the dynamic entries only.

Related Commands

- **show ip decap-group**
- **tunnel decap-ip (Decap Group)**
- **tunnel type (Decap Group)**

Examples

- This command displays the IP decap groups that are available in a switch.

```
switch(config)#show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name                | Type       | Info             | Version | Addr Type
--|---------------------|------------|------------------|---------|--------
* | d1                  | GRE        | 1.2.3.4          |         |
* | d2                  | IP-in-IP   | Ethernet12/3     | IPv4    | primary
  | gre-with-intf       | GRE        |                  |         |
  | ipip-with-decapall  | IP-in-IP   | all              | IPv4    | all
  | ipip-with-decapall  | IP-in-IP   | all              | IPv6    | all
  | ipip-with-intf      | IP-in-IP   | Ethernet11/3     | IPv6    | all
  | ipip-with-intf      | IP-in-IP   | Ethernet11/3     | IPv4    | primary
* | ipip-with-ip        | IP-in-IP   | 1001::1          | IPv6    |
* | ipip-with-ip        | IP-in-IP   | 1.1.1.1          | IPv4    |
  | p1                  | GRE        | 100.100.100.100  |         |
  | p2                  | UNKNOWN    |                  |         |
```

- This command displays the UDP decap groups that are available in a switch.

```
switch(config)#show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name    | Type  | Info       | Version | Address  | UDP Dest | Payload
  |         |       |            |         | Type     | Port     | Type
--|---------|-------|------------|---------|----------|----------|----------
  | foo     | UDP   | Ethernet1  | IPv4    |  primary | 6080     | ip
  |         |       |            |         |          | 5555     | mpls
  | bar     | UDP   | 2.2.2.2    | IPv4    |          | 6080     | ip
  |         |       |            |         |          | 5555     | mpls
```

- The following command displays the decap-groups configured in HW:

```
switch(config)#show platform fap decap-group
DecapIp                                        LIF
-----------------------------------------------   ----------
2.2.2.2                                       |   0
3.3.3.3                                       |   1
```

13.8.1.3.3 tunnel decap-interface (Decap Group)

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per decap group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the decap group.

Command Mode

Decap-Group Configuration

Command Syntax

tunnel decap-interface{ Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

no tunnel decap-interface {Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

default tunnel decap-interface{Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all}

Parameters

- **Ethernet *e_num*** Ethernet interface specified by ***e_num***. The Ethernet port number ranges from ***1*** to ***36***.
- **Loopback *l_num*** Loopback interface specified by ***l_num***. The loopback interface number ranges from ***0*** to ***1000***.
- **Management *m_num*** Management interface specified by ***m_num***. The management port number ranges from ***1*** to ***1***.
- **Port-channel *p_num*** Port-channel interface specified by ***p_num***. Options include:
  - **Port-channel** interface number. The port-channel interface number ranges from ***1*** to ***2000***.
  - **Port-channel** sub interface number. The port-channel sub interface number ***1-2000***,***1-4094***.
- **tunnel *t_num*** Tunnel interface specified by ***t_num***. The tunnel interface number ranges from ***0*** to ***255***.
- **vlan *v_num*** VLAN interface specified by ***v_num***. The VLAN interface number ranges from ***1*** to ***4094***.
- **vxlan *vx_num*** VXLAN interface specified by ***vx_num***. The VXLAN tunnel interface number ranges from ***1*** to ***1***.
- **all *address-family*** This parameter configures all L3 interfaces as a decap interface.

Related Commands

- **ip decap-group**
- **tunnel type (Decap Group)**
- **show ip decap-group**

Example

These commands add locally configured IP addresses to the Ethernet interface ***1/1*** for the ***dg1*** decap group.

```
switch(config)#ip decap-group dg1
switch(config-dg-dg1)#tunnel decap-interface Ethernet1/1

switch(config-dg-dg1)#show active
ip decap-group dg1
   tunnel type ipip
   tunnel decap-interface Ethernet1/1
```

```
    tunnel decap-interface all address-family ipv6 address all
```

13.8.1.3.4 tunnel decap-ip (Decap Group)

The **`tunnel decap-ip`** command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-Group Configuration

Command Syntax

`tunnel decap-ip` *ipv4_address*

Parameters

ipv4_addr An IPv4 address.

Related Commands

- The **ip decap-group** command places the switch in ***decap-group*** configuration mode.
- The **tunnel type (Decap Group)** command specifies the tunnel protocol for extracting payload.
- The **show ip decap-group** command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

These commands configure ***10.14.3.2*** as the decap-IP address for the ***DC-1*** decap group.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
 ip decap-group DC-1
   tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#
```

13.8.1.3.5 tunnel type (Decap Group)

The **`tunnel type`** command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include General Routing Encapsulation (GRE) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

Command Mode

Decap-group Configuration

Command Syntax

`tunnel type gre`

Related Commands

- The **ip decap-group** command places the switch in ***decap-group*** configuration mode.
- The **tunnel decap-ip (Decap Group)** command specifies the IP address of packets handled by the decap group.
- The **show ip decap-group** command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

This command configures decap group ***DC-1*** to terminate packets from GRE tunnel packets.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#show active
 ip decap-group DC-1
   tunnel type gre
switch(config-dg-DC-1)#
```

13.9 Nexthop Groups

These sections describe the Nexhop groups:

- Nexthop Group Description
- Nexthop Group Configuration
- Support for IPv6 Link-Local Addresses in Nexthop Groups Entries
- Nexthop Group Commands

13.9.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry's specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group's tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet's hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

13.9.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an **ip route nexthop-group** statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- **Creating and Editing Nexthop Groups**
- **Configuring a Group's Encapsulation Parameters**
- **Configuring the Group's Size**
- **Creating Nexthop Group Entries**
- **Displaying Nexthop Groups**
- **Applying a Nexthop Group to a Static Route**

Creating and Editing Nexthop Groups

Nexthop groups are created by a **nexthop-group** command that specifies a group that isn't already configured. The switch enters ***nexthop-group*** configuration mode for the new group. ***Nexthop-group*** mode is also accessible for modifying existing groups. When in ***nexthop-group*** configuration mode, the **`show active`** command displays the group's configuration.

- This command creates a nexthop group named ***NH-1***.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter ***nexthop-group*** configuration mode for the group named ***NH3***, then displays the previously configured group parameters.

```
switch(config)#nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
 nexthop-group NH3
   size 4
   ttl 10
   entry 0 tunnel-destination 10.14.21.3
   entry 1 tunnel-destination 10.14.21.5
   entry 2 tunnel-destination 10.14.22.5
   entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

Configuring a Group's Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group's tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

- This command configures the TTL setting to ***32*** for nexthop group ***NH-1*** encapsulation packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 128
   ttl 32
switch(config-nexthop-group-NH-1)#
```

  The address is inserted in the encapsulation source IP fields is specified by **tunnel-source (Nexthop Group)**.
- These commands create Loopback interface ***100***, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group ***NH-1***.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback
 100
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 256
   ttl 32
   tunnel-source intf Loopback100
```

```
switch(config-nexthop-group-NH-1)#
```

Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)#ip route 124.0.0.1/32 nexthop-group abc
switch(config)#nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)#size 512
switch(config-nexthop-group-abc)#tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)#entry 0 tunnel-destination
 1.1.1.2
switch(config-nexthop-group-abc)#entry 1 tunnel-destination
 10.1.1.1
switch(config-nexthop-group-abc)#ttl 64
switch(config-nexthop-group-abc)#
```

Configuring the Group's Size

The group's size specifies the number of entries in the group. A group can contain up to ***256*** entries, which is the default size. The group's size is specified by **size (Nexthop Group)**.

This command configures the nexthop group ***NH-1*** to contain ***128*** entries.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group's size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by **entry (Nexthop Group)**.

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
```

```
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination
 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination
 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination
 10.15.5.37
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 4
   ttl 64
   entry 0 tunnel-destination 10.13.4.4
   entry 1 tunnel-destination 10.15.4.22
   entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)#nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls)#size 3
switch(config-nhg-v6-mpls)#entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls)#entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)#entry 2 nexthop 2002::6404:2
switch(config-nhg-v6-mpls)#
```

- These commands configure an IPv4 route to point to the nexthop group **nhg-v6-mpls**. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch#ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mplsp
switch#
```

Displaying Nexthop Groups

The **show nexthop-group** command displays a group's configured parameters.

This command displays the properties of the nexthop group named ***NH-1***.

```
switch>show nexthop-group NH-1
Name              Id       type     size   ttl    sourceIp
NH-1              4        ipInIp   256    64     0.0.0.0
switch>
```

Applying a Nexthop Group to a Static Route

The **ip route nexthop-group** associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

This command creates a static route in the default VRF, using the nexthop group of ***NH-1*** to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

The **show ip route** command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of ***NG***.

This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

```
switch>show ip route
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF
 Summary,
       NG - Nexthop Group Static Route

Gateway of last resort is not set

 S      10.22.0.0/16 [1/0] via 10.17.0.1, Management1

switch>
```

13.9.3 Support for IPv6 Link-Local Addresses in Nexthop Groups Entries

IPv6 Link-local addresses in Nexthop Groups entries support IPv6 link-local nexthops belonging to a Nexthop Group. Only the MPLS Nexthop Group supports IPv6 and because of this, IPv6 is limited to getting support only by the Nexthop Group of MPLS. An advantage is that you can use these devices even when they are not configured with globally routable IPv4 or IPv6 addresses.

13.9.3.1 Configuration

An MPLS next-hop group with IPv6 address now accepts an interface if the IPv6 address is a link-local. Note the use of percentages between the IPv6 address and the interface.

```
switch(config)#nexthop-group nhg1 type mpls
switch(config-nexthop-group-nhg1)#entry 0 push label-stack 606789 nexthop
 fe80::fe80:2%Ethernet2
switch(config-nexthop-group-nhg1)#entry 1 push label-stack 204164 nexthop
 fe80::fe80:2%Ethernet3
```

13.9.3.2 Show Commands

Use the **show nexthop-group** command to display the current status of the nexthop-groups.

```
switch#show nexthop-group
nhg1
```

```
Id                1
Type              mpls
Size              12
Entries (left most label is the top of the stack)
  0  push label-stack 606789   nexthop fe80::fe80:2
       Tunnel destination directly connected, Ethernet2
       00:d4:27:77:e9:77, Ethernet2
  1  push label-stack 204164   nexthop fe80::fe80:2
       Tunnel destination directly connected, Ethernet3
       00:79:21:32:0f:32, Ethernet3
```

13.9.3.3 Limitations

Review the following limitations for the support of IPv6 link-local address in nexthop group entries:

- Only the nexthop-group of MPLS supports an IPv6 address. Therefore, link-local IPv6 addresses are only supported for this type of nexthop-group.
- Nexthop-groups are configured and exist in the default VRF. The link-local IPv6 addresses for nexthop-group entries can only be resolved for interfaces in the default VRF.

13.9.4 Nexthop Group Commands

Nexthop Commands

- entry (Nexthop Group)
- ip route nexthop-group
- nexthop-group
- size (Nexthop Group)
- ttl (Nexthop Group)
- tunnel-source (Nexthop Group)

Nexthop Show Command

- show nexthop-group

13.9.4.1 entry (Nexthop Group)

The **entry** command defines a nexthop entry in the ***nexthop group*** configuration mode . Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size (**size (Nexthop Group)**) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The **no entry** and **default entry** commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding **entry** statement from ***running-config.***

Command Mode

Nexthop-group Configuration

Command Syntax

entry *index* tunnel-destination *ipv4_address*

no entry *index*

default entry *index*

Parameters

- ***index*** Entry index. Values range from **0** to **group-size – 1**.
- ***ipv4_address*** Nexthop IPv4 address.

group-size is the group's entry capacity, as specified by the **size (Nexthop Group)** command.

Example

These commands sets the nexthop group size at four entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination
 10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination
 10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination
 10.15.5.37
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 4
   ttl 64
   entry 0 tunnel-destination 10.13.4.4
   entry 1 tunnel-destination 10.15.4.22
   entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

13.9.4.2 ip route nexthop-group

The **`ip route nexthop-group`** command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; ***running-config*** stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is ***1***. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of ***200*** is overridden by OSPF intra-area routes, which have a default distance of ***110***.

The **`no ip route nexthop-group`** and **`default ip route nexthop-group`** commands delete the specified route by removing the corresponding **`ip route nexthop-group`** command from ***running-config***. **`Ip route nexthop-group`** statements for an IP address in multiple VRFs must be removed separately.

A **`no ip route`** or **`default ip route`** command without a nexthop parameter deletes all corresponding **`ip route nexthop-group`** statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode

Global Configuration

Command Syntax

`ip route` [**VRF_INST** *dest_net* **`nexthop-group`** *nhgp_name* [*dist*][**TAG_OPTION**][**RT_NAME**]

`no ip route` [**VRF_INST**] *dest_net* [**`nexthop-group`** *nhgroup_name*][*distance*]

`default ip route` [**VRF_INST**] *dest_net* [**`nexthop-group`** *nhgroup_name*][*distance*]

Parameters

- **VRF_INST** Specifies the VRF instance being modified.
  - ***no parameter*** Changes are made to the default VRF.
  - **vrf *vrf_name*** Changes are made to the specified VRF.
- ***dest_net*** Destination IPv4 subnet (CIDR or address-mask notation).
- ***nhgp_name*** Name of nexthop group.
- ***dist*** Administrative distance assigned to route. Options include:
  - ***no parameter*** Route assigned default administrative distance of one.
  - **`1-255`** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
  - ***no parameter*** Assigns default static route tag of ***0***.
  - **tag *t_value*** Static route tag value. ***t_value*** ranges from `0` to **`4294967295`**.
- **RT_NAME** Associates descriptive text to the route. Options include:
  - ***no parameter*** No text is associated with the route.
  - **name *descriptive_text*** The specified text is assigned to the route.

Related Commands

The **ip route** command creates a static route that specifies the nexthop address without using nexthop groups.

Example

This command creates a static route in the default VRF, using the nexthop group of ***NH-1*** to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

13.9.4.3 nexthop-group

The **nexthop-group** command places the switch in ***nexthop-group*** configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing ***nexthop group*** configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

The ***nexthop-group*** configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting the ***nexthop-group*** configuration mode does not affect ***running-config***. The **exit** command returns the switch to ***global*** configuration mode.

The **no nexthop-group** and **default nexthop-group**commands delete previously configured commands in the specified **nexthop-group** mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

Command Mode

Global Configuration

Command Syntax

nexthop-group *group_name* type **TUNNEL_TYPE**

no nexthop-group [*group_name*][type **TUNNEL_TYPE**]

default nexthop-group [*group_name*][type**TUNNEL_TYPE**]

Parameters

- ***group_name*** Nexthop group name.
- **TUNNEL_TYPE** Tunnel protocol of the nexthop-group. Options include:
  - **ip** ECMP nexthop.
  - **ip-in-ip** IP in IP tunnel.
  - **gre** Encapsules the Layer 3 protocols overs IP networks.
  - **mpls-over-gre** Tunnels MPLS over a non-MPLS network.
    - **entry** Nexthop Group Entry Configuration.
    - **size** Nexthop Group Entry Size.
    - **tos** Tunnel encapsulation IP type of service.
    - **ttl** Tunnel encapsulation TTL value.
    - **tunnel-source** Source Interface or Address.

Commands Available in Nexthop-group Configuration Mode

- **entry (Nexthop Group)**
- **size (Nexthop Group)**
- **ttl (Nexthop Group)**
- **tunnel-source (Nexthop Group)**

Restrictions

Tunnel type availability varies by switch platform.

Examples

- This command creates a nexthop group named ***NH-1*** that specifies ECMP nexthops.

```
switch(config)#nexthop-group NH-1 type ip
```

```
switch(config-nexthop-group-NH-1)#
```

- This command exits nexthop-group mode for the ***NH-1*** nexthop group.

```
switch(config-nexthop-group-NH-1)#exit
switch(config)#
```

- These commands creates a nexthop group ***NH-2*** of type MPLS over GRE.

```
switch(config)#nexthop-group NH-2 type mpls-over-gre
switch(config-nexthop-group-NH-2)#tunnel-source 11.1.1.1
switch(config-nexthop-group-NH-2)#ttl 32
switch(config-nexthop-group-NH-2)#tos 20
switch(config-nexthop-group-NH-2)#entry 0 push label-stack 16000
 tunnel-destination 11.1.1.2
switch(config)#ip route 100.1.1.1/32 Nexthop-Group NH-2

Counters for nexthop group may be enabled using the following command
switch(config)#hardware counter feature nexthop
```

13.9.4.4 show nexthop-group

The **show nexthop-group** command displays properties of the specified nexthop group.

Command Mode

EXEC

Command Syntax

show nexthop-group *nhgroup_name* [**VRF_INST**]

Parameters

- ***nhgroup_name*** Name of the group displayed by command.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
  - ***no parameter*** Context-active VRF.
  - **vrf *vrf_name*** Specifies the name of VRF instance. System default VRF is specified by **default**.

Related Commands

The **show nexthop-group** command places the switch in the ***nexthop-group*** configuration mode to create a new group or modify an existing group.

Example

This command displays the nexthop group information.

```
switch(config)#show nexthop-group
  Id          107
  Type        mplsOverGre
  Size        1  (auto size enabled, programmed size 1)
  TTL         32
  Source IP   11.1.1.1
  Entries (left most label is the top of the stack)
    0  push label-stack 16000   tunnel-destination 11.1.1.2
         Tunnel destination directly connected, Ethernet1
         00:00:aa:aa:aa:aa, Ethernet1

With nexthop group counter enabled
switch(config)#show nexthop-group
  Id          1
  Type        mplsOverGre
  Size        1  (auto size enabled, programmed size 1)
  TTL         64
  Source IP   0.0.0.0
  Entries (left most label is the top of the stack)
    0  push label-stack 16000   tunnel-destination 1.1.1.2
         Tunnel destination directly connected, Ethernet1
         00:00:aa:aa:aa:aa, Ethernet1
         0 packets, 0 bytes

switch(config)#show nexthop-group summary
Number of Nexthop Groups configured: 1
Number of unprogrammed Nexthop Groups: 0

  Nexthop Group Type   Configured
-------------------- ------------
       MPLS over GRE            1

  Nexthop Group Size   Configured
-------------------- ------------
                   1            1
```

13.9.4.5 size (Nexthop Group)

The **size** command configures the quantity of nexthop entries in the ***nexthop group*** configuration mode . Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the **entry (Nexthop Group)** command. The default size is ***256*** entries.

The **no size** and **default size** commands restore the size of the configuration mode nexthop group to its default of ***256*** by removing the corresponding **size** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

size *entry_size*

no size *entry_size*

default size *entry_size*

Parameter

entry_size Group size (entries). Value ranges from **1** to **255**. Default value is **256**.

Example

This command configures the nexthop group ***NH-1*** to contain ***128*** entries.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

13.9.4.6 ttl (Nexthop Group)

The **ttl** command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is ***64***.

The **no ttl** and **default ttl** commands restore the default TTL value written into TTL fields for the ***nexthop group*** configuration mode by deleting the corresponding **ttl** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

ttl *hop_expiry*

no ttl *hop_expiry*

default ttl *hop_expiry*

Parameters

hop_expiry Period that the packet remains valid (seconds or hops) Value ranges from **1** to **64**.

Restrictions

This command is available only to Nexthop groups for tunnels of type **IP-in-IP**, **GRE**, **MPLS**, and **MPLS over GRE**.

Related Commands

The **nexthop-group** command places the switch in the ***nexthop-group*** configuration mode.

Examples

- This command configures the **ttl** setting to ***32*** for nexthop group ***NH-1*** packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
 nexthop-group NH-1
   size 128
   ttl 32
switch(config-nexthop-group-NH-1)#
```

- This command restores the **no ttl** setting for nexthop group ***NH-1*** packets.

```
switch(config-nexthop-group-NH-1)#no ttl
switch(config-nexthop-group-NH-1)#show active nexthop-group
 NH-1
   size 128
   ttl 64
switch(config-nexthop-group-NH-1)#
```

13.9.4.7 tunnel-source (Nexthop Group)

The **`tunnel-source`** command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the ***nexthop group*** configuration mode . The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is ***0.0.0.0***.

The **`no tunnel-source`** and **`default tunnel-source`** commands remove the source IP address setting from the configuration mode nexthop group by deleting the **`tunnel-source`** command from ***running-config***.

Command Mode

Nexthop-group Configuration

Command Syntax

`tunnel-source` **SOURCE**

`no tunnel-source` **SOURCE**

`default tunnel-source` **SOURCE**

Parameters

SOURCE IP address or derivation interface. Options include:

- ***ipv4_addr*** An IPv4 address.
- **intf ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **intf loopback *l_num*** Loopback interface specified by ***l_num***.
- **intf management *m_num*** Management interface specified by ***m_num***.
- **intf port-channel *p_num*** Port-channel interface specified by ***p_num***.
- **intf vlan *v_num*** VLAN interface specified by ***v_num***.

Restrictions

This command is available only to Nexthop groups for tunnels of type **ip-in-ip**.

Related Commands

The **nexthop-group** command places the switch in the ***nexthop-group*** configuration mode.

Example

These commands create **`interface loopback 100`**, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group ***NH-1***.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit

switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)#show active nexthop-group NH-1
   size 256
   ttl 64
   tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)#show nexthop-group NH-1
Name             Id       type     size   ttl    sourceIp
NH-1             2        ipInIp   256    64     10.1.1.1
```

```
switch(config-nexthop-group-NH-1)#
```

13.10 Global Knob to Set MTU for all Layer 3 Interfaces

- Global Layer 3 Maximum Transfer Unit (MTU) feature provides a CLI command to set the MTU value for all Layer 3 interfaces.
- The default value for global Layer 3 MTU and for each interface Layer 3 MTU is ***1500***.
- Any interface which has an MTU configured is not affected by the global L3 MTU.
- When the global L3 MTU is changed, any existing interfaces which are using the default are updated to use the new MTU. Any additional interfaces which are configured in the future will also use the new default MTU.

The related sections are:

- **Global Knob to Set MTU for all Layer 3 Interfaces Configuration**
- **Show Commands**
- **Limitations**

13.10.1 Global Knob to Set MTU for all Layer 3 Interfaces Configuration

The global L3 **mtu** command is under ***interface-defaults*** sub-mode. In this example, the MTU value is set to ***1600***.

```
(config)#interface defaults
(config-interface-defaults)#mtu 1600
```

13.10.2 Limitations

The following are limitations for the Global knob to set MTU for all Layer 3 interfaces feature:

- Only Ethernet, Port-Channel, and VLAN interfaces are supported.
- Other interface types, such as Management, Loopback, VXLAN, and Tunnel, are not supported.

13.10.3 Show Commands

Use the **show interface** command to display the current MTU value applied on the selected interface. In the following example, interfaces ***Ethernet1***, ***Ethernet2***, and ***Ethernet3*** are selected for display.

```
(config)#interface Ethernet3
(config-if-Et3)#no switchport
(config-if-Et3)#mtu 1600
(config-if-Et3)#interface defaults
(config-interface-defaults)#mtu 1700
(config-interface-defaults)#show interfaces Ethernet1
  ...
  IP MTU 1700 bytes (default) , BW 10000000 kbit
  ...
(config-interface-defaults)#show interfaces Ethernet2
  ...
  IP MTU 1700 bytes (default) , BW 10000000 kbit
  ...
(config-interface-defaults)#show interfaces Ethernet3
  ...
```

```
   IP MTU 1600 bytes , BW 10000000 kbit
   ...
```

In this example,

- switch ***Ethernet3*** from Layer 2 to Layer 3 and explicitly set its MTU to ***1600***.
- enter the ***interface-defaults sub-mode***, set global L3 MTU to ***1700***.
- the **`show interface`** command states ***Ethernet1*** and ***Ethernet2*** are using global L3 MTU value, while ***Ethernet3*** are using its local MTU value.
- the **`default`** in the output indicates whether or not the interface is using global L3 MTU.

13.11 Support for L3 MTU on 7280R3/7500R3/7800R3

Support for Layer 3 Maximum Transmission Unit (MTU) on 7280R3/7500R3/7800R3 switches includes the following:

- Enforces the MTU for Layer 3 packets on 7280R3/7500R3/7800R3 switches. The MTU can be set on any SVI and the MTU of that specific SVI is enforced when the packets egress out of a trunk port. This behavior is not supported on 7280E/R/R2 and 7500E/R/R2 line cards.
- MTU enforcement is done after adding all of the encapsulation headers in the Egress packet. For example, if an interface is configured with an MTU value of ***1500*** and the packet size is larger than ***1500*** with all encapsulation headers added, the packet is considered MTU violated. In 7280E/R/R2 and 7500E/R/R2 line cards, MTU is enforced before adding encapsulation headers.
- Actual MTU configured in hardware is MTU configured in the CLI + ***18*** bytes. ***18*** bytes is added to accommodate the L2 header. If the outgoing packet is untagged, the actual MTU configured in hardware is the MTU configured in the CLI + four (***4***) bytes.

13.11.1 Layer 3 MTU Configuration

You can configure Layer 3 MTU on Layer 3 interfaces and SVI's using the **`mtu`** command within interface configuration mode.

This command sets the MTU size of ***1492*** bytes on ***interface ethernet 1/1***.

```
(config)#interface ethernet 1/1
(config-if-Et1/1)#mtu 1492
```

MTU is independently configurable on all routable interfaces. The switch supports MTU sizes ranging from ***68*** to ***9214*** bytes. The default MTU size is ***1500*** bytes.

The **`no mtu`** and **`default mtu`** commands restore the interface's MTU to the default value by removing the corresponding **`mtu`** command from ***running-config***.

13.11.2 Layer 3 MTU Show Commands

The **`show interfaces`** command displays the MTU configured on the L3 interface. In this example, ***ethernet 1/1*** interface is selected to display. **`IP MTU`** represents the Layer 3 MTU of the interface.

```
switch(config-if-Et9/1)#show interfaces ethernet 1/1
...
  IP MTU 1600 bytes , BW 100000000 kbit
  Full-duplex, 100Gb/s over 4 lanes, auto negotiation: off, uni-
link: n/a
...
```

13.11.3 L3 MTU Limitations

The following limitations apply to support of Layer 3 MTU:

- Only three (3) unique MTU values can be configured on a switch. If the number of unique MTU values exceeds three (3), additional unique MTU definitions will not be enforced on an interface.

    - When the number of unique MTU values becomes less than three (3) (after unconfiguring MTU on some interfaces), MTU on interfaces that are previously unprogrammed, are not reprogrammed automatically. CLI commands **no mtu** followed by **mtu** must be called to program MTU on an interface.
- When the startup configuration has more than three (3) unique MTU values defined on different interfaces of the switch, there is no guarantee which unique MTU values will be active when the switch is rebooted.
- L3 MTU is not enforced on Multicast packets for Jericho2 based platforms.

13.12 Segment Security

- Overview
- Configuring Segment Security
- Show Commands
- Limitations
- Segment Security Commands

13.12.1 Overview

The Segment Security provides the convenience of applying policies on segments rather than interfaces or subnets. Hosts or networks are classified into segments based on prefixes.

Grouping prefixes into segments allows for definition of policies between segments that govern flow of traffic between them. Policies define inter-segment or intra-segment communication rules, For example, segment A can communicate with segment B but hosts in segment B can not communicate with each other.

By default, traffic destined to a given segment is dropped and explicit allow policies are required to allow communication. Policy configurations in Segment security are unidirectional. To allow or drop traffic between two segments forward or drop policy configuration in both segments is required.

Licensing

The Segment security requires an **E** license to be fully supported at device level. When running in combination with CloudVision, Cloud Vision Full license is required.

Supported Functionalities

- Maximum of ***60*** segments can be configured across all VRFs.
- Support for both IPv4 and IPv6 match-list configuration.
- Single segment can be defined using both IPv4 and IPv6 match-lists.
- Feature can be enabled without need to enable routing.
- Built-in policies to permit or drop policy traffic.
- Policies configured are applied to both bridged and routed traffic.
- Traffic from/to VLANs with no SVI configuration are considered to be part of default VRF and subject to policies defined in default VRF.

13.12.2 Configuring Segment Security

Consider the following steps to configure the Segment security in the switch:

1. Define prefix-ipv4, prefix-ipv6 match lists.
2. Define segments using match lists.
3. Define policies between segments.
4. Enable Segment Security.

Define IPv4, IPv6 Match-list

Use **`match-list`** command under ***global*** configuration mode to define a IPv4/IPv6 subnet list as shown below. In the below example we have defined two prefix-ipv4 match lists and two prefix-ipv6 lists namely **camera-prefixes** and **admin-prefixes**.

Example

```
switch(config)#match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 69.89.31.200/32
```

```
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 70.89.31.0/24
!
switch(config)#match-list input prefix-ipv6 camera-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2001:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2002:0:9d38:6ab8::3/128
!
switch(config)#match-list input prefix-ipv4 admin-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 80.80.0.0/16
!
switch(config)#match-list input prefix-ipv6 admin-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2003:0:9d38:6ab8::/64
!
```

Match-list name is unique within a type. A match-list can share the same name across IPv4 and IPv6 configuration.

Define Segments using Match-lists

Under ***router segment-security*** mode, goto **vrf *vrf-name*** sub-mode and create named segments. The segments are bound to the prefix-ipv4 and/or prefix-ipv6 match list created earlier.

Example

```
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment camera
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 camera-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 camera-
prefixes
      !
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment secure-admin
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 admin-
prefixes
      !
   !
!
```

Note: Top level mode starts with **router** keyword however feature does not require routing to be enabled on switch.

Define Policies between Segments

There are two built-in policies defined **policy-forward-all** and **policy-drop-all** to forward and drop traffic between segments. For example, in the segments defined in the previous section, to allow segment admin access to segment camera, we need to allow bidirectional traffic by using **policy-forward-all**.

In the ***policy*** sub-mode under ***segment*** mode, the segment name after **from** token refers to the source of the flow.

```
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment camera
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 camera-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 camera-
prefixes
!
switch(config)#router segment-security
switch(config-router-seg-sec)#policies
switch(config-router-seg-sec-policies)#from secure-admin policy policy-
forward-all

!
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment secure-admin
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 admin-
prefixes
!

switch(config)#router segment-security
switch(config-router-seg-sec)#policies
switch(config-router-seg-sec-policies)#from camera policy policy-forward-
all

!
```

Enable Segment Security

By default, the Segment security is not enabled in the switch. In order to enable the Segment security, run a **no shutdown** command within the ***router segment-security*** mode. Use the **shutdown** form of the command to disable the Segment security feature.

```
switch(config)#router segment-security
switch(config-router-seg-sec)#no shutdown
```

Default Drop Behavior

By default, after enabling the Segment security feature, all traffic destined to the defined segment is dropped unless explicitly permitted by **policy-forward-all** policy rules. This includes intra-segment traffic. To change this default behavior use the following command under ***router segment-security*** mode.

```
switch(config)#router segment-security
switch(config-router-seg-sec)#no no segment policy policy-drop-all
 default
```

After changing default intra-segment traffic is allowed. For example, to limit nodes in the camera's segment communicating with each other, **policy-drop-all** rules for intra-segment traffic need to be defined.

```
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
```

```
switch(config-router-seg-sec-vrf-default)#segment camera
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 camera-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 camera-
prefixes
!

switch(config)#router segment-security
switch(config-router-seg-sec)#policies
switch(config-router-seg-sec-policies)#from camera policy policy-drop-all
!
```

13.12.3 Limitations

- Multicast and Link Local prefixes are not supported.
- Traffic disruption during prefix and policy configuration is expected. We do not support atomicity during segment and prefix configuration.
- MSS-Group and URPF feature interaction is not supported. If both features are configured (misconfiguration), the platform gives URPF higher priority and removes any existing segment configurations from hardware.
- Prefixes entries failed to get installed in hardware (because of insufficient hardware resources) are retried periodically till resources become available and prefixes are successfully installed. However, the same is not true for policy entries. There is no retry mechanism implemented for failed policy entries. The user needs to free up hardware resources and re-enable the MSS-Group feature after removing it once.
- Custom policies can not be configured. Clients can choose from two built-in policies ‘policy-drop-all’ and ‘policy-forward-all’.
- A given prefix can only be part of a single segment in VRF. Attempting to configure the same prefix in more than one segment leads to undefined traffic forwarding behavior.
- The same prefix can not be configured in both MSS-Group and MSS-L3 configurations.
- SSU can be performed with MSS-Group configured but the traffic flows for MSS-Group configuration will not be hitless.
- DHCP discovery packets with broadcast destination IP of ***255.255.255.255*** will only match ***0.0.0.0/0*** prefix.
- All traffic sourced from and/or destined to switch owned IPs are allowed regardless of MSS-Group configuration.
- Due to source and destination IP lookup being required, the capacity of the LPM table is halved when MSS-G is enabled. The host table capacity is unchanged as the source and destination lookup is always enabled by default.

13.12.4 Show Commands

- Use the **`show segment-security`** command to verify the state of configuration.

```
switch#show segment-security
VRF : default
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment Policy

  ------------ ---------- --------------- --------------- ------------ ------------------
  camera                  camera-prefixes camera-prefixes secure-admin policy-forward-all
  secure-admin            admin-prefixes  admin-prefixes  camera       policy-forward-all
```

- Use the **`show match-list`**command to verify the match list.

```
switch#show match-list prefix-ipv4
Name             Prefix
---------------- ---------------
admin-prefixes  80.80.0.0/16
```

```
camera-prefixes 69.89.31.200/32
                69.89.31.201/32
                70.89.31.0/24

switch#show match-list prefix-ipv6
Name            Prefix
--------------- ----------------------
admin-prefixes  2003:0:9d38:6ab8::/64
camera-prefixes 2001:0:9d38:6ab8::/64
                2002:0:9d38:6ab8::3/128
```

- Use the **show segment-security hardware summary** command to display hardware ID allocated to the configured segment, number of prefixes configured and number of prefixes successfully programmed in hardware.

```
switch#show segment-security hardware summary
VRF: default
Segment              Hardware ID     Prefixes   Programmed
-------------------- --------------- ---------- ---------------
camera               63              5          5
secure-admin         62              2          2
```

- Use the **show segment-security hardware detail** command hardware ID allocated to the configured segment, prefixes programmed in hardware and adjacency index used by prefix (as prefixes use L3 hardware tables).

```
switch#show segment-security hardware detail
VRF: default
Segment       Hardware ID     Prefixes                  Adj Ind  ex
------------- --------------- ------------------------- ---------------
camera        63              69.89.31.200/32           1
                              69.89.31.201/32           1
                              70.89.31.0/24             1
                              2001:0:9d38:6ab8::/64     2
                              2002:0:9d38:6ab8::3/128   2
secure-admin  62              80.80.0.0/16              1
                              2003:0:9d38:6ab8::/64     2
```

- As MSS-Group prefixes use L3 hardware tables which means the prefixes can overlap with FIB routes. There are following three classifications possible for a configured prefix:
  - Prefix is not overlapping with FIB route. In this case Route Type will be classified as Segment prefix `S`
  - Prefix was also configured in FIB. For example, the same /32 or /128 host prefix was already present in FIB. In this case Route Type will be classified as S,F, i.e. Segment and FIB prefixes are identical.
  - Prefix overlapped with FIB entry. For example /24 prefix was configured and processing logic has detected all FIB routes which fall under /24 need to be classified as segment prefixes. All such classified FIB routes have Route Type `F` i.e. FIB-only.

The **show segment-security hardware routes** command displays the status of **route type** for programmed prefixes in hardware.

```
switch#show segment-security hardware routes
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB

VRF: default
Segment       Hardware ID  Routes                    Route Type
------------  -----------  ------------------------ ----------
camera        63           69.89.31.200/32           S
```

```
                            69.89.31.201/32           S
                            70.89.31.0/24             S,F
                            2001:0:9d38:6ab8::/64     S
                            2002:0:9d38:6ab8::3/128   S
secure-admin  62            80.80.0.0/16              S
                            2003:0:9d38:6ab8::/64     S
```

- Use the **show segment-security hardware counters** to display the policy and counters for policies configured for segments. For each policy configured between two segments a row shows Hit and Drop counters. Hit counter includes all policy hits regardless of action. Drop counter indicates packets dropped. Drop counter also accounts for packets dropped because of default drop when no policy match fails.

```
switch#show segment-security hardware counters
VRF: default
Policy               Hit        Drop
-------------------- ---------- ----------
policy-drop-all      6          6
policy-forward-all   13         0

Dest Segment   Source Segment   Policy    Hit   Drop
-------------- ---------------- --------- ----- ------
camera         *                 n/a      0      3
camera         camera                     6      6
camera         secure-admin               4      0
secure-admin   *                 n/a      0      12
secure-admin   camera                     9      0
```

13.12.5 Segment Security Commands

Global Configuration Commands

- match-list
- router segment-security

Show Commands

- show match-list
- show segment-security
- show segment-security hardware

13.12.5.1 match-list

The **match-list** command is configured under the ***global*** configuration mode to define a IPv4/IPv6 subnet list which is then used in the Segment security configuration.

The **no match-list** command removes the IPv4/IPv6 subnet list configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

match-list

no match-list

Example

In the following example, we have defined two prefix-ipv4 match lists and two prefix-ipv6 lists, namely ***camera-prefixes*** and ***admin-prefixes***.

```
switch(config)#match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 69.89.31.200/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 70.89.31.0/24
!
switch(config)#match-list input prefix-ipv6 camera-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2001:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2002:0:9d38:6ab8::3/128
!
switch(config)#match-list input prefix-ipv4 admin-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)#match prefix-ipv4
 80.80.0.0/16
!
switch(config)#match-list input prefix-ipv6 admin-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)#match prefix-ipv6
 2003:0:9d38:6ab8::/64
!
```

13.12.5.2 router segment-security

The **`router segment-security`** command to create named segments, later the segments are bound to the prefix-ipv4 and/or prefix-ipv6 match list created earlier. The named segments are created under the VRF submode.

The **`no router segment-security`** command removes the segment security configuration from the ***running-config***.

Command Mode

Global Configuration Mode

Command Syntax

`router segment-security`

`no router segment-security`

Example

In the following example, we are creating segments named ***camera*** and ***secure-admin*****.**

```
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment camera
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 camera-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 camera-
prefixes
      !
switch(config)#router segment-security
switch(config-router-seg-sec)#vrf default
switch(config-router-seg-sec-vrf-default)#segment secure-admin
switch(config-router-seg-sec-vrf-segment-camera)#definition
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv4 admin-
prefixes
switch(config-router-seg-sec-vrf-segment-def)#match prefix-ipv6 admin-
prefixes
      !
   !
!
```

13.12.5.3 show match-list

The **show match-list** command displays the IPv4 and IPv6 prefix match-list of the configured segments.

Command Mode

Privileged EXEC

Command Syntax

show match-list {prefix-ipv4 | prefix-ipv6} [*list-name*]

Parameters

- **prefix-ipv4** IPv4 prefix list.
- **prefix-ipv6** IPv6 prefix list.
- ***list-name*** Route Segment name.

Example

This command displays all the IP address matching the prefix list IPv4 and IPv6 mentioned.

```
switch#show match-list prefix-ipv4
Name            Prefix
--------------- ---------------
admin-prefixes  80.80.0.0/16
camera-prefixes 69.89.31.200/32
                69.89.31.201/32
                70.89.31.0/24

switch#show match-list prefix-ipv6
Name            Prefix
--------------- ----------------------
admin-prefixes  2003:0:9d38:6ab8::/64
camera-prefixes 2001:0:9d38:6ab8::/64
                2002:0:9d38:6ab8::3/128
```

13.12.5.4 show segment-security

The **show segment-security** command displays the state of segment security configuration.

Command Mode

Privileged EXEC

Command Syntax

show segment-security [vrf vrf-name][segment *seg-name*]

Parameters

- **vrf *vrf-name*** VRF name.
- **segment *seg-name*** Route Segment name.

Example

This command displays the state of Segment security configuration.

```
switch#show segment-security
VRF : default
  Segment      Interfaces Prefix IPv4     Prefix IPv6     From Segment Policy
  ------------ ---------- --------------- --------------- ------------ ------------------
  camera                  camera-prefixes camera-prefixes secure-admin policy-forward-all
  secure-admin            admin-prefixes  admin-prefixes  camera       policy-forward-all
```

13.12.5.5 show segment-security hardware

The **show segment-security hardware** command displays the detailed information about the hardware resources used by the Segment security feature.

Command Mode

Privileged EXEC

Command Syntax

show segment-security hardware {summary | detail | routes | counters}[vrf *vrf-name*][segment *seg-name*]

Parameters

- **summary** displays the hardware ID allocated to the configured segment, number of prefixes configured and number of prefixes successfully programmed in hardware.
- **detail** displays the hardware ID allocated to the configured segment, prefixes programmed in hardware and adjacency index used by prefix (as prefixes use L3 hardware tables).
- **routes** displays the status 'Route Type' for programmed prefixes in hardware.
- **counters** displays the policy and counters for policies configured for segments.

Examples

- This command displays the hardware ID allocated to the configured segment, number of prefixes configured and number of prefixes successfully programmed in hardware.

```
switch#show segment-security hardware summary
VRF: default
Segment              Hardware ID     Prefixes   Programmed
-------------------- --------------- ---------- ---------------
camera               63              5          5
secure-admin         62              2          2
```

- This command displays the hardware ID allocated to the configured segment, prefixes programmed in hardware and adjacency index used by prefix (as prefixes use L3 hardware tables).

```
switch#show segment-security hardware detail
VRF: default
Segment         Hardware ID     Prefixes                 Adj Ind  ex
--------------- --------------- ------------------------ ------------
camera          63              69.89.31.200/32           1
                                69.89.31.201/32           1
                                70.89.31.0/24             1
                                2001:0:9d38:6ab8::/64     2
                                2002:0:9d38:6ab8::3/128   2
secure-admin    62              80.80.0.0/16              1
                                2003:0:9d38:6ab8::/64     2
```

- This command displays the status 'Route Type' for programmed prefixes in hardware.

```
switch#show segment-security hardware routes
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB

VRF: default
Segment        Hardware ID   Routes                     Route Type
-------------- ------------- -------------------------- ----------
camera         63            69.89.31.200/32             S
                             69.89.31.201/32             S
                             70.89.31.0/24               S,F
                             2001:0:9d38:6ab8::/64       S
```

```
                                2002:0:9d38:6ab8::3/128     S
secure-admin  62                80.80.0.0/16                S
                                2003:0:9d38:6ab8::/64       S
```

- This command displays the policy and counters for policies configured for segments.

```
switch#show segment-security hardware counters
VRF: default
Policy               Hit        Drop
-------------------- ---------- ----------
policy-drop-all      6          6
policy-forward-all   13         0

Dest Segment   Source Segment   Policy  Hit  Drop
-------------- ---------------- ------- ---- -----
camera         *                 n/a     0    3
camera         camera                    6    6
camera         secure-admin              4    0

secure-admin   camera                    9    0
```

Chapter 14

IP Services

The Internet Protocol Services (IP Services) chapter contains the following section(s):

- CloudVision eXchange (CVX)

14.1 CloudVision eXchange (CVX)

CloudVision eXchange (CVX) provides a single access point for real-time provisioning, orchestration and integration with third-party controllers. CVX aggregates and distributes operational state information across a set of EOS switches to support applications that provide network services. See the *CloudVision User Guide*, https://www.arista.com/en/support/product-documentation, for additional information.

Topics in this section include:

- Upgrading CVX
- CVX Overview
- CVX Services
- Deploying CVX
- CVX Configuration
- CVX Secure out-of-band Connection
- CVX High Availability
- CVX VIP
- CVX Command Descriptions

14.1.1 Upgrading CVX

You can upgrade CVX from a previous version to the current version by performing a few simple tasks. You can use the following procedure to upgrade any previous version of CVX to the current version.

Requirements

Make sure you follow these requirements during the upgrade process.

- If you have CVP, CVX and client switches in your environment, make sure you upgrade each component in the following order:
- Upgrade CVP first
- Upgrade the CVX cluster.
- Upgrade the client switches. The reason for this is to ensure backward compatibility.
- You must upgrade the CVX cluster before you upgrade the client switches.
- If the CVX cluster is a 3 node cluster, make sure that only one node of the cluster is down at any one time during the upgrade process. (The order in which you upgrade the nodes does not matter.)

Pre-requisites

Before you begin the upgrade, make sure that:

- You perform a backup to ensure that you can restore data if needed.
- You download the latest version of CVX from Arista's Software Download page (https://www.arista.com/en/support/software-download).

Complete the following steps to upgrade CVX.

1. Login to the cluster to be upgraded. (You can login to any node.)
2. Upgrade the node. You must deploy a new image to perform the upgrade.
3. Wait for the node you are upgrading to rejoin the cluster. Once the node has rejoined, go to the next step. (The node automatically rejoins the cluster as a follower node.)
4. Repeat steps **1 through 3** to upgrade the two remaining nodes one node at a time. It does not matter the order in which you upgrade the remaining nodes.

14.1.2 CVX Overview

A CVX deployment includes CVX and a set of CVX clients to which CVX provides services. CVX is not part of the data plane, nor does it receive data-path traffic. All CVX components exist as agents that run on EOS instances.

For more information, see:

- System Requirements
- CVX Infrastructure
- CVX Features
- CVX Clients

14.1.2.1 System Requirements

Certain hardware and software is required to be able to use CloudVision eXchange in your CloudVision virtual appliance implementation.

The CloudVision eXchange should be installed on a single system along with CloudVision Portal.

The following table lists the minimum hardware and software required to use CloudVision eXchange.

Required Hardware

The hardware required to use the CloudVision eXchange are:

- CPU: 4 cores (base), 8 cores (recommended)
- RAM: 4G (base), 8G (recommended)
- Disk: 4G

Required Software

The software required to use the CloudVision eXchange are:

- EOS switches: Recommend 4.16.8M or later

Note: It is a best practice and highly recommended that the version of CVX should match the version running on the switches.

- CloudVision Portal: version 2016.1

(CloudVision Portal software is required if you want to use it in conjunction with CloudVision eXchange. If you plan to use only CloudVision eXchange, CloudVision Portal software is not required.)

Note: CVX supports live vMotion.

14.1.2.2 CVX Infrastructure

CVX provides a single integration point into network-wide services running across CVX clients. CVX is typically deployed as an EOS instance running on a VM (vEOS). The CVX infrastructure consists of a CVX instance functioning as a server and a set of CVX clients. The CVX server uses a heartbeat keepalive (KA) mechanism to maintain contact with its clients.

When de-configuring or shutting down CVX, client services should be shut down first.

14.1.2.3 CVX Features

CVX manages communications among the network CVX clients, and provides an integration point for services to those clients. CVX also discovers the physical network topology by aggregating topology information it receives from its client devices.

14.1.2.4 CVX Clients

CVX client is the agent that allows a switch to interact with a CVX server to access CVX services. Enabling the CVX client includes providing the IP address or host name of the device running CVX. The CVX client can then access services that are enabled on the CVX server.

The CVX client must be enabled to access the CVX server and the services it offers. Individual services may require additional configuration statements.

Services should be shut down or de-configured on clients before shutting down or de-configuring CVX. CVX-controlled switch features may continue to run after shutting down CVX if they are not explicitly shut down or de-configured prior to shutting down CVX.

14.1.3 CVX Services

CVX services are applications that run on top of the CVX infrastructure, and are accessed by CVX clients through the CVX server. All CVX services are maintained by version level; client switches negotiate the version they use when connecting to the server. This allows multiple switches that run different EOS versions to connect to the same CVX server.

The following sections briefly describe some of the services available to CVX clients through CVX:

- VXLAN Control Service
- Network Topology Service

14.1.3.1 OpenStack Service

The OpenStack service on CVX allows the networking component of an OpenStack deployment (also known as Neutron) to share state with CVX.

When deployed, this integration allows CVX to send state about the logical networks created in the OpenStack cloud to the CVX clients that configure the network.

More information on OpenStack software can be found in its online documentation at http://docs.openstack.org/.

14.1.3.2 VXLAN Control Service

The VXLAN control service allows hardware VXLAN tunnel end points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane. Configuration is required both on the client switches and in CVX.

14.1.3.3 Hardware Switch Controller (HSC) Service

Traffic between virtual machines which share a physical host (or between virtual machines and the rest of the network) is forwarded by virtual switches. The management and configuration of virtual switches uses the Open vSwitch Database (OVSDB) management protocol, as described in RFC 7047.

The hardware switch controller (HSC) service provides an integration point between OVSDB controllers and the VXLAN control service, allowing exchange of state information among virtual and hardware switches.

14.1.3.4 Network Topology Service

The network topology service gathers information from CVX clients to provide a view of the physical topology of the network. Aggregated information gathered by the network topology service is used by other CVX services, and can be viewed on the CVX server.

14.1.4 Deploying CVX

CloudVision Exchange (CVX) can be deployed on KVM and ESXi. The required EOS version and Aboot version vary depending on whether you are deploying CVX on KVM or ESXi.

For the detailed steps to use to deploy CVX, see:

- Deploying CVX on Kernel-based Virtual Machine (KVM)
- Deploying CVX on VMware ESXi

14.1.4.1 Deploying CVX on Kernel-based Virtual Machine (KVM)

Complete the following steps to install CVX on Ubuntu/KVM. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS and Aboot that meet the minimum requirements for CVX. The supported versions are:

- EOS (version *4.16.8M* or later)
- `Aboot-veos-serial-8.0.0.iso` (located in the vEOS section of the download)

Pre-requisites

Before you begin the procedure, make sure that:

- Install **qemu-kvm**, **libvirt*,** and all related dependencies using yum (RHEL7/CentOS7) and apt-get (Ubuntu).
- Two bridges are configured for use by the KVM VM, and that you have the names of the bridges. (Steps are included in the procedure to add bridges, if they are not already configured.)

  Note: The bridges must be configured to persist (**brctl** commands do no persist across reboots). You can use Network Manager (or another application available to you) to complete this configuration.
- You have both **generateXmlForKvm.py** and **cvpTemplate.xml**. They are required to complete the procedure. You can find them in the CVP tarball for Ubuntu.

Complete the following steps to install CVX.

1. Download the Aboot and EOS files from: https://www.arista.com/en/support/software-download/.
2. Use **sudo su** to acquire superuser privileges, which are required to complete some of the installation steps.
3. Confirm that KVM is running on the server by entering the following command:

   ```
   virsh -c qemu:///system listAb
   ```

   The command output should match this example:

   ```
   Id    Name      State
     ------------------------------
     $
   ```
4. If the output does not look correct (previous step) go to for additional assistance: https://help.ubuntu.com/community/KVM/Installation.
5. Use the following command to convert the **vmdk** file to qcow2: `qemu-img convert EOS_4_16_8M.vmdk -O qcow2 EOS.qcow2`

   Note: Step **6** and **7** are required if you do not already have 2 bridges defined in different subnets. If the bridges exist, go directly to step **8**.

6. Use **brctl** to add bridges for the KVM VM to use (br1 and br2 can be any names you choose).

```
brctl addbr br1
brctl addbr br2
```

ifconfig can be used to identify Ethernet ports to be bridged. Once you identify the ports, add them to the bridges.

Example

```
brctl addif br1 enx803f5d086eae
```

7. Confirm that the bridges are up using **brctl show**.
   - Enter: ifconfig br1 up
   - And: ifconfig br2 up

   Note: The following step uses a number of input parameters (the number required vary depending on your server setup). To ensure the command executes successfully, we recommend that you type it into a scratch pad and edit as needed before typing it into the Linux Terminal.
8. Use the following command to generate **cvx.xml**, which will be used to setup the CVX VM.
   `generateXmlForKvm.py`

   Example

```
python generateXmlForKvm.py -n cvx --device-bridge br1 --cluster-bridge
 br2 -e /usr/bin/kvm -i cvpTemplate.xml -c /home/myname/Downloads/Abo
ot-veos-serial-8.0.0.iso -x /home/myname/Downloads/EOS.qcow2 -b 8192 -p
 2 -t

 -n cvx: VM name.
 --device-bridge br1: This is the name you gave the bridge - br1 or
 anything else.
 --cluster-bridge br2: Cluster bridge if clustering servers.
 -i cvpTemplate.xml: Path to XML file input template.
 -k: VM ID number used by virsh. If not entered, a random number is
 assigned.
 -b 8192: 8G of RAM.
 -p 2: # of CPU cores.
 -c: Path to Aboot file.
 -x: Path to qcow2 file created in step 3.
 -t: This parameter indicates the file defined by -x is for CVX.
 -e â€˜/usr/bin/kvm: Ubuntu path to KVM.
 (for RHEL KVM this is: -e â€˜usr/libexec/qemu-kvm)
 -o: XML file used by virsh to define the KVM VM.
```

9. Run the following commands:

```
virsh define cvx.xml
virsh start cvx
virsh console cvx
```

10. (Optional) To configure CVX to start automatically, enter:

```
virsh autostart cvx
```

You are now ready to begin the CVX configuration (see CVX Configuration).

14.1.4.2 Deploying CVX on VMware ESXi

Complete the following steps to install CVX on ESXi. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS that meet the minimum requirements for CVX. The supported version is EOS (version ***4.21.0*** or later).

Complete the following steps to install CVX.

1. Go to: https://www.arista.com.
2. Select **Support** > **Software Download**.
3. From the software download page, expand **Active Releases** > **4.21** > **EOS-4.21.0F** to download **EOS-4.21.0F.vmdk**.
4. Load the files you downloaded into a filestore location within the VMware vSphere environment.

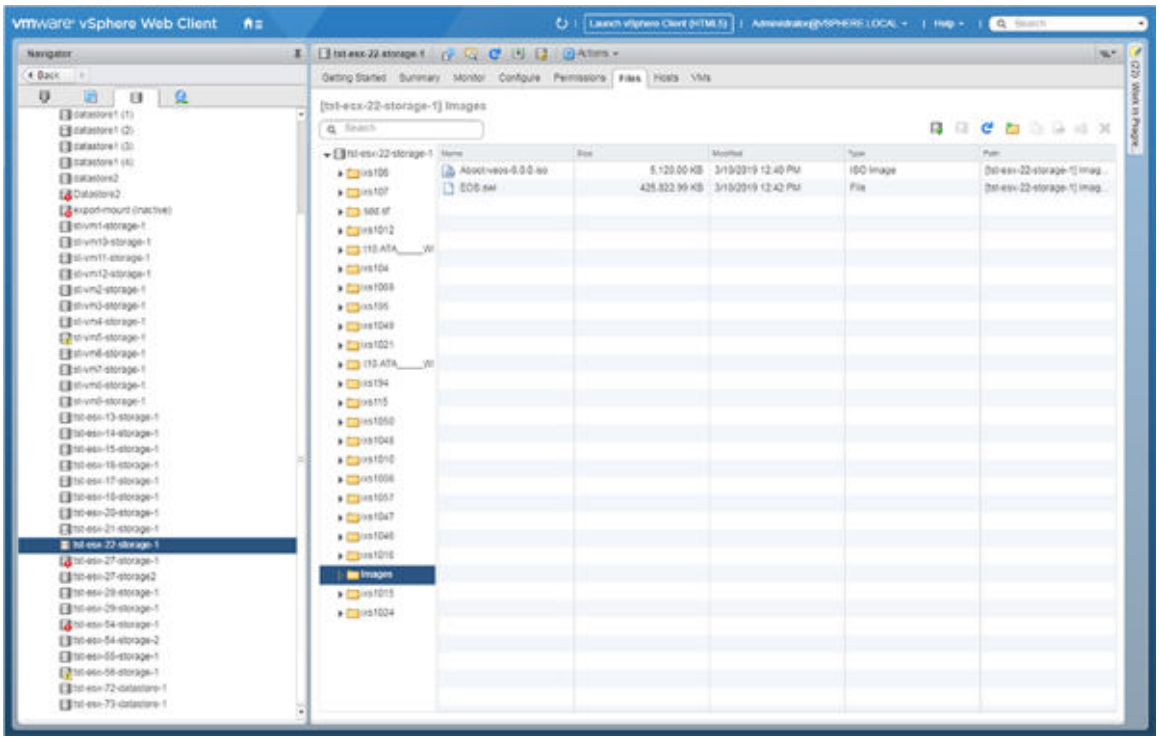

Figure 36: Loading the files into the VMware vSphere environment

5. Right-click the **filestore location** you selected, and choose **New Virtual Machine**.

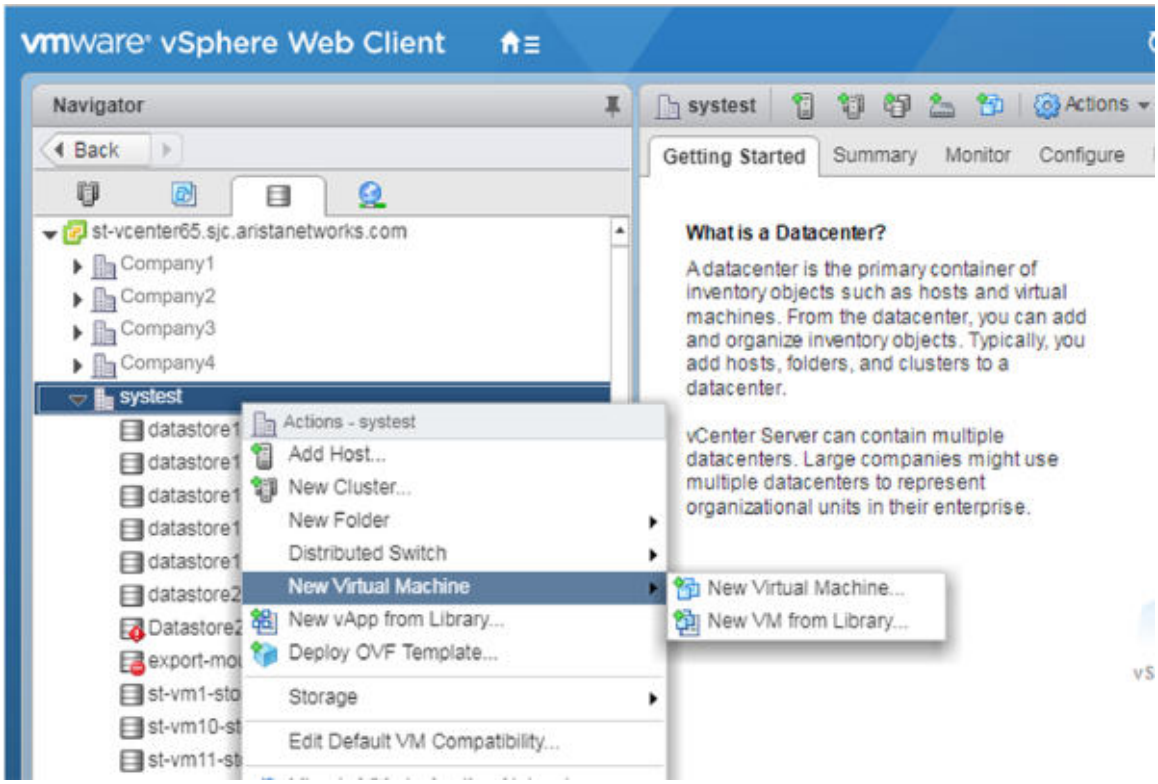

Figure 37: Selecting New Virtual Machine

The New Virtual Machine dialog appears.

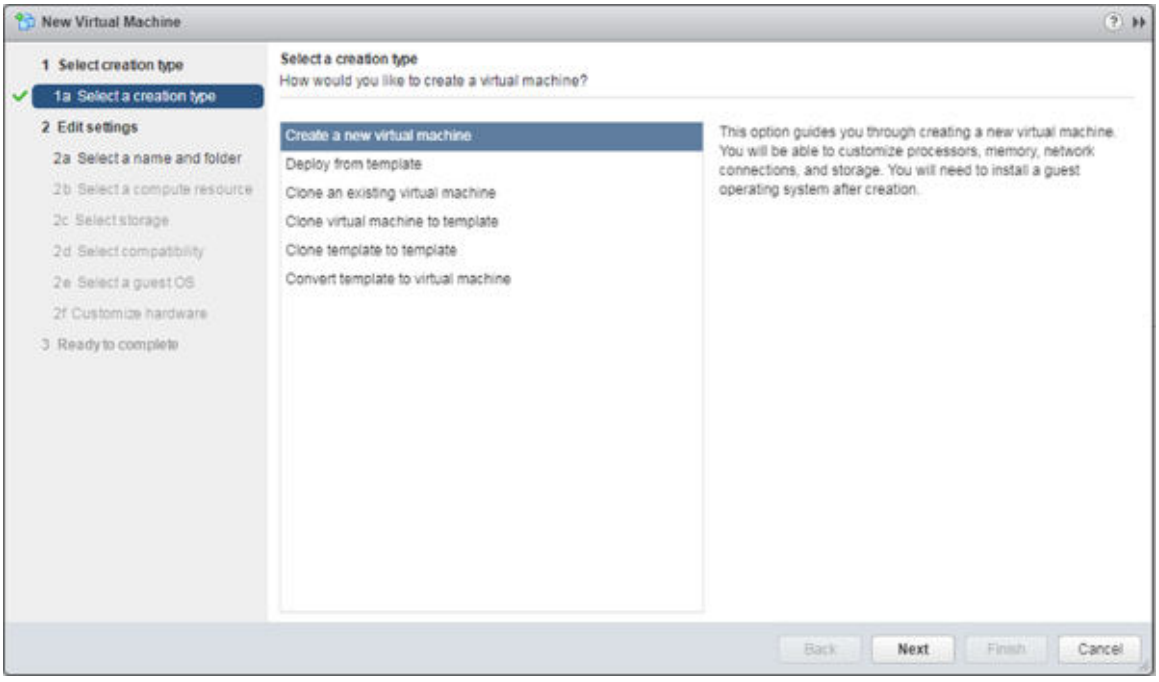

Figure 38: New Virtual Machine dialog

6. In the New Virtual Machine dialog, select **Create a new virtual machine**, then click **Next**.

   The dialog refreshes, showing options for the new Virtual Machine.

   New Virtual Machine dialog (naming and selecting the location)

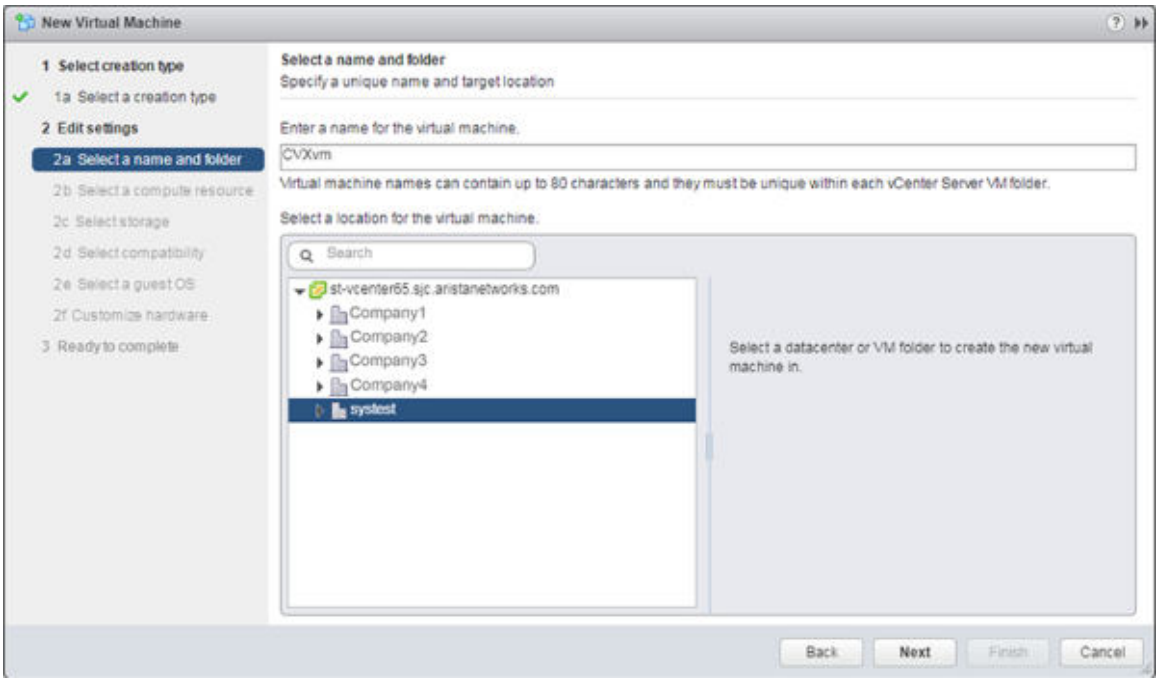

Figure 39: New Virtual Machine dialog (naming and selecting the location)

The dialog refreshes, showing options for selecting the datastore.

7. Enter a **name** for the new Virtual Machine.
8. Select a **location** for the new Virtual Machine, then click **Next**.

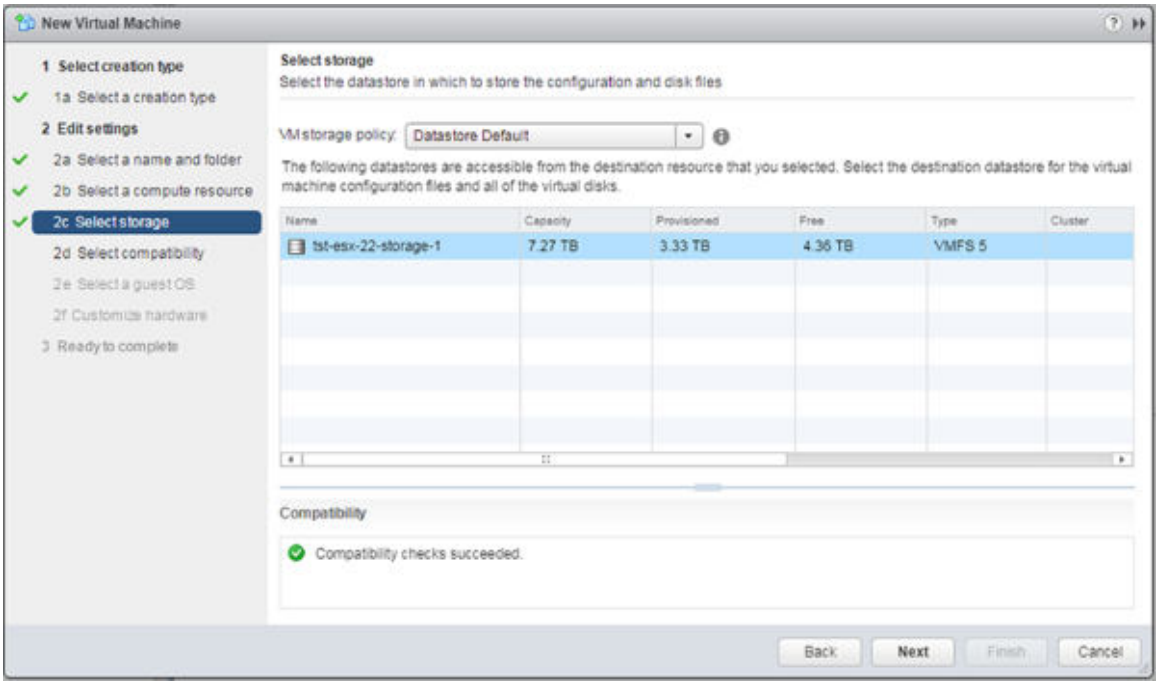

Figure 40: New Virtual Machine dialog (selecting the datastore)

9. Select the **datastore** for the new Virtual Machine configuration files and all of the virtual disks.
   - Click **Next**.

   The dialog refreshes, showing operating system selection options.
10. Click **Next**.

The dialog refreshes, showing compatibility options.

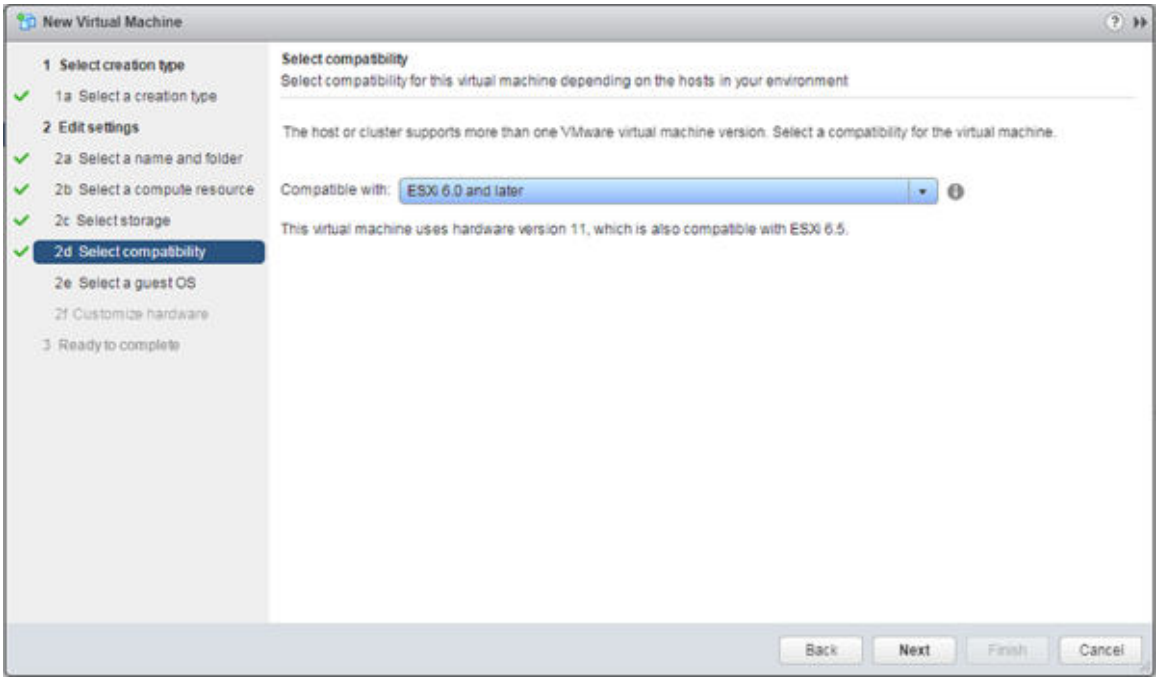

Figure 41: New Virtual Machine dialog (compatibility options)

11. Using the Compatible with menu, select the **ESXi compatibility** for the new Virtual Machine.

    Note: When adding the VMDK to ESX6, it treats this as sparse by default, whereas in ESX 5 it is thick. Converting the vEOS VMDK file from thin to thick would allow it to boot properly in ESX6: `vmkfstools -i vEOS-lab-4.18.5M.vmdk -d eagerzeroedthick vEOS-lab-4.18.5M-thick.vmdk`.

    Go to https://eos.arista.com/ and refer to the following topics for the issue and solution:

    - Tip for Arista vEOS on VMware ESX 6
    - Common Issues When Deploying CVX *4.18.2F* on vCenter 6 or 6.5

    Note: If the VM keeps rebooting and showing â€œThis is not a bootable disk. Insert a bootable floppy and press any key to try again", then go to https://eos.arista.com/ and refer to the **Common Issues When Deploying CVX 4.18.2F on vCenter 6 or 6.5** topic.

12. Click **Next**.

    The dialog refreshes, showing operating system selection options.

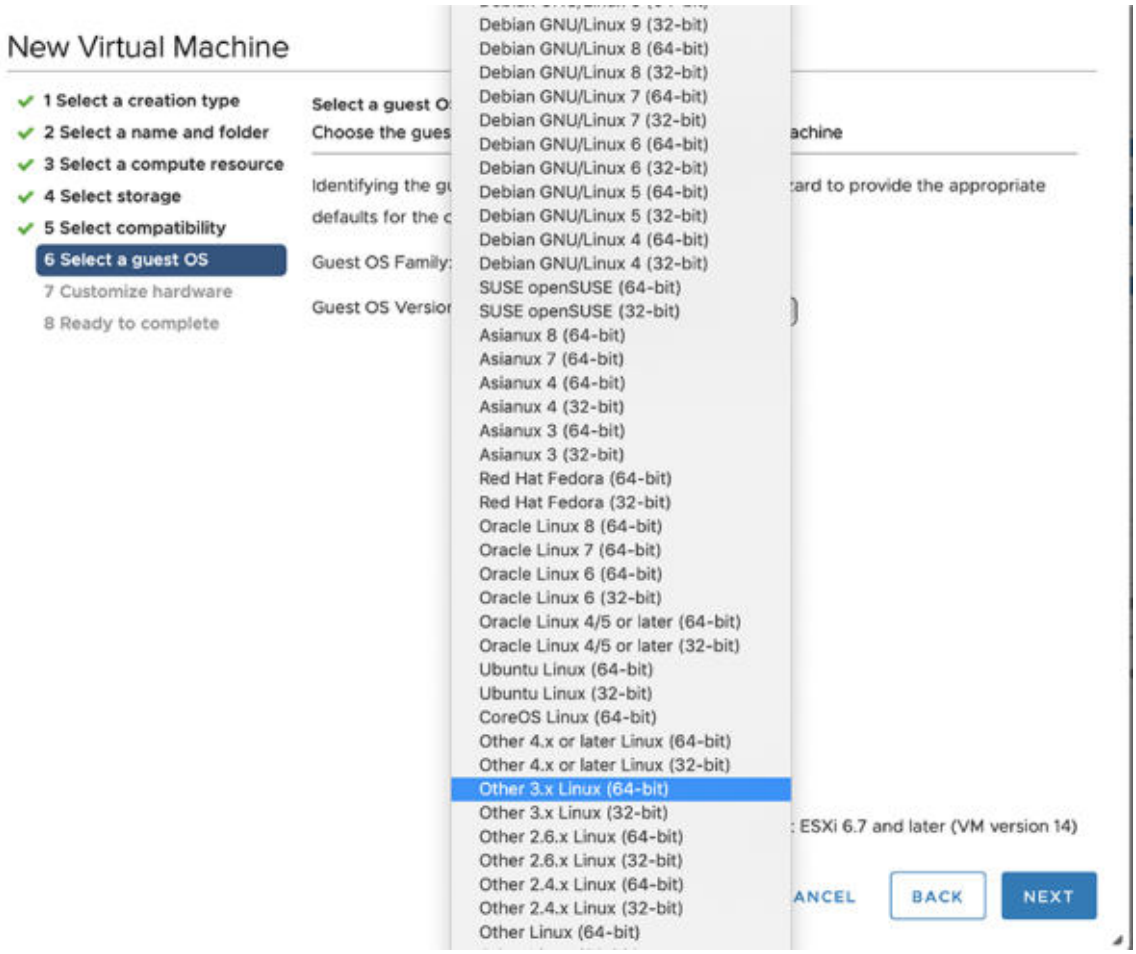

Figure 42: New Virtual Machine dialog (operating system options)

13. Using the Guest OS Family menu, choose **Linux**.
14. Using the Guest OS Version menu, choose **Other Linux (64-Âbit)**.
15. Click **Next**.

    The dialog refreshes, showing options for customizing hardware.

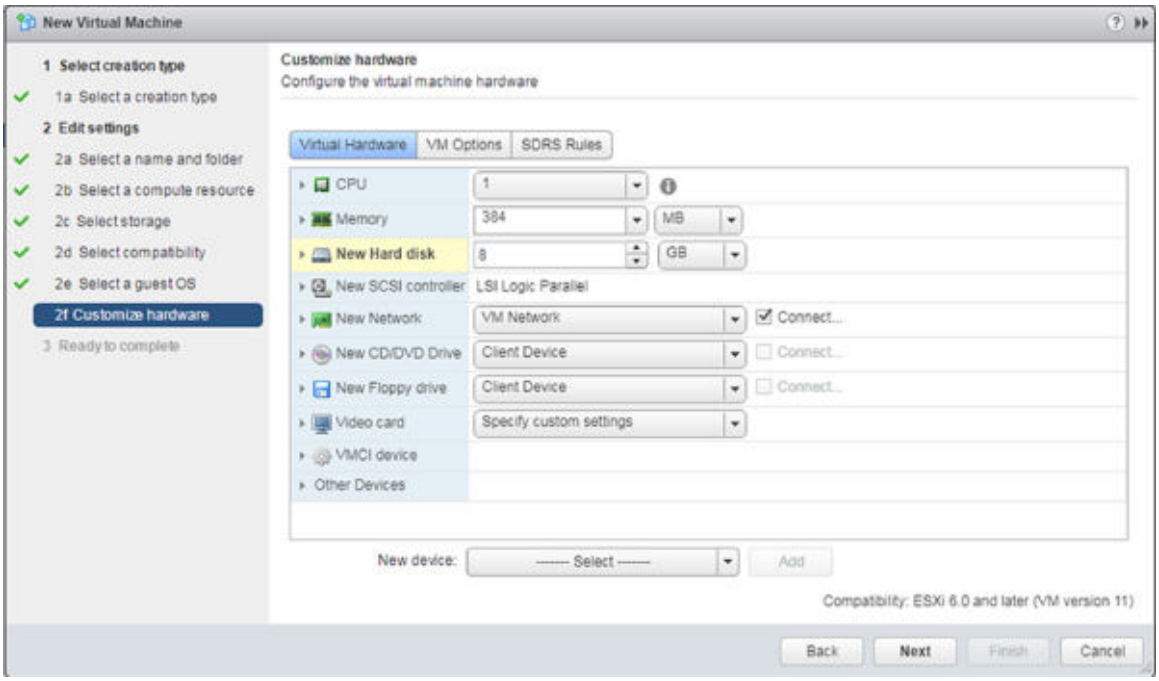

Figure 43: New Virtual Machine dialog (hardware configuration options)

16. Change the default settings for the following options:

CPU	Set to **4** (number of CPUs)
Memory	Set to **8 GB**
New Hard Disk	Delete the current setting (leave this option empty).
New Network	Specify connection to Network LAN segment with connectivity to CVX client devices (the Management LAN). Choose VMXNET3 network adapter type. This connection is used for CVX client / server communications.
Existing Hard Disk	Specify the **EOS-4.21.0F.vmdk** you downloaded in step 3.

17. (Optional) Delete the floppy drive and SCSI controller.
18. Click **Next**.

    You are now ready to begin the CVX configuration (seeCVX Configuration).

14.1.5 CVX Configuration

CVX, its clients, and its services, are independently configured. These sections describe configuration processes for each:

- Ports Used by CVX
- CVX Server Configuration
- CVX Client Configuration
- CVX Client Services Configuration

14.1.5.1 Ports Used by CVX

CVX uses the following ports:

- Controller database (Controllerdb): Port 9979
- Client-server out-of-band connection: Port 50003

- CVX cluster peer out-of-band connection: Port 50004

Note: All of these connections are TCP.

14.1.5.2 CVX Server Configuration

Enabling CVX on the CVX Server

CVX parameters for the server infrastructure are configured in ***CVX configuration*** mode. CVX configuration mode is not a group-change mode; ***running-config*** is changed when commands are entered, and exiting the mode does not modify ***running-config***. The **cvx** command places the switch in ***CVX configuration*** mode.

CVX is disabled by default. The **no shutdown (CVX)** command enables CVX on the switch.

Example

These commands enter CVX-configuration mode and enable CVX.

```
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#
```

CVX Heartbeat Configuration

CVX synchronizes with its client devices by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period determine when a client's access to the server is disrupted.

The interval between heartbeat messages that the server transmits is specified by the **heartbeat-interval (CVX)** command. The CVX timeout period is specified by the **heartbeat-timeout (CVX)** command. When CVX does not receive a subsequent heartbeat message from a CVX client before the timeout expiry, the server discontinues CVX services to that client.

Best practices dictate that CVX and its client applications configure identical heartbeat interval and heartbeat timeout values.

Example

These commands configure a CVX heartbeat interval of 30 seconds and a server heartbeat timeout period of 90 seconds.

```
switch(config-cvx)#heartbeat-interval 30
switch(config-cvx)#heartbeat-timeout 90
switch(config-cvx)#
```

Disabling CVX on the CVX Server

Note: Before disabling or de-configuring CVX on the CVX server, CVX client services should be explicitly disabled or shut down. Failure to disable or de-configure services prior to disabling or de-configuring CVS may result in CVX features continuing to run after CVX shutdown.

When disabling the CVX service, service VXLAN configuration may be retained or erased. Be sure to disable or shut down client services prior to disabling the CVX service.

Examples

- These commands shut down the CVX service while retaining the CLI configuration for service VXLAN.

```
localhost(config)#cvx
localhost(config-cvx)#service vxlan
localhost(config-cvx-vxlan)#shutdown
```

- These commands shut down the CVX service and also erase service VXLAN CLI configuration.

```
localhost(config-cvx-vxlan)#
localhost(config)#cvx
localhost(config-cvx)#no service vxlan
```

14.1.5.3 CVX Client Configuration

This section describes the CVX client configuration and commands that enable CVX services. Most commands for the configuration of the CVX client infrastructure are accessed in Management-CVX configuration mode.

- Enabling CVX on the CVX Client

CVX client parameters are configured in ***Management-CVX configuration*** mode. Management-CVX configuration mode is not a group-change mode; running-config is changed when commands are entered, and exiting the mode does not modify running-config. The **`management cvx`** command places the switch in ***Management-CVX configuration*** mode.

CVX client is disabled by default. The **`no shutdown (Management-CVX)`** command enables CVX client on the switch.

For the CVX network topology service to create an inventory of all CVX clients, ensure that LLDP is enabled on each client switch using the **`lldp run`** command.

Example

These commands enter ***Management-CVX-configuration*** mode and enable the CVX client.

```
switch(config)#lldp run
switch(config)#management cvx
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

- **CVX Client Heartbeat Configuration**

A CVX client synchronizes and maintains contact with CVX by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period define when communication with CVX will be considered down.

The interval between heartbeat messages that the CVX client transmits is configured by the **`heartbeat-interval (Management-CVX)`** command.

The CVX client timeout period is specified by the **`heartbeat-timeout (Management-CVX)`** command. When a CVX client does not receive a subsequent heartbeat message from CVX within this timeout period, the client assumes that services provided by CVX are no longer available.

Best practices dictate that a CVX client's heartbeat interval and heartbeat timeout values are identical to those of the CVX server to which it connects.

Example

This command configures a CVX client heartbeat interval of 30 seconds and client timeout period of 90 seconds.

```
switch(config-mgmt-cvx)#heartbeat-interval 30
switch(config-mgmt-cvx)#heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

Connecting the CVX Client to a Server

The **`server host (Management-CVX)`** command identifies the location of the CVX server that the client accesses. The **`source-interface (Management-CVX)`** command specifies the interface

from which the client derives the IP address it uses as the source in CVX packets that it transmits. And the **no shutdown (Management-CVX)** command enables CVX on the client switch.

Example

These commands configure the switch as a CVX client, connecting to a CVX server at IP address ***10.1.1.14*** and using IP address ***10.24.24.1*** as the source address for its outbound packets.

```
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.24.24.1/24
switch(config-if-Lo5)#management cvx
switch(config-mgmt-cvx)#server host 10.1.1.14
switch(config-mgmt-cvx)#source-interface loopback 5
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

14.1.5.4 CVX Client Services Configuration

Switches running EOS must be configured as CVX clients to access the network services running on CVX. Individual services may require additional configuration.

Refer to the following for information regarding the services available to a CVX client.

- Configuring VXLAN Control Service
- Configuring Hardware Switch Controller Service (HSC)
- Configuring Network Topology Service

14.1.5.4.1 Configuring OpenStack Service

The OpenStack service is enabled from CVX-OpenStack configuration mode, which is accessed by the **service openstack** command. The **no shutdown (CVX-OpenStack)** command enables CVX OpenStack services on the CVX server. Additional configuration is necessary to deploy OpenStack; http://docs.openstack.org/.

Example

- These commands enable the CVX-OpenStack service.

```
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#no shutdown
switch(config-cvx-openstack)#
```

14.1.5.4.2 Configuring VXLAN Control Service

The VXLAN control service is enabled on CVX by the **no shutdown (CVX-VXLAN)** command and on the client switches by enabling CVX and configuring the VXLAN as a controller client. When VXLAN control service is enabled, CVX functions as a VXLAN controller for its clients.

For information about configuring VXLAN on the client switch, see the VXLAN chapter of the *User Manual* .

Examples

- These commands enable VXLAN control service on the CVX server.

```
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#no shutdown
switch(config-cvx-vxlan)#
```

- These commands enable VXLAN Control Service on the CVX client. (This example assumes that the VXLAN has already been configured on the client switch. For information about configuring VXLAN, see the VXLAN chapter of the *User Manual*).

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan controller-client
```

14.1.5.4.3 Configuring Hardware Switch Controller Service (HSC)

The HSC service is enabled on the CVX server by the `no shutdown (CVX-HSC)` command.

Certificate Requirements for CVX Interoperability with VMware NSX *6.2.2* and higher

The certificate type needs to be changed from MD5 to SHA512 for use with VMware NSX *6.2.2*. Complete the following steps to make the change.

1. At the EOS prompt of CVX, use the following commands.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#shut
```

2. Acquire superuser privileges and edit the default.

```
switch(config)#bash
switch(config)#sudo su
switch(config)#vi /usr/bin/ovs-pki
```

3. Find and replace **default_md** with **sha512 (**from **md5)**.

```
default_md =md5
default_md =sha512
```

4. Delete all files and folders from `/persist/secure/openvswitch/`.

```
cd /persist/secure/openvswitch/
bash-4.1#sudo rm -r *
```

5. Generate the new certificate.

```
[admin@CVX ~]$ exit
logout
CVX(config-cvx-hsc)#no sh
CVX(config-cvx-hsc)#end
```

6. Verify the change using the command:

```
CVX#show nsx status
```

Example

These commands enable the CVX-HSC service.

```
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#no shutdown
```

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers

(such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the vtep (CVX-HSC) command.

Example

This command configures the CVX-HSC service to use send-to-any replication.

```
switch(config-cvx-hsc)#vtep flood list type all
switch(config-cvx-hsc)#
```

Note: HSC also makes use of the VXLAN control service; ensure that VXLAN control service is enabled and properly configured (see VXLAN Control Service for details).

HSC also requires a connection to an OVSDB controller. Configure the IP address or host name of the controller using the **`manager`** command.

Example

This command configures the CVX-HSC service to connect to an OVSDB controller at IP address ***192.168.2.5***, using the default port ***6632***.

```
switch(config-cvx-hsc)#manager 192.163.2.5
switch(config-cvx-hsc)#
```

Having established a connection to the OVSDB controller, the HSC service will publish the inventory of switches managed by CVX to OVSDB. For the inventory to succeed, LLDP must be enabled on each CVX client switch with the `lldp run` command.

Note: LLDP is enabled by default on Arista switches.

Example

This command enables LLDP.

```
switch(config)#lldp run
switch(config)#
```

14.1.5.4.4 Configuring Network Topology Service

A network topology agent runs on each Arista switch whether or not the switch is connected to a CVX server. It requires no configuration. The network topology service on the CVX server is also enabled by default and requires no configuration.

To view the aggregated topology information, use the **`show network physical-topology`** command on the switch running the CVX server instance.

Examples

- This command displays all visible hosts.

```
switch#show network physical-topology hosts
Unique Id            Hostname
-------------------- ------------------------------
001c.7385.be69       cvx287.sjc.aristanetworks.com
0000.6401.0000       cvc1
0000.6402.0000       cvc2
0000.6403.0000       cvc3
0000.6404.0000       cvc4
```

```
bcf6.85bd.8050       dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch#show network physical-topology neighbors
cvx287.sjc.aristanetworks.com
Interface          Neighbor Intf      Neighbor Host
------------------ ------------------ ----------------------
Ethernet1          Ethernet7          cvc4
Ethernet2          Ethernet7          cvc2
Ethernet9          Ethernet7          cvc1
Ethernet10         Ethernet7          cvc3
Management1        27                 dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE
  dsj14-rack14-tor1

Interface          Neighbor Intf      Neighbor Host
------------------ ------------------ ----------------------
27                 Management1        cvx287.sjc.aristanetwork
```

14.1.6 CVX Secure out-of-band Connection

This feature adds support for securing out-of-band connection between CVX server and CVX clients by SSL/TLS transport protocol. SSL/TLS is an application-layer protocol that provides secure transport between client and server through a combination of authentication, encryption and data integrity. SSL/TLS uses certificates and private-public key pairs to provide this security. We will use the term SSL to mean SSL/TLS.

By default, CVX server and CVX clients communicate over insecure transport (there is no authentication and encryption between CVX server and CVX clients). This poses the possibility of security risks, such as communicating with untrusted CVX server and CVX clients, or eavesdropping CVX server/client communications. This feature can be used to secure the out-of-band connection between CVX server and CVX clients.

Note: The CVX client-server out-of-band connection uses port 50003. The CVX cluster peer out-of-band connection uses port 50004. These are TCP ports.

For more information, see:

- Show Commands

14.1.6.1 Configuring the CVX Secure out-of-band Connection

This feature uses SSL certificate and key management infrastructure for managing certificates, keys and SSL profiles. For more information regarding this infrastructure see *SSL Certificate and Key Management* in the *Arista Users Guide*.

1. On CVX server, copy the server certificate and key and also the CA certificate to verify CVX clients.

```
switch(config)#!Copy the PEM encoded certificate and RSA key files for
 CVX server
switch(config)#!Lets call them server.crt and server.key
switch(config)#copy <url> certificate:server.crt
switch(config)#copy <url> sslkey:server.key
switch(config)#!Copy the PEM encoded CA certificate to verify the
 certificate of CVX clients.Lets call it ca.crt
switch(config)#copy <url> certificate:ca.crt
```

2. On CVX server, configure SSL profile with the certificates and key as below. Lets call the SSL profile as serverssl.

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile serverssl
switch(config-mgmt-sec-ssl-profile-serverssl)#certificate server.crt
 key server.key
switch(config-mgmt-sec-ssl-profile-serverssl)#!You can trust multiple
 CA certificates
switch(config-mgmt-sec-ssl-profile-serverssl)#trust certificate ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **server.crt -> intermediate1.crt -> intermediate2.crt -> ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-serverssl)#chain certificate
 intermediate1.crt
switch(config-mgmt-sec-ssl-profile-serverssl)#chain certificate
 intermediate2.crt
```

3. On CVX server, configure to use the serverssl SSL profile. With this configuration, the CVX server starts listening on a secure port. The CVX server will continue to listen on the default port. i.e., the CVX server will accept connections from CVX clients over both SSL and default non-SSL transports. During a SSL negotiation, the CVX server will authenticate itself to the CVX clients by presenting server.crt and it verifies the authenticity of the CVX client by checking if the CVX client certificate is signed by the trusted certificate ca.crt.

```
switch(config)#cvx
switch(config-cvx)#ssl profile serverssl
```

4. On CVX client, copy the client certificate and key and also the CA certificate to verify CVX server.

```
switch(config)#!Copy PEM encoded certificate and RSA key files for CVX
 client
switch(config)#!Lets call them client.crt and client.key
switch(config)#copy <url> certificate:client.crt
switch(config)#copy <url> sslkey:client.key
switch(config)#!Copy PEM encoded CA certificate used to verify the
switch(config)#!certificate of CVX server. Lets call it ca.crt
switch(config)#copy <url> certificate:ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **client.crt -> intermediate1.crt -> intermediate2.crt -> ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-clientssl)#chain certificate
 intermediate1.crt
switch(config-mgmt-sec-ssl-profile-clientssl)#chain certificate
 intermediate2.crt
```

5. On CVX client, configure SSL profile with the certificates and key as below. Lets call the SSL profile as clientssl.

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile clientssl
switch(config-mgmt-sec-ssl-profile-clientssl)#certificate client.crt
 key client.key
switch(config-mgmt-sec-ssl-profile-clientssl)#!You can trust multiple
 CA certificates
switch(config-mgmt-sec-ssl-profile-clientssl)#trust certificate ca.crt
```

6. On CVX client, configure to use the SSL profile clientssl. With this configuration, the CVX client will connect to the secure port of the CVX server over SSL transport. During SSL negotiation, the CVX client will authenticate itself to the CVX server by presenting client.crt and it verifies the authenticity of the CVX server by checking if the CVX server certificate is signed by the trusted certificate ca.crt.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#ssl profile clientssl
```

14.1.6.2 Show Commands

For information regarding show commands of SSL certificate, key and profile, please refer to *SSL Certificate and Key Management*.

To show the SSL profile status on CVX server, use the **show cvx** command.

```
switch#show cvx

CVX Server
 Status: Enabled
 UUID: beb19142-dfaa-11e4-b996-001c73105347
 Heartbeat interval: 20.0
 Heartbeat timeout: 60.0
 SSL profile: serverssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled for CVX server and the CVX clients can connect to CVX server over SSL transport. If there are any errors, then the status will show Disabled and the reason will be listed. In Disabled state, the CVX clients wont be able to connect to CVX server over SSL transport.

To show the SSL connection status of CVX clients on CVX server, use the show cvx connections command.

```
switch#show cvx connections

Switch 00:1c:73:10:53:48
 Hostname: sq302
 Status: up
Last heartbeat sent: 0:00:04 ago
Last heartbeat received: 0:00:10 ago
Clock offset: -0.00201620385865
Out-of-band connection: SSL secured
In-band connection: Not secured (SSL not supported)
```

The out-of-band connection shows as SSL secured, which means that the CVX client has connected to CVX server over SSL transport. The in-band connection is another connection between CVX server and CVX client. The SSL is not yet supported for this connection and hence it shows as SSL not supported. There is already some level of protection for the in-band connection. The CVX server and CVX client opens up the access to in-band connection only if the out-of-band connection is successful. Since the out-of-band connection is configured to use SSL, the in-band connection access is granted only for authentic CVX client and CVX server.

To show SSL profile status and connection status on CVX client, use the show management cvx command.

```
switch#show management cvx

CVX Client
 Status: Enabled
 Last connected time: 2015-04-14 11:16:19
```

```
 Connection status: Connected
  Out-of-band connection: SSL secured
  In-band connection: Not secured (SSL not supported)
Negotiated version: 2
Controller UUID: 0e7dee2e-e2cf-11e4-880f-001c73105347
Controller: 127.0.0.1
  Last heartbeat sent: 0:00:00 ago
  Last heartbeat received: never
  Clock offset: 0.0
SSL profile: clientssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled and the CVX client can connect to CVX server over SSL transport. If there are any errors, then the status will show as Disabled and the reason will be listed. In Disabled state, the CVX client wont be able to connect to the CVX server.

Similar to the CVX server, the out-of-band connection shows as SSL secured and the SSL is not yet supported for in-band connection.

The possible reasons for Disabled SSL status on CVX server and CVX client are:

- **SSL profile does not exist:** If the SSL profile configured under CVX server/client is not configured under management security, you will see this message. Configure the SSL profile with required certificates and key under management security.
- **Invalid SSL profile:** If the SSL profile configured under CVX server/client is in invalid state, you will see this message. Check `show management security ssl profile <name>` command to see the errors on the SSL profile and fix them.
- **Trusted certificates not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have trusted certificates configured, you will see this message. Please configure trusted CA certificates in the SSL profile.
- **Certificate not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have certificate key pair configured, you will see this message. Please configure certificate and key pair in the SSL profile.

Diffie-Hellman parameters not yet ready: When EOS is booted, a Diffie-Hellman parameters file is auto generated by the system if one does not exist. This Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. Only the CVX server uses this file and hence this message can be seen only on `show cvx` command output. If the file is not yet generated, you will see this message. When the file is ready, this message automatically goes away and the SSL profile will become Enabled.

14.1.7 CVX High Availability

CVX provides high availability by enabling you to use multiple (redundant) CVX Controllers in the same cluster. Each Controller in the cluster has its own dedicated machine so that if a Controller fails, the failure is isolated to a single machine.

Within a cluster, one of the Controllers is a primary (leader), and the other Controllers are backup (follower) Controllers. If the primary Controller fails, one of the backup Controllers automatically assumes the role of the primary Controller.

CVX high availability does not prevent or compromise the detection of software failures or link failures that may cause Controllers to be unreachable on the network.

The configuration that is required to ensure CVX is set up for high availability involves:

- Configuring the CVX cluster.
- Configuring the CVX clients.

For more information, see:

- CVX Clusters

- Handling of CVX Controller Failures
- CVX Support for EOS Failure Modes
- Client Interaction
- Service Agents Interaction
- Leader Election
- Configuring CVX Clusters for High Availability
- Configuring CVX Clients for High Availability

14.1.7.1 CVX Clusters

CVX clusters are sets of CVX Controllers (usually 3 Controllers). Within a cluster, each Controller runs on its own dedicated machine, and all of the Controllers run the same version of CVX. Each Controller in the cluster functions as either the primary (leader) Controller, or a backup (follower) Controller.

One of the CVX Controllers is elected by the group of Controllers to be the primary Controller. Once a Controller is elected to be the primary, the other Controllers in the cluster are automatically assigned the role of backup Controllers. Cluster members maintain an out-of-band connection amongst themselves, which is used for the leader election protocol.

CVX Controllers in a cluster that are not the primary Controller always function as backup Controllers. Within the same cluster, only one CVX Controller can assume the role of a primary at any time.

For more information, see:

- Required Number of Controllers to Support High Availability
- Cluster Configuration Options

14.1.7.1.1 Required Number of Controllers to Support High Availability

A cluster must have enough Controllers so that in the case of a failure of the primary Controller, there are enough remaining Controllers for the election process to be completed. The election process is used by clusters to select a new primary Controller in the case of failure.

Note: The number of Controllers for a cluster is **3** (one primary and two backup Controllers).

Examples

In a cluster with only **two** Controllers (one primary and one backup), a simple majority of backup Controllers does not exist after a failure of the primary Controller. A simple majority of two backup Controllers is required for the leader election process.

- Service Agents Interaction
- Leader Election

14.1.7.1.2 Cluster Configuration Options

You can configure the cluster for high availability using either of the following modes:

- Cold followers mode - Only the Controllerdb of the primary (leader) CVX Controller mounts from the client switches.
- Warm followers mode - The Controllerdb of every (all) CVX Controllers in the cluster mount from the client switches.

Advantages and disadvantages of the modes

The advantage of the warm follower mode is that if the primary CVX Controller fails, the switchover to the new primary is faster than a switchover in cold follower mode. The reason for this is that the state of the new primary does not have to be rebuilt from scratch. The disadvantage of the warm follower mode is that serialization from the switch is slower compared to cold follower mode.

- CVX Support for EOS Failure Modes
- Client Interaction
- Service Agents Interaction
- Leader Election

14.1.7.2 Handling of CVX Controller Failures

CVX Controllers can fail because of hardware or software faults. Because EOS agents are designed to be software fault-tolerant, an agent that fails is automatically restarted and resumes operation statefully. The most recent saved state in Sysdb for the agent is used to restore the state of the agent.

Unlike software failures, hardware failures are not handled by EOS. CVX handles hardware failures through the use of redundant backup (follower) CVX Controllers that run on their own dedicated machine. Within a cluster, any backup Controller can assume the role of the primary (leader) Controller.

Note: In the event of a network partition, the partition with a majority of the Controllers elects a leader from its Controllers, and the minority partition relinquishes any leadership it might have had.

Related Topics

- CVX Clusters
- CVX Support for EOS Failure Modes
- Client Interaction
- Service Agents Interaction
- Leader Election

14.1.7.3 CVX Support for EOS Failure Modes

CVX supports both EOS failure modes that apply when a CVX Controller fails. The EOS failure modes are:

- Fail-stop
- Fail-recover

Because CVX supports both EOS failure modes, a failed CVX Controller can rejoin the cluster if the following failures occur:

- A crash of the agent or machine running CVX.
- The CVX controller or dedicated machine it runs on is removed (partitioned) from the cluster.

Related Topics

- Handling of CVX Controller Failures
- CVX Clusters
- Client Interaction
- Service Agents Interaction
- Leader Election

14.1.7.4 Client Interaction

Client switches maintain an out-of-band connection to all members of the cluster. The connection is used to determine liveness and for communications. The connection is also used to signal a change in leadership (switchover) to the client switches. Switchovers that are changes in leadership within a cluster are executed similarly to CVX Graceful Reboot switchovers.

The ControllerClient agent on the switch is responsible for maintaining liveness with the Controllers and for exchanging metadata. The ControllerClient agent registers with all cluster members. Each Controller's ControllerStatus has an additional flag to record whether the Controller is a leader within the cluster.

If there is more than one leader, the switch automatically waits until only one Controller is designated as the leader in the cluster. Once a single Controller is designated as the leader, the switch executes a graceful switchover to the new leader Controller.

- Client Interaction
- Service Agents Interaction
- Leader Election

14.1.7.5 Service Agents Interaction

One change to Service Agents is required to support CVX high availability. Service Agents must be modified to include the leader flag (this flag identifies the leader CVX Controller in the cluster). On a leader switchover, Service Agents are deactivated on the old leader Controller and activated on the new leader Controller. The client switches will perform a graceful switchover to the new leader Controller.

- Handling of CVX Controller Failures
- CVX Clusters
- CVX Support for EOS Failure Modes
- Client Interaction
- Leader Election

14.1.7.6 Leader Election

Leader election is an internal, system-run process that is essential to CVX high availability. The leader election process is used to safely elect a new leader Controller within a cluster following the failure of the current leader Controller, or a network configuration change that results in the loss of the current leader Controller in the cluster.

The leader election process is designed to ensure stability of leader Controllers within clusters. The process is based on an algorithm that provides the mechanism for the backup (follower) Controllers to elect (by consensus), the new leader Controller in the cluster.

14.1.7.7 Configuring CVX Clusters for High Availability

Configuring CVX clusters for high availability is a simple process that involves pointing each cluster member to the other cluster members using the peer host command. The objective of this task is to successfully register each cluster member with the other cluster members. Successful registration of the cluster members with each other ensures that the members can communicate with each other to elect a new leader member if the original leader member fails.

Once you complete the process, the cluster members will be successfully registered with each other. In addition, the cluster members will automatically elect a leader member and assign the leader to that member. The non-leader members are automatically assigned the role of follower.

Requirements

The requirements for setting up clusters for high availability are:

- The number of CVX Controllers in a cluster is **3**.
- An **odd number** of CVX instances (CVX Controllers) are required to form a cluster.

> **Note:** If an even number of CVX Controllers are configured in a cluster, a CVX instance will automatically refuse to participate in the cluster.

- All cluster members must point to each other. This is essential for clusters to operate normally. (The steps required to complete this task are included in the following procedure.)

Procedure

> **Note:** This procedure provides configuration examples for each step. The example cluster used throughout the procedure contains 3 cluster members (named *cvs1*, *cvs2*, and *cvs3*). The IP addresses of the cluster members are:
>
> - *cvs1* (*10.0.0.1*)
>
> - *cvs2* (*10.0.0.2*)
>
> - *cvs3* (*10.0.0.3*).

Complete the following steps to configure clusters for high availability.

1. Using the peer host command, configure one of the cluster members to point to every other cluster member.

   This example shows the configuration of cluster member ***cvs1*** to point to the other cluster members (*cvs2* and *cvs3*).

   ```
   cvs1(config-cvx)#peer host 10.0.0.2 (connects cvs1 to cvs2)
   cvs1(config-cvx)#peer host 10.0.0.3 (connects cvs1 to cvs3)
   ```

2. Use the `sh cvx` command to check the **Mode** and **Peer registration state** status values for cluster member *cvs1*. The status values should be:

   - **Mode** = *Cluster*
   - **Peer registration state** = *Connecting*

   > **Note: Mode** automatically changes from Standalone to Cluster when configuring a CVX cluster. This is because the presence of multiple CVX peers causes the Mode to change to Cluster.
   >
   > **Peer registration state** remains in Connecting status after you configure the first cluster member. This is because the two peers must register with each other for the registration of the two members to be successful.

3. Using the peer host command, configure peer cluster member *cvs2* to point to every other cluster member.

   This example shows the configuration of cluster member ***cvs2*** to point to the other cluster members (*cvs1* and *cvs3*).

   ```
   cvs2(config-cvx)#peer host 10.0.0.1 (connects cvs2 to cvs1)
   cvs2(config-cvx)#peer host 10.0.0.3 (connects cvs2 to cvs3)
   ```

4. Use the sh cvx command to check the **Peer registration state** settings for *cvs1*. This is done to verify that peers *cvs1* and *cvs2* are successfully registered with each other.

```
cvs1(config-cvx)#sh cvx
```

Example

This example shows the output of the sh cvx command for *cvs1*. The **Peer registration state** setting of Registration Complete for peer *cvs2 indicates a successful registration between cvs1 and cvs2*.

```
cvs1(config-cvx)#sh cvx

CVX Server
 Status: Enabled
 UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
 Mode: Cluster
 Heartbeat interval: 20.0
 Heartbeat timeout: 60.0
 Cluster Status
  Name: default
  Role: Standby
  Leader: 10.0.0.2
  Peer timeout: 10.0
  Last leader switchover timestamp: 0:00:03 ago
  Peer Status for 10.0.0.3
   Peer registration state: Connecting
   Peer service version compatibility : Version mismatch
  Peer Status for 10.0.0.2
   Peer Id : 02-01-63-02-00-00
   Peer registration state: Registration complete
   Peer service version compatibility : Version ok
```

5. Using the peer host command, configure peer cluster member *cvs3* to point to every other cluster member.

   This example shows the configuration of cluster member ***cvs3*** to point to the other cluster members (*cvs1* and *cvs2*).

```
cvs3(config-cvx)#peer host 10.0.0.1 (connects cvs3 to cvs1)
cvs3(config-cvx)#peer host 10.0.0.2 (connects cvs3 to cvs2)
```

6. Use the `sh cvx` command to check the **Peer registration state** settings for *cvs1*. This is done to verify that peers *cvs1* and *cvs3* are successfully registered with each other.

```
cvs1(config-cvx)#sh cvx
```

Example

This example shows the output of the `sh cvx` command for *cvs1*. The **Peer registration state** setting of Registration Complete for peer *cvs3 indicates a successful registration between cvs1* and *cvs3*.

```
cvs1(config-cvx)#sh cvx

CVX Server
 Status: Enabled
 UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
 Mode: Cluster
 Heartbeat interval: 20.0
 Heartbeat timeout: 60.0
 Cluster Status
```

```

Last leader switchover timestamp: 0:05:37 ago
Peer Status for 10.0.0.3
 Peer Id : 02-01-63-03-00-00
 Peer registration state: Registration complete
 Peer service version compatibility : Version ok
Peer Status for 10.0.0.2
 Peer Id : 02-01-63-02-00-00
 Peer registration state: Registration complete
 Peer service version compatibility : Version ok
```

Next Step

You are now ready to configure the CVX clients for high availability (see Configuring CVX Clients for High Availability).

14.1.7.8 Configuring CVX Clients for High Availability

Configuring CVX clients for high availability is a simple process that involves pointing each CVX client to every CVX cluster member using the server host command. The objective of this task is to successfully establish connections between each CVX client and every CVX cluster member. The connections are essential to ensure that the CVX clients are aware of the current status of each cluster member.

Note: If a CVX client is not pointing to every cluster member, or if it is pointing to a CVX instance (Controller) that is not part of the cluster, the client may not be aware of leadership changes in the cluster, or may become confused about which cluster member is currently the leader. Either of these scenarios can result in unexpected errors.

Once you complete the process, the CVX clients will have established connections with each cluster member (the Connection status for each Controller should be Established). In addition, the clients will be aware of which CVX instance (Controller) is currently the leader in the cluster.

Procedure

Note: This procedure provides configuration examples for each step. The example CVX client used throughout the procedure is named cvc1. The IP addresses of the cluster members are *10.0.0.1* (*cvs1*), *10.0.0.2* (*cvs2*), and *10.0.0.3* (*cvs3*).

Complete the following steps to configure CVX clients for high availability.

1. Using the server host command, configure each of the CVX clients to point to every cluster member.

   This example shows the configuration of client ***cvc1*** to point to all of the cluster members (the addresses of the cluster members are *10.0.0.1*, *10.0.0.2*, and *10.0.0.3*).

```
cvc1(config-mgmt-cvx)#server host 10.0.0.1 (connects cvc1 to cluster
 member 10.0.0.1)
cvc1(config-mgmt-cvx)#server host 10.0.0.2 (connects cvc1 to cluster
 member 10.0.0.2)
cvc1(config-mgmt-cvx)#server host 10.0.0.3 (connects cvc1 to cluster
 member 10.0.0.3)
```

2. Use the sh man cvx command to check the status of client ***cvc1***.

   The Connection status for each cluster member should be Established. In addition, the client is also aware that cluster member *10.0.0.3* is the current Master.

```
cvc1(config-mgmt-cvx)#sh man cvx
```

```
CVX Client
 Status: Enabled
 Source interface: Inactive (Not configured)
 Controller cluster name: default
  Controller status for 10.0.0.1
   Connection status: established
    Out-of-band connection: Not secured
    In-band connection: Not secured (SSL not supported)
   Negotiated version: 2
   Controller UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
   Last heartbeat sent: 0:00:07 ago
   Last heartbeat received: 0:00:07 ago
 Controller status for 10.0.0.3
  Master since 0:03:34 ago
  Connection status: established
   Out-of-band connection: Not secured
   In-band connection: Not secured (SSL not supported)
 Negotiated version: 2
 Controller UUID: c64954b8-7324-11e5-9f33-51f8b016cae8
 Last heartbeat sent: 0:00:14 ago
 Last heartbeat received: 0:00:14 ago
Controller status for 10.0.0.2
 Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
 Negotiated version: 2
 Controller UUID: 6a0dbf2c-7324-11e5-94f3-ff17a8a1cdc8
 Last heartbeat sent: 0:00:05 ago
 Last heartbeat received: 0:00:05 ago
```

14.1.8 CVX VIP

CVX VIP provides the virtual IP address that actively follows the master controller of the CVX cluster.

The virtual IP address of the CVX HA Cluster is configured on a macvlan interface setup on top of a physical management interface of the master controller. The virtual IP and virtual MAC needs to be provided by the customer as part of the controller configuration. This information is available to all controllers as each cluster member has to be configured manually by the user on all controllers.

The macvlan interface created should be designated as `***Management0***`. `***Management0***` is currently used for the ManagementActive interface on modular switches. Without explicit configuration of VIP and VMAC, CVX VIP functionality will not work in the CVX HA cluster.

Customers can pick the VMAC from a pool of MAC addresses reserved for use with CVX clusters. The OUI pool, 00:1C:73:00:00:AA “ 00:1C:73:00:00:FF has been reserved for this purpose.

The macvlan interface is setup if all of the following conditions are met:

- VMAC is configured by the user
- The controller instance is a leader
- There are more than one controller instances
- The controller is not being run on a modular system

- CVX VIP
- Data Replication
- SSH Host Key Tagging

14.1.8.1 Configuring VIP

All CLI commands applicable to the management interface of the controller will be allowed on `***Management0***`, with the exception of Layer 1 / phy level commands. So auto-negotiation or flow control cannot be configured on the `***Management0***` interface. Instead these commands can only be run on the physical management interfaces. This makes sense as the phy-level configuration really depends on what the interface is physically wire.

To configure VMAC/VIP

```
CVX(config)#interface management 0
CVX(config-if-Ma0)# mac-address 00:1C:72:00:00:FF
CVX(config-if-Ma0)# ip address 10.0.0.2
```

14.1.8.2 Data Replication

At EOS boot time, SSH host keys and Diffie-Hellman parameters are automatically generated and persistently stored on each controller. Multiple SSL profiles / keys / certificates might also be created and used by various agents on the controllers. Since these information contribute to the identity of the master, they will need to follow the master controller for all time.

In case of a controller switchover, the newly elected master controller will need to use the same SSH host keys & SSL profiles / keys / certificates to retain its identity and prevent any kind of network security alarms from being tripped. For example, if an SSH client notices that the host key has changed, it will normally flag an error warning the user of a possible man-in-the-middle type attack. Hence, this data will be replicated from the master to slaves.

14.1.8.3 SSH Host Key Tagging

SSH host keys are tagged with the chassis MAC address to deal with key regeneration issues when a supervisor module is moved from one chassis to another. This behavior will cause regeneration issues if we replicate the SSH host keys across the cluster resulting in the key fingerprint seen by management tools to be different.

To mitigate this, in addition to the chassis MAC address, the host keys would now be tagged with VMAC of the CVX HA cluster. If CVX VIP and VMAC are configured, SshHostKeysAgent will not regenerate keys if tagged VMAC and configured VMAC are the same, even if there is a mismatch between the chassis MAC and tagged MAC.

14.1.9 CVX Command Descriptions

CVX Server Commands

- cvx
- heartbeat-interval (CVX)
- heartbeat-timeout (CVX)
- port (CVX)
- show cvx
- shutdown (CVX)

CVX Client Commands

- management cvx
- heartbeat-interval (Management-CVX)
- heartbeat-timeout (Management-CVX)
- server host (Management-CVX)
- source-interface (Management-CVX)
- shutdown (Management-CVX)

CVX OpenStack Commands

- name-resolution force (CVX-OpenStack)
- name-resolution interval (CVX-OpenStack)
- service openstack
- shutdown (CVX-OpenStack)

CVX VXLAN Control Service Commands

- resync-period
- service vxlan
- shutdown (CVX-VXLAN)
- vtep (CVX-VXLAN)

CVX Hardware Switch Controller (HSC) Commands

- manager
- ovsdb-shutdown
- shutdown (CVX-HSC)
- vtep (CVX-HSC)

CVX Network Topology Service Commands

- lldp run
- show network physical-topology

Related Topics

- CVX Overview
- CVX Services
- Deploying CVX
- CVX Configuration
- CVX Secure out-of-band Connection
- CVX High Availability

14.1.9.1 cvx

CVX (CloudVision eXtension) aggregates and shares status across a network of physical switches running EOS. CVX services provide visibility and coordinate activities across a network of switches that are configured as CVX clients.

The **cvx** command enters CVX configuration mode. CVX configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting CVX configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no cvx** and **default cvx** commands restore all CVX server defaults by deleting all CVX configuration mode statements from running-config.

Command Mode

Global Configuration

Command Syntax

```
cvx

no cvx

default cvx
```

Commands Available in CVX Configuration Mode

- port (CVX)
- service openstack
- service vxlan
- shutdown (CVX)
- heartbeat-interval (CVX)
- heartbeat-timeout (CVX)

Example

- These commands enter CVX-configuration mode and display the CVX configuration.

```
switch(config)#cvx
switch(config-cvx)#show active all

 cvx
  shutdown
  port 9979
  heartbeat-interval 20
  heartbeat-timeout 60
  no service vxlan
  service openstack
   shutdown
   name-resolution interval 21600
switch(config-cvx)#
```

14.1.9.2 heartbeat-interval (CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX server. Heartbeat messages are part of the keepalive mechanism between CVX and the CVX clients to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands restore the heartbeat interval to the default setting by removing the **heartbeat-interval** command from **running-config**.

Command Mode

CVX Configuration

Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

Parameters

- **period** Interval duration (seconds). Value ranges from 5 through 60. Default value is 20.

Related Commands

- **cvx**
- **heartbeat-timeout (CVX)**

Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When a client stops receiving heartbeat messages from the server within a specified period, the client assumes that the CVX server is no longer functioning.

Best practices dictate that CVX and its client applications configure identical heartbeat interval values.

Examples

- This command configures a CVX server heartbeat interval of 30 seconds:

```
switch(config)#cvx
switch(config-cvx)#heartbeat-interval 30
switch(config-cvx)#
```

14.1.9.3 heartbeat-interval (Management-CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX client. Heartbeat messages are part of the keepalive mechanism between the CVX client and the CVX server to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

`heartbeat-interval` period

`no heartbeat-interval`

`default heartbeat-interval`

Parameters

period: Interval duration (seconds). Value ranges from 5 through 60. Default value is 20.

Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When the server stops receiving heartbeat messages from a client within a specified period, the server assumes that the device it is no longer functioning as a CVX client.

Best practices dictate that the CVX client's heartbeat interval value is identical to that of its CVX server.

Related Commands

- heartbeat-timeout (Management-CVX) specifies the CVX client timeout interval.

Example

These commands configure a CVX client heartbeat interval of 30 seconds:

```
switch(config)#management cvx
switch(config-mgmt-cvx)#heartbeat-interval 30
switch(config-mgmt-cvx)#
```

14.1.9.4 heartbeat-timeout (CVX)

The **heartbeat-timeout** command specifies the CVX timeout period. When a CVX server does not receive consecutive heartbeat messages from a CVX client within the heartbeat timeout period, the server discontinues providing CVX services to the client device. The default timeout period is 60 seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout-timeout** commands restore the heartbeat timeout to the default setting by removing the heartbeat-timeout command from running-config.

Command Mode

CVX Configuration

Command Syntax

heartbeat-timeout period

no heartbeat-timeout

default heartbeat-timeout

Related Commands

- cvx places the switch in CVX configuration mode.
- heartbeat-interval (CVX) specifies the CVX heartbeat interval.

Parameters

- period: heartbeat timeout interval (seconds). Value ranges from 15 to 10800. Default value is 60.

Guidelines

Best practices dictate that CVX and its client applications configure identical heartbeat timeout values.

Examples

- These commands set the CVX timeout period to 90 seconds.

```
switch(config)#cvx
switch(config-cvx)#heartbeat-timeout 90
switch(config-cvx)#
```

14.1.9.5 heartbeat-timeout (Management-CVX)

The **heartbeat-timeout** command specifies the CVX client timeout period. When a CVX client does not receive consecutive heartbeat messages from a CVX server within the period specified by this command, the client assumes that its connection to CVX is disrupted. The default timeout period is 60 seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout** commands restore the CVX client heartbeat timeout to the default setting by removing the **heartbeat-timeout** command from ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

`heartbeat-timeout` period

`no heartbeat-timeout`

`default heartbeat-timeout`

Parameters

period: heartbeat timeout interval (seconds). Value ranges from 15 to 10800. Default value is 60

Guidelines

Best practices dictate that the CVX client's heartbeat timeout value is identical to that of its CVX server.

Related Commands

- heartbeat-interval (Management-CVX) specifies the CVX client heartbeat interval.

Example

These commands set the CVX client timeout period to 90 seconds.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

14.1.9.6 lldp run

The **lldp run** command enables LLDP on the Arista switch.

Command Mode

Global Configuration

Command Syntax

```
lldp run

no lldp run

default lldp run
```

Examples

- This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run
switch(config)#
```

- This command disables LLDP globally on the Arista switch.

```
switch(config)# no lldp run
switch(config)#
```

14.1.9.7 management cvx

The **`management cvx`** command places the switch in **mgmt-CVX configuration** mode to configure CVX client parameters.

Mgmt-CVX configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting mgmt-CVX configuration mode does not affect running-config. The **`exit`** command returns the switch to global configuration mode.

The **`no management cvx`** and **`default management cvx`** commands delete all mgmt-CVX configuration mode statements from running-config.

Command Mode

Global Configuration

Command Syntax

```
management cvx
no management cvx
default management cvx
exit
```

Commands Available in Mgmt-CVX Configuration Mode

- `heartbeat-interval (Management-CVX)`
- `heartbeat-timeout (Management-CVX)`
- `server host (Management-CVX)`
- `source-interface (Management-CVX)`
- `shutdown (Management-CVX)`

Examples

- This command places the switch in mgmt-CVX configuration mode:

```
switch(config)#management cvx
switch(s1)(config-mgmt-cvx)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-cvx)#exit
switch(config)#
```

14.1.9.8 manager

The **manager** command configures the IP address of the OVSDB controller for the HSC service, allowing CVX to connect to the controller.

The **no manager** and **default manager** commands remove the HSC manager configuration from **running-config**.

Command Mode

CVX-HSC Configuration

Command Syntax

```
manager ip_address [port]
```

Parameters

ip_address IP address of the HSC manager.

port connection port. Values range from 1 to 65535; default value is 6632.

Related Commands

- **service hsc** places the switch in CVX-HSC configuration mode.

Example

- These commands point the HSC service to a controller at IP address *192.168.2.5* using the default port *6632*.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#manager 192.163.2.5
switch(config-cvx-hsc)#
```

14.1.9.9 name-resolution force (CVX-OpenStack)

The **name-resolution force** command initiates an OpenStack controller function that communicates with the OpenStack Keystone and Nova services to update names of VMs and tenants mapped by the local OpenStack instance.

The OpenStack controller accesses the Keystone and Nova services in response to various triggering events (such as the creation of a new tenant, network or VM), and also at a regular interval configured by the **name-resolution interval (CVX-OpenStack)** command (default interval 6 hours). The **name-resolution force** command is used to force an immediate update without waiting for a triggering event.

Command Mode

CVX-OpenStack Configuration

Command Syntax

```
name-resolution force
```

Related Commands

- **service openstack** places the switch in CVX-OpenStack configuration mode.
- **name-resolution interval (CVX-OpenStack)** sets the interval for automatic Keystone updates.

Example

- These commands update the OpenStack instance immediately with data from the Keystone service.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#name-resolution force
switch(config-cvx-openstack)#
```

14.1.9.10 name-resolution interval (CVX-OpenStack)

The **name-resolution interval** command specifies the period between consecutive requests that the OpenStack controller sends to the Keystone service for VM and tenant name updates. Keystone is OpenStack's authentication and authorization service.

The default period is 21600 seconds (6 hours).

The **name-resolution force (CVX-OpenStack)** command performs an immediate update, as opposed to waiting for the periodic update.

Command Mode

CVX-OpenStack Configuration

Command Syntax

```
name-resolution interval period
```

Parameters

period: Keystone identity service polling interval (seconds).

Related Command

service openstack places the switch in **CVX-OpenStack** configuration mode.

Example

These commands set the name resolution interval period at five hours.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#name-resolution interval 18000
switch(config-cvx-openstack)#
```

14.1.9.11 ovsdb-shutdown

The **ovsdb-shutdown** command shuts down the OVSDB server.

The **no ovsdb-shutdown** and **default ovsdb-shutdown** commands enable the OVSDB server by removing the ovsdb-shutdown commandfrom running-config.

Command Mode

CVX-HSC Configuration

Command Syntax

```
ovsdb-shutdown

no ovsdb-shutdown

default ovsdb-shutdown
```

Related Commands

- **service hsc** places the switch in **CVX-HSC configuration** mode.

Example

- These commands shut down the OVSDB server used by the HSC service.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#ovsdb-shutdown
switch(config-cvx-hsc)#
```

14.1.9.12 port (CVX)

The **port** command specifies the TCP port number the CVX server listens on. The default port number is **9979**.

The **no port** and **default port** commands restore the default port number by removing the port statement from **running-config**.

Command Mode

CVX Configuration

Command Syntax

`port` *port_number*

`no port`

`default port`

Parameters

- *port_number*: TCP port number. Value ranges from 1 to 65535.

Related Commands

- cvx places the switch in **CVX configuration** mode.

Example

- These commands configure **9500** as the CVX server port.

```
switch#config
switch(config)#cvx
switch(config-cvx)#port 9500
switch(config-cvx)#
```

- These commands restore the default port (9979) as the CVX server port.

```
switch(config-cvx)#no port
switch(config-cvx)#
```

14.1.9.13 resync-period

The **resync-period** command configures the grace period for completion of synchronization between the VXLAN control service and clients after a CVX restart. Arista recommends leaving the grace period set to its default of 300 seconds.

The **no resync-period** command disables VXLAN control service graceful restart. The **default resync-period** command resets the grace period to its default of 300 seconds.

Command Mode

CVX-VXLAN Configuration

Command Syntax

`resync-period` *seconds*

`no resync-period`

`default resync-period`

Parameters

- *seconds*: synchronization grace period in seconds. Values range from 30 to 4800; default is 300.

Examples

- These commands reset the VXLAN control service synchronization grace period to 300 seconds.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#default resync-period
switch(config-cvx-vxlan)#
```

14.1.9.14 server host (Management-CVX)

The **server host** command configures the IP address or host name of the CVX server to which the CVX client device connects. The configuration of this address is required for the switch to function as a CVX client. By default, no CVX host address is specified.

The **no server host** and **default server host** commands remove the CVX host address assignment by removing the server host statement from running-config.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
server host host

no server host

default server host
```

Parameters

- host: IPv4 address (in dotted decimal notation) or FQDN host name of the CVX server.

Examples

- This command specifies *10.1.1.14* as the address of the server to which the CVX client connects.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#server host 10.1.1.14
switch(config-mgmt-cvx)#
```

14.1.9.15 service hsc

The **service hsc** command enters **CVX-HSC configuration** mode where the HSC service is enabled and configured.

CVX-HSC configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **CVX-HSC configuration** mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

service hsc

Commands Available in CVX-HSC Configuration Mode

- manager
- ovsdb-shutdown
- shutdown (CVX-HSC)

Related Commands

- **cvx** places the switch in CVX configuration mode.

Example

- These commands enter **CVX-HSC configuration** mode.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#
```

14.1.9.16 service openstack

The service openstack command places the switch in CVX-OpenStack configuration mode.

In order to integrate Arista switches into an OpenStack managed cloud network, OpenStack needs to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to hosts where the VMs reside.

CVX-OpenStack configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **CVX-OpenStack** configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

```
service openstack
```

Commands Available in CVX-OpenStack Configuration Mode

- `name-resolution force (CVX-OpenStack)`
- `name-resolution interval (CVX-OpenStack)`
- `shutdown (CVX-OpenStack)`

Related Commands

- **cvx** places the switch in CVX configuration mode.

Example

- These commands places the switch in **CVX-OpenStack** configuration mode.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#
```

14.1.9.17 service vxlan

The service vxlan command enters **CVX-VXLAN configuration** mode where the VXLAN control service is enabled and configured.

CVX-VXLAN configuration mode is not a group change mode; ***running-config*** is changed immediately upon entering commands. Exiting **CVX-VXLAN configuration** mode does not affect running-config. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

```
service vxlan
```

Commands Available in CVX-VXLAN Configuration Mode

- `resync-period`
- `shutdown (CVX-VXLAN)`
- `vtep (CVX-VXLAN)`

Related Commands

- **cvx** places the switch in CVX configuration mode.

Example

- These commands enter **CVX-VXLAN configuration** mode.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#
```

14.1.9.18 show cvx

The **show cvx** command displays the enable status and current configuration of CVX.

Command Mode

EXEC

Command Syntax

```
show cvx
```

Example

- This command displays status and configuration of CVX.

```
switch(config)#cvx
 cvx
 no shutdown
 heartbeat-interval 30
 heartbeat-timeout 90
switch(config-cvx)#dis
switch>show cvx
CVX Server
 Status: Enabled
 UUID: 75ce27ce-cc04-11e4-a404-233646319a2c
 Heartbeat interval: 30.0
 Heartbeat timeout: 90.0
switch>
```

14.1.9.19 show network physical-topology

The **show network physical-topology** command displays the network topology discovered through CVX.

Command Mode

EXEC

Command Syntax

`show network physical-topology` *hosts*|*neighbors*

Parameters

- *hosts* Displays all hosts visible in the topology.
- *neighbors* Displays all connections in the network topology. Table is sorted by host name, and can be optionally filtered by host.

Example

- This command displays all visible hosts.

```
switch#show network physical-topology hosts

Unique Id            Hostname
-------------------- ------------------------------
001c.7385.be69       cvx287.sjc.aristanetworks.com
0000.6401.0000       cvc1
0000.6402.0000       cvc2
0000.6403.0000       cvc3
0000.6404.0000       cvc4
bcf6.85bd.8050       dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch#show network physical-topology neighbors

cvx287.sjc.aristanetworks.com

Interface          Neighbor Intf      Neighbor Host
------------------ ------------------ ----------------------
Ethernet1          Ethernet7          cvc4

```

14.1.9.20 shutdown (CVX)

The **shutdown** command, in cvx mode, disables or enables the switch as a CVX server. By default, CVX is disabled on the switch.

The **no shutdown** command enables the switch as a CVX server. The shutdown and **default shutdown** commands disable the switch as a CVX server by removing the **no shutdown** command from running-config.

Note: Be sure to de-configure or shut down all CVX client services before disabling CVX; failure to do so may result in CVX client services continuing to run after CVX has been disabled.

Command Mode

CVX Configuration

Command Syntax

```
shutdown
no shutdown
default shutdown
```

Related Commands

- cvx places the switch in CVX configuration mode.

Example

- These commands enable the switch as a CVX server.

```
switch#config
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#
```

- This command disables CVX on the switch.

```
switch(config-cvx)#shutdown
switch(config-cvx)#
```

14.1.9.21 shutdown (CVX-HSC)

The **shutdown** command, in **CVX-HSC configuration** mode, disables or enables the CVX service on the switch. HSC is disabled by default.

When a CVX server enables HSC, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the HSC service; the **shutdown** and **default shutdown** commands disable the HSC service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
shutdown

no shutdown

default shutdown
```

Related Commands

- **service hsc** places the switch in CVX-HSC configuration mode.

Example

- These commands enable the HSC service.

```
switch(config)#cvx
switch(config-cvx)#service hsx
switch(config-cvx-hsc)#no shutdown
switch(config-cvx-hsc)#
```

- These commands disable the HSC service.

```
switch(config)#cvx
switch(config-cvx)#service hsx
switch(config-cvx-hsc)#shutdown
switch(config-cvx-hsc)#
```

14.1.9.22 shutdown (Management-CVX)

The **shutdown** command, in ***mgmt-cvx*** mode, disables or enables CVX client services on the switch. CVX services are disabled by default.

The **no shutdown** command enables CVX client services. The **shutdown** and **default shutdown** commands disable CVX client services by removing the corresponding no shutdown command from running-config.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Example

- These commands enable CVX client services.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

- This command disables CVX client services.

```
switch(config-mgmt-cvx)#shutdown
switch(config-mgmt-cvx)#
```

14.1.9.23 shutdown (CVX-OpenStack)

The **shutdown** command, in **cvx-openstack** configuration mode, disables or enables CVX-OpenStack on the switch. CVX-OpenStack is disabled by default.

When a CVX server enables OpenStack services, its clients are accessible to the OpenStack network controller (Neutron). Integrating Arista switches into an OpenStack-managed cloud network requires OpenStack to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to the hosts where the VMs reside.

The **no shutdown** command enables CVX-OpenStack. The **shutdown** and **default shutdown** commands disable CVX-OpenStack by removing the corresponding no shutdown command from running-config.

Command Mode

CVX-OpenStack Configuration

Command Syntax

```
shutdown

no shutdown

default shutdown
```

Related Commands

- **service openstack** places the switch in **CVX-OpenStack configuration** mode.

Example

- These commands enable CVX-OpenStack.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#no shutdown
switch(config-cvx-openstack)#
```

- These commands disable CVX-OpenStack.

```
switch(config-cvx-openstack)#
switch(config-cvx-openstack)#shutdown
switch(config-cvx-openstack)#
```

14.1.9.24 shutdown (CVX-VXLAN)

The **shutdown** command, in ***CVX-VXLAN configuration*** mode, disables or enables the CVX VXLAN control service on the switch. VXLAN control service is disabled by default.

When a CVX server enables VXLAN control service, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the VXLAN control service. The **shutdown** and **default shutdown** commands disable the VXLAN control service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
shutdown

no shutdown

default shutdown
```

Related Commands

- **service vxlan** places the switch in CVX-VXLAN configuration mode.

Example

- These commands enable VXLAN control service.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#no shutdown
switch(config-cvx-vxlan)#
```

- These commands disable VXLAN control service

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#shutdown
switch(config-cvx-vxlan)#
```

14.1.9.25 source-interface (Management-CVX)

The **source-interface** command specifies the interface from where the IPv4 address is derived for use as the source for outbound CVX packets that the switch sends as a CVX client. There is no default source interface assignment.

The **no source-interface** and **default source-interface** commands remove the source interface assignment for the CVX client by deleting the source-interface statement from ***running-config***.

Command Mode

Mgmt-CVX Configuration

Command Syntax

`source-interface` **INT_NAME**

`no source-interface`

`default source-interface`

Parameters

INT_NAME: Interface type and number. Options include:

- **ethernet** *e_num*: Ethernet interface specified by e_num.
- **loopback** *l_num*: Loopback interface specified by l_num.
- **management** *m_num*: Management interface specified by m_num.
- **port-channel** *p_num*: Port-Channel Interface specified by p_num.
- **vlan** *v_num*: VLAN interface specified by v_num.

Example

- These commands configure the CVX client to use the IP address *10.24.24.1* as the source address for its outbound packets.

```
switch#config
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.24.24.1/24
switch(config-if-Lo5)#exit
switch(config)#management cvx
switch(config-mgmt-cvx)#source-interface loopback 5
switch(config-mgmt-cvx)#
```

14.1.9.26 vtep (CVX-HSC)

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the **`vtep`** command in ***CVX-HSC configuration*** mode.

Command Mode

CVX-HSC Configuration

Command Syntax

`vtep` flood *list type* all | any

`no vtep` flood *list type*

`default vtep` flood *list type*

Parameters

- all: send-to-all replication; flood list is the list of VTEPs.
- any: send-to-any replication; flood list is a list of replication nodes. This is the default setting.

Example

These commands configure the HSC to use send-to-all replication.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#vtep flood list type all
switch(config-cvx-hsc)#
```

14.1.9.27 vtep (CVX-VXLAN)

The OVSDB management protocol includes provisions for control-plane MAC learning, which allows MAC addresses to be distributed among VTEPs without using the data plane. Some controllers (such as VMware NSX) take advantage of this facility; others (such as Nuage VSP) do not. By default, CVX uses control-plane MAC learning.

To switch to data plane MAC learning, use the **vtep** command in CVX-VXLAN configuration mode, as shown below.

Command Mode

CVX-VXLAN Configuration

Command Syntax

`vtep mac-learning` **control-plane|data-plane**

Related Commands

- **service vxlan** places the switch in **CVX-VXLAN configuration** mode.

Example

- These commands configure CVX to use data-plane MAC address learning.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#vtep mac-learning data-plane
switch(config-cvx)#
```

Chapter 15

Routing Protocols

The Routing Protocols chapter contains the following sections:

- Routing Information Protocol (RIP)
- Open Shortest Path First – Version 2
- Open Shortest Path First – Version 3
- IS-IS
- Border Gateway Protocol (BGP)
- Maintenance Mode
- Bidirectional Forwarding Detection

15.1 Routing Information Protocol (RIP)

This chapter contains the following sections.

- **RIP Conceptual Overview**
- **Running RIP on the Switch**
- **Configuring RIP on Multiple VRFs**
- **RIP Commands**

15.1.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an Interior Gateway Protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of ***15*** hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address ***224.0.0.9*** to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every ***30*** seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of ***1***, and the router adds ***1*** to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.

15.1.2 Running RIP on the Switch

15.1.2.1 Accessing RIP Configuration Mode and Enabling RIP

15.1.2.1.1 RIP Configuration Mode

The **router rip** command places the switch in router-RIP configuration mode to configure Routing Information Protocol (RIP) routing.

Example

This command places the switch in router-RIP configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```

Using the **router rip** command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

15.1.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The **no shutdown (RIP)** command in router-RIP configuration mode will enable RIP.

Example

This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown
switch(config-router-rip)#
```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the **network (RIP)** command.

15.1.2.1.3 Disabling RIP

You can disable RIP in two ways. The **shutdown (RIP)** command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the ***running-config***. The **no router rip** command disables RIP and removes all user-entered router-RIP configuration statements from the ***running-config***.

Examples

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.

```
switch(config)#no router rip
switch(config)#
```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.

```
switch(config-router-rip)#shutdown
switch(config-router-rip)#
```

15.1.2.2 Configuring RIP

Issuing the **no shutdown (RIP)** command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the **network (RIP)** command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.

15.1.2.2.1 Specifying RIP Networks

The **network (RIP)** command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the **network (RIP)** command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the **no network (RIP)** command.

Examples

- This command enables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)network 10.168.1.1/24
switch(config-router-rip)#
```

- This command disables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)#no network 10.168.1.1/24
switch(config-router-rip)#
```

15.1.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the **redistribute (RIP)** command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

Example

This command redistributes all routes learned from OSPF into RIP.

```
switch(config-router-rip)#redistribute OSPF
switch(config-router-rip)#
```

15.1.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the **timers (RIP)** command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

Example

This command sets the update interval to ***60*** seconds, expiration time to ***90*** seconds, and deletion time to ***150*** seconds.

```
switch(config-router-rip)#timers 60 90 150
switch(config-router-rip)#
```

15.1.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the **rip v2 multicast disable** command in the configuration mode for the interface.

Example

The following commands configure RIP version 2 broadcasting on ***interface ethernet 5***.

```
switch(config)#interface ethernet5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```

15.1.2.3 Displaying RIP Information

15.1.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch's routing table, use the **show ip rip database** command. (You can also display similar information using the RIP option in the **show ip route** command.)

Examples

- This command displays all active rip routes.

```
switch>show ip rip database
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

-
```
switch>show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

  This command submits a query for RIP route information for a network.

15.1.2.3.2 Displaying RIP Route Gateways

To see information about the switch's RIP route gateways, use the **show ip rip neighbors** command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

This command displays information about all the gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard   Bad-Packets   Bad-Routes   Flags
10.2.12.33  00:00:15                                SRC, TRSTED,
                                                    ACCPTED, RJCTED,
                                                    Q_RJCTED, AUTHFAIL
```

15.1.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The **vrf instance** and **vrf (Interface mode)** commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The **router rip vrf** command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

Examples

- These commands configure a non-default VRF and enable unicast routing in it.

```
switch(config)#vrf instance test
switch(config-vrf-test)#exit
switch(config)#ip routing vrf test
switch(config)#
```

- This command configures a RIP instance in a non-default VRF.

```
switch(config)#router rip vrf test
switch(config-router-rip-router-rip-vrf-test)#no shutdown
switch(config-router-rip)#exit
switch(config)#
```

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)#interface Ethernet 3 / 1
switch(config-if-Et3/1)#no switchport
switch(config-if-Et3/1)#ip address 1.0.0.1/24
switch(config-if-Et3/1)#vrf test
switch(config-if-Et3/1)#network 1.0.0.1
switch(config-if-Et3/1)#exit
switch(config)#
```

15.1.4 RIP Commands

Global Configuration Commands

- router rip
- router rip vrf

Interface Configuration Commands

- rip v2 multicast disable

Router-RIP Configuration Mode

- distance (RIP)
- distribute-list (RIP)
- metric default
- network (RIP)
- redistribute (RIP)
- shutdown (RIP)
- timers (RIP)

Display Commands – EXEC Mode

- show ip rip database
- show ip rip neighbors

15.1.4.1 distance (RIP)

The **distance** command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from ***1 to 255***; lower distance values correspond to higher reliability. The default RIP distance value is ***120***.

The **no distance** and **default distance** commands restore the administrative distance default value of ***120*** by removing the **distance** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

distance *distance_value*

no distance

default distance

Parameters

distance_value distance assigned to RIP routes. Values range from ***1*** to ***255***.

Example

These commands assign an administrative distance of ***75*** to RIP routes.

```
switch(config)#router rip
switch(config-router-rip)#distance 75
switch(config-router-rip)#
```

15.1.4.2 distribute-list (RIP)

The **`distribute-list`** command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

Configuration Notes:

- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - **`match ip address access-list`**
  - **`match ip address prefix-list`**
- The **`distribute-list`** command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the **`distribute-list`** command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The **`no distribute-list`** and **`default distribute-list`** commands remove the corresponding **`distribute-list`** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

`distribute-list` **DIRECTION MAP** [**INTF**]

`no distribute-list` **DIRECTION MAP** [**INTF**]

`default distribute-list` **DIRECTION MAP** [**INTF**]

Parameters

- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - **in** specifies inbound as the direction the distribute-list is applied.
  - **out** specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
  - ***no parameter*** attributes are not assigned through a route map.
  - **route-map** ***map_name*** attributes listed by specified route map are assigned to the network.
- **INTF** interface to be configured. Options include:
  - **ethernet** ***e_num*** Ethernet interface.
  - **loopback** ***l_num*** Loopback interface.

- **port-channel *p_num*** Port channel interface.
- **vlan *v_num*** VLAN interface.

Examples

- The following commands demonstrate that an **access-list** or **prefix-list** can be used within a ***route-map*** for use in a **distribute-list**.

```
switch(config)#ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
switch(config)#route-map myRouteMap permit 10
switch(config-route-map-myRouteMap)#match ip address prefix-list 8to24
switch(config-route-map-myRouteMap)#exit
switch(config)#
switch(config)#router rip
switch(config-router-rip)#distribute-list in route-map myRouteMap
switch(config-router-rip)#
```

- These commands suppress routes advertised on a particular interface.

```
switch(config)#ip prefix-list 2 seq 10 deny 30.1.1.0/24
switch(config)#route-map myRmOut permit 10
switch(config-route-map-myRmOut)#match ip address prefix-list 2
switch(config-route-map-myRouteMap)#exit
switch(config)#router rip
switch(config-router-rip)#distribute-list out route-map myRmOut
```

15.1.4.3 metric default

The **metric default** command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of ***0*** is assigned to redistributed connected and static routes. The default metric values range from ***0*** to ***16*** with a default value of ***1***.

The **no metric default** and **default metric default** commands remove the **metric default** command from ***running-config*** and returns the metric value to its default value of ***1***.

Command Mode

Router-RIP Configuration

Command Syntax

metric default metric_value

no metric default

default metric default

Parameters

metric_value default metric value assigned. Values range from ***0 to 16***; default is ***1***.

Example

This command sets the default metric value to ***5***.

```
switch(config)#router rip
switch(config-router-rip)#metric default 5
switch(config-router-rip)#
```

15.1.4.4 network (RIP)

The **network** command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The **no network** and **default network** commands disable RIP on the specified network by removing the corresponding **network** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

network NETWORK_ADDRESS

no network NETWORK_ADDRESS

default network NETWORK_ADDRESS

Parameters

NETWORK_ADDRESS network IP address. Entry formats include the following:

- ***ipv4_subnet*** IPv4 subnet (CIDR notation).
- ***ipv4_addr* mask *wildcard_mask*** IP address and wildcard-mask.

Examples

- This command enables RIP on ***10.168.1.1/24***.

```
switch(config)#router rip
switch(config-router-rip)#network 10.168.1.1/24
switch(config-router-rip)#
```

- This command also enables RIP on ***10.168.1.1/24***.

```
switch(config-router-rip)#network 10.168.1.1 mask 0.0.0.255
switch(config-router-rip)#
```

15.1.4.5 redistribute (RIP)

The **redistribute** command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.
- **BGP**, **OSPF**, and **IP static routes** by default, routes are not redistributed. The **redistribute** command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The **no redistribute** and **default redistribute** commands reset the default route redistribution setting by removing the **redistribute** statement from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

redistribute connected **ROUTE_MAP**

redistribute **ROUTE_TYPE** [**ROUTE_MAP**]

no redistribute connected **ROUTE_MAP**

no redistribute **ROUTE_TYPE**

default redistribute connected **ROUTE_MAP**

default redistribute **ROUTE_TYPE**

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - ***no parameter*** all routes are redistributed.
  - **route-map** ***map_name*** only routes in the specified route map are redistributed.

Example

These commands redistribute OSPF routes into RIP.

```
switch(config)#router rip
switch(config-router-rip)#redistribute OSPF
switch(config-router-rip)#
```

15.1.4.6 rip v2 multicast disable

The **rip v2 multicast disable** command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to ***255.255.255.255***.

The **no rip v2 multicast disable** and **default rip v2 multicast disable** commands specify the transmission of update packets as multicast to ***224.0.0.9*** if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

rip v2 multicast disable

no rip v2 multicast disable

default rip v2 multicast disable

Example

The following example configures version 2 broadcasting on ***interface Ethernet 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```

15.1.4.7 router rip vrf

The **router rip** command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The **no router rip vrf** and **default router rip vrf** commands disable an RIP routing instance in the non-default VRF, and remove all user-entered **router-rip** configuration statements from ***running-config***. To disable RIP without removing configuration statements, use the **shutdown (RIP)** command.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

router rip vrf [**RIP_INSTANCE**]

no router rip vrf [**RIP_INSTANCE**]

default router rip vrf [**RIP_INSTANCE**]

Parameters

RIP_INSTANCE configure a RIP VRF instance in the non-default VRF.

Examples

- This command configures a RIP instance in the non-default VRF.

```
switch(config)#router rip vrf test
switch(config-router-rip-router-rip-vrf-test)#no shutdown
switch(config-router-rip)#exit
switch(config)#
```

- This command disables a RIP instance in the non-default VRF.

```
switch(config)#no router rip vrf test
switch(config)#
```

15.1.4.8 router rip

The **router rip** command places the switch in ***router-rip*** configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; ***running-config*** is changed immediately upon command entry. The **exit** command does not affect ***running-config***.

The **no router rip** and **default router rip** commands disable RIP and remove all user-entered **router-rip** configuration statements from ***running-config***. To disable RIP without removing configuration statements, use the **shutdown (RIP)** command.

The **exit** command returns the switch to the ***global*** configuration mode.

Command Mode

Global Configuration

Command Syntax

router rip

no router rip

default router rip

Commands Available in router-rip Configuration Mode

- **distance (RIP)**
- **network (RIP)**
- **redistribute (RIP)**
- **shutdown (RIP)**
- **timers (RIP)**

Example

This command places the switch in the ***router-rip*** configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```

15.1.4.9 show ip rip database

The **show ip rip database** command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- **default (no arguments):** information about all RIP routes.
- **IPv4 address and mask:** information about the referenced addresses.
- **active:** information about routes not superseded by routes from other protocols.

Command Mode

EXEC

Command Syntax

show ip rip database [**FILTER**]

Parameters

FILTER routing table entries that the command displays. Values include :.

- ***no parameter*** displays all routing table entries.
- **active** displays all active routing table entries.
- ***net_addr*** subnet address (CIDR or address-mask). Command displays entries in this subnet.

Examples

- This command displays all active rip routes.

```
switch>show ip rip database active
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- This command submits a query for RIP route information for a network.

```
switch>show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

- This command returns information for all RIP routes.

```
switch>show ip rip database
10.1.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.2.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.3.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, inactive
10.212.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, active
10.214.0.0/255.255.255.0
[1] via 10.8.12.17, 00:00:30, Et4, active
```

15.1.4.10 show ip rip neighbors

The **show ip rip neighbors** command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Command Mode

EXEC

Command Syntax

show ip rip neighbors

Example

The **show ip rip neighbors** command displays information about all gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway     Last-Heard      Bad-Packets     Bad-Routes    Flags
10.2.12.33  00:00:15                                      SRC, TRSTED,
                                                          ACCPTED, RJCTED,
                                                          Q_RJCTED, AUTHFAIL
```

15.1.4.11 shutdown (RIP)

The **shutdown** command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The **no shutdown** command enables RIP. The **default shutdown** command disables RIP.

Command Mode

Router-RIP Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Examples

- This command disables RIP on the switch.

```
switch(config)#router rip
switch(config-router-rip)#shutdown
switch(config-router-rip)#
```

- This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown
switch(config-router-rip)#
```

15.1.4.12 timers (RIP)

The **timers** command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The **no timers** and **default timers** commands return the timer values to their default values by removing the **timers** command from ***running-config***.

Command Mode

Router-RIP Configuration

Command Syntax

timers *update_time expire_time deletion_time*

no timers

default timers

Parameters

- ***update_time*** Default is ***30*** seconds.
- ***expire_time*** Default is ***180*** seconds.
- ***deletion_time*** Default is ***120*** seconds.

Parameter values are in seconds and range from ***5 to 2147483647***.

Example

This command sets the update (***60*** seconds), expiration (***90*** seconds), and deletion (***150*** seconds) times.

```
switch(config)#router rip
switch(config-router-rip)#timers 60 90 150
switch(config-router-rip)#
```

15.2 Open Shortest Path First – Version 2

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by ***RFC 2328***.

This section contains the following topics:

- OSPFv2 Introduction
- OSPFv2 Conceptual Overview
- Configuring OSPFv2
- OSPFv2 Configuration Examples
- OSPFv2 Commands

15.2.1 OSPFv2 Introduction

This section contains the following topics:

- **Supported Features**
- **Features Not Supported**

15.2.1.1 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- OSPFv2 MIB support

15.2.1.2 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance.
- Intra- and inter-area routing.
- Type 1 and 2 external routing.
- Broadcast and P2P interfaces.
- Stub areas.
- Not so stubby areas (NSSA) (***RFC 3101***).
- MD5 Authentication.
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering.
- Opaque LSAs (***RFC 2370***).
- Graceful restart (***RFC 3623***).
- **OSPF Routes over GRE Tunnels**

15.2.2 OSPFv2 Conceptual Overview

This section contains the following topics:

- **Storing Link States**
- **Topology**
- **Link Updates**
- **OSPFv2 Route Redistribution Instance**
- **OSPFv2 and BFD Sessions for Adjacencies in any State**
- **OSPFv2 Multiple Instances Support**
- **OSPF Routes over GRE Tunnels**

15.2.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The Link State Database (LSDB) stores an areas topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

15.2.2.2 Topology

An Autonomous System (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal Router (IR) a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area Border Router (ABR) a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous System Boundary Router (ASBR) a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.
- **OSPFv2 Router Types** displays the OSPFv2 router types.

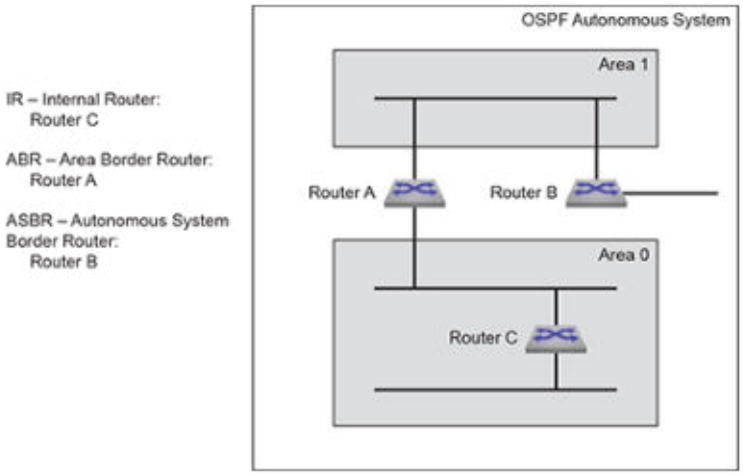

Figure 44: OSPFv2 Router Types

OSPFv2 areas are assigned a number between ***0*** and ***4,294,967,295*** (2321). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

- Not-So-Stubby-Area (NSSA) may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

15.2.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A routers hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

OSPFv2 Neighbors illustrates OSPFv2 neighbors.

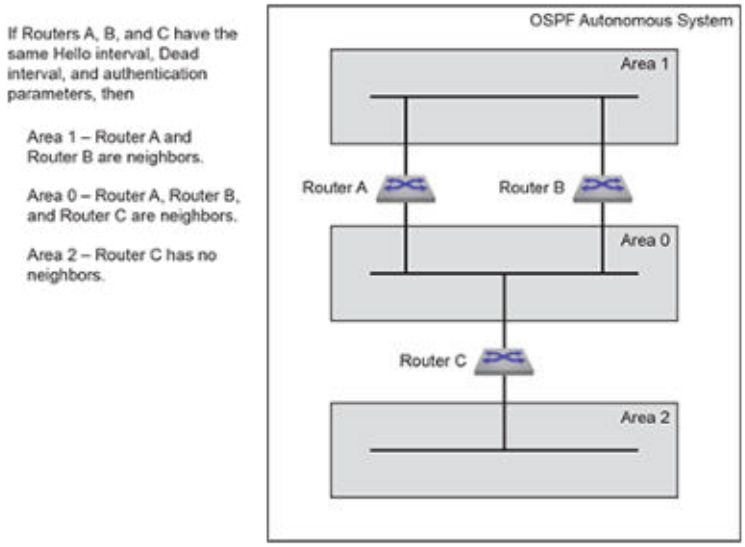

Figure 45: OSPFv2 Neighbors

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router generates an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a routers LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstras algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

15.2.2.4 OSPFv2 Route Redistribution Instance

OSPFv2 Route Redistribution is used for redistributing OSPFv2 leaked and non-leaked routes from one instance to another when multiple OSPFv2 instances are configured. The OSPFv2 Route Redistribution is supported on all platforms in the multi-agent routing mode.

15.2.2.5 OSPFv2 and BFD Sessions for Adjacencies in any State

- BFD sessions are only established for OSPFv2 adjacencies that are in the FULL state. In a LAN environment this results in BFD sessions not being established for OSPFv2 adjacencies with DR Other neighbors.
- This feature provides configuration that enables the establishment of BFD sessions for OSPFv2 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv2 adjacencies with DR Other neighbors.

15.2.2.6 OSPFv2 Multiple Instances Support

EOS Release 4.22.1F adds support for multiple OSPFv2 instances to be configured in the default VRF. OSPFv2 Multiple Instances Support provides isolation and allows segregating and dividing the link state database based on the interface.

Basic OSPFv2 functionality along with redistribution of OSPFv2 routes (all instances) into BGP and default information originate always is available forward from the ***EOS Release 4.22.1F***.

Support for graceful restart and BFD with multiple OSPFv2 instances was added in the ***EOS Release 4.23.1***.

15.2.2.6.1 OSPFv2 Multiple Instances Support Platform Compatibility

OSPFv2 Multiple Instances Support is supported on all platforms.

15.2.2.7 OSPF Routes over GRE Tunnels

This feature introduces the support for OSPF routes over GRE tunnels under default as well as non-default VRFs. The feature is disabled by default.

15.2.2.7.1 Limitations

The platform does not support any arbitrarily created TCAM profile. When the TCAM profile cannot be programmed, the show command prints **ERROR** in the status column.

15.2.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- **Configuring the OSPFv2 Instance**
- **Configuring OSPFv2 Areas**
- **Support for OSPFv2 dn-bit-ignore**
- **OSPFv2 Area Filter by Prefix-List**
- **IPv4 Unnumbered Interfaces**
- **Configuring Interfaces for OSPFv2**
- **Enabling OSPFv2**
- **OSPFv2 Multiple Instances Support Configuration**
- **OSPF Routes over GRE Tunnels Configuration**
- **Displaying OSPFv2 Status**

15.2.3.1 Configuring the OSPFv2 Instance

15.2.3.1.1 Entering OSPFv2 Configuration Mode

The **router ospf** command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

Example

This command places the switch ***in router-ospf*** configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of ***100***.

```
switch(config)#router ospf 100
switch(config-router-ospf)#
```

15.2.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **router-id (OSPFv2)** command configures the router ID for an OSPFv2 instance.

Example

This command assigns ***10.1.1.1*** as the OSPFv2 router ID.

```
switch(config-router-ospf)#router-id 10.1.1.1
switch(config-router-ospf)#
```

15.2.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.

LSA Overload

The **max-lsa (OSPFv2)** command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- **Warning**: the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown**: when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is ***5*** minutes).

- **Permanent shutdown**: the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is ***5***). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a **router ospf** command.

The LSDB size restriction is removed by setting the LSA limit to zero.

Note: if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

Example

- This command configures the OSPFv2 maximum LSA count to ***20000*** and triggers these actions:
  - The switch logs an **OSPF MAXLSAWARNING** if the LSDB has ***8000*** LSAs (***40%*** of ***20000***).
  - The switch temporarily disables OSPFv2 for ***10*** minutes if the LSDB contains ***20000*** LSAs.
  - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
  - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for ***20*** minutes.

```
switch(config-router-ospf)#max-lsa 20000 40 ignore-time 10 ignore-
count 4 reset-time 20
switch(config-router-ospf)#
```

Logging Adjacency Changes

The **log-adjacency-changes (OSPFv2** command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

```
switch(config-router-ospf)#log-adjacency-changes
switch(config-router-ospf)#
```

- This command configures the switch to log all OSPFv2 link-state changes.

```
switch(config-router-ospf)#log-adjacency-changes detail
switch(config-router-ospf)#
```

OSPF RFC Compatibility

RFC 2328 and ***RFC 1583*** specify different methods for calculating summary route metrics. The **compatible (OSPFv2)** command allows the selective disabling of compatibility with ***RFC 2328***.

Example

This command sets the OSPF compatibility list with ***RFC 1583***.

```
switch(config)#router ospf 6
switch(config-router-ospf)#compatible rfc1583
switch(config-router-ospf)#
```

Administrative Distance

The **distance ospf (OSPFv2)** command configures the administrative distance for intra-area, inter-area, or external OSPF routes. To configure the administrative distance for multiple route types,

the command must be entered multiple times. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for all routes is ***110***.

Note: OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the **distance ospf** command directly through the CLI or by applying a configuration file that contains the command.

Example

This command configures an administrative distance of **95** for OSPFv2 intra-area routes, and will cause links to flap if issued while OSPF is running.

```
switch(config-router-ospf)#distance ospf intra-area 95
switch(config-router-ospf)#
```

Passive Interfaces

The **passive-interface <interface> (OSPFv2)** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The **no passive-interface** command re-enables OSPFv2 processing on the specified interface.

Examples

- This command configures ***vlan 2*** as a passive interface.

```
switch(config-router-ospf)#passive-interface vlan 2
switch(config-router-ospf)#
```

- This command configures ***vlan 2*** as an active interface.

```
switch(config-router-ospf)#no passive-interface vlan 2
switch(config-router-ospf)#
```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Example

The **redistribute (OSPFv2) connected** command converts connected routes to OSPFv2 external routes.

```
switch(config-router-ospf)#redistribute connected
switch(config-router-ospf)#
```

Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Examples

- The **redistribute (OSPFv2)** static command converts the static routes to OSPFv2 external routes.

```
switch(config-router-ospf)#redistribute static
```

```
switch(config-router-ospf)#
```

- The **no** **redistribute (OSPFv2)** command stops the advertising of the static routes as OSPFv2 external routes.

```
switch(config-router-ospf)#no redistribute static
switch(config-router-ospf)#
```

Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **distribute-list in** command specifies the filter to be used and applies it to the OSPF instance.

Example

These commands configure a prefix-list named dist_list1 in OSPF instance ***5*** to filter certain routes from incoming OSPF LSAs.

```
switch(config)#router ospf 5
switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```

15.2.3.1.4 Configuring OSPFv2 Route Redistribution

Use the **redistribute ospf instance** command to redistribute either the non-leaked routes, or both leaked and non-leaked routes. This command is configured under the ***router-ospf*** mode.

Examples

- The **leaked** clause includes both internal annd external routes.

```
switch(config-router-ospf)#redistribute ospf instance include leaked
<cr>
Options:
  include    Include leaked routes
  match      Routes learned by the OSPF protocol
  route-map  Specify which route map to use
```

- The **match** clause allows matching on the different OSPFv2 route types.

```
switch(config-router-ospf)#redistribute ospf instance match external
<cr>
Options:
  external       OSPF routes learned from external sources
  internal       OSPF routes learned from internal sources
  nssa-external  OSPF routes learned from external NSSA sources
```

- The following command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)#redistribute ospf instance match external
```

- The following command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)#redistribute ospf instance include leaked
 match internal
```

- Matching based on the OSPFv2 instance ID is supported in the route-map.

```
switch(config)#route-map rm1 permit 10
switch(config-route-map-rm1)#match ospf instance 3
```

- The following command redistributes the OSPFv2 external routes from the OSPFv2 instance with ***ID 3*** in the same VRF into the given instance.

```
switch(config-router-ospf)#redistribute ospf instance match external
 route-map rm1
```

Show Commands

- The **`show ip ospf database external`** command is used to verify if the AS-External LSAs are created in the instance for the redistributed route and advertised into the OSPFv2 domain.
- The **`show route-map`** command is used to display the details of a configured route-map.

15.2.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in ***router-ospf*** configuration mode, as described in **Entering OSPFv2 Configuration Mode**, to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

15.2.3.2.1 Configuring the Area Type

The **`area (OSPFv2)`** commands specifies the area type, refer **OSPFv2 Commands** section for the **`area`** commands. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area ***0***) is a normal area.
- **Stub area:** Area that does not advertise external routes. External routes are reached through a default summary route (***0.0.0.0***). Networks with no external routes do not require stub areas.
- **Not So Stubby Area (NSSA):** ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

Examples

- This command configures area ***45*** as a stub area.

```
switch(config-router-ospf)#area 45 stub
switch(config-router-ospf)#
```

- This command configures area ***10.92.148.17*** as an NSSA.

```
switch(config-router-ospf)#area 10.92.148.17 NSSA
switch(config-router-ospf)#
```

15.2.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The **area nssa no-summary (OSPFv2)** command configures the router to not import type-3 summary LSAs into the Not-So-Stubby Area (NSSA) and injects a default summary route (***0.0.0.0/0***) into the NSSA to reach the inter-area prefixes.

Example

This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (***0.0.0.0/0***) into the NSSA area.

```
switch(config)#router ospf 6
switch(config-router-ospf)#area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

15.2.3.2.3 Assigning Network Segments to the Area

Assigning Routes to an Area

The **network area (OSPFv2)** command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. ***1.2.3.4/24*** converts to ***1.2.3.0/24*** and ***1.2.3.4/16*** converts to ***1.2.0.0/16***.

Example

Each of these equivalent commands assign the network segment ***10.1.10.0/24*** to area ***0***.

```
switch(config-router-ospf)#network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)#network 10.1.10.0/24 area 0
```

In each case, ***running-config*** stores the command in CIDR (prefix) notation.

Summarizing Routes

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The **area range (OSPFv2)** command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The **area range (OSPFv2)** command can be used to suppress route advertisements.

Examples

- Two **network area** command assigns subnets to an area. The **area range (OSPFv2)** command summarizes the addresses, which the ABR advertises in a single LSA.

  ```
  switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
  switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
  switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
  switch(config-router-ospf)#
  ```

- The **network area** command assigns a subnet to an area, followed by an **area range (OSPFv2)** command that suppresses the advertisement of that subnet.

  ```
  switch(config-router-ospf)#network 10.12.31.0 0.0.0.255 area 5
  switch(config-router-ospf)#area 5 range 10.12.31.0 0.0.0.255 not-
  advertise
  switch(config-router-ospf)#
  ```

15.2.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

Default Summary Route Cost

The **area default-cost (OSPFv2)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

Example

This command configures a cost of ***15*** for the default summary route in area ***23***.

```
switch(config-router-ospf)#area 23 default-cost 15
switch(config-router-ospf)#
```

Filtering Type 3 LSAs

The area filter (OSPFv2) command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

Example

This command prevents the switch from entering Type 3 LSAs originating from the ***10.1.1.2/24*** subnet into its ***area 2*** LSDB.

```
switch(config-router-ospf)#area 2 filter 10.1.1.2/24
switch(config-router-ospf)#
```

15.2.3.3 Support for OSPFv2 dn-bit-ignore

The OSPFv2 **dn-bit-ignore** command allows enabling or disabling the inclusion of LSAs having “Down” (DN) bit set in SPF calculations. The DN Bit is a loop prevention mechanism that implements when using OSPF as a CE - PE IGP protocol.

OSPFv2 only honors the DN-bit in **type-3** LSAs in non-default VRFs. Starting with ***Release EOS-4.25.0F***, OSPFv2 honors the DN-bit in **type-5** and **type-7** LSAs in non-default VRFs. This means that the type-3/5/7 LSAs with DN-bit set are not in SPF calculation, and any routes that carry LSAs are not installed in the routing table. This behavior changes when using the **dn-bit-ignore lsa type-5 type-7** command.

15.2.3.3.1 Configuration

OSPFv2

Use the command **dn-bit-ignore** to ignore the DN-bit in type-3/5/7 LSAs.

Use the command **dn-bit-ignore lsa type-5 type-7** to include only type-5, and type-7 LSAs having their DN-bit set in the SPF calculation. The commands **no dn-bit-ignore lsa type-5 type-7** or **default dn-bit-ignore lsa type-5 type-7** are configured to revert the behavior back to default. This command is available in **router ospf PROCESS_ID vrf VRF_NAME** configuration mode.

Note: This command is not available in the default VRF.

This command is for backwards compatibility to revert the behavior seen prior to Release ***EOS-4.25.0*** where the type-5 and type-7 LSAs with DN-bit set would get included in the SPF calculations.

```
(config)#router ospf 1 vrf red
(config-router-ospf-vrf-red)#?
...
 dn-bit-ignore             Disable DN-bit check for Type-3, Type-5 and
 Type-7 LSAs in non-default VRFs
...
(config-router-ospf-vrf-red)#dn-bit-ignore ?
  lsa   Disable DN-bit check only for Type-5 and Type-7 LSAs in non-
default VRFs
  <cr>
(config-router-ospf-vrf-red)#dn-bit-ignore lsa type-5 type-7
```

OSPFv3

Use the command **dn-bit-ignore** to include type-3/5/7 LSAs having their DN-bit set in the SPF calculation.

Use the commands **dn-bit-ignore** or **default dn-bit-ignore** to revert the behavior back to default. This command is available in **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode and **router ospfv3 vrf <VRF_NAME>** configuration mode. Note that this command is not available in the default VRF, and that both configuration styles are captured below.

router ospfv3 Configuration Style

The **dn-bit-ignore** command is available under the **router ospfv3 vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)#router ospfv3 vrf red
(config-router-ospfv3-vrf-red)#dn-bit-ignore
```

ipv6 router ospf Configuration Style

The **dn-bit-ignore** command is also available under the **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)#ipv6 router ospf 1 vrf red
(config-router-ospfv3-vrf-red)#dn-bit-ignore
```

15.2.3.3.2 Show Commands

Use the **show running-config** command to verify whether the **dn-bit-ignore** command is configured.

15.2.3.4 OSPFv2 Area Filter by Prefix-List

The **ospf area <area_id> filter** command configures the set of prefixes to be filtered for multi-agent routing and the ribd routing protocols. Area filters are used to prevent specific prefixes from being announced by an area as Type 3 summary LSAs in an OSPFv2 Area Border Router (ABR).

Examples

The following configures a prefix-list filter to permit two prefixes and deny all others.

```
switch(config)# ip prefix-list type3Permit
switch(config-ip-pfx)# ip seq 10 permit 10.0.1.0/24
```

```
switch(config-ip-pfx)# ip seq 20 permit 10.0.2.0/24
switch(config-ip-pfx)# ip seq 30 deny 10.0.0.0/0
switch(config-ip-pfx)# exit
```

The following applies the filter to the backbone area.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 0 filter prefix-list type3Permit
```

The following configures a prefix-list to deny a list of prefixes and permit all others.

```
switch(config)# ip prefix-list type3Deny
switch(config-ip-pfx)# ip seq 10 deny 10.0.1.0/24
switch(config-ip-pfx)# ip seq 20 deny 10.0.2.0/24
switch(config-ip-pfx)# exit
```

The following applies the filter.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 1.1.1.1 filter prefix-list type3Deny
```

Show commands

The following displays the output of **`show ip ospf`** with the area filter listed.

```
switch# show ip ospf
Area 3.3.3.3
 Number of interface in this area is 2
   It is a normal area
   Traffic engineering is disabled
   Area has None authentication
   SPF algorithm executed 1 times
   Number of LSA 1. Checksum Sum 53568
   Number of opaque link LSA 0. Checksum Sum 0
   Number of opaque area LSA 0. Checksum Sum 0
   Area ranges are
      3.3.0.0/16 Cost 0 Advertise
      3.30.0.0/16 Cost 0 Advertise
   Area filter prefix-list type3Permit
```

15.2.3.5 IPv4 Unnumbered Interfaces

The **`ip address unnumbered`** command specifies a lending interface from which many interfaces may borrow the same address, reducing the number of unique IPv4 addresses needed. A lending interface is a loopback interface. Only one borrowing interface is referenced to one lender at a time even though multiple loopbacks may be used as lending interfaces. Unnumbered interfaces may reference the same or different lending interfaces. Any IPv4 routed interface is configurable as unnumbered interface and is referenced to one lending interface.

The following configures an unnumbered borrowing interface.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#ip address unnumbered Loopback1
```

OSPF configuration

To enable OSPF on an unnumbered interface, configure the area and set the network type to point-to-point under the ***interface*** config mode.

```
switch(config-if-Et1)#ip ospf area 1
switch(config-if-Et1)#ip ospf network point-to-point
```

Note: The **network** command under ***router ospf configuration mode*** is not supported for the configuration of unnumbered interfaces. You must specify the area and **network point-to-point** command in the configuration context of the unnumbered interface.

Enabling OSPF on the lending interface in the same area as the borrowing interfaces is recommended. For different unnumbered interfaces in different areas, configure them to use different loopbacks.

```
switch(config)#interface loopback 1
switch(config-if-Lo1)#ip address 1.1.1.1/32
switch(config-if-Lo1)#ip ospf area 1
```

ISIS configuration

To enable ISIS on an unnumbered interface, configure the area and set the network type to point-to-point under the ***interface*** config mode.

```
switch(config-if-Et1)# isis enable inst1
switch(config-if-Et1)# isis network point-to-point
```

Enabling ISIS on the lending interface in the same area as the borrowing interfaces is recommended.

```
switch(config)#interface loopback 1
switch(config-if-Lo1)#ip address 1.1.1.1/32
switch(config-if-Et1)#isis enable inst1
switch(config-if-Et1)#isis network point-to-point
```

Show commands

The same IP address that may be in use on multiple interfaces at the same time, and is displayed as shown below.

The following displays the output of show ip interface brief. In this example, Ethernet ***2-5*** are all unnumbered and borrowing from ***loopback1***.

```
switch(config-if-Et2)#show ip interface brief
Address
Interface   IP Address  Status  Protocol   MTU    Owner
----------- ----------- ------- --------- ------- -------
Ethernet1   1.1.2.1/24  up       up        1500
Ethernet2   1.1.1.1/32  up       up        1500    Lo1
Ethernet3   1.1.1.1/32  up       up        1500    Lo1
Ethernet4   1.1.1.1/32  up       up        1500    Lo1
Ethernet5   1.1.1.1/32  up       up        1500    Lo1
Loopback1   1.1.1.1/32  up       up        65535
```

The following displays OSPF with two adjacencies with the same peer via ***Ethernet 2*** and ***Ethernet 3***. The same **Neighbor ID** is listed for both interfaces. IS-IS behaves similarly.

```
switch(config-if-Et2)#show ip ospf neighbor
Neighbor ID   Instance VRF      Pri State    Dead Time  Address  Interface
2.2.1.1       1        default  0   FULL     00:00:36   2.2.1.1  Ethernet3
```

```
2.2.1.1         1         default  0    FULL     00:00:34    2.2.1.1   Ethernet2
```

Limitations

- Configuring the addresses on the lending loopbacks as */32* is recommended. In order to resolve routes via an unnumbered peer, the*/32* address is required. Configuring a lending loopback as */32* and enabling OSPF/ISIS on it propagates that prefix.
- Use only loopback interfaces as a lending interface.
- Enable only one IGP on a lending loopback interface. For multiple IGPs enable each on a different loopback.
- Configure only one BFD multi-hop session per loopback.
- SSO is not supported for BFD multihop sessions over unnumbered interfaces.
- OSPFv3 does not support unnumbered interface addressing.

15.2.3.6 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

15.2.3.6.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- Simple password authentication: A password is assigned to an area. Interfaces connected to the area can authenticate packets by enabling authentication and specifying the area password.
- Message digest authentication: Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).

To configure simple authentication on a VLAN interface:

1. Enable simple authentication with the **`ip ospf authentication`** command.

```
switch(config-if-vl12)#ip ospf authentication
```

2. Configure the password with the **`ip ospf authentication-key`** command.

```
switch(config-if-vl12)#ip ospf authentication-key 0 code123
```

The ***running-config*** stores the password as an encrypted string, using a proprietary algorithm.To configure Message-Digest authentication on a VLAN interface:

1. Enable Message-Digest authentication with the **`ip ospf authentication`** command.

```
switch(config-if-vl12)#ip ospf authentication message-digest
```

2. Configure the key ID and password with the **ip ospf message-digest-key** command.

```
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
```

The ***running-config*** stores the password as an encrypted string, using a proprietary algorithm. The key ID (***23***) is between keywords **message-digest-key** and **md5**.

15.2.3.6.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in ***interface-vlan*** configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbors dead interval.

The **ip ospf hello-interval** command configures the hello interval for the configuration mode interface. The default is ***10*** seconds.

Example

This command configures a hello interval of ***30*** seconds for ***VLAN 2***.

```
switch(config-if-Vl2)#ip ospf hello-interval 30
switch(config-if-Vl2)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The **ip ospf dead-interval** command configures the dead interval for the configuration mode interface. The default is ***40*** seconds.

Example

This command configures a dead interval of ***120*** seconds for ***vlan 4***.

```
switch(config-if-Vl4)#ip ospf dead-interval 120
switch(config-if-Vl4)#
```

Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The **ip ospf retransmit-interval** command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is ***5*** seconds.

Example

This command configures a retransmit interval of ***15*** seconds for ***vlan 3***.

```
switch(config-if-Vl3)#ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The **ip ospf transmit-delay** command configures the transmission delay for the configuration mode interface.

Example

This command configures a transmission delay of ***5*** seconds for ***vlan 6***.

```
switch(config-if-Vl6)#ip ospf transmit-delay 5
switch(config-if-Vl6)#
```

15.2.3.6.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is ***10***.

The **ip ospf cost** command configures the OSPFv2 cost for the configuration mode interface.

Example

This command configures a cost of ***15*** for ***vlan 2***.

```
switch(config-if-Vl2)#ip ospf cost 15
switch(config-if-Vl2)#
```

Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The **ip ospf priority** command configures router priority for the configuration mode interface. The default priority is 1.

Examples

- This command configures a router priority of ***15*** for ***vlan 8***.

```
switch(config-if-Vl8)#ip ospf priority 15
switch(config-if-Vl8)#
```

- This command restores the router priority of ***1*** for ***vlan 7***.

```
switch(config-if-Vl7)#no ip ospf priority
switch(config-if-Vl7)#
```

15.2.3.7 Enabling OSPFv2

15.2.3.7.1 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

- **shutdown (OSPFv2)** disables all OSPFv2 activity.
- **ip ospf disabled** disables OSPFv2 activity on a VLAN interface.

The **no shutdown** and **no ip ospf disabled** commands resume OSPFv2 activity.

Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config-router-ospf)#shutdown
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)#no shutdown
switch(config-router-ospf)#
```

- This command disables OSPFv2 activity on VLAN 5.

```
switch(config-if-Vl5)#ip ospf disabled
switch(config-if-Vl5)#
```

15.2.3.7.2 IPv4 Routing

OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Examples

- This message is displayed if, when entering the ***router-ospf*** configuration mode, IP routing is not enabled.

```
switch(config)#router ospf 100
! IP routing not enabled
switch(config-router-ospf)#
```

- This command enables IP routing on the switch.

```
switch(config)#ip routing
switch(config)#
```

15.2.3.8 OSPFv2 Multiple Instances Support Configuration

The existing OSPFv2 configuration commands remain unchanged and are used for configuring multiple OSPFv2 instances. Each OSPFv2 instance in the default VRF is identified by a unique instance ID.

router ospf *id* [vrf | general]

15.2.3.8.1 Redistribute Configuration

Configuring the **redistribute ospf** command under the ***config-router-bgp*** mode with multiple OSPFv2 instances configured redistributes routes from all OSPFv2 instances into BGP.

These commands redistribute OSPFv2 routes into the BGP domain.

```
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute OSPF
switch(config-router-bgp)#
```

15.2.3.8.2 Special Cases

Route Selection in case of Ties between Instances

When the same prefix happens to be learned in multiple instances with the same metric, route-type are used as the first criteria to tie break:

O > O IA > N1 > N2 > E1 > E2

```
Codes: O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2
```

When routes have identical route-type as well, the route with the lowest nexthop IP address is selected.

Note: An ECMP route is not created in this case.

Overlapping Network Statements Configured

The CLI does not guard against overlapping network statements configured in different instances. This state is a misconfiguration.

15.2.3.8.3 OSPFv2 Multiple Instances Limitations

- OSPFv2 Multiple Instances is available only with the multi-agent routing protocol model.
- Only one interface can only have one instance of OSPFv2 running at any point in time.
- All the OSPFv2 instances must be in the default VRF.
- Multiple OSPFv2 instances can not be connected to the same network or configured with interfaces in the same area. In particular, multiple OSPFv2 instances may not be connected to the same instance on another router, in the same area.
- The following features are not supported with multiple OSPFv2 instances:
  - Redistributing routes from a specific OSPFv2 instance into BGP.
  - Redistribution of routes into an OSPFv2 instance.
  - Per interface area configuration.
  - Passive interface configuration.
  - SNMP.
  - Summary address.
  - Service ACL.
  - Max Metric with **`on-startup`** configuration.

15.2.3.9 OSPF Routes over GRE Tunnels Configuration

The following commands may be employed in the router OSPF mode:

- **tunnel routes**
- **`no tunnel routes`**
- **`default tunnel routes`**

To enable OSPFv2 over GRE tunnels, use the following commands:

```
switch(config)#router ospf 6
switch(config-router-ospf)#tunnel routes
switch(config-router-ospf)#
```

To disable OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)#router ospf 6
switch(config-router-ospf)#no tunnel routes
switch(config-router-ospf)#
```

To enable the default OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)#router ospf 6
switch(config-router-ospf)#default tunnel routes
switch(config-router-ospf)#
```

15.2.3.9.1 TCAM Profile Configuration

On DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 enabling OSPF routes over GRE tunnels requires the system TCAM profile to have “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. This can be achieved by creating a user defined TCAM profile as described below.

The user defined TCAM profile can be created either manually from scratch or by copying from an existing TCAM profile. The system TCAM profile must have the feature **tunnel ipv4** for the OSPFv2 over GRE tunnel interfaces to work. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

15.2.3.9.2 User Defined PMF (or TCAM) Profiles

This section describes a set of CLI commands to create user defined PMF (or TCAM) profile. The profile is composed of a set of TCAM features, with each feature having customized lookup key, actions and packet types to hit.

All TCAM profile CLIs are under **hardware tcam** mode.

```
(config)#hardware tcam
(config-hw-tcam)#
```

There are two ways to create a TCAM profile. The recommended way is to create a profile based on an existing one. In this example, a copy of the profile ***newprofile1*** is created.

```
(config)#hardware tcam
(config-hw-tcam)#profile newprofile1 copy default
(config-hw-tcam-profile-newprofile1)#
```

The other way is to create one profile from scratch. In this example, the profile ***newprofile2*** is created.

```
(config)#hardware tcam
(config-hw-tcam)#profile newprofile2
(config-hw-tcam-profile-newprofile2)#
```

To remove a profile, use the **no profile** command similar to the following. In this example, the profile ***newprofile2*** is removed.

```
(config)#hardware tcam
(config-hw-tcam)#no profile newprofile2
```

Features can be turned on and off in the new profile. In this example, the feature **acl port ipv6** is turned on.

```
(config-hw-tcam-profile-<profile>)#feature acl port ipv6
```

Features can be turned on and off in the new profile. In this example, the feature **acl port ipv6** is turned off.

```
(config-hw-tcam-profile-<profile>)#no feature acl port ipv6
```

The features are described by hierarchical CLI tokens. For example, IPv4 port ACL is represented by **feature acl port ip** and IPv6 port ACL is represented by **`feature acl port ipv6`**. Under each feature mode, there are various fields that can be modified.

- **`packet`**

  This describes packet types that the feature will be applied on.

  `packet` *packet header tokens* **forwarding [bridged** | **routed** | **mpls][multicast][decap]**

  `no packet` *packet header tokens* **forwarding [bridged** | **routed** | **mpls][multicast][decap]**

  The packet header is described a series of CLI packet header tokens after **packet** token. It starts from the outer most header after Ethernet. For example, a regular IPv4 packet is ***packet ipv4*** and a vxlan packet is ***packet ipv4 vxlan eth ipv4***. The **forwarding** token indicates the forwarding type of the packet. **multicast** indicates if the packet is a multicast packet. Lastly, **decap** indicates if the packet is decapsulated after a tunnel.
- **`key field`**

  This describes the TCAM key format for the feature. The CLI can add or delete fields that are used to build the key.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)
  #[no]keyfield field
  ```

  All supported key fields can be found with **`key field ?`**
- **`key size`**

  This describes the TCAM key size limit. If too many key fields are added to the feature so that the key size goes beyond the limit, a Syslog will be issued. The default key size limit is ***320***.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)#[no]key size
   limit size
  ```
- **`action`**

  This describes the action to take if a TCAM entry is hit.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)#[no]action action
  ```

  The supported actions can be found through **`action ?`**.
- **`sequence`**

  This describes the programming order of each feature. Changing the order may affect the programming status of a profile. The default sequence is ***0***.

  ```
  (config-hw-tcam-profile-<profile>-feature-<feature>)
  #[no]sequence sequence
  ```

  The profile is saved after exiting the feature mode. To use the newly defined profile, a CLI is available to apply the profile to the system globally.

  ```
  (config)#hardware tcam
  (config-hw-tcam)#system profile newprofile1
  ```

15.2.3.10 Displaying OSPFv2 Status

This section describes OSPFv2 **show** commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

15.2.3.10.1 OSPFv2 Summary

The **show ip ospf** command displays general OSPFv2 configuration information and operational statistics.

Example

This command displays general OSPFv2 information.

```
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msecs
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

15.2.3.10.2 Viewing OSPFv2 on the Interfaces

The **show ip ospf interface** command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

Examples

- This command displays complete OSPFv2 information for ***vlan 1***.

```
switch#show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
switch#
```

The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router (DR), and Backup Designated Router (BDR).

- This command displays a summary of interface information for the switch.

```
switch#show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1
Vlan210.0.0.210.168.2.1/2410BDR1
Vlan310.0.0.310.168.3.1/2410DR0
switch#
```

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

15.2.3.10.3 Viewing the OSPFv2 Database

The **`show ip ospf database <link state list>`** command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Examples

- This command displays LSDB contents for ***area 2***.

```
switch#show ip ospf 1 2 database
